

Integrated Relay, Inductive Load Driver

NUD3105

This device is used to switch inductive loads such as relays, solenoids incandescent lamps, and small DC motors without the need of a free-wheeling diode. The device integrates all necessary items such as the MOSFET switch, ESD protection, and Zener clamps. It accepts logic level inputs thus allowing it to be driven by a large variety of devices including logic gates, inverters, and microcontrollers.

Features

- Provides a Robust Driver Interface Between DC Relay Coil and Sensitive Logic Circuits
- Optimized to Switch Relays from 3.0 V to 5.0 V Rail
- Capable of Driving Relay Coils Rated up to 2.5 W at 5.0 V
- Internal Zener Eliminates the Need of Free-Wheeling Diode
- Internal Zener Clamp Routes Induced Current to Ground for Quieter Systems Operation
- Low $V_{DS(on)}$ Reduces System Current Drain
- SZ Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q101 Qualified and PPAP Capable
- These Devices are Pb-Free and Halide Free

Typical Applications

- Telecom: Line Cards, Modems, Answering Machines, FAX
- Computers and Office: Photocopiers, Printers, Desktop Computers
- Consumer: TVs and VCRs, Stereo Receivers, CD Players, Cassette Recorders
- Industrial: Small Appliances, Security Systems, Automated Test Equipment, Garage Door Openers
- Automotive: 5.0 V Driven Relays, Motor Controls, Power Latches, Lamp Drivers

Designing with this Data Sheet

1. Determine the maximum inductive load current (at max V_{CC} , min coil resistance & usually minimum temperature) that the NUD3105 will have to drive and make sure it is less than the max rated current.
2. For pulsed operation, use the Transient Thermal Response of Figure 11 and the instructions with it to determine the maximum limit on transistor power dissipation for the desired duty cycle and temperature range.
3. Use Figures 10 and 11 with the SOA notes to insure that instantaneous operation does not push the device beyond the limits of the SOA plot.
4. Verify that the circuit driving the gate will meet the $V_{GS(th)}$ from the Electrical Characteristics table.
5. Using the max output current calculated in step 1, check Figure 7 to insure that the range of Zener clamp voltage over temperature will satisfy all system & EMI requirements.
6. Use I_{GSS} and I_{DSS} from the Electrical Characteristics table to ensure that "OFF" state leakage over temperature and voltage extremes does not violate any system requirements.
7. Review circuit operation and insure none of the device max ratings are being exceeded.

APPLICATIONS DIAGRAMS

Figure 12. A 200 mW, 5.0 V Dual Coil Latching Relay Application with 3.0 V Level Translating Interface

Max Continuous Current Calculation

for TX2-5V Relay, $R_1 = 178 \, \Omega$ Nominal @ $R_A = 25^\circ\text{C}$

Assuming $\pm 10\%$ Make Tolerance,

$R_1 = 178 \, \Omega * 0.9 = 160 \, \Omega$ Min @ $T_A = 25^\circ\text{C}$

T_C for Annealed Copper Wire is $0.4\%/^\circ\text{C}$

$R_1 = 160 \, \Omega * [1 + (0.004) * (-40^\circ - 25^\circ)] = 118 \, \Omega$ Min @ -40°C

$I_O \text{ Max} = (5.5 \text{ V Max} - 0.25\text{V}) / 118 \, \Omega = 45 \text{ mA}$
