

NV3023A Datasheet

A-Si TFT LCD Single Chip Driver
132RGBx162 Resolution and 262K color

Version 0.1
Oct, 2019

Introduction	1
1. Features	2
2. Pin Descriptions	4
3. Bump Arrangement and Coordination	6
3.1. Bump Arrangement.....	6
3.2. Pin Connection.....	7
3.3. Pad Coordination.....	8
4. Interface Description	32
4.1. Interface Type Selection	32
4.2. Serial Interface	32
4.2.1 Command/Data Write	33
4.2.2 Command/Data Read	34
4.3. 8080-Series Parallel Interface (P68='0').....	36
4.3.1. Write Cycle/Sequence.....	37
4.3.2. Read Cycle/Sequence.....	38
4.4. 6800-Series Parallel Interface (P68='1').....	39
4.4.1. Write Cycle Sequence	40
4.4.2. Read Cycle Sequence.....	41
4.5. Serial Interface Recovery Function.....	42
4.6. Display Data Transmission Pause.....	43
4.7. Display Data Transfer Mode.....	44
4.8. RGB Interface	45
4.8.1. RGB Interface Selection	45
4.8.2. RGB Interface Timing.....	47
4.8.3 RGB Interface Mode Selection	48
4.9. Display Data Color Coding	49
4.9.1. Serial Interface	49
4.9.2. Parallel 8-bit Interface (IM="100").....	52
4.9.3. Parallel 9-bit Interface (IM="110").....	53
4.9.4. Parallel 16-bit Interface (IM="101").....	54
4.9.5. Parallel 18-bit Interface (IM="111").....	56
5. Display Data with SRAM.....	58
5.1. SRAM Organization	58
5.2. Memory To Display Mapping.....	59
5.3. MCU To SRAM Access Direction.....	60
6. Tearing Effect.....	62
6.1. Tearing Effect Line Modes	62
6.2. Tearing Effect Line Timing	64
6.2.1. Example 1 MCU Write is Faster than Panel Read	65
6.2.2. Example 2 MCU Write is slower than Panel Read	66
7. Power ON/OFF Sequence	67
7.1. Case 1 - RESX line is held high or Unstable by Host at Power On.....	68
7.2. Case 2 - RESX line is held low by Host at Power On.....	69
7.3. Uncontrolled Power Off.....	69
8. Power Level Definition	70
8.1. Power Levels.....	70
8.2. Power Flow Chart	71
9. Gamma Curve.....	72
9.1. Gamma curve according to the Gamma 1.0/1.8/2.2/2.5.....	72
9.2. Gamma Structure	73
10. Reset Function	74
10.1. State of Register After Different Reset	74
10.2. Reset Timing	75
11. Sleep Out and Self-Diagnostic Functions of Display.....	76
12. Command	77

12.1.1. System Function Command List and Description.....	77
12.1.1. NOP (00h).....	79
12.1.2. SWRESET (01h).....	80
12.1.3. RDDID (04h)	81
12.1.4. RDDST (09h).....	82
12.1.5. RDDPM (0Ah).....	84
12.1.6. RDDMADCTL (0Bh).....	85
12.1.7. RDDCOLMOD (0Ch).....	86

Introduction

NV3023A is a 262,144-color one-chip SoC driver for a-TFT liquid crystal display with resolution of 132RGBx162 dots, comprising a 396-channel source driver, a 162-channel gate driver, 48,114 bytes GRAM for graphic data of 132RGBx162 dots, and power supply circuit.

The NV3023A supports 18-/16-/9-/8-bit data bus interface and serial peripheral interfaces (SPI). It also supplies 18-bit, 16-bit or 6-bit RGB interface for driving video signal directly from application controller. The moving picture area can be specified in internal GRAM by window address function. The specified window area can be updated selectively, so that moving picture can be displayed simultaneously independent of still picture area.

NV3023A can operate with 1.65V I/O interface voltage, and an incorporated voltage follower circuit to generate voltage levels for driving an LCD. The NV3023A also supports a function to display in 8 colors idle mode, allowing for precise power control by software. So these features make the NV3023A an ideal LCD driver for medium or small size portable products such as digital cellular phones, smart phone, MP3 and PMP, on which long battery life is a major concern.

1. Features

- ◆ Display resolution options
 - 120(RGB) (H) X 160 (V)
 - 128(RGB) (H) X 128 (V)
 - 128(RGB) (H) X 160 (V)
 - 130(RGB) (H) X 130 (V)
 - 132(RGB) (H) X 132(V)
 - 132(RGB) (H) X 162 (V)
- ◆ LCD Driver Output Circuits
 - 396 source outputs
 - 162 gate outputs
 - Common electrode output
- ◆ AM-LCD driver with on-chip full display RAM: 34,749 bytes
- ◆ System Interfaces
 - 8-bits, 9-bits, 16-bits, 18-bits interface with 8080-series MCU
 - 8-bits, 9-bits, 16-bits, 18-bits interface with 6800-series MCU
 - 6-bits, 16-bits, 18-bits RGB interface
 - 3-pin/4-pin serial interface
- ◆ Display color modes
 - Full color mode (idle mode off): 262K-colors
 - Reduced color modes (idle mode on): 8-colors
- ◆ On Chip Functions
 - VCOM generator and adjustment
 - Timing generator
 - Oscillator
 - DC/DC converter
 - Line/frame inversion
 - Factory default value (Maker ID, Version ID, Module ID, etc) are stored on the display module

- ◆ Low-Power Consumption
 - Low operating power supplies
 - IOVCC = 1.65V ~ 3.6 V (interface I/O)
 - VCI = 2.5V ~ 4.8 V (analog)
- ◆ LCD Voltage Drive
 - Source/VCOM power supply voltage
 - AVDD – VSS = 4.5V ~ 5.0V
 - VCL – VSS = -1.0V ~ -3.0V
 - VCI – VCL \leq 5.0V
 - Gate driver output voltage
 - VGH – VSS = 10V ~ 16V
 - VGL – VSS = -6V ~ -12V
 - VGH – VGL \leq 30V
 - VCOM driver output voltage
 - VCOMH = 3.1725V ~ 4.41V
 - VCOML = -0.36V ~ -1.8225V
- ◆ Operate Temperature Range: -30°C to 85°C

2. Pin Descriptions

Pin Name	I/O	Descriptions																																			
Power Supply Pin																																					
IOVCC	I	Power supply for interface logic circuits (1.65 ~ 3.6V)																																			
VCI	I	Power supply for analog circuit. Could connect to external power supply (VCI=2.5~4.8V).																																			
VSSA	I	System Ground for Analog System and Booster Circuit.																																			
VSS	I	System Ground for I/O System and Digital System.																																			
Interface Logic Pin																																					
P68	I	8080/6800 MCU Interface Mode Selection P68 = '1' : Select 6800-MCU parallel interface P68 = '0' : Select 8080-MCU parallel interface Note: If not used, please fix this pin at VSS level.																																			
IM2 IM1 IM0	I	MCU Parallel interface bus and Serial interface select : <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <th>IM2</th><th>IM1</th><th>IM0</th><th>SPI4W</th><th>Interface Type</th></tr> <tr> <td>1</td><td>0</td><td>0</td><td>X</td><td>MCU 8-bit Parallel</td></tr> <tr> <td>1</td><td>0</td><td>1</td><td>X</td><td>MCU 16-bit Parallel</td></tr> <tr> <td>1</td><td>1</td><td>0</td><td>X</td><td>MCU 9-bit Parallel</td></tr> <tr> <td>1</td><td>1</td><td>1</td><td>X</td><td>MCU 18-bit Parallel</td></tr> <tr> <td>0</td><td>X</td><td>X</td><td>1</td><td>SPI 4 Wire Serial</td></tr> <tr> <td>0</td><td>X</td><td>X</td><td>0</td><td>SPI 3 Wire Serial(or 2 Data Line SPI)</td></tr> </table>	IM2	IM1	IM0	SPI4W	Interface Type	1	0	0	X	MCU 8-bit Parallel	1	0	1	X	MCU 16-bit Parallel	1	1	0	X	MCU 9-bit Parallel	1	1	1	X	MCU 18-bit Parallel	0	X	X	1	SPI 4 Wire Serial	0	X	X	0	SPI 3 Wire Serial(or 2 Data Line SPI)
IM2	IM1	IM0	SPI4W	Interface Type																																	
1	0	0	X	MCU 8-bit Parallel																																	
1	0	1	X	MCU 16-bit Parallel																																	
1	1	0	X	MCU 9-bit Parallel																																	
1	1	1	X	MCU 18-bit Parallel																																	
0	X	X	1	SPI 4 Wire Serial																																	
0	X	X	0	SPI 3 Wire Serial(or 2 Data Line SPI)																																	
SPI4W		SPI4W='0', 3-line SPI or 2 Data Line SPI Enable. SPI4W='1', 4-line SPI Enable. If Not Used, Please fix this Pin at VSS Level.																																			
RESX	I	Chip Reset Pin ("Low Active") Note: Keep this pin without glitch																																			
CSX	I	Chip Select Pin ("Low Active") Pull down when chip accessable																																			
DCX	I	Reuse Pin according parallel and serial interface: <ul style="list-style-type: none"> ➤ MCU Interface: Distinguish Data ('1') or Command ('0'). ➤ SPI Interface: Used as 'SCL' clock pin. If not used, please connect this pin to VSS.																																			
RDX	I	<ul style="list-style-type: none"> ➤ 8080-parallel interface: used as 'Read' enable. ➤ 6800-parallel interface: <ol style="list-style-type: none"> 1. when WRX='0' , RDX used as 'write' enable; 2. When WRX='1', RDX used as 'Read' enable. 																																			
WRX	I	<ul style="list-style-type: none"> ➤ 8080-parallel interface, used as write enable. ➤ 6800-parallel interface, used to distinguish 'write' or 'read' operation. ➤ SPI 4-wire interface, used as D/CX. ➤ 2 Data Line SPI as RS; 																																			

Pin Name	I/O	Descriptions			
D[17:0]	I/O	<ul style="list-style-type: none"> ➤ SPI without RGB interface : D[0] used as SDI/O, others don't care; ➤ SPI with RGB interface : D[17:0] used as data bus; ➤ MCU interface : D[17:0] used as data bus; Note : When RGB interface enable , SPI should use 'SDA' pin as SDI/O			
TE	O	Tearing effect output pin to synchronize MCU to frame writing			
TEST12/SDA	I/O	When RCM[1]='1',SDA is used for SPI write/read data line; When RCM[0]='0',SDA is not used;			
TEST1P	I	RCM[0], dont use.			
TEST2P	I	RCM[1], choose RGB interface, internal pull low.			
TEST8/PCLK	I	RGB interface pixel clock signal			
TEST10/HS	I	RGB interface horizontal synchronization signal			
TEST11/VS	I	RGB interface vertical synchronization signal			
TEST9/DE	I	RGB interface data enable signal			
OSC	O	OSC waveform output pin, for test purpose.			
Mode Selection Pin					
GM2 GM1 GM0	I	Panel Resolution Selection Pins.			
		GM2	GM1	GM0	
		0	0	0	
		0	0	1	
		0	1	0	
		0	1	1	
		1	0	0	
		1	0	1	
Descriptions					
132RGBX162(S1~396 and G1~G162 output)					
128RGBX128(S7~390 and G2~G129 output)					
120RGBX160(S7~366 and G2~G161 output)					
128RGBX160(S7~390 and G2~G161 output)					
130RGBX130(S7~396 and G2~G131 output)					
132RGBX132(S1~396 and G2~G133 output)					
VPP	I	When writing NVM, it needs external power supply voltage (7.5V).			
Driver Output pins					
S1~S396	O	Source driver output pins.			
G1~G162	O	Gate driver output pins.			
VDD	O	Test pin for internal digital logic Power supply			
GVDD	O	A power supply for Grayscale Voltage Generator			
DDVDH	O	A power supply pin for source driver block that is generated from power block. Output of booster 1 circuit (output of 2-times output of VCI).			
VCL	O	A power supply pin for generating VCOML			
VGH	O	Power supply for Gate Driver			
VGL	O	Negative power supply for Gate Driver			
VCOMH	O	The high level of VCOM AC voltage.			
VCOML	O	The low level of VCOM AC voltage.			
VCOM	O	TFT display common electrode power supply. Alternates between voltage levels between VCOMH-VCOML. Registers set the alternating cycle for operating or halting VCOM.			
TEST_C<3:0>	O	Digital function test outputs, it is not accessible to user.must be open.			
TESTOP[8:1]	O	Analog function test outputs, it is not accessible to user.must be open.

4. Interface Description

4.1. Interface Type Selection

The selection of a given interfaces are done by setting P68, IM2, IM1, and IM0 pins as show in below tables.

Table 4-1 Interface Type Selection

P68	IM2	IM1	IM0	Interface	Read Back Selection
X	0	X	X	Serial interface	Via the read instruction (8-bit , 24-bit and 32-bit read parameter)
0	1	0	0	8080 MCU 8-bit Parallel	RDX strobe (8-bit read data and 8-bit read parameter)
0	1	0	1	8080 MCU 16-bit Parallel	RDX strobe (16-bit read data and 8-bit read parameter)
0	1	1	0	8080 MCU 9-bit Parallel	RDX strobe (9-bit read data and 8-bit read parameter)
0	1	1	1	8080 MCU 18-bit Parallel	RDX strobe (18-bit read data and 8-bit read parameter)
1	1	0	0	6800 MCU 8-bit Parallel	RDX strobe (8-bit read data and 8-bit read parameter)
1	1	0	1	6800 MCU 16-bit Parallel	RDX strobe (9-bit read data and 8-bit read parameter)
1	1	1	0	6800 MCU 9-bit Parallel	RDX strobe (16-bit read data and 8-bit read parameter)
1	1	1	1	6800 MCU 18-bit Parallel	RDX strobe (18-bit read data and 8-bit read parameter)

4.2. Serial Interface

The Module uses a 3-wire 9-bit serial interface or 4-pins/8-bit bi-directional interface for communication between the micro controller and the LCD driver chip. The 3-pins serial use: CSX (chip enable), SCL (serial clock) and SDA (serial data input/output) and the 4-pins serial use: CSX (chip enable), D/CX (data/ command select), SCL (serial clock), and SDA (serial data input/output).

Table 4-2 Serial Interface Type Selection

IM2	4WSPI	Interface	Read back selection
0	0	3-Pins Serial Interface(or 2 Data Line SPI)	Via the read instruction (8-bit , 24-bit and 32-bit read parameter)
0	1	4-Pins Serial Interface	Via the read instruction (8-bit , 24-bit and 32-bit read parameter)

4.2.1 Command/Data Write

The write mode of the interface means the micro controller writes commands and data to the LCD driver. 3-pins serial data packet contains a control bit D/CX and a transmission byte, but in 4-pins serial case, data packet contains just transmission byte and control bit D/CX is transferred by the D/CX pin. If D/CX is “low”, the transmission byte is interpreted as a command byte. If D/CX is “high”, the transmission byte is stored in the display data RAM (Memory write command), or command register as parameter.

Any instruction can be sent in any orders to the Driver. The MSB is transmitted first. The serial interface is initialized when CSX is high status. In this state, SCL clock pulse or SDA data have no effect. A falling edge on CSX enables the serial interface and indicated the start of data transmission.

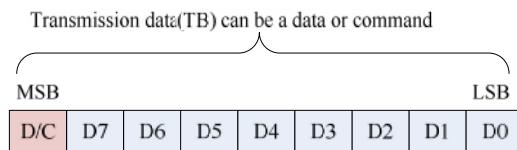

Figure 4-2-1-1 SPI 3-Wire Write Data Format

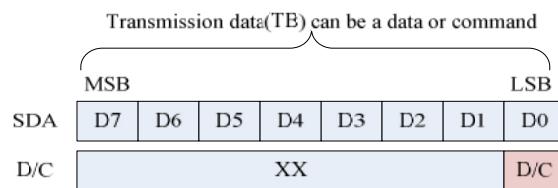

Figure 4-2-1-2 SPI 4-Wire Write Data Format

When CSX is “high”, SCL clock is ignored. At the falling edge of CSX, SCL can be high or low. SDA is sampled at the rising edge of SCL. D/CX indicates, whether the byte is command code (D/CX=’0’) or parameter/RAM data (D/CX=’1’). If CSX stays low after the last bit of command/data byte, the serial interface expects the D/CX bit (3-pin serial interface) or D7 (4-pins serial interface) of the next byte at the next rising edge of SCL.

4.2.2 Command/Data Read

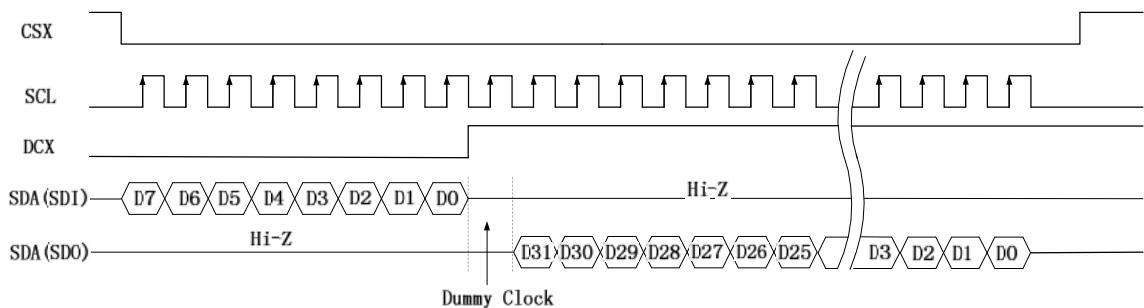

Figure 4-2-2-6 SPI 4-Wire 32-bit Read Operation
(For ‘09H’ Command with one dummy clock)

4.3. 8080-Series Parallel Interface (P68='0')

The MCU uses an 11-wires 8-data parallel interface or 12-wires 9-data parallel interface or 19-wires 16-data parallel interface or 21-wires 18-data parallel interface. The chip-select CSX (active low) enables and disables the parallel interface. RESX (active low) is an external reset signal. WRX is the parallel data write, RDX is the parallel data read and D[17:0] is parallel data.

The graphics controller chip reads the data at the rising edge of WRX signal. The D/CX is the data/command flag. When D/CX='1', D[17:0] bits are display RAM data or command parameters. When D/C='0', D[17:0] bits are commands.

The 8080-series bi-direction interface can be used for communication between the micro-controller and LCD driver chip. The selection of this interface is done when P68 pin is low state (VSS). Interface bus width can be selected with IM2, IM1 and IM0. The interface functions of 8080-series parallel interface are given in Table 4-3-1.

Table 4-3-1 8080 MCU Operation

P68	IM2	IM1	IM0	Interface	D/CX	RDX	WRX	Function
0	1	0	0	8-bit parallel	L	H	R	Write 8-bit command
					H	H	R	Write 8-bit display data or 8-bit parameter
					H	R	H	Read 8-bit display data or 8-bit parameter
0	1	0	1	16-bit parallel	L	H	R	Write 8-bit command
					H	H	R	Write 16-bit display data or 8-bit parameter
					H	R	H	Read 16-bit display data or 8-bit parameter
0	1	1	0	9-bit parallel	L	H	R	Write 8-bit command
					H	H	R	Write 9-bit display data or 8-bit parameter
					H	R	H	Read 9-bit display data or 8-bit parameter
0	1	1	1	18-bit parallel	L	H	R	Write 8-bit command
					H	H	R	Write 18-bit display data or 8-bit parameter
					H	R	H	Read 18-bit display data or 8-bit parameter

Note: Reading operation applied for command code: DAh, DBh, DCh, 04h, 09h, 0Ah, 0Bh, 0Ch, 0Dh, 0Eh, 0Fh

4.3.1. Write Cycle/Sequence

The write cycle means that the host writes information (command or/and data) to the display via the interface. Each write cycle (WRX high-low-high sequence) consists of 3 control (D/CX, RDX, WRX) and data signals (D[17...0]). D/CX bit is a control signal, which tells if the data is a command or a data. The data signals are a command if the control signal is low (= ‘0’) and vice versa it is data (= ‘1’). The write cycle is described in the following figure.

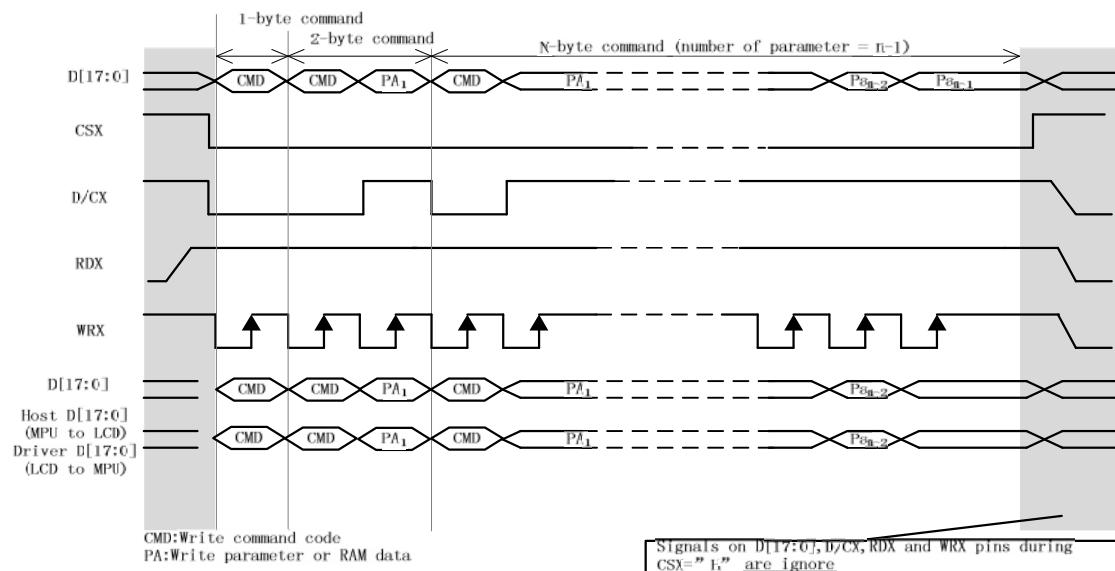

Figure 4-3-1 8080 MCU Write sequence

4.3.2. Read Cycle/Sequence

The read cycle (RDX high-low-high sequence) means that the host reads information from the display via interface. The display sends data (D[17:0]) to the host when there is a falling edge of RDX and the host reads data when there is a rising edge of RDX.

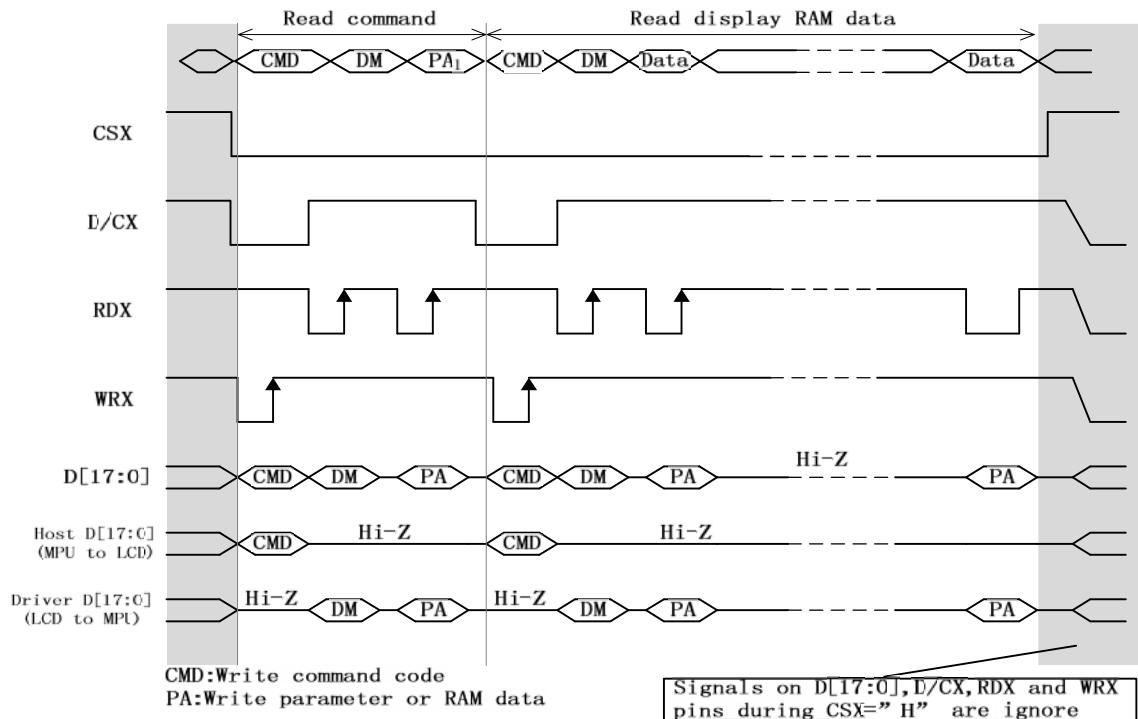

Figure 4-3-2 8080 Read sequence

4.4. 6800-Series Parallel Interface (P68='1')

The MCU uses a 11-wires 8-data parallel interface or 12-wires 9-data parallel interface or 19-wires 16-data parallel interface or 21-wires 18-data parallel interface. The chip-select CSX (active low) enables and disables the parallel interface. RESX (active low) is an external reset signal. WRX is read/write flag, RDX is the parallel data read/write enable and D[17:0] is parallel data.

The Graphics Controller Chip reads the data at the falling edge of RDX signal when WRX = '1' and writes the data at the falling of the RDX signal when R/WX='0'. The D/CX is the data or command flag. When D/CX='1', D[17:0] bits are display RAM data or command parameters. When D/C='0', D[17:0] bits are commands.

The 6800-series bi-direction interface can be used for communication between the micro- controller and LCD driver chip. The selection of this interface is done when P68 pin is high state (IOVCC). Interface bus width can be selected with IM2, IM1 and IM0. The interface functions of 6800-series parallel interface are given in Table 4-4-1.

Table 4-4-1 6800 MCU Operation

P68	IM2	IM1	IM0	Interface	D/CX	WRX	RDX	Function
1	1	0	0	8-bit parallel	L	L	F	Write 8-bit command
					H	L	F	Write 8-bit display data or 8-bit parameter
					H	H	F	Read 8-bit display data or 8-bit parameter
1	1	0	1	16-bit parallel	L	L	F	Write 8-bit command
					H	L	F	Write 16-bit display data or 8-bit parameter
					H	H	F	Read 16-bit display data or 8-bit parameter
1	1	1	0	9-bit parallel	L	L	F	Write 8-bit command
					H	L	F	Write 9-bit display data or 8-bit parameter
					H	H	F	Read 9-bit display data or 8-bit parameter
1	1	1	1	18-bit parallel	L	L	F	Write 8-bit command
					H	L	F	Write 18-bit display data or 8-bit parameter
					H	H	F	Read 18-bit display data or 8-bit parameter

Note: Reading operation applied for command code: DAh, DBh, DCh, 04h, 09h, 0Ah, 0Bh, 0Ch, 0Dh, 0Eh, 0Fh

4.4.1. Write Cycle Sequence

The write cycle means that the host writes information (command or/and data) to the display via the interface. Each write cycle consists of 3 control (D/CX, RDX, WRX) and data signals (D[17:0]). D/CX bit is a control signal, which tells if the data is a command or a data. The data signals are a command if the control signal is low (D/CX= ‘0’), vice versa, it is data (D/CX= ‘1’).WRX work as write or read flag, WRX=’0’ stands for write operation, WRX=’1’ means read operation.The detail write cycle is described in the Figure 4-4-1.

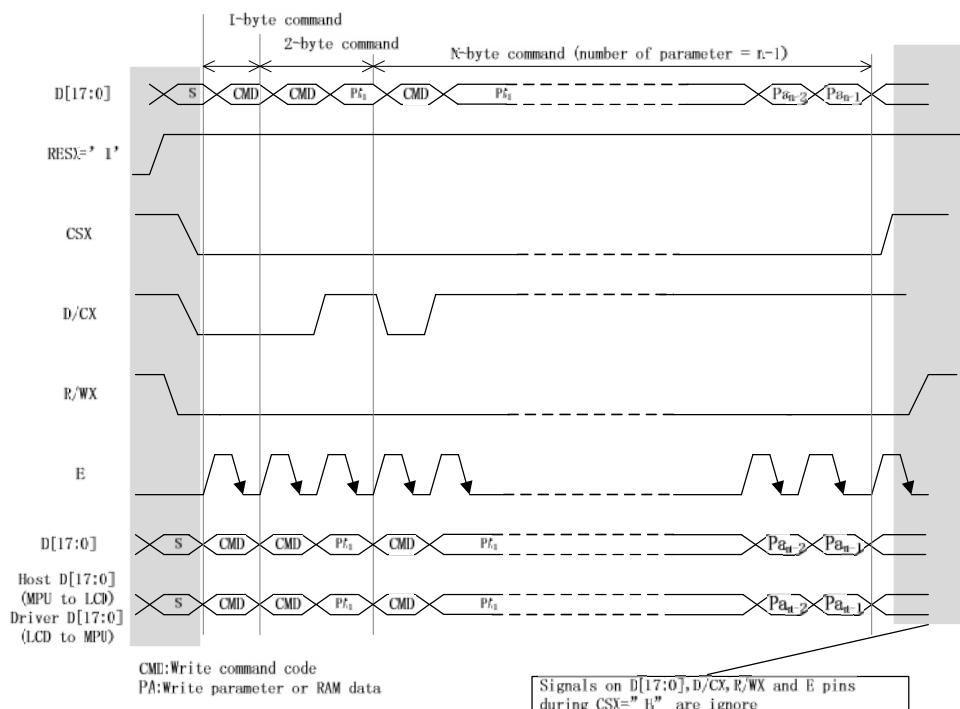

Figure 4-4-1 6800 Write Sequence

4.4.2. Read Cycle Sequence

The read cycle means that the host reads information (command or/and data) to the display via the interface. Each read cycle consists of 3 control (D/CX, WRX, RDX) and data (D[17:0]). D/CX bit is control signal, which tells if the data is a command or a data. The data signals are the command if the control signal is low and vice versa it is data .WRX work as write or read flag,WRX='0' stands for write operation,WRX='1' means read operation.The detail read cycle is described in the figure Figure 4-4-2.

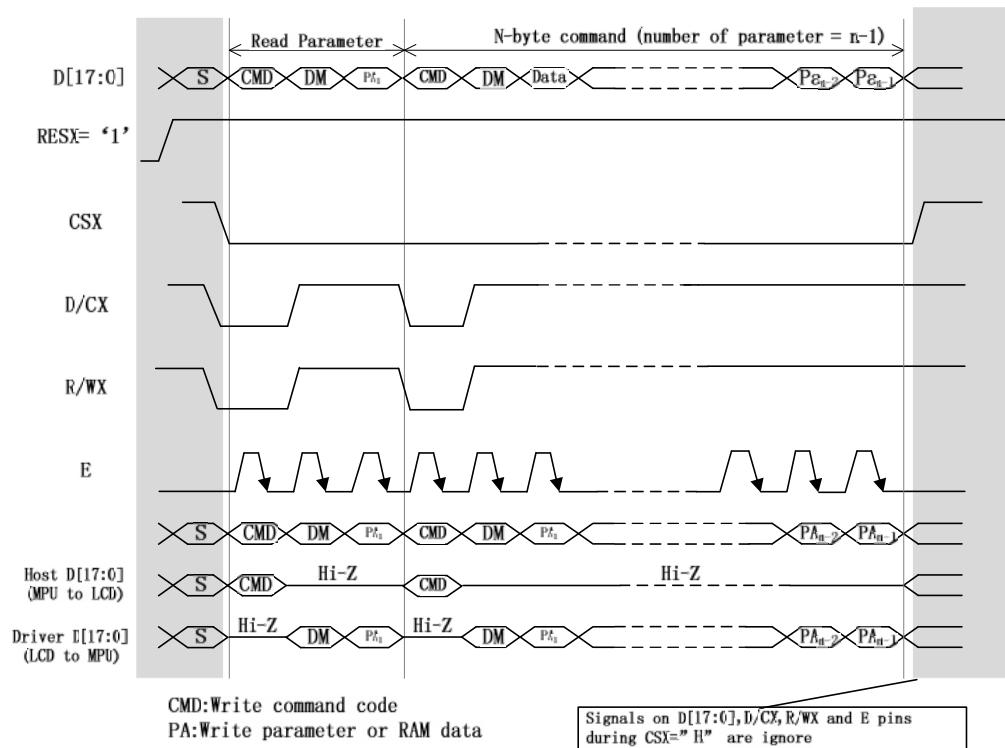

Figure 4-4-2 6800 Read Sequence

4.5. Serial Interface Recovery Function

If there is a break in data transmission by RESX pulse, while transferring a Command or Frame Memory Data or Multiple Parameter command Data, before Bit D0 of the byte has been completed, then Driver will reject the previous bits and should reset the interface that it will be ready to receive command data again when the chip select line (CSX) is next activated after RESX have been High state. See the following example.

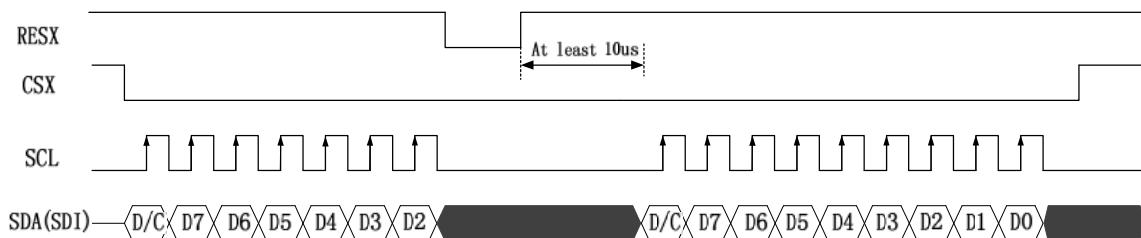

Figure 4-5-1 Serial interface recovery

If there is a break in data transmission by CSX pulse, while transferring a Command or Frame Memory Data or Multiple Parameter command Data, before Bit D0 of the byte has been completed, Then the Driver will reject the previous bits and should reset the interface such that it will be ready to receive the same byte re-transmitted when the chip select line (CSX) is next activated. See the following example.

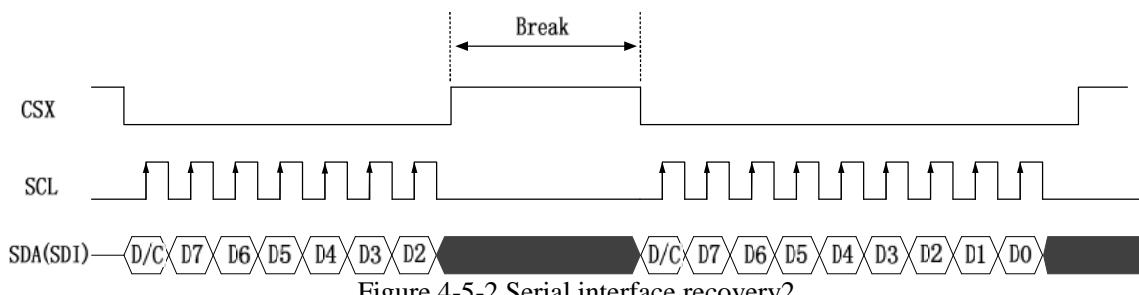

Figure 4-5-2 Serial interface recovery2

If 1, 2 or more parameter command is being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than re-transmitting the parameter that was interrupted, then the parameters that were successfully sent are stored and the parameter where the break occurred is rejected. The interface is ready to receive next byte as show below.

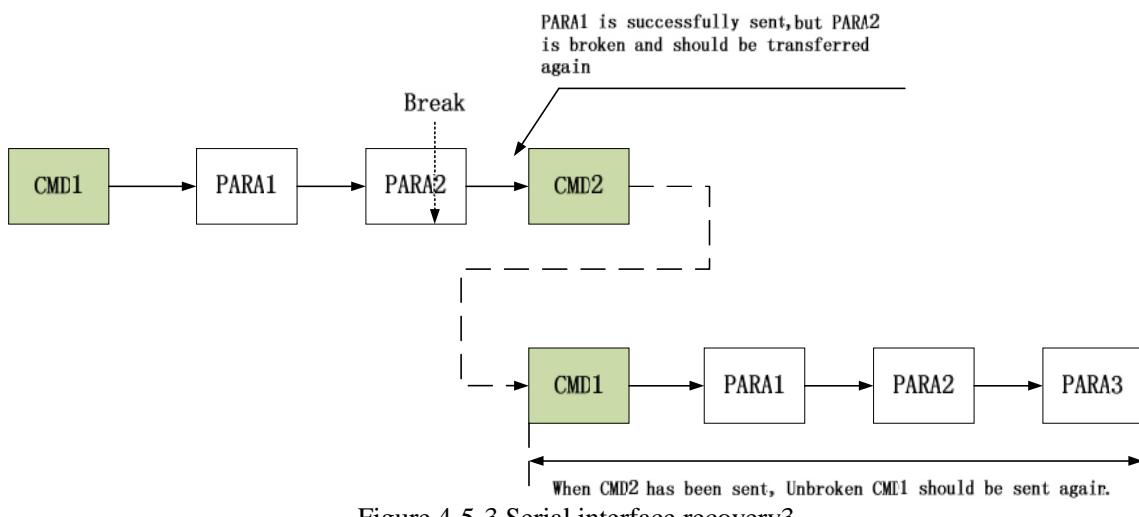

Figure 4-5-3 Serial interface recovery3

4.6. Display Data Transmission Pause

It will be possible when transferring a Command, Frame Memory Data or Multiple Parameter Data to invoke a pause in the data transmission. If the Chip Select Line is released after a whole byte of a Frame Memory Data or Multiple Parameter Data has been completed, then the Display Module will wait and continue the Frame Memory Data or Parameter Data Transmission from the point where it was paused. If the Chip Select Line is released after a whole byte of a command has been completed, then the Display Module will receive either the command's parameters (if appropriate) or a new command when the Chip Select Line is next enabled as shown below:

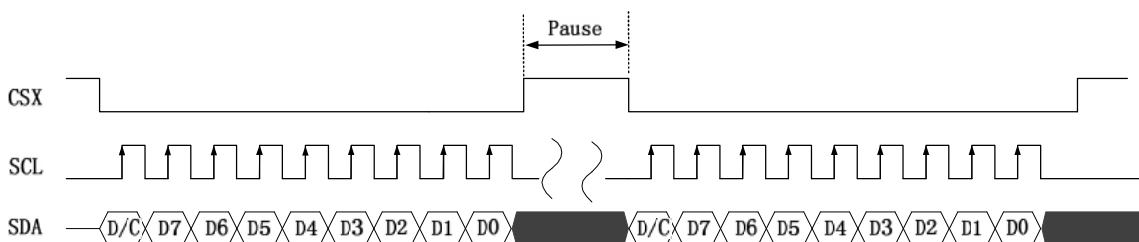

Figure 4-6 Serial interface recovery3

4.7. Display Data Transfer Mode

The data format is described for each interface. Data can be downloaded to the Frame Memory by 2 methods.

Method1:

The Image data is sent to the Frame Memory in successive Frame writes, each time the Frame Memory is filled, the Frame Memory pointer is reset to the start point and the next Frame is written.

Start Frame Write	Image Data Frame1	Image Data Frame2	Image Data Frame3
-------------------	-------------------	-------------------	-------------------

Method2:

After image data is sent and at the end of each Frame Memory download, a command is sent to stop Frame Memory Write. Then Start Memory Write command is sent, and a new Frame is downloading.

Start Frame Write	Image Data Frame1	Any Command	Start Frame Write	Image Data Frame2	Any Command	...	Any Command
-------------------	-------------------	-------------	-------------------	-------------------	-------------	-----	-------------

4.8. RGB Interface

4.8.1. RGB Interface Selection

The RGB interface mode is available for NV3023A and the interface is selected by setting the VIPF[3:0] bits as following table.

Table 4-8-1 RGB Interface Selection

VIPF[3:0]				RGB Interface				Data Bus							
0	1	1	0	18-bit RGB interface				D[17:0]							
0	1	0	1	16-bit RGB interface				D[17:13],D[11:1]							
1	1	1	0	6-bit RGB interface				D[7:2]							
Others				Setting prohibited											

The display operation via RGB interface is synchronized with the VS, HS and PCLK signals. The RGB interface transfers the updated data to GRAM and the update area is defined by the window address function. The back porch and back porch are used to set the RGB interface timing.

- ◆ 18-bit data bus interface (D[17:0] is used) , VIPF[3:0] = 0110

D17	D16	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
R[5]	R[4]	R[3]	R[2]	R[1]	R[0]	G[5]	G[4]	G[3]	G[2]	G[1]	G[0]	B[5]	B[4]	B[3]	B[2]	B[1]	B[0]

- ◆ 16-bit data bus interface (D[17:13] and D[11:1] are used) , VIPF[3:0] = 0101

D17	D16	D15	D14	D13	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1		
R[4]	R[3]	R[2]	R[1]	R[0]	G[5]	G[4]	G[3]	G[2]	G[1]	G[0]	B[4]	B[3]	B[2]	B[1]	B[0]		

- ◆ 6-bit data bus interface (D[7:2] is used) , VIPF[3] = 1110

First Transmission						Second Transmission						Third Transmission					
D7	D6	D5	D4	D3	D2	D7	D6	D5	D4	D3	D2	D7	D6	D5	D4	D3	D2
R[5]	R[4]	R[3]	R[2]	R[1]	R[0]	G[5]	G[4]	G[3]	G[2]	G[1]	G[0]	B[5]	B[4]	B[3]	B[2]	B[1]	B[0]

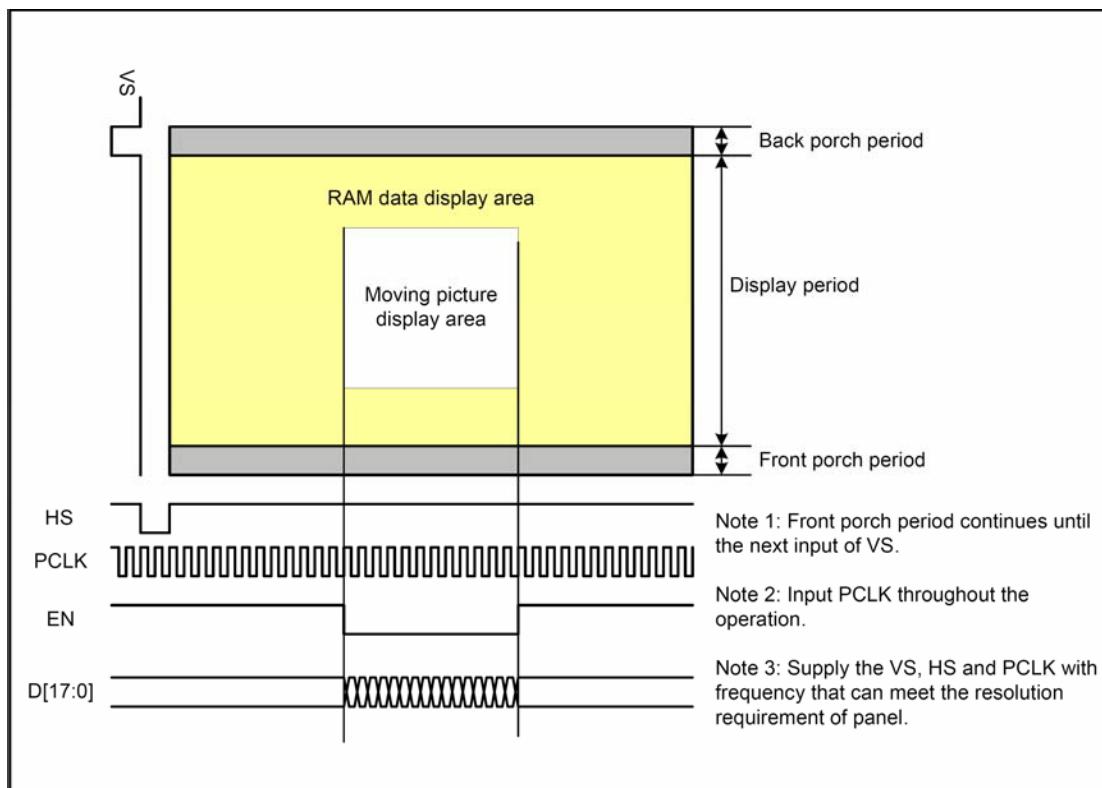

Pixel clock (PCLK) is running all the time without stopping and it is used to entering VS, HS, EN and D[17:0] states when there is a rising edge of the PCLK. The PCLK can not be used as continues internal clock for other functions of the display module.

Vertical synchronization (VS) is used to tell when there is received a new

frame of the display. This is high enable and its state is read to the display module by a rising edge of the PCLK signal.

Horizontal synchronization (HS) is used to tell when there is received a new line of the frame. This is low enable and its state is read to the display module by a rising edge of the PCLK signal.

Data Enable (DE) is used to tell when there is received RGB information that should be transferred on the display. This is a high enable and its state is read to the display module by a rising edge of the PCLK signal. D[17:0] are used to tell what is the information of the image that is transferred on the display (When EN= '1' and there is a rising edge of PCLK). D[17:0] can be '0' (low) or '1' (high). These lines are read by a rising edge of the PCLK signal.

4.8.2. RGB Interface Timing

The timing chart of Signals in 18-/16-bit RGB interface mode is shown as below:

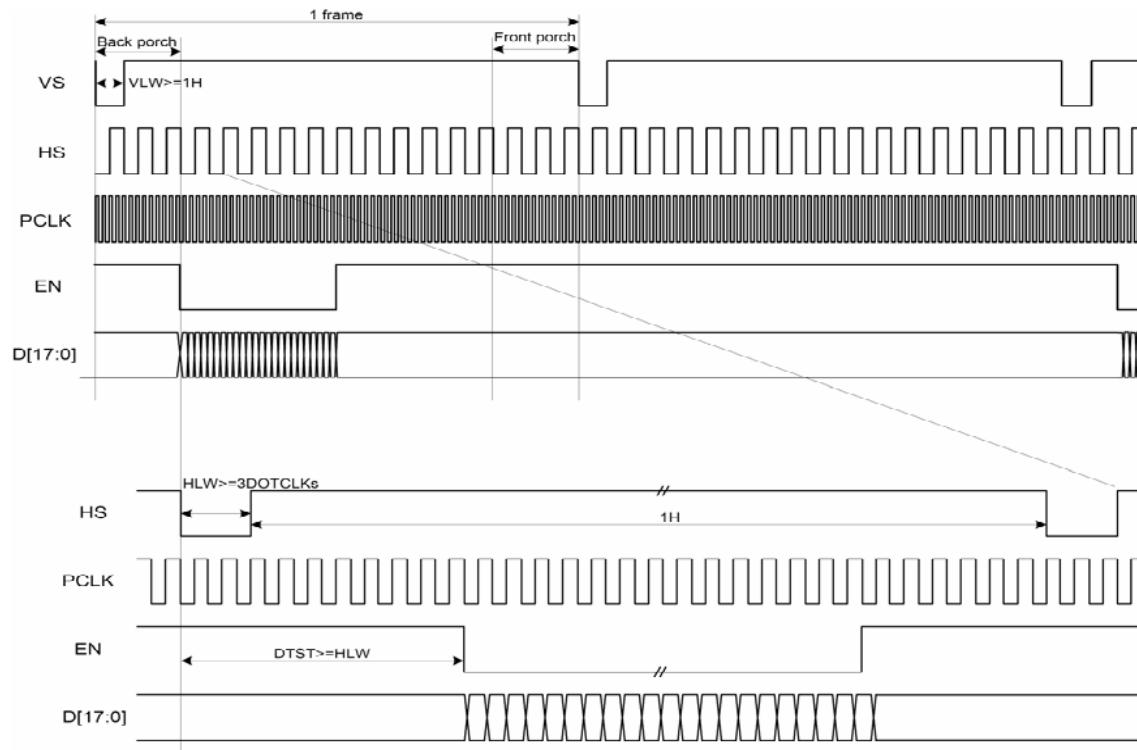

Figure 4-8-2-1 Timing Chart of Signals in 18-/16-bit RGB Interface Mode

The timing chart of 6-bit RGB interface mode is shown as below:

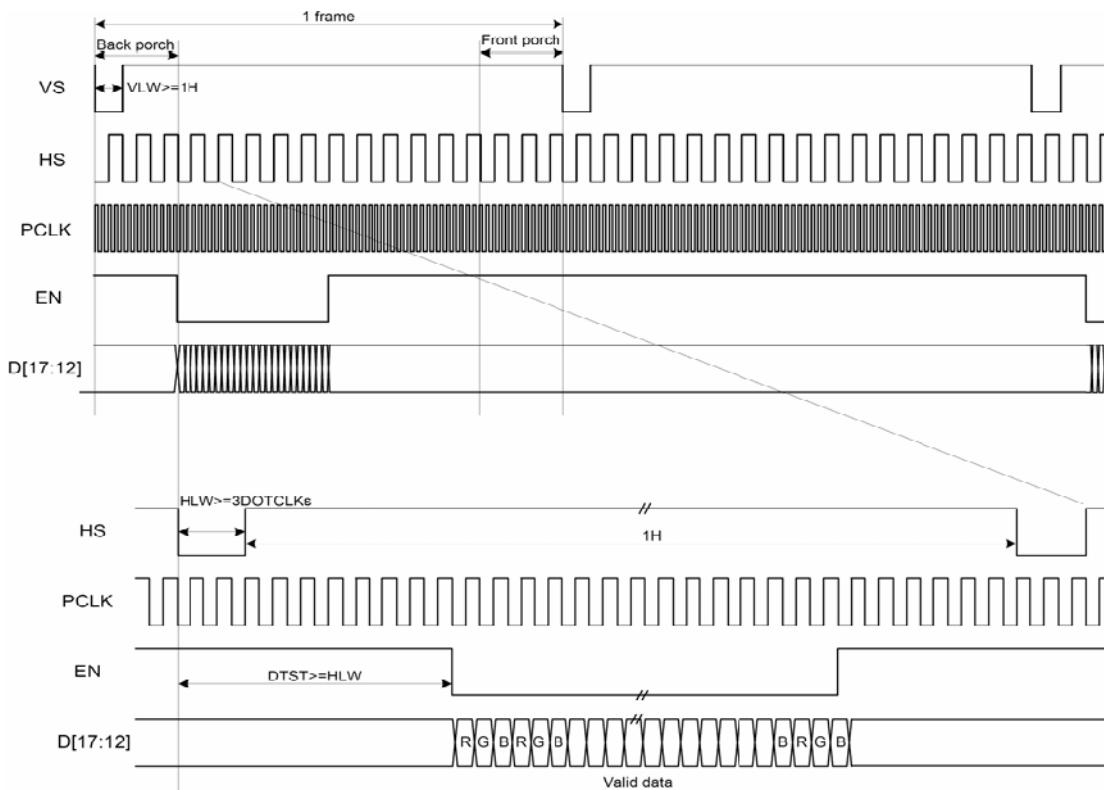

Figure 4-8-2-2 Timing Chart of Signals in 6-bit RGB Interface Mode

Note 1: In 6-bit RGB interface mode, each dot of one pixel (R, G and B) is transferred in synchronization with PCLK.

Note 2: In 6-bit RGB interface mode, set the cycles of VS, HS and EN to 3 multiples of PCLK.

4.8.3 RGB Interface Mode Selection

NV3023A supplies a RGB interface with DE mode and can be selected by pull high external “RCM” pad.

When use RGB interface, writing data to frame memory is done by “PCLK” and Video Data Bus. So, controller (host) needn’t always transfer PCLK, VS, HS and DE signals to driver.

4.9. Display Data Color Coding

4.9.1. Serial Interface

Different display data formats are available for three colors depth supported by the LCM listed below.

- ◆ 4k colors, RGB 4-4-4-bits input
- ◆ 65K colors, RGB 5-6-5-bits input
- ◆ 262K colors, RGB 6-6-6-bits input

Data format and Reconstruct ways are shown as follow figures:

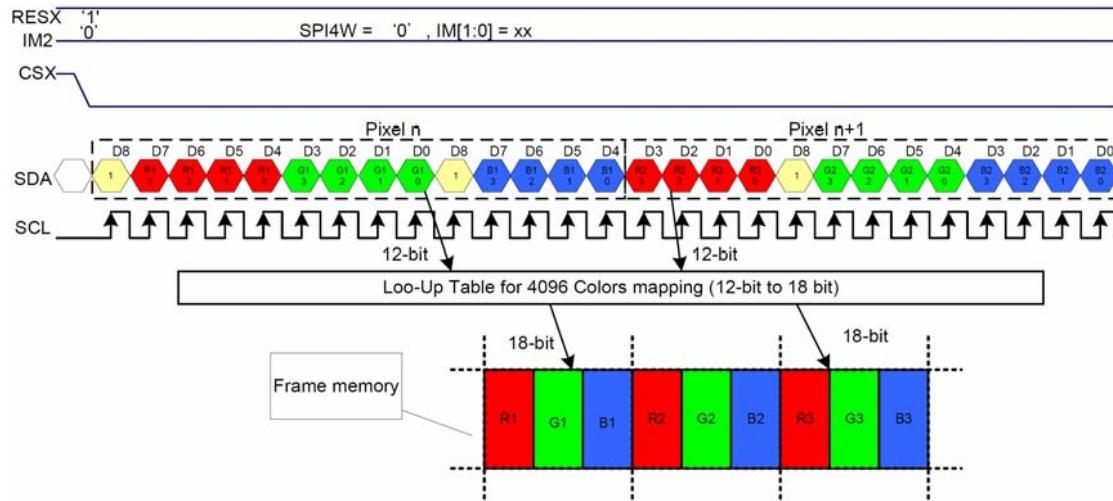

Figure 4-9-1-1 SPI 3-Wire 9-bit RGB4-4-4 Write Data Format

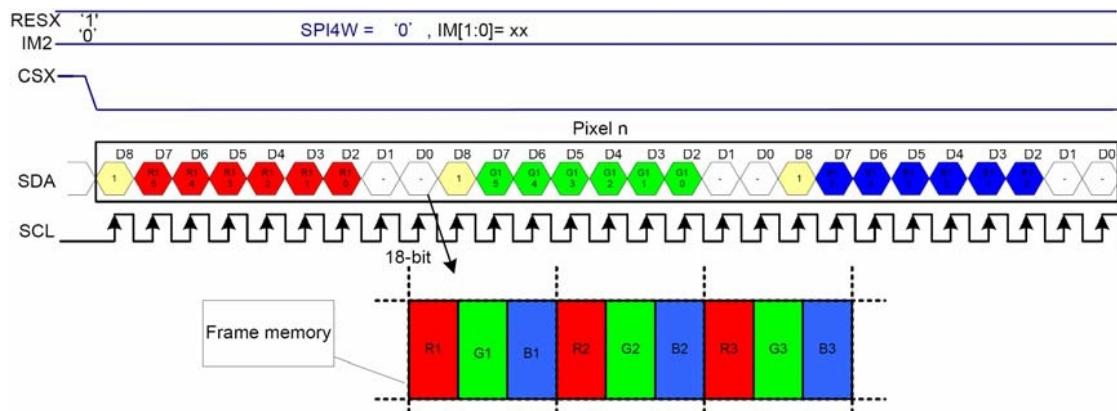

Figure 4-9-1-2 SPI 3-Wire 9-bit RGB6-6-6 Write Data Format

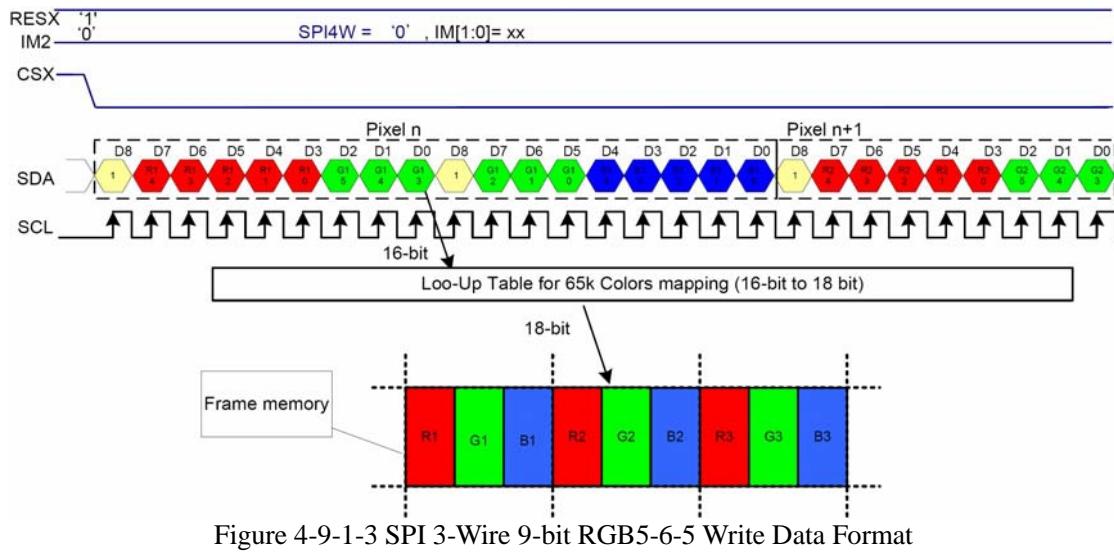

Figure 4-9-1-3 SPI 3-Wire 9-bit RGB5-6-5 Write Data Format

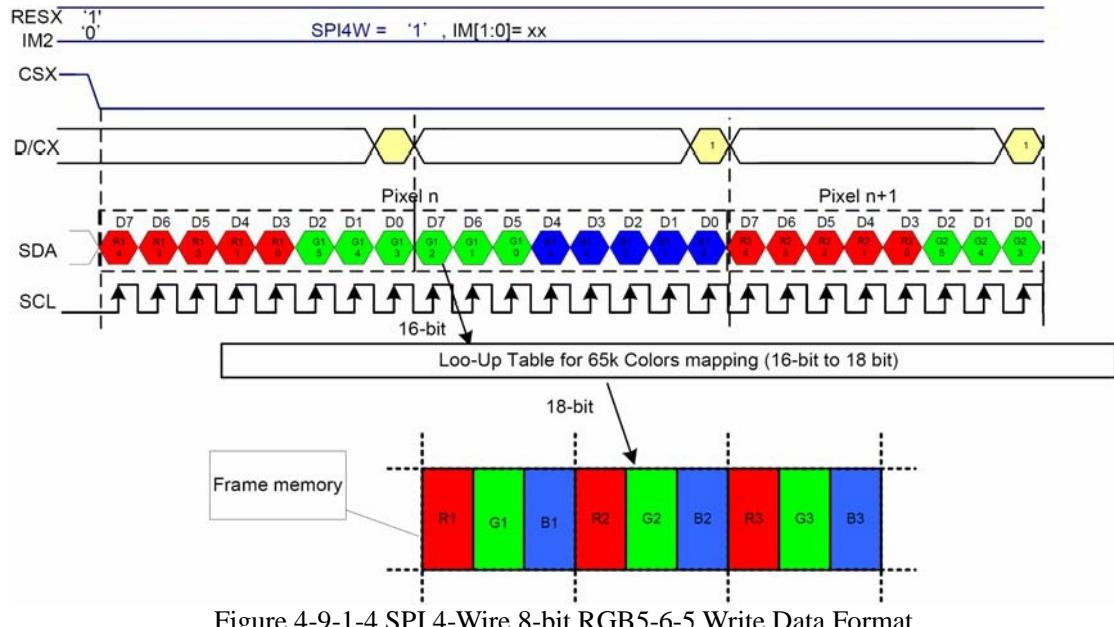

Figure 4-9-1-4 SPI 4-Wire 8-bit RGB5-6-5 Write Data Format

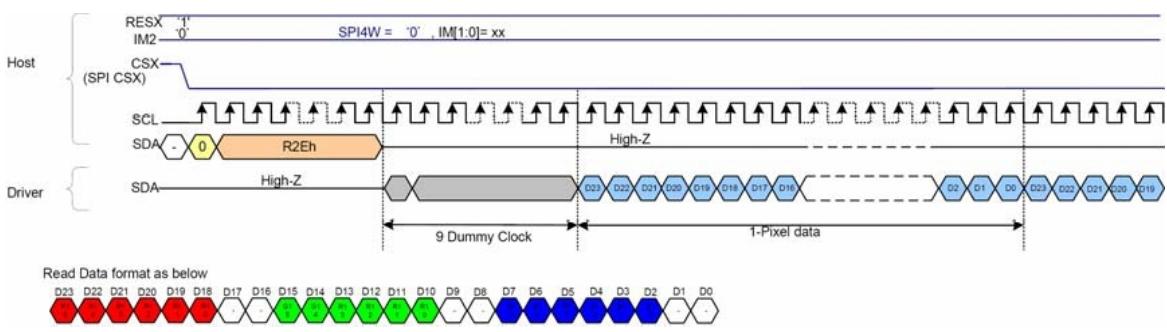

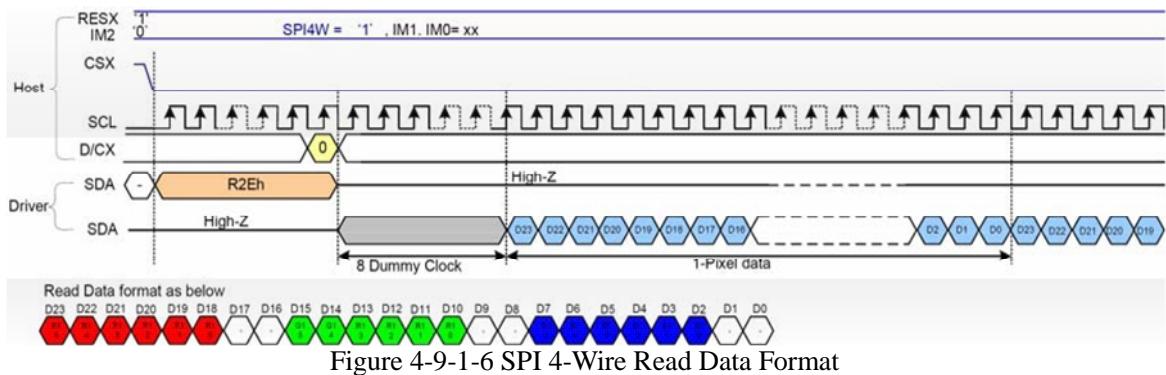

Figure 4-9-1-5 SPI 3-Wire Read Data Format

4.9.2. Parallel 8-bit Interface (IM="100")

Different display data formats are available for three colors depth supported by the LCM listed below.

- ◆ 4k colors, RGB 4-4-4-bits input
- ◆ 65K colors, RGB 5-6-5-bits input
- ◆ 262K colors, RGB 6-6-6-bits input

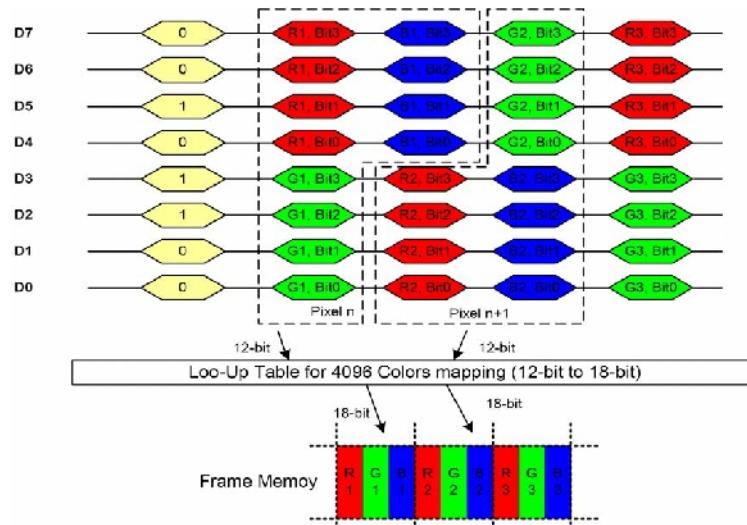

Figure 4-9-2-1 Two pixel (RGB4-4-4) in each three 8-bit write data packets

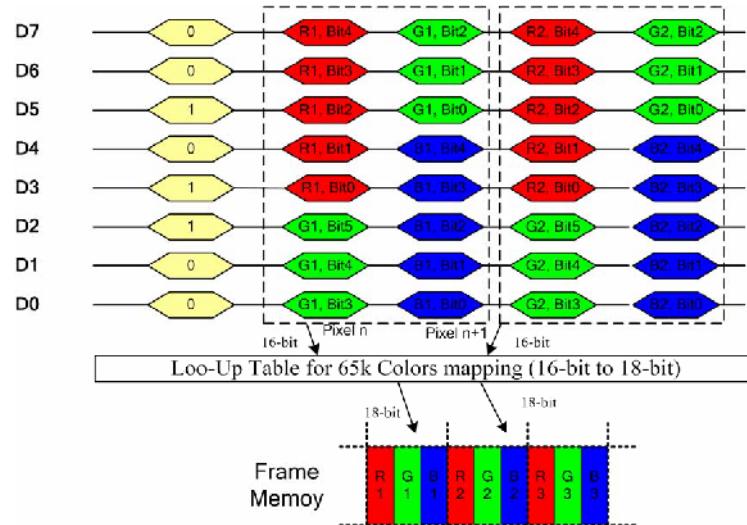

Figure 4-9-2-2 One pixel (RGB5-6-5) in each two 8-bit write data packets

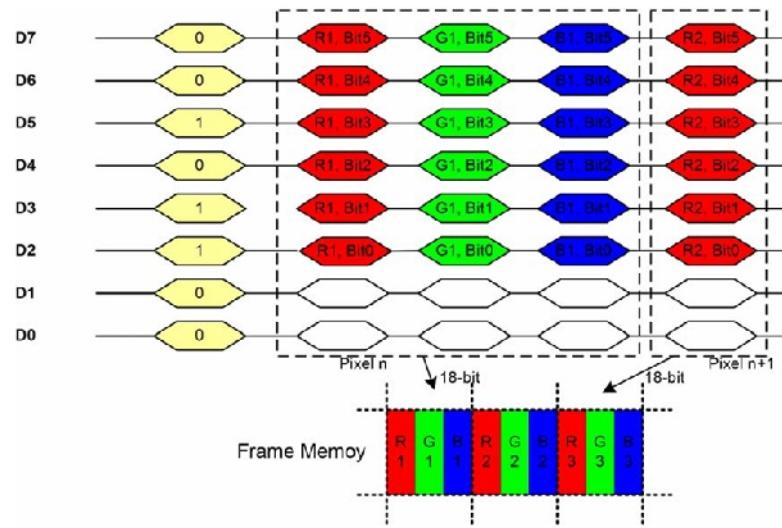

Figure 4-9-2-3 One pixel (RGB6-6-6) in each three 8-bit write data packets

4.9.3. Parallel 9-bit Interface (IM='110')

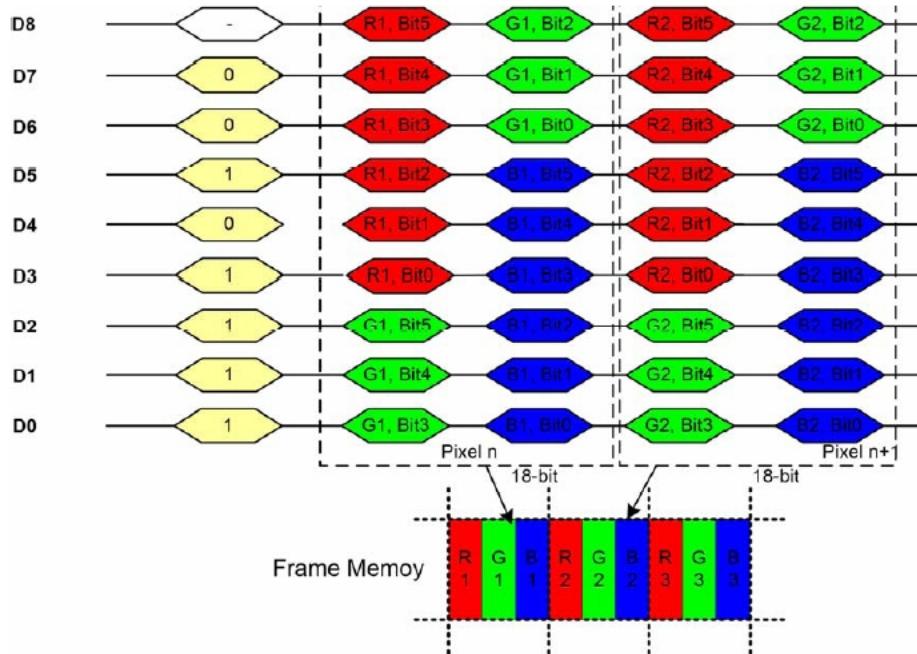

Figure 4-9-3 One pixel (RGB6-6-6) in each two 9-bit write data packets

4.9.4. Parallel 16-bit Interface (IM="101")

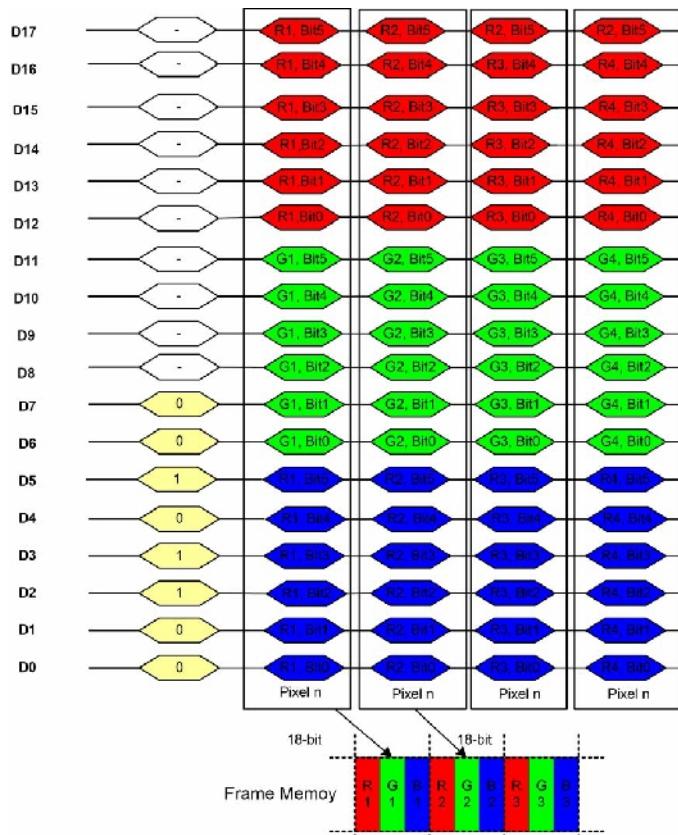

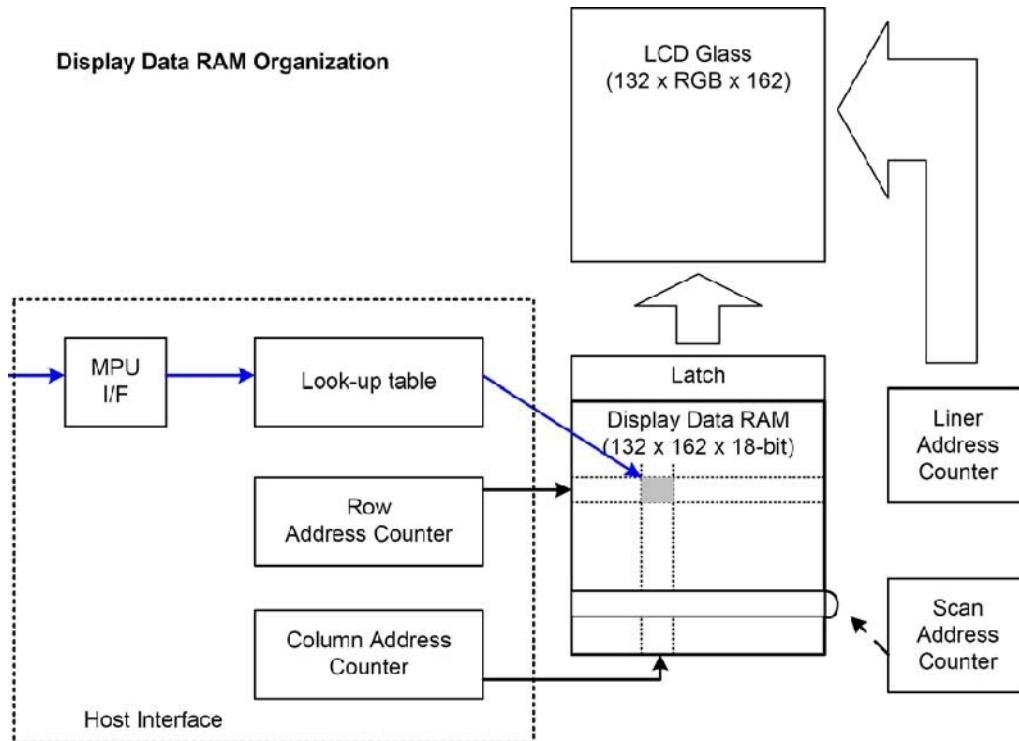

Figure 4-9-5-3 One pixel (RGB5-6-5) in one 18-bit write data packets

5. Display Data with SRAM

5.1. SRAM Organization

The display data SRAM stores display dots and consists of 384,912 bits (132x18x162 bits). There is no restriction on access to the RAM even when the display data on the same address is loaded to “Source”. There will be no abnormal visible effect on the display when there is a simultaneous Panel Read and Interface Read or Write to the same location of the Frame Memory.

5.2. Memory To Display Mapping

Display data are written in different direction according to different MX/MY settings, and scan read from SRAM also controlled by ML configuration. The detail as below figure shows:

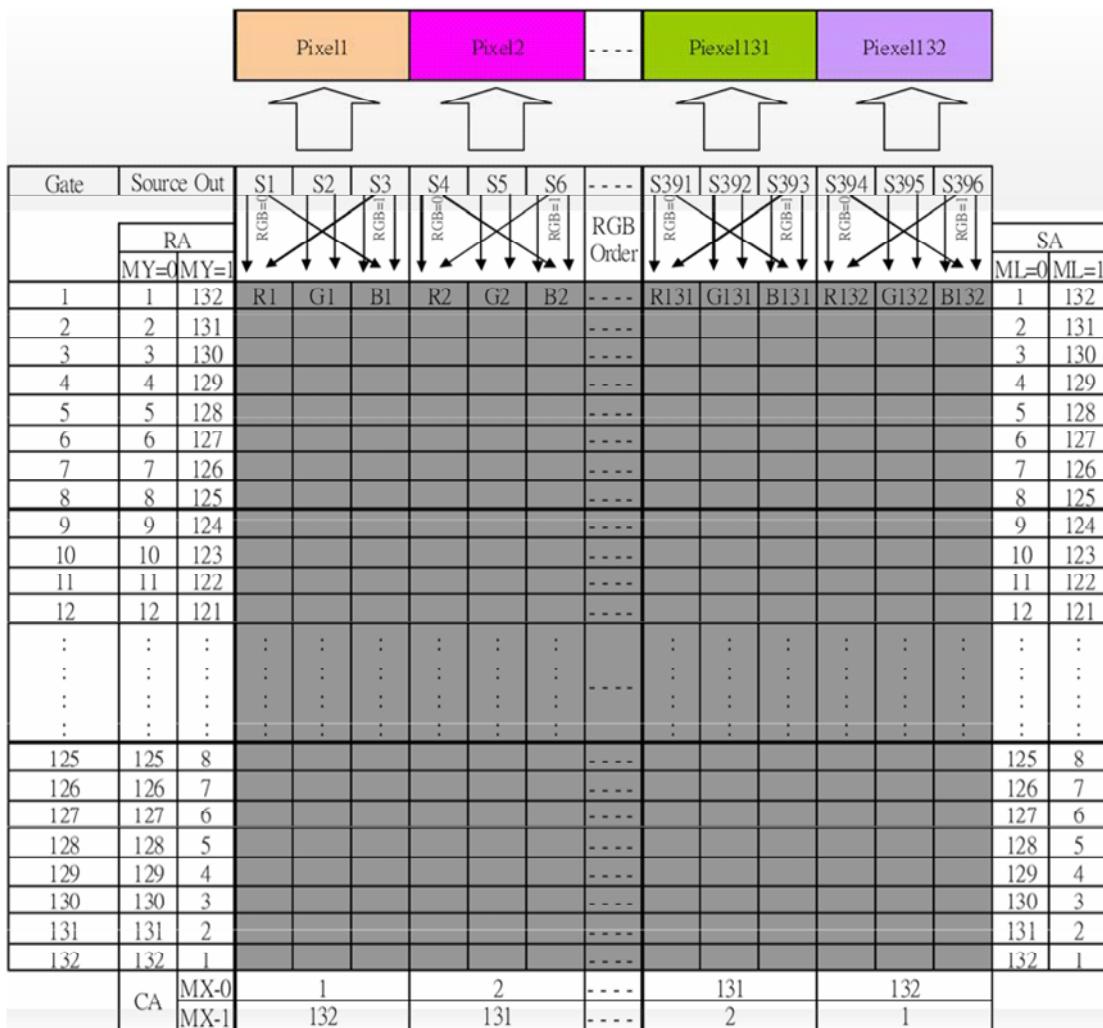

Figure 5-2 Display Data Mapping in SRAM

Note:

RA: Row Address

CA: Column Address

SA: Scan Address

MX: Mirror X-axis (Column address direction parameter), configured by MADCTL command

MY: Mirror Y-axis (Row address direction parameter), configured by MADCTL command

ML: Scan direction parameter, configured by MADCTL command

RGB: Red, Blue subpixel position change, configured by MADCTL command

5.3. MCU To SRAM Access Direction

The address counter set the addresses of the display data RAM for writing and reading. Data is written pixel-wise into the RAM matrix of DRIVER. The data for one pixel or two pixels is collected (RGB 6-6-6-bit), according to the data formats. As soon as this pixel-data information is complete the “Write access” is activated on the RAM. The locations of RAM are addressed by the address pointers. When GM=011, 132RGB x 162, the address ranges are X=0 to X=131 (83h) and Y=0 to Y=161 (A1h). Addresses outside these ranges are not allowed. Before writing to the RAM a window must be defined into which will be written. The window is programmable via the command register XS, YS designating the start address and XE, YE designating the end address.

For example, the whole display contents will be written, the window is defined by the following values: XS=0(0h) YS=0(0h) and XE=131(83h), YE=161(A1h) In vertical addressing mode (MV=1), the Y-address increments after each byte, after the last Y-address (Y=YE), Y wraps around to YS and X increments to address the next column. In horizontal addressing mode (V=0), the X-address increments after each byte, after the last X-address(X=XE), X wraps around to XS and Y increments to address the next row. After every last address (X=XE and Y=YE) the address pointers wrap around to address (X=XS and Y=YS).

For flexibility in handling a wide variety of display architectures, the commands “CASET, RASET” and “MADCTR”, define flags MX and MY, which allows mirroring of the X-address and Y-address. All combinations of flags are allowed. Below table shows the available combinations of writing to the display RAM. When MX, MY and MV will be changed the data bust be rewritten to the display RAM. For each image orientation, the controls for the column and page counters apply as below:

Condition	Column Counter	Row Counter
When RAMWR/RAMRD command is accepted	Return to “Start	Return to “Start Row (YS)”
	Column (XS)”	
Complete Pixel Read/Write action	Increment by 1	No change
The Column counter value is larger than “End Column (XE)”	Return to “Start Column (XS)”	Increment by 1
The Column counter value is larger than “End Column (XE)” and the Row counter value is larger than “End Row (YE)”	Return to “Start Column (XS)”	Return to “Start Row (YS)”

Table 5-3 Frame Data Write Direction According to the MADCTR parameters (MV, MX and MY)

Display Data Direction	MADCTR Parameter			Image in the Memory (MPU)	Image in the Driver (DDRAM)
	MV	MX	MY		
Normal	0	0	0		
Y-Mirror	0	0	1		
X-Mirror	0	1	0		
X-Mirror Y-Mirror	0	1	1		
X-Y Exchange	1	0	0		
X-Y Exchange Y-Mirror	1	0	1		
XY Exchange	1	1	0		
XY Exchange	1	1	1		

6. Tearing Effect

The Tearing Effect output line supplies to the MCU a Panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect Signal is defined by the Parameter of the Tearing Effect Line On command. The signal can be used by the MCU to synchronize Frame Memory Writing when displaying video images.

6.1. Tearing Effect Line Modes

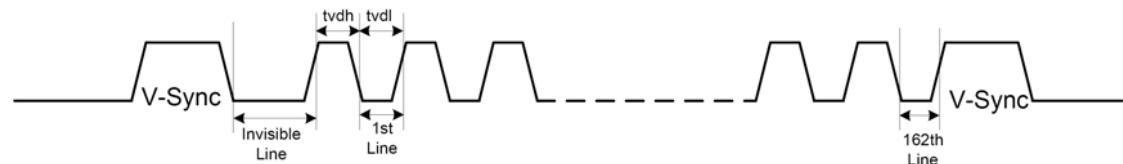

Mode 1, the Tearing Effect Output signal consists of V-Sync information only:

Tvdh = The LCD display is not updated from the Frame Memory.

Tvdl = The LCD display is updated from the Frame Memory (except Invisible Line – see below).

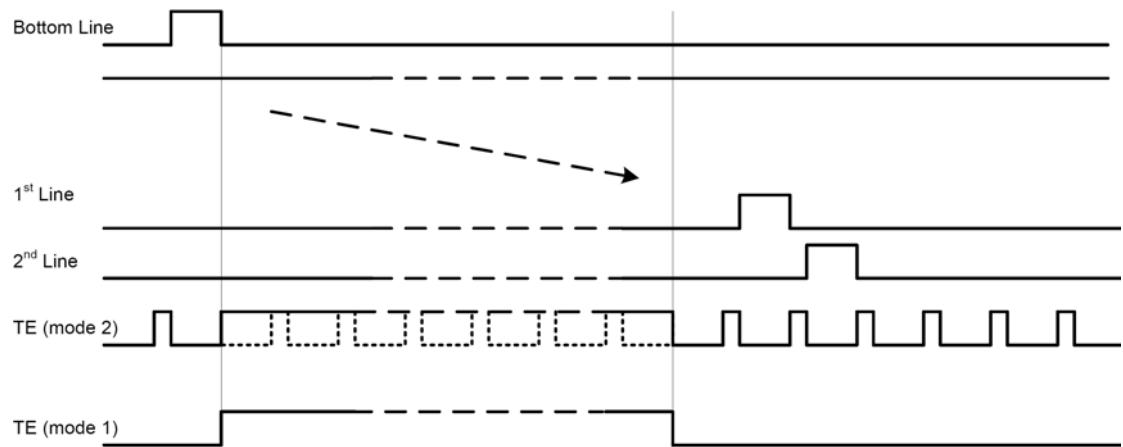

Mode 2, the Tearing Effect Output signal consists of V-Sync and H-Sync information, There are one V-sync and 162 H-sync pulses per field:

Thdh = The LCD display is not updated from the Frame Memory.

Thdl = The LCD display is updated from the Frame Memory (except Invisible Line – see above).

NV3023A—132RGB x162 dot, 262k-color TFT LCD Single-Chip Driver

Note: During Sleep In Mode, the Tearing Effect Output Pin is active Low.

6.2. Tearing Effect Line Timing

The Tearing Effect signal is described below:

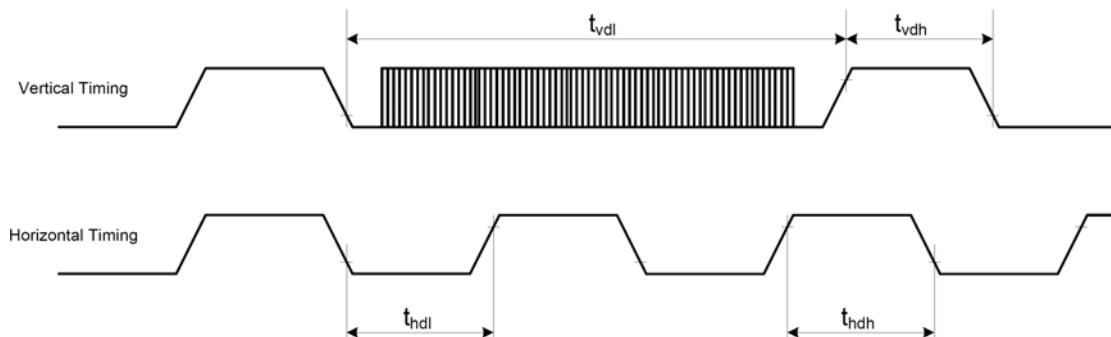

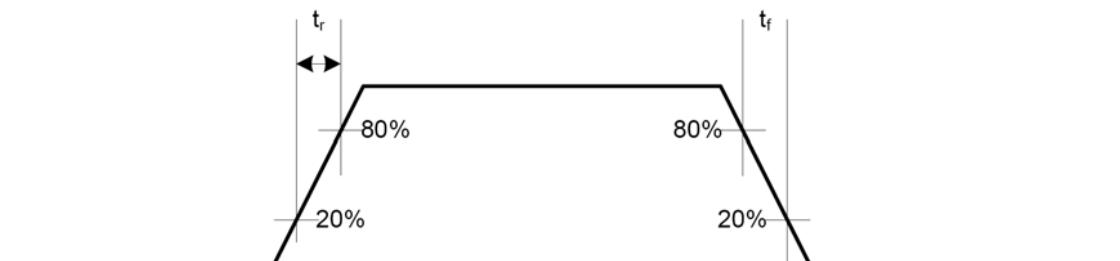

Table 6-2 AC characteristics of Tearing Effect Signal Idle Mode Off/On (Frame Rate = 58.9Hz)

Symbol	Parameter	MIN	MAX	Unit	Description
t_{vdl}	Vertical Timing Low Duration	13	-	Ms	
t_{vdh}	Vertical Timing High Duration	1000	-	μ s	
t_{hdl}	Horizontal Timing Low Duration	33	-	μ s	
t_{hdh}	Horizontal Timing High Duration	25	500	μ s	

Notes:

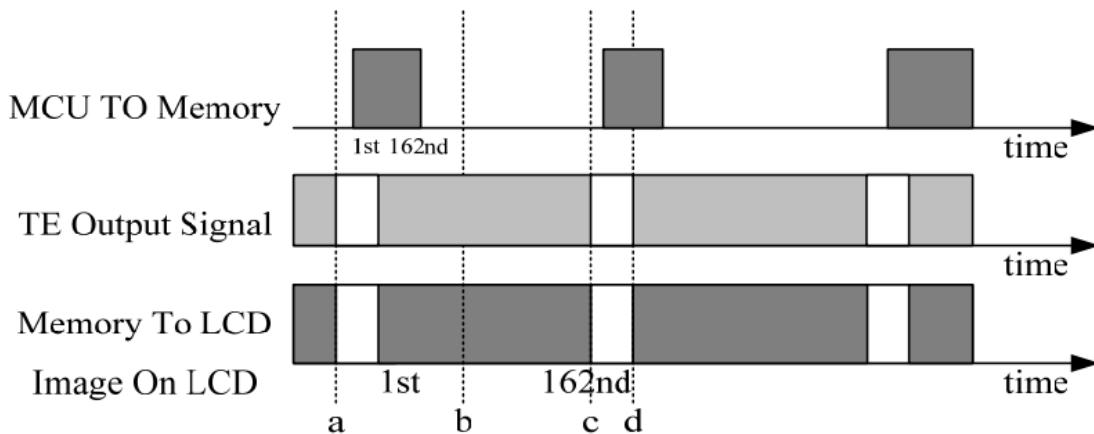

The timings in Table 7-2 apply when MADCTL B4=0

The signal's rise and fall times (t_f , t_r) are stipulated to be equal to or less than 15ns.

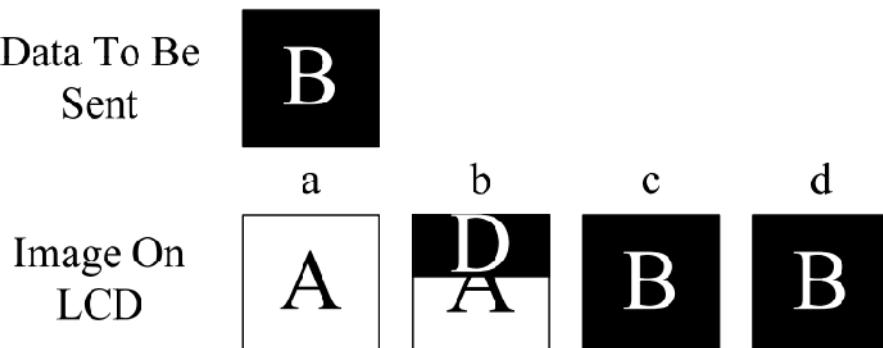

The Tearing Effect Output Line is fed back to the MCU and should be used as shown below to avoid Tearing Effect:

6.2.1. Example 1 MCU Write is Faster than Panel Read

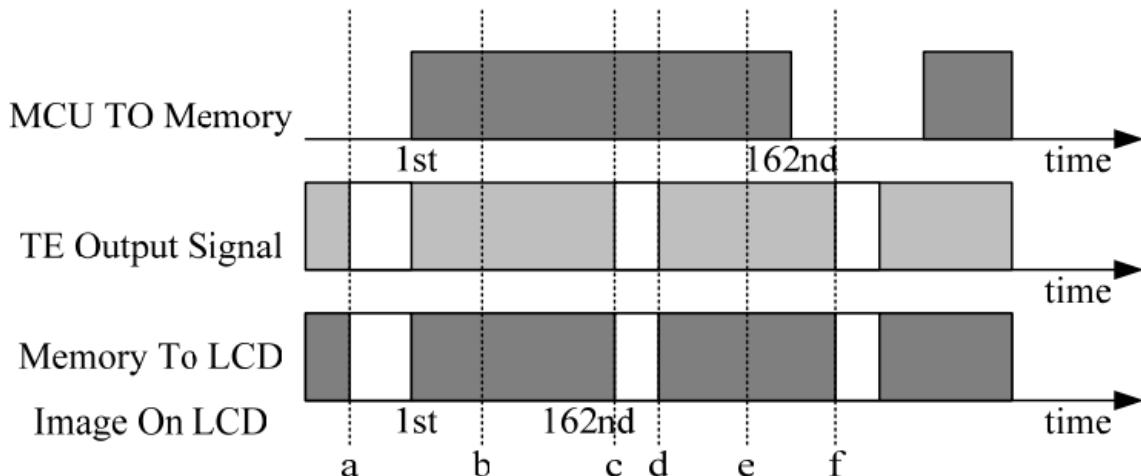

The MCU to Frame Memory write begins just after Panel Read has commenced i.e. after one horizontal sync pulse of the Tearing Effect Output Line. This allows time for the image to download behind the Panel Read pointer and finishing download during the subsequent Frame before the Read Pointer “catches” the MCU to Frame memory write position.

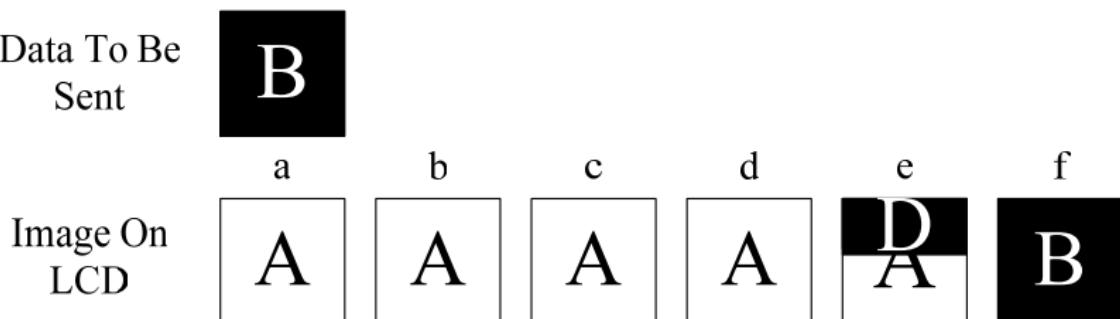

Frame refresh has a complete new image:

6.2.2. Example 2 MCU Write is slower than Panel Read

The MCU to Frame Memory write begins just after Panel Read has commenced i.e. after one horizontal sync pulse of the Tearing Effect Output Line. This allows time for the image to download behind the Panel Read pointer and finishing download during the subsequent Frame before the Read Pointer “catches” the MCU to Frame memory write position.

7. Power ON/OFF Sequence

IOVCC and VCI can be applied in any order.

VCI and IOVCC can be powered down in any order.

During power off, if LCD is in the Sleep Out mode, VCI and IOVCC must be powered down minimum 120 msec after RESX has been released.

During power off, if LCD is in the Sleep In Mode, IOVCC or VCI can be powered down minimum 0 msec after RESX has been released.

CSX can be applied at any timing or can be permanently grounded. RESX has priority over CSX.

Notes:

There will be no damage to the display module if the power sequences are not met.

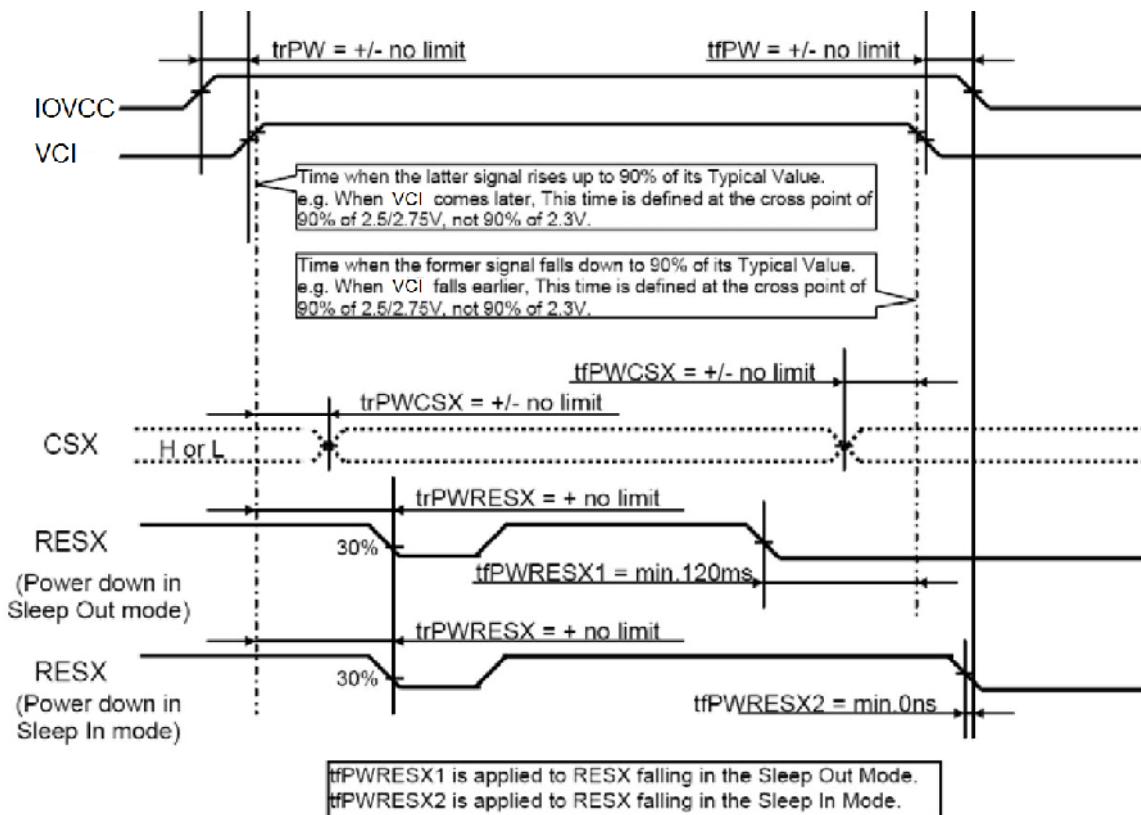

There will be no abnormal visible effects on the display panel during the Power On/Off Sequences.

There will be no abnormal visible effects on the display between end of Power On Sequence and before receiving Sleep Out command. Also between receiving Sleep In command and Power Off Sequence.

If RESX line is not held stable by host during Power On Sequence as defined in Sections 8.1 and 8.2, then it will be necessary to apply a Hardware Reset (RESX) after Host Power On Sequence is complete to ensure correct operation. Otherwise function is not guaranteed.

7.1. Case 1 - RESX line is held high or Unstable by Host at Power On

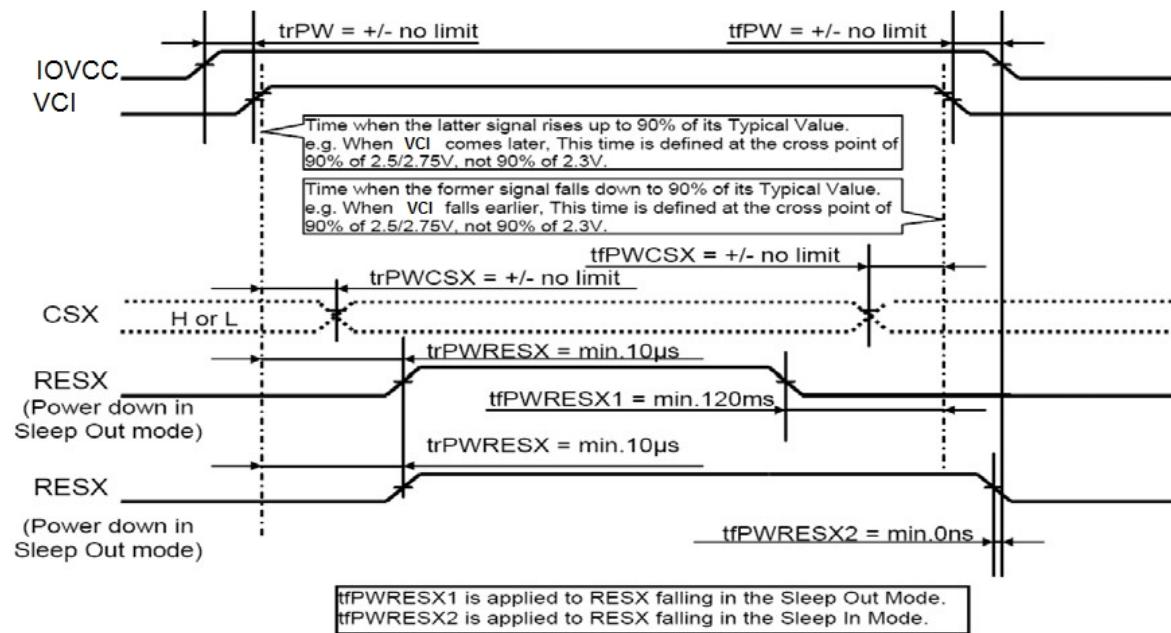

If RESX line is held high or unstable by the host during Power On, then a Hardware Reset must be applied after both VCI and IOVCC have been applied – otherwise correct functionality is not guaranteed. There is no timing restriction upon this hardware reset.

Note: Unless otherwise specified, timings herein show cross point at 50% of signal/power level.

7.2. Case 2 - RESX line is held low by Host at Power On

If RESX line is held Low (and stable) by the host during Power On, then the RESX must be held low for minimum 10 μ sec after both VCI and IOVCC have been applied.

Note: Unless otherwise specified, timings herein show cross point at 50% of signal/power level.

7.3. Uncontrolled Power Off

The uncontrolled power off means a situation when e.g. there is removed a battery without the controlled power off sequence. The display module must meet following requirements:

There cannot be any damages for the display module or the display module cannot cause any damages for the host or lines of the interface.

There cannot be any abnormal visible effects (= Display must be blank) within 1 second on the display and remains blank until “Power On Sequence” powers it up.

8. Power Level Definition

8.1. Power Levels

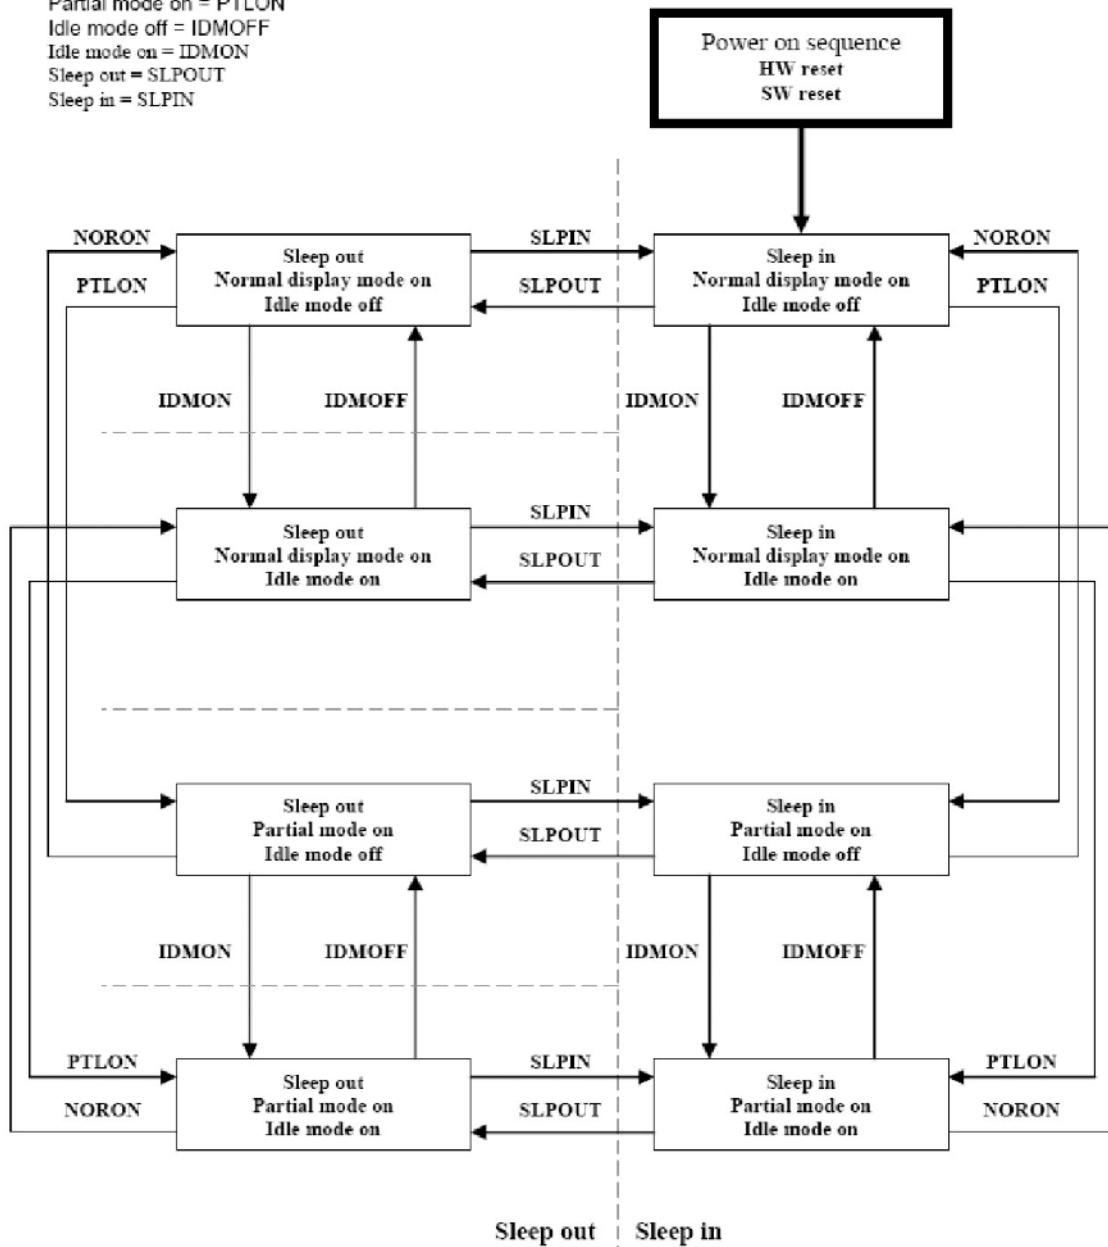

6 level modes are defined they are in order of Maximum Power consumption to Minimum Power Consumption:

1. Normal Mode On (full display), Idle Mode Off, Sleep Out. In this mode, the display is able to show maximum 262,144 colors.
2. Partial Mode On, Idle Mode Off, Sleep Out. In this mode part of the display is used with maximum 262,144 colors.
3. Normal Mode On (full display), Idle Mode On, Sleep Out. In this mode, the full display area is used but with 8 colors.
4. Partial Mode On, Idle Mode On, Sleep Out. In this mode, part of the display is used but with 8 colors.
5. Sleep In Mode. In this mode, the DC/DC converter, internal oscillator and panel driver circuit are stopped. Only the MCU interface and memory works with IOVCC power supply. Contents of the memory are safe.
6. Power Off Mode. In this mode, both VCI and IOVCC are removed.

Note: Transition between modes 1-5 is controllable by MCU commands. Mode 6 is entered only when both Power supplies are removed. If RESX line is held high or unstable by the host during Power On, then a Hardware Reset must be applied after both VCI and IOVCC have been applied – otherwise correct functionality is not guaranteed. There is no timing restriction upon

8.2. Power Flow Chart

Normal display mode on = NORON
Partial mode on = PTLON
Idle mode off = IDMOFF
Idle mode on = IDMON
Sleep out = SLPOUT
Sleep in = SLPIN

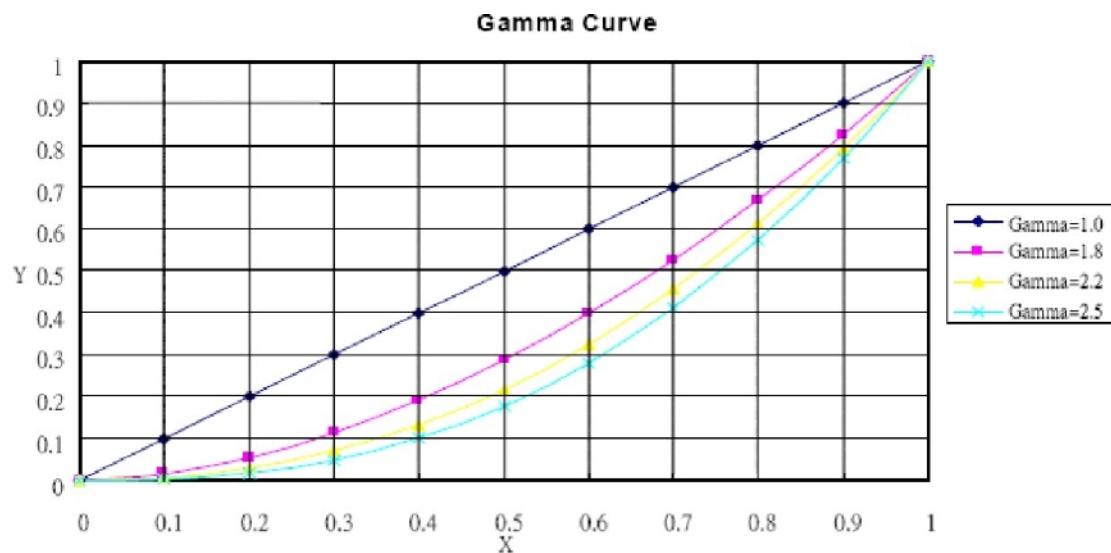

Note 1: There is not any abnormal visual effect when there is changing from one power mode to another power mode.

Note 2: There is not any limitation, which is not specified by Nokia, when there is changing from one power mode to another power mode.

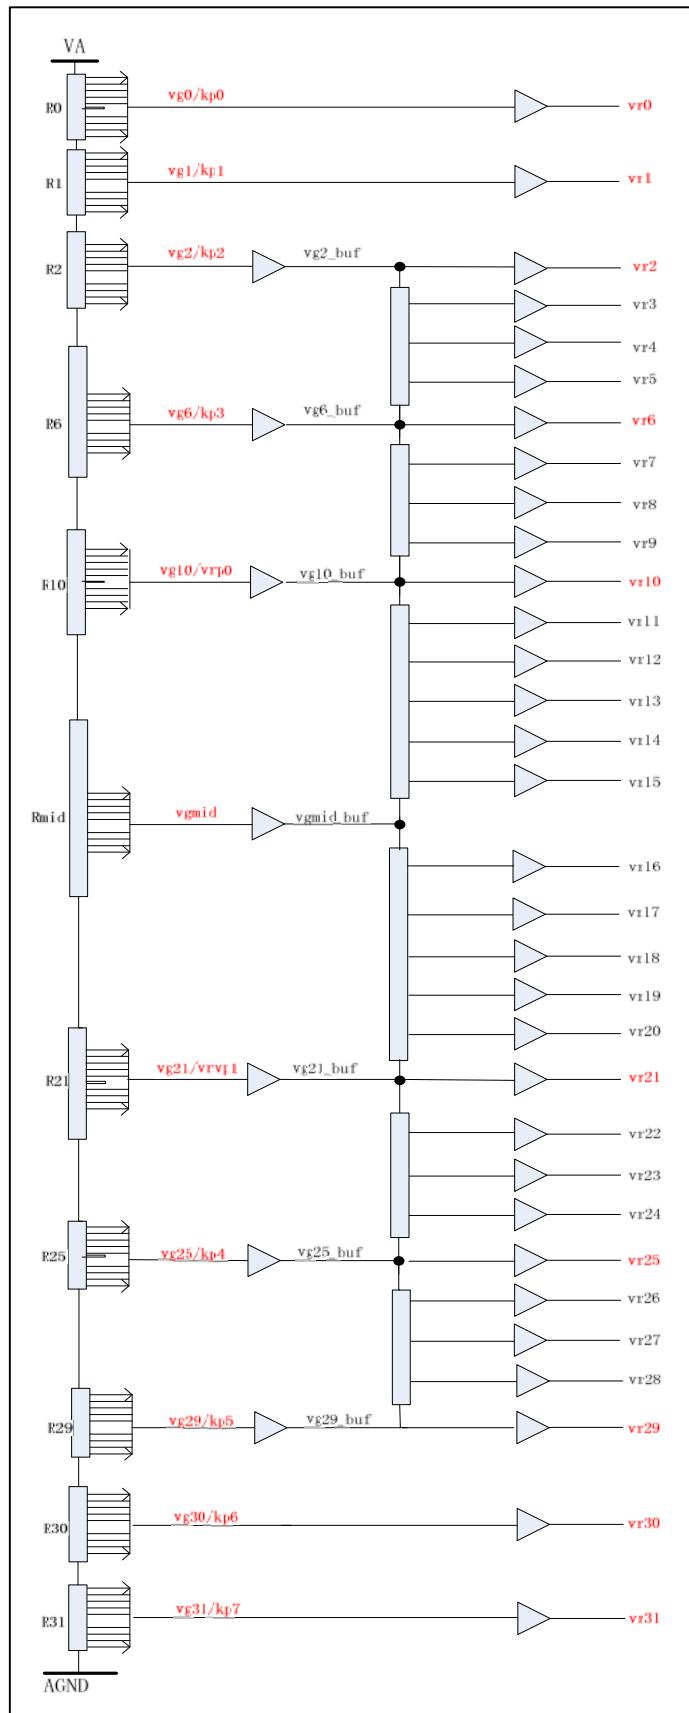

Note 3: It is recommended that it should be enter Sleep in before power off.

9. Gamma Curve

9.1. Gamma curve according to the Gamma 1.0/1.8/2.2/2.5

9.2. Gamma Structure

10. Reset Function

10.1. State of Register After Different Reset

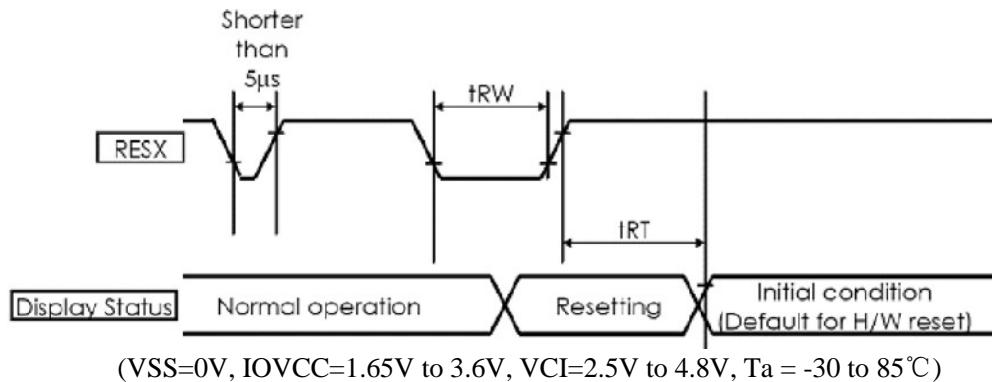

The registers for resolution 128(RGB) x160 are initialized are listed below:

Item	After Power On	After Hardware Reset	After
			Software Reset
Frame memory	Random	No Change	No Change
Sleep In/Out	In	In	In
Display On/Off	Off	Off	Off
Display mode(normal/partial)	Normal	Normal	Normal
Display Inversion On/Off	Off	Off	Off
Display Idle Mode On/Off	Off	Off	Off
Column:Start Address(XS)	0000h	0000h	0000h
Column:End Address(XE)	007Fh	007Fh	007Fh
Row:Start Address(YS)	0000h	0000h	0000h
Row:End Address(YE)	009Fh	009Fh	009Fh
Gamma Setting	GC0	GC0	GC0
Color Set	262K	262K	262K
Partial:Start Address(PSL)	0000h	0000h	0000h
Partial:End Address(PEL)	009Fh	009Fh	009Fh
Scroll:Vertical scrolling	Off	Off	Off
Scroll:Top Fixed Area(TFA)	0000h	0000h	0000h
Scroll:Scroll Area(VSA)	00A0h	00A0h	00A0h
Scroll:Bottom Fixed Area(BFA)	0000h	0000h	0000h
Scroll Start Address (SSA)	0000h	0000h	0000h
Tearing:On/Off	Off	Off	Off
Tearing Effect Mode*3	0(Mode1)	0(Mode1)	0(Mode1)
Memory Data Access Control (MY/MX/MV/ML/MH/RBG)	0/0/0/0/0/0	0/0/0/0/0/0	No change
Interface Pixel Color Format	6(18-Bit/Pixel)	6(18-Bit/Pixel)	No change
RDDPM	08h	08h	08h
RDDMADCTR	0	0	No change
RDDCOLMOD	6(18-Bit/Pixel)	6(18-Bit/Pixel)	No change
RDDIM	00h	00h	No change
RDDSM	00h	00h	00h
RDDSER	00h	00h	00h
ID1	33h	33h	33h
ID2	30h	30h	30h
ID3	25h	25h	25h

Notes:

1. There will be no abnormal visible effects on the display when S/W or H/W Reset are applied.
2. After Powered-On Reset finishes within 10μs after both VCI & IOVCC are applied.
3. Mode 1 means Tearing Effect Output Line consists of V-Blanking Information only.

10.2. Reset Timing

Symbol	Parameter	Related Pins	MIN	TYP	MAX	Note	Unit
tRW	Valid Reset low pulse width	RESX	10	-	-	-	us
tRT	Valid Reset Complete width	RESX	-	-	5	When reset applied during Sleep in mode	ms
		RESX	-	-	120	When reset applied during Sleep out mode	ms

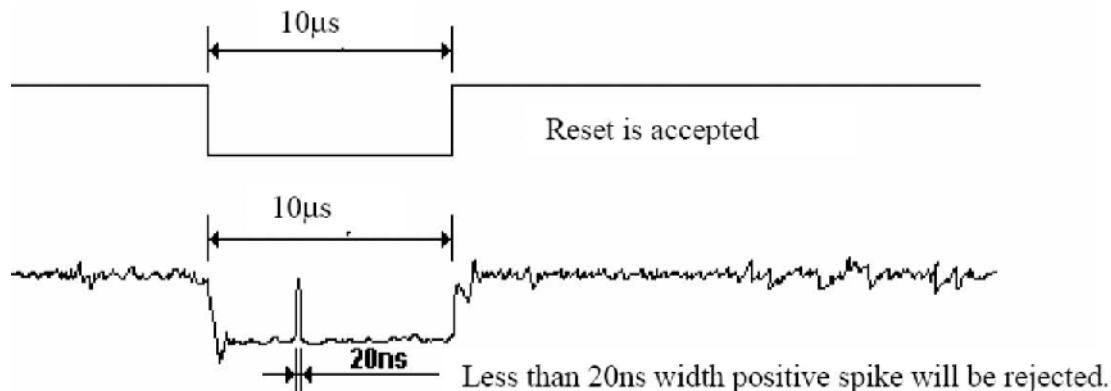

Note:

1> Spike due to an electrostatic discharge on RESX line does not cause system reset according to the table below.

RESX Pulse	Action
Shorten than 5us	Reset Rejected
Longer than 10us	Reset
Between 5us and 10us	Reset starts(It depends on voltage and temperature condition)

2> During the resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Sleep Out –mode. The display remains the blank state in Sleep In mode) and then return to Default condition for Hardware Reset.

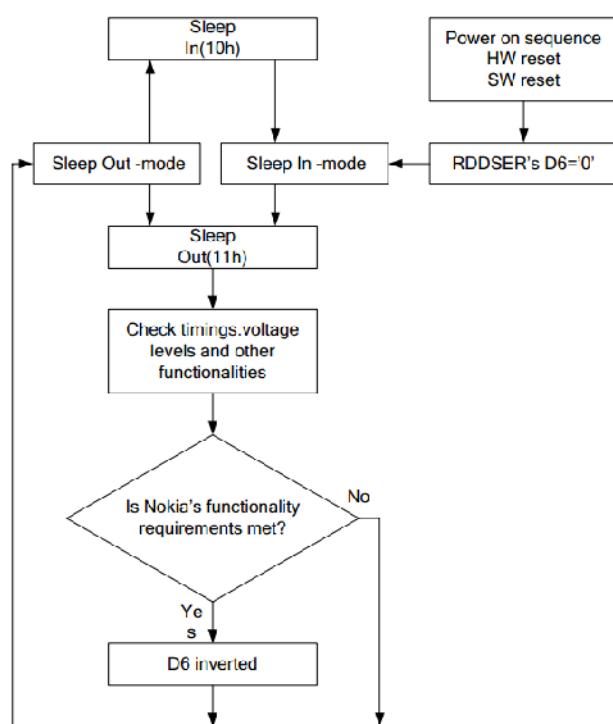

3> Spike Rejection also applies during a valid reset pulse as shown below:

4> It is necessary to wait 5msec after releasing RESX before sending commands. Also Sleep Out command cannot be sent for 120msec.

11. Sleep Out and Self-Diagnostic Functions of Display

Sleep Out-command (11h) is a trigger for an internal function of the display module, which indicates, if the display module is still running and meets functionality requirements. The internal function (= the display controller) is comparing, if the display module is still meeting functionality requirements (only Booster voltage level). If functionality requirement is met, there is inverted a bit, which defined in command (“0Fh”, The used bit of this command is D6). If functionality requirement is not same, this bit (D6) is not inverted. The flow chart for this internal function is following:

Note: There is needed 120msec after Sleep Out command, when there is changing from Sleep In mode to Sleep Out mode, before there is possible to check if Nokia's functionality requirements are met and a value of RDDSDR's D6 is valid. Otherwise, there is 5msec delay for D6's value, when Sleep Out command is sent in Sleep Out mode.

10H		Sleep In																						
	D/CX	RDX	WRX	D7	D6	D5	D4	D3	D2	D1	D0	HEX												
Command	L	H	R	0	0	0	1	0	0	0	0	10H												
Parameter	No Parameter																							
Description	This command causes the LCD module to enter the minimum power consumption mode. In this mode e.g. the DC/DC converter is stopped, Internal oscillator is stopped, and panel scanning is stopped. MCU interface and memory are still working and the memory keeps its contents.																							
Restriction	This command has no effect when module is already in sleep in mode. Sleep In Mode can only be left by the Sleep Out Command (11h). It will be necessary to wait 5msec before sending next command; this is to allow time for the supply voltages and clock circuits to stabilize. It will be necessary to wait 120 msec after sending Sleep Out command (when in Sleep In Mode) before Sleep In command can be sent.																							
Register Availability	<table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>Status</th> <th>Availability</th> </tr> </thead> <tbody> <tr> <td>Normal Mode on,Idle Mode Off,Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Normal Mode on,Idle Mode On,Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode on,Idle Mode Off,Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode on,Idle Mode On,Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Sleep In</td> <td>Yes</td> </tr> </tbody> </table>											Status	Availability	Normal Mode on,Idle Mode Off,Sleep Out	Yes	Normal Mode on,Idle Mode On,Sleep Out	Yes	Partial Mode on,Idle Mode Off,Sleep Out	Yes	Partial Mode on,Idle Mode On,Sleep Out	Yes	Sleep In	Yes

12.1.21 RAMWR (2Ch)

2CH		Memory Write																							
	D/CX	RDX	WRX	D7	D6	D5	D4	D3	D2	D1	D0	HEX													
Command	L	H	R	0	0	1	0	1	1	0	0	2CH													
1st Parameter	H	H	R	D[7:0]								-													
	H	H	R	D[7:0]								-													
Nth Parameter	H	H	R	D[7:0]								-													
Description	This command is used to transfer data from MCU to frame memory. This command makes no change to the other driver status. When this command is accepted, the column register and the page register are reset to the Start Column/Start Page positions. The Start Column /Start Page positions are different in accordance with MADCTL setting. Then D[7:0] is stored in frame memory and the column refister and the row register incremented. Sending any other command can stop frame Write.																								
Restriction	In all color modes, there is no restriction on length of parameters. 1. 132x132 memory base (GM="101") 132x132x18-bit memory can be written by this command. Memory range(0000h,0000h)->(0083h,083h) 2. 130x130 memory base (GM="100") 130x130x18-bit memory can be written by this command. Memory range(0000h,0000h)->(0081h,081h) 3. 128x160 memory base (GM="011") 128x160x18-bit memory can be written by this command. Memory range(0000h,0000h)->(007Fh,09Fh) 4. 120x160 memory base (GM="010") 120x160x18-bit memory can be written by this command. Memory range(0000h,0000h)->(0077h,09Fh) 5. 128x128 memory base (GM="001") 128x128x18-bit memory can be written by this command. Memory range(0000h,0000h)->(007Fh,007Fh) 6. 132x162 memory base (GM="000") 132x162x18-bit memory can be written by this command. Memory range(0000h,0000h)->(0083h,00A1h)

12.1.22 RAMRD (2Eh)

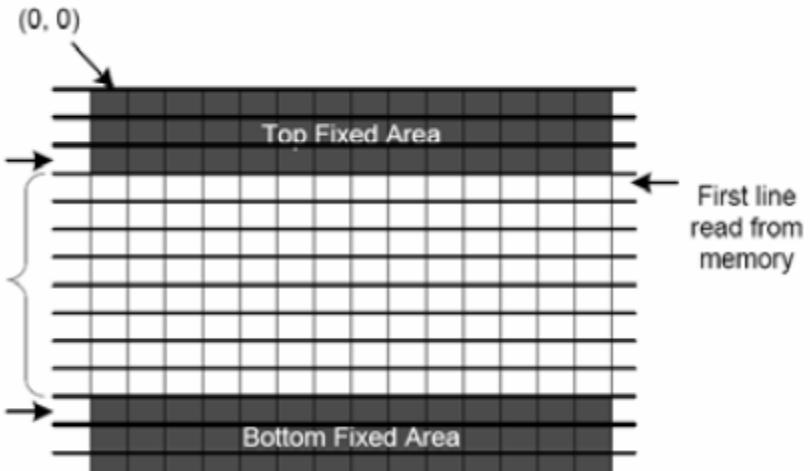

2EH		Memory Read																							
	D/CX	RDX	WRX	D7	D6	D5	D4	D3	D2	D1	D0	HEX													
Command	L	R	H	0	0	1	0	1	1	1	0	2EH													
1st Parameter	H	R	H	D[7:0]								-													
	H	H	R	D[7:0]								-													
Nth Parameter	H	H	R	D[7:0]								-													
Description	This command is used to transfer data from frame memory to MCU. This command makes no change to other driver status. When this command is accepted, the column register and then row register are reset to the Start Column/Start Row positions. The Start Column/Start Row positions are different in accordance with MADCTL setting. Then D[7:0] is read back from the frame memory and the column register and the register incremented. Frame Read can be stopped by sending any other command. Display Data Format for color coding (18 bit cases), when there is used 8,9,16 or 18 data line for image data.																								
Restriction	In all color modes, the Frame Read is always 24 bit so there is no restriction on length of parameters. Note: Memory Read is only possible via the Parallel Interface.

12.1.24 SCRLAR (33h)

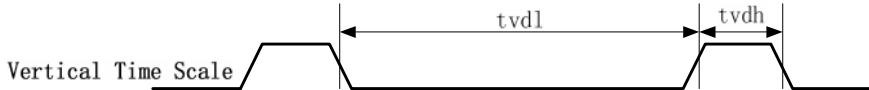

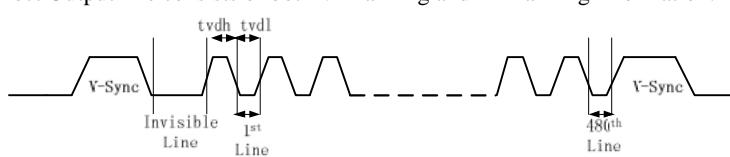

33H	Scroll Area											
	D/CX	RDX	WRX	D7	D6	D5	D4	D3	D2	D1	D0	HEX
Command	L	H	R	0	0	1	1	0	0	1	1	33H
Parameter1	H	H	R	00								
Parameter2	H	H	R	TFA[7:0]								
Parameter3	H	H	R	00								
Parameter4	H	H	R	VSA[7:0]								
Description	<p>This command defines the Vertical Scrolling Area of the display. When MADCTL ML=0 The 1st &2nd parameter TFA[7:0]describes the Top Fixed Area (in No.of lines from TOP of the Frame Memory and Display). The 3rd &4th parameter VSA[7:0]describes the height of the Vertical Scrolling Area(in No.of lines of the Frame Memory[not the display] from the Vertical Scrolling Start Address). The first line read from Frame Memory appears immediately after the bottom most line of the Top Fixed Area.</p> <p>TFA, VSA refer to the Frame Memory Line Point.</p>  <p>When MADCTL ML=1 The 1st &2nd parameter TFA[7:0] describes the Top Fixed Area (in No.of lines from Bottom of the Frame Memory and Display). The 3rd &4th parameter VSA[7:0] describes the height of the Vertical Sxrolling Area (in No.of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address). The first line read from Frame Memory appears immediately after the top most line of the Top Fixed Area.</p>											

	<p>The diagram illustrates the LCD panel structure. It features a central grid of pixels. At the top, there is a 'Bottom Fixed Area' and at the bottom, there is a 'Top Fixed Area'. A specific row of pixels is highlighted, labeled '(0, 0)' at its top-left corner. An arrow points to the left edge of this row, indicating it is the 'First line read from memory'.</p>																																															
Restriction	<p>The condition is $(TFA+VSA+BFA)=128$ in 128RGBx128(GM="001") The condition is $(TFA+VSA+BFA)=130$ in 130RGBx130(GM="100") The condition is $(TFA+VSA+BFA)=132$ in 132RGBx132(GM="101") The condition is $(TFA+VSA+BFA)=160$ in 128RGBx160(GM="011") or 120 RGB x 160 (GM="010") The condition is $(TFA+VSA+BFA)=162$ in 132RGBx162(GM="000") Otherwise Scrolling mode is undefined. In Vertical Scrol Mode,MADCTL parameter MV should be set to "0" this affects the Frame memory Write.</p>

13. Example Panel Connection (GM="011")

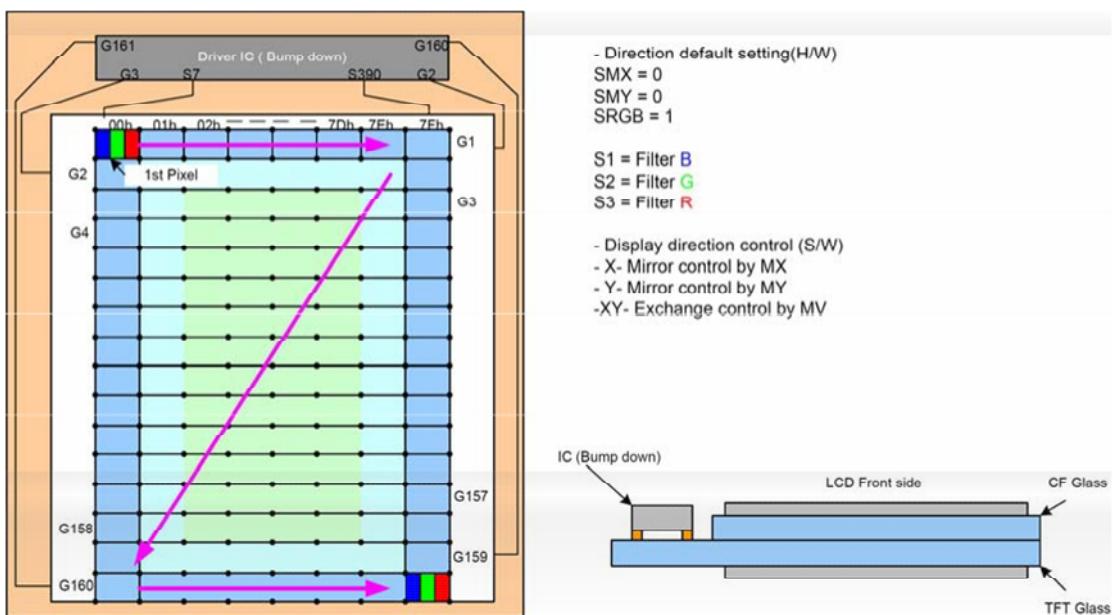

CASE 1: First pixel is at left_top of the panel

RGB order is “R.G.B”

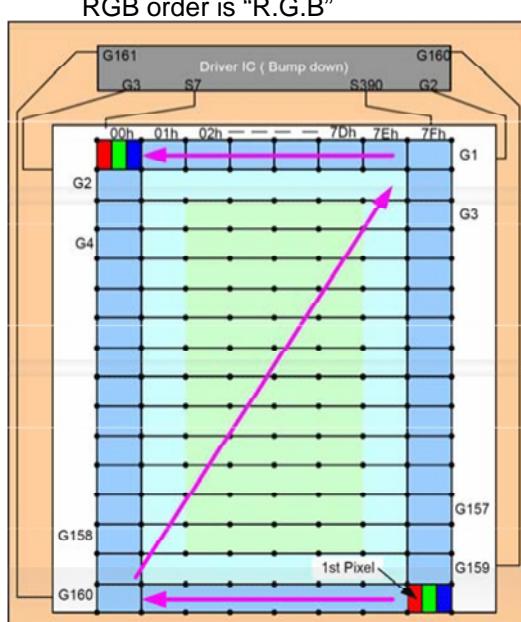

CASE 2: First pixel is at left_top of the panel

RGB order is “B.G.R”

CASE 3: First pixel is at Right_bottom of the panel
RGB order is “R.G.B”

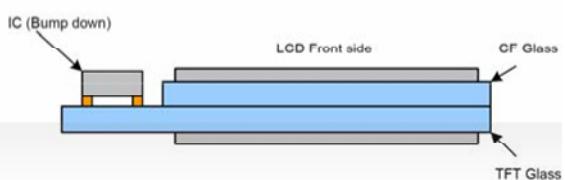

CASE 3: First pixel is at Right_bottom of the panel

- Direction default setting(H/W)
- SMX = 0
- SMY = 0
- SRGB = 0

S1 = Filter R
S2 = Filter G
S3 = Filter B

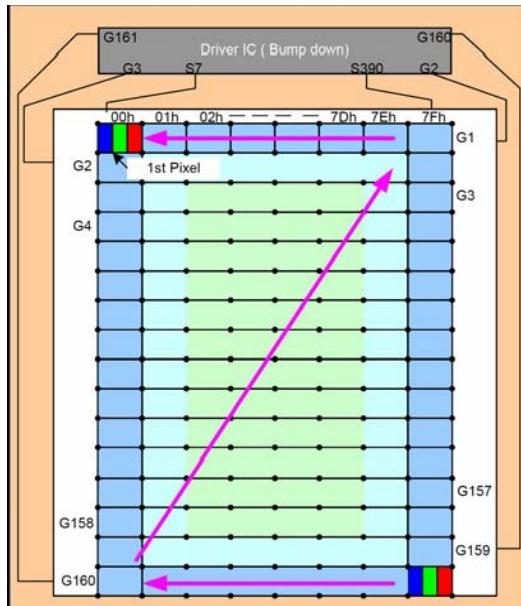

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

CASE 4: First pixel is at Right_bottom of the panel

RGB order is “B.G.R”

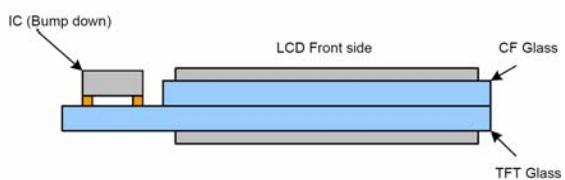

CASE 3: First pixel is at Right_bottom of the panel
RGB order is “R.G.B”

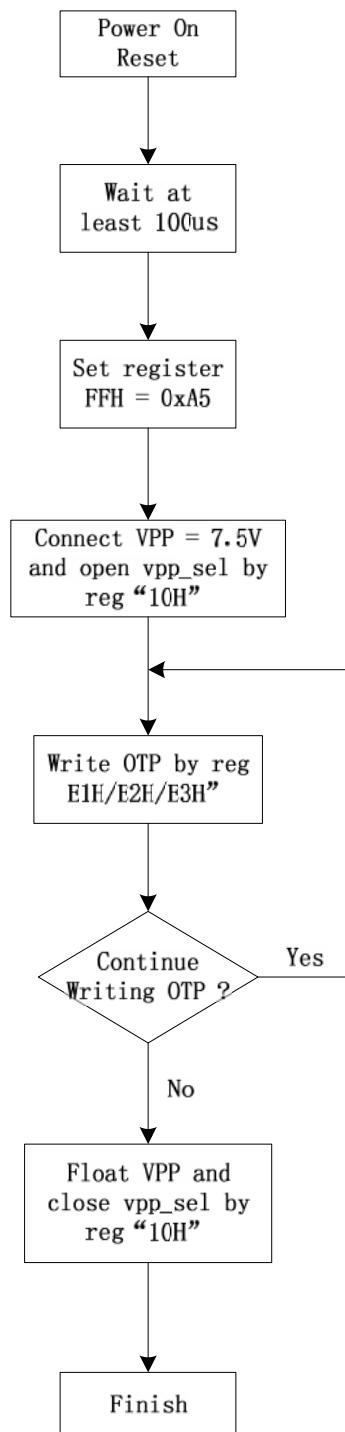

- Direction default setting(H/W)
- SMX = 0
- SMY = 0
- SRGB = 1

S1 = Filter B
S2 = Filter G
S3 = Filter R

- Display direction control (S/W)
- X- Mirror control by MX
- Y- Mirror control by MY
- XY- Exchange control by MV

14. OTP Flow

15. Electrical Characteristics

15.1. Absolute Maximum Ratings

The absolute maximum rating is listed on following table. When NV3023A is used out of the absolute maximum ratings, the NV3023A may be permanently damaged. So working within the following electrical characteristics limit is strongly recommended during normal operation.

Item	Symbol	Unit	Value Note
Supply voltage	VCI	V	-0.3~+4.8
Supply voltage(Logic)	IOVCC	V	-0.3~+3.6
Supply voltage(Digital)	VCC	V	-0.3~+2.4
Driver supply voltage	VGH-VGL	V	-0.3~+30.0
Logic input voltage range	VIN	V	-0.3~IOVCC+0.3
Logic output voltage range	VO	V	-0.3~IOVCC+0.3
Operation temperature	Topr	°C	-35~+85
Storage temperature	Tstg	°C	-55~+110

15.2. DC Characteristics

Item	Symbol	Unit	Condition	Min.	Typ.	Max.	Note
Power & Operation Voltage							
Analog Operation Voltage	VCI	V	Operation Voltage	2.5	2.75	4.8	Note 2
Logic Operation Voltage	IOVCC	V	I/O Supply Voltage	1.65	1.8	3.6	Note 2
Digital Operation Voltage	VCC	V	Digital Supply Voltage		1.8		Note 2
Gate Driver High Voltage	VGH	V		10		16	Note 3
Gate Driver Low Voltage	VGL	V		-16		-7.5	Note 3
Driver Supply Voltage		V	VGH-VGL	19		32	Note 3
Input/Output							
Logic High Level Input Voltage	VIH	V		0.7IO VCC		IOVCC	Note 1,2,3
Logic Low Level Input Voltage	VIL	V		VSS		0.3IOVC C	Note 1,2,3
Logic High Level Output Voltage	VOH	V	IOH=-1.0mA	0.8IO VCC		IOVCC	Note 1,2,3
Logic Low Level Output Voltage	VOL	V	IOL=1.0mA	VSS		0.2IOVC C	Note 1,2,3
Logic Input Leakage Current	IIL	uA	VIN=IOVCC or VSS	-0.1		0.1	Note 1,2,3
VCOM Operation							
VCOM High Voltage	VCOM H	V	Ccom=12nF	2.5		5	Note 3
VCOM Low Voltage	VCOML	V	Ccom=12nF	-2.5		0	Note 3
VCOM Amplitude Voltage	VOMA	V	VCOMH-VCOML	4		5.5	Note 3
Source Driver							
Source Output Range	Vsout	V		0.5		AVDD-0.1	Note 4
Gama Reference Voltage	GVDD	V		3		4.9	Note 3

Note 1: IOVCC=1.65 to 3.3V, VCI=2.5 to 4.8V, VSSA=VSS=0V, Ta=-30 to 70 (to +85 °C °C no damage)

Note2: Please supply digital IOVCC voltage equal or less than analog VCI voltage. (IOVCC≤VCI)

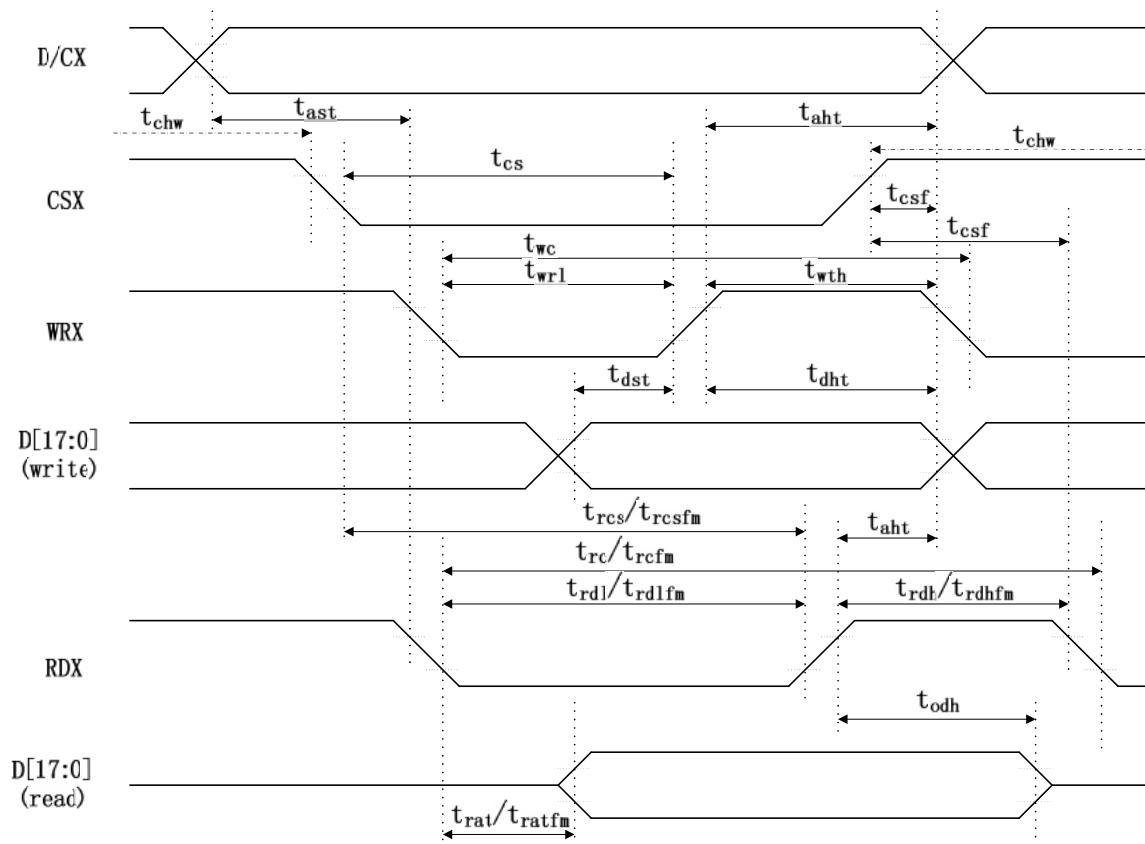

Note2, 3, 4: When the measurements are performed with LCD module. Measurement Points are like below.

Note3: CSX, RDX, WRX, D[23:0], D/CX, RESX, TE, PCLK, VS, HS, DE, SDA, SCL, GM2, GM1, GM0, RCM1, RCM0, P68, IM2, IM1, IM0, SRGB, REV, SMX, SMY, RL, TB, IDM, SHUT, PREG, GS and Test pins.

Note5: Source channel loading = 10pF/channel, Gate channel loading = 50pF/channel

15.3. AC Characteristics

15.3.1 Parallel MCU 18/16/9/8-bit BUS

Note: Logic high and low levels are specified as 30% and 70% of IOVCC for Input signals.

Table 15.3.1 AC characteristics of parallel MCU I/F in asynchronous mode

Signal	Symbol	Parameter	MIN	MAX	UNIT	Description
D/CX	TAST	Address Setup Time	0		ns	
	THAT	Address Hold Time (W/R)	10		ns

	TSLW	S" L " " L " Pulse Width(Write)	15		ns	
	TSCYCR	Serial Clock	150		ns	

Signal	Symbol	Parameter	MIN	MAX	UNIT	Description
		Cycle(Read)				
	TSHR	S”L””H” Pulse Width(Read)	60		ns	
	TSLR	S”L””L” Pulse Width(Read)	60		ns	
SDA(DIN) /(DOUT)	TSDS	Data Setup Time	15		ns	
	TSDH	Data Hold Time	5		ns	
	TACC	Access Time	5	50	ns	CLmax=30pF CLmin=8pF
	TOH	Output Disable Time	10		ns	

Note 1: IOVCC=1.65 to 3.3V, VCI=2.6 to 3.3V, VSSA=VSS=0V. Ta=-30 to 70°C (to +85°C no damage)

Note 2: The input signal rise time and fall time(tr, tf) is specified at 15 ns or less. Logic high and low levels are specified as 10% and 90% of IOVCC for Input signals.

15.3.2.2 SPI 4-Wire Interface

Table 15.3.2.2: 4 pin Serial Interface Characteristics

Signal	Symbol	Parameter	MIN	MAX	UNIT	Description
CSX	TCSS	Chip Select Setup Time	10		ns	
	TCSH	Chip Select Hold Time	30		ns	
	TCHW	Chip Select “H” Pulse Width	30		ns	
SCL	TSCYCW	Serial Clock Cycle(Write)	66		ns	
	TSHW	S”L””H” Pulse Width(Write)	15		ns	
	TSLW	S”L””L” Pulse Width(Write)	15		ns	
	TSCYCR	Serial Clock Cycle(Read)	150		ns	
	TSHR	S”L””H” Pulse Width(Read)	60		ns	
	TSLR	S”L””L” Pulse Width(Read)	60		ns	
D/CX	TDCS	D/CX Setup Time	5		ns	
	TDCH	D/CX Hold Time	5		ns	
SDA(DIN) (DOUT)	TSDS	Data Setup Time	15		ns	
	TSDH	Data Hold Time	5		ns	
	TACC	Access Time	5	50	ns	CLmax=30pF CLmin=8pF
	TOH	Output Disable Time	10		ns	

Note 1: IOVCC=1.65 to 3.3V, VCI=2.6 to 3.3V, VSSA=VSS=0V. Ta=-30 to 70°C (to +85°C no damage)

Note 2: The input signal rise time and fall time (tr, tf) is specified at 15 ns or less. Logic high and low levels are specified as 10% and 90% of IOVCC for Input signals.

15.3.3 Parallel RGB 18/16/6-bit BUS

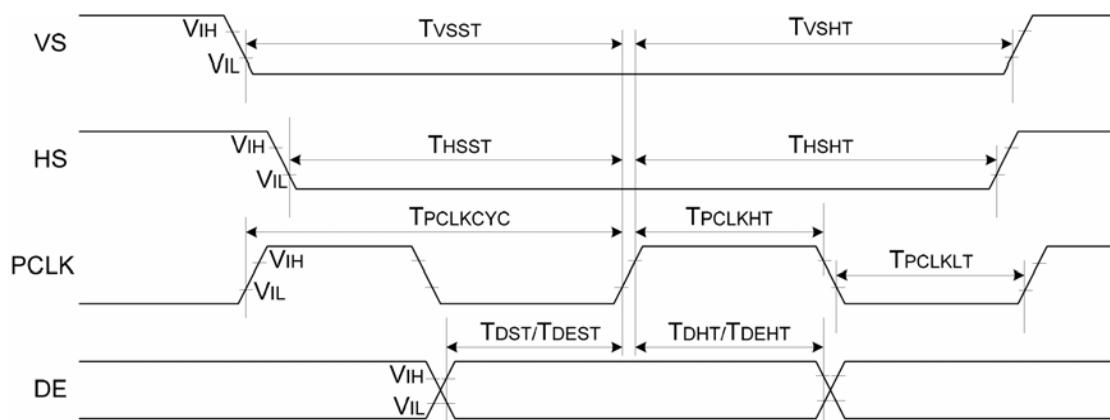

Table 15.3.3 RGB Interface Characteristics

Signal	Symbol	Parameter	MIN	MAX	UNIT	Description
PCLK	TPCLKCYC	TPCLK Cycle Time	66	-	ns	
	TPCLKLT	Pixel Low Pulse Width	15	-	ns	
	TPCLKHT	Pixel High Pulse Width	15	-	ns	
VS	TVSST	Vertical Sync.setup time	15	-	ns	
	TVSHT	Vertical Sync.hold time	15	-	ns	
HS	THSST	Horizontal Sync.setup time	15	-	ns	
	THSHT	Horizontal Sync.hold time	15	-	ns	
DE	TDEST	Data Enable Setup Time	15	-	ns	
	TDEHT	Data Enable Hold Time	15	-	ns	
D[17:0]	TDST	Data Setup Time	15	-	ns	
	TDHT	Data Hold Time	15	-	ns
