

Product Specification
GENERAL DESCRIPTION

OB2520 is a high performance offline PSR controller for low power AC/DC charger and adapter applications. It operates in primary-side sensing and regulation. Consequently, opto-coupler and TL431 could be eliminated. Proprietary Constant Voltage (CV) and Constant Current (CC) control is integrated as shown in the figure below.

In CC control, the current and output power setting can be adjusted externally by the sense resistor R_s at CS pin. In CV control, PFM operations are utilized to achieve high performance and high efficiency. In addition, good load regulation is achieved by the built-in cable drop compensation. The chip consumes very low operation current (typical 300uA), it can achieve less than 30mW standby power to meet strict standby power standard.

OB2520 offers comprehensive protection coverage with auto-recovery features including Cycle-by-Cycle current limiting, VDD over voltage protection, feedback loop open protection, short circuit protection, built-in leading edge blanking, VDD under voltage lockout (UVLO), etc. OB2520 is offered in SOT23-6 package.

Figure.1. Typical CC/CV Curve

TYPICAL APPLICATION

FEATURES

- $\pm 5\%$ Constant Voltage Regulation at Universal AC input
- High precision Constant Current Regulation at Universal AC input
- Primary-side Sensing and Regulation Without TL431 and Opto-coupler
- Programmable CV and CC Regulation
- Built-in Primary winding inductance compensation
- Programmable Cable Drop Compensation
- Driver BJT Switch
- Ultra Low Start-up Current (Typ. 1uA)
- VDD Over Voltage Protection
- Built-in Feedback Loop Open Protection
- Built-in Short Circuit Protection
- Built-in Leading Edge Blanking (LEB)
- Cycle-by-Cycle Current Limiting
- VDD Under Voltage Lockout with Hysteresis (UVLO)

APPLICATIONS

Low Power AC/DC offline SMPS for

- Cell Phone Charger
- Digital Cameras Charger
- Small Power Adapter
- Auxiliary Power for PC, TV etc.
- Linear Regulator/RCC Replacement

GENERAL INFORMATION

Pin Configuration

The pin map is shown as below for SOT23-6.

Package Dissipation Rating

Package	R θ JA (°C/W)
SOT23-6	200

Absolute Maximum Ratings

Parameter	Value
VDD Voltage	-0.3 to 30V
VC Voltage	-0.3 to 7V
BASE Voltage	-0.3 to 7V
CS Input Voltage	-0.3 to 7V
FB Input Voltage	-0.3 to 7V
Min/Max Operating Junction Temperature T _J	-40 to 150 °C
Min/Max Storage Temperature T _{stg}	-55 to 150 °C
Lead Temperature (Soldering, 10secs)	260 °C

Ordering Information

Part Number	Description
OB2520MP	SOT23-6, Pb-free, T&R

Note: Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute maximum-rated conditions for extended periods may affect device reliability.

Marking Information

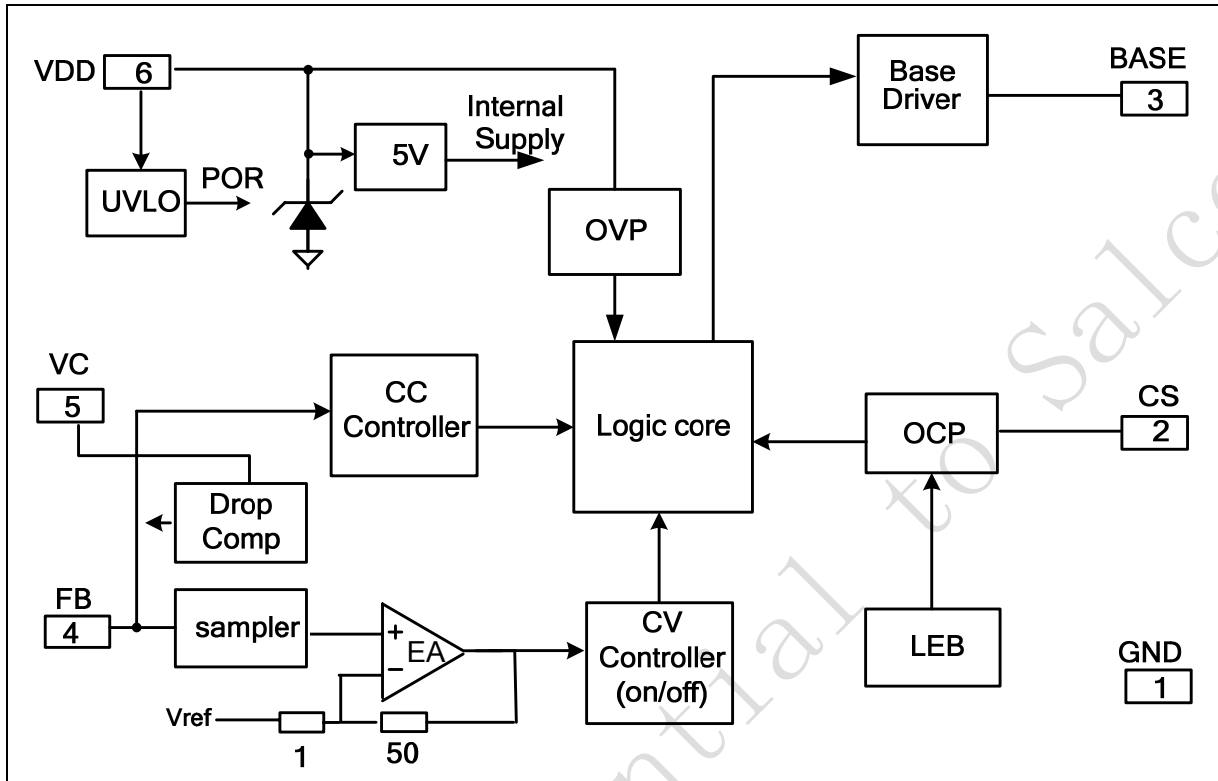

Y: Year Code(0-9)
 WW: Week Code(01-52)
 S: Internal Code(Optional)

TERMINAL ASSIGNMENTS

Pin Num	Pin Name	I/O	Description
1	GND	P	Ground
2	CS	I	Current sense input.
3	BASE	O	Base drive with current limit for power BJT.
4	FB	I	The voltage feedback from auxiliary winding. Connected to resistor divider from auxiliary winding reflecting output voltage.
5	VC	I	Low pass filter capacitor for cable compensation
6	VDD	P	Power Supply

BLOCK DIAGRAM

ELECTRICAL CHARACTERISTICS

(TA = 25°C, VDD=15V, if not otherwise noted)

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit
Supply Voltage (VDD) Section						
I _{start-up}	Start up current	VDD=11V		1	3	uA
I _{static}	Static current	VDD=15V		300	400	uA
UVLO(OFF)	VDD under voltage lockout exit		11.5	12.5	13.5	V
UVLO(ON)	VDD under voltage lockout enter		6.0	6.8	7.6	V
VDD_OVP	VDD over voltage protection		25	27	29	V
Max. Operating Voltage					25	V
Current Sense Input Section						
TLEB	LEB time			0.5		uS
Vth_ocp	Over current threshold		485	500	515	mV
Td_oc	OCP propagation delay	From ocp comparator to base drive		100		ns
FB Input Section						
Vref_fb	Reference voltage for feedback threshold		1.98	2.00	2.02	V
Tpause_min				2.0		uS
Tpause_max	Maximum pause		8	10	12	mS
Icomp_cable	Maximum cable compensation current		42	45	48	uA
BASE Drive Section						
I _{s_max}	Base sourcing maximum current		20	30	40	mA
I _{s_preoff}	Base sourcing current after pre-off		0.5	1	1.5	mA
Rdson_l	Base drive low side on resistor			1		ohm

CHARACTERIZATION PLOTS

OPERATION DESCRIPTION

OB2520 is a cost effective PSR controller optimized for off-line low power AC/DC applications including battery chargers. It operates in primary side sensing and regulation, thus opto-coupler and TL431 are not required. Proprietary built-in CV and CC control can achieve high precision CC/CV control meeting most charger application requirements.

- **Startup Current and Start up Control**

Startup current of OB2520 is designed to be very low so that VDD could be charged up above UVLO threshold and starts up quickly. A large value startup resistor can therefore be used to minimize the power loss in application.

- **Operating Current**

The Operating current of OB2520 is as low as 300uA. Good efficiency and very low standby power(less than 30mW) is achieved with the low operating current.

- **CC/CV Operation**

OB2520 is designed to produce good CC/CV control characteristic as shown in the Figure. 1. In charger applications, a discharged battery charging starts in the CC portion of the curve until it is nearly full charged and smoothly switches to operate in CV portion of the curve. The CC portion provides output current limiting. In CV operation, the output voltage is regulated through the primary side control. In CC operation mode, OB2520 will regulate the output current constant regardless of the output voltage drop.

- **Principle of Operation**

To support OB2520 proprietary CC/CV control, system needs to be designed in DCM mode for flyback system (Refer to Typical Application Diagram on page1).

In the DCM flyback converter, the output voltage can be sensed via the auxiliary winding. During MOSFET turn-on time, the load current is supplied from the output filter capacitor, Co. The current in the primary winding ramps up. When MOSFET turns off, the energy stored in the primary winding is transferred to the secondary side such that the current in the secondary winding is

$$I_S = \frac{N_P}{N_S} \cdot I_P \quad (1)$$

The auxiliary voltage reflects the output voltage

as shown in Figure.2 and it is given by

$$V_{AUX} = \frac{N_{AUX}}{N_S} \cdot (V_O + \Delta V) \quad (2)$$

Where ΔV indicates the drop voltage of the output Diode.

Figure.2. Auxiliary voltage waveform

Via a resistor divider connected between the auxiliary winding and FB (pin 4), the auxiliary voltage is sampled at the middle of the de-magnetization and it is hold until the next sampling. The sampled voltage is compared with Vref (2.0V) and the error is amplified. The error amplifier output reflects the load condition and controls the switching off time to regulate the output voltage, thus constant output voltage can be achieved.

When the sampled voltage is below Vref and the error amplifier output reaches its minimum, the switching frequency is controlled by the sampled voltage to regulate the output current, thus the constant output current can be achieved.

- **Adjustable CC point and Output Power**

In OB2520, the CC point and maximum output power can be externally adjusted by external current sense resistor Rs at CS pin as illustrated in typical application diagram. The larger Rs, the smaller CC point is, and the smaller output power becomes, and vice versa as shown in Figure.3.

Figure.3. Adjustable output power by changing Rs

● Operation switching frequency

The switching frequency of OB2520 is adaptively controlled according to the load conditions and the operation modes.

For flyback operating in DCM, The maximum output power is given by

$$P_{o_{MAX}} = \frac{1}{2} L_p F_{SW} I_p^2 \quad (3)$$

Where L_p indicate the inductance of primary winding and I_p is the peak current of primary winding.

Refer to the equation 3, the change of the primary winding inductance results in the change of the maximum output power and the constant output current in CC mode. To compensate the change from variations of primary winding inductance, the switching frequency is locked by an internal loop such that the switching frequency is

$$F_{SW} = \frac{1}{2T_{Demag}} \quad (4)$$

Since T_{Demag} is inversely proportional to the inductance, as a result, the product L_p and f_{sw} is constant, thus the maximum output power and constant current in CC mode will not change as primary winding inductance changes. Up to $\pm 10\%$ variation of the primary winding inductance can be compensated.

● Programmable Cable drop Compensation

In OB2520, cable drop compensation is implemented to achieve good load regulation. An offset voltage is generated at FB pin by an internal current flowing into the resistor divider. The current is proportional to the switching off time, as a result, it is inversely proportional to the output load current, thus the drop due to the cable loss can be compensated. As the load current decreases from full-load to no-load, the offset voltage at FB will increase. It can also be

programmed by adjusting the resistance of the divider to compensate the drop for various cable lines used.

The percentage of maximum compensation is

$$\frac{\Delta V}{V_{out}} = \frac{I_{comp_cable} \times (R1 // R2) \times 10^{-6}}{2} \times 100\%$$

ΔV is load compensation voltage and V_{out} is output voltage;

For example: $R1 // R2 = 3K\Omega$, the percentage of maximum compensation is

$$\frac{\Delta V}{V_{out}} = \frac{45 \times 3000 \times 10^{-6}}{2} \times 100\% = 6.75\%$$

● Current Sensing and Leading Edge Blanking

Cycle-by-Cycle current limiting is offered in OB2520. The switch current is detected by a sense resistor into the CS pin. An internal leading edge blanking circuit chops off the sensed voltage spike at initial power BJT on state so that the external RC filtering on sense input is no longer needed.

● Base Drive

The drive is a push pull stage with supply voltage VDD. It provides the driving current for the external power bipolar transistor. The output signal is current limit to I_{s_max} (typical 30mA).

● Protection Control

Good power supply system reliability is achieved with its rich protection features including Cycle-by-Cycle current limiting (OCP), VDD over voltage protection, feedback loop open protection, short circuit protection and Under Voltage Lockout on VDD (UVLO).

VDD is supplied by transformer auxiliary winding output. The output of OB2520 is shut down when VDD drops below UVLO (ON) and the power converter enters power on start-up sequence thereafter.
