OL2068

OPTOLAB MICROSYSTEMS

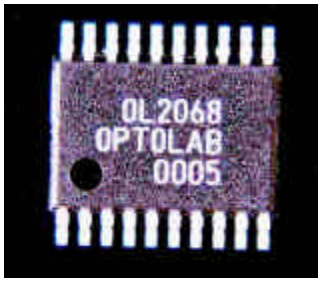
Industrial 30 Volt 4-Channel Differential Power Line Driver - Short Circuit Proof -

Applications

- Industrial encoder interfacing
- Industrial sensor interfacing
- Proximity switches
- Industrial controllers
- Light barriers

Features

- Ultra small package TSSOP 20
- Max. voltage range from 4,5 V – 36 V
- Short circuit proof tri-state outputs drive up to 120mA sink / source
- Operating frequency up to 4 MHz
- Integrated voltage reg. with 5V output
- Dynamic peak current up to 1,5 Amp.
- High impedance CMOS / TTL compatible buffered inputs with hysteresis
- Outputs RS422A compatible



Ultra small package TSSOP 20

General Description

The OL2068 is an industrial power line driver and contains four identical short circuit proof differential line drivers up to 30 Volts driver supply with a joint enable function. An internal 5 V power supply is used as reference and supply voltage for the circuitry and is able to supply max. 5mA for external 5V components like a sensor or a constant current source for an LED.

The very small outline TSSOP package gives excellent thermal power dissipation, thus the usage in space limited applications is easy.

Industrial 30 Volt 4-Channel Differential Power Line Driver - Short Circuit Proof -

Electrical characteristics

All voltage values are referenced to GND (GND = 0V).

Unless stated otherwise all signals are assumed to be high active.

Table 1 Absolute Maximum Ratings

Parameter	Symbol	Condition	Min	Max	Unit
DC supply voltage	V_{CCD}		-0.3	36.0	V
DC input voltage	V_{IN}		-0.3	V_{CC}+0.3	V
DC input current	I_{In}			±10	mA
Output voltage	V_{OUT}		-0.3	V_{CC}+0.3	V
Driver output current **(see cable model)**	I_{OUT}	pulse peak/average		1500/100	mA
Storage and operating temperature range	T_{STGOP}		-55	+125	°C
Junction temperature	T_J			+150[1]	°C
Lead temperature	T_L	soldering, 10s		+260[2]	°C
Power dissipation: **OL7272** SOIC16NB: R_{thj-a}=111.8 K/W **OL206**8 TSSOP20: R_{thj-a}= 81.4 K/W	PD	still air, T_A=85°C, T_J=150°C		 581 798	 mW mW

Table 2 Recommended Operating Conditions

Parameter	Symbol	Condition	Min	Max	Unit
DC supply voltage	V_{CCD}		4.5	30.0	V
DC data input voltage	$V_{IN}D$		0	V_{CCD}	V
DC enable input voltage	$V_{IN}EN$[3]		0	5.5	V
Data output voltage	$V_{OUT}D$		0	V_{CCD}	V
TMON output voltage	$V_{OUT}TM$		0	V_{CCI}	V
Driver output current **(see cable model)**	I_{OUT}[4]			100	mA
Operating ambient temperature range	T_A[5]		-40	+100	°C
Junction temperature range (lifetime)	T_J		-55	+125	°C

NOTE: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability (eq. hot carrier degradation).

Over-temp. release point (junction)		T_{JRP}		+125	+135		°C

[6] Either the low or high side switch is active at a time.
[7] Values will not be part of the production test but guaranteed by design.
[8] Output MON external driving current up to 4mA possible - but using this limits the thermal power budget!
[9] Measured without external load on V_{CCI} pin, all outputs open.
[10] For decoupling V_{CCI} please connect this output with a 100nf capacitor to GND
[11] Depends on supply voltage V_{CCD}, V_{CCI} could be not higher than V_{CC} - 0.3 V.
[12] This is measured per input with all other inputs held at VCCI or GND.
[13] Limited by power dissipation, high I_{CCI} current with growing V_{CCD} voltage generates heat, thus the driving limit can be reached earlier.
[14] Value will not be part of the production test but guaranteed by design.

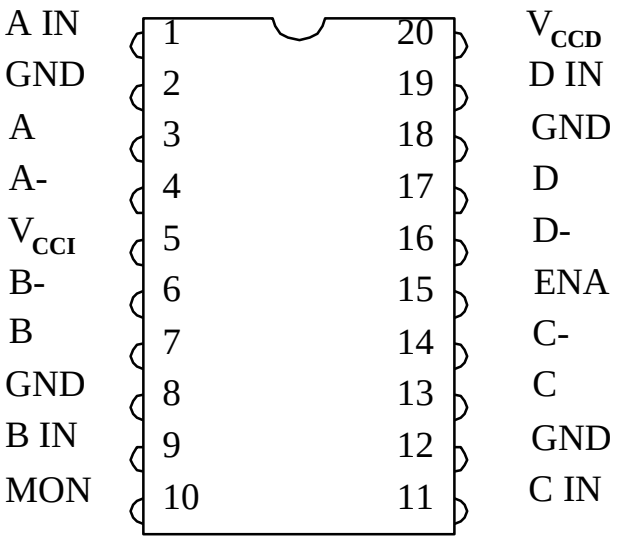
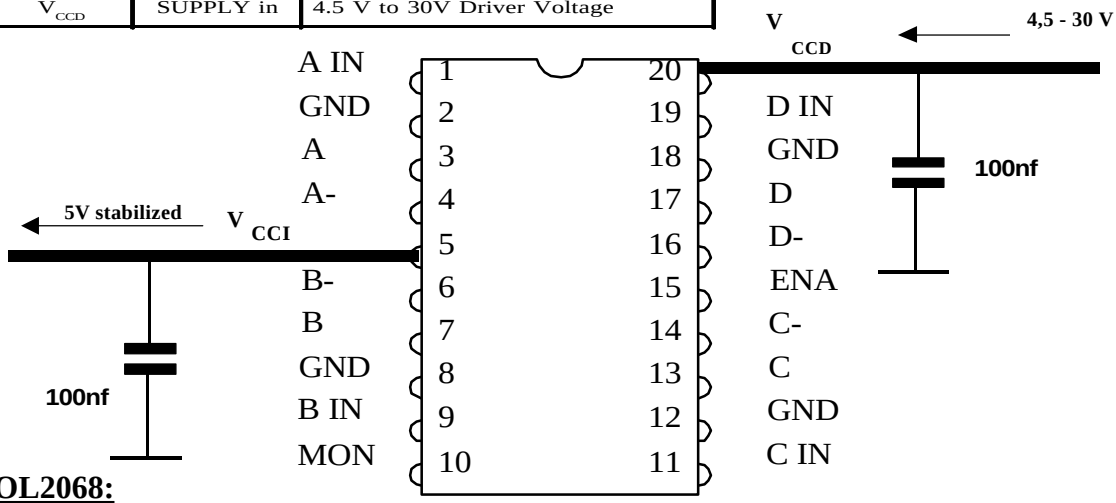
18	GND	GROUND	Ground
19	D IN	INPUT	Input Driver D
20	V_{CCD}	SUPPLY in	4.5 V to 30V Driver Voltage





Note on OL2068:

The 4 GND pins do not need to be connected to electrical GND simultaneously. One of them tied to GND is enough. However - for heavy driving of loads it is recommended to tie all four pins to GND.

The internal voltage regulator (Pin 5,Vcci) can be used for external loads (5mA max.) as well. Please make sure, that a decoupling capacitor of min. 100nf is connected to Vcci. If, due to heavy loads, the internal voltage supply will be rippled, please increase the capacitor value to stabalize Vcci.

Industrial 30 Volt 4-Channel Differential Power Line Driver - Short Circuit Proof -

Functional description

The main contents of this new CMOS power line driver are four identical blocks (systems A to D) with each a CMOS/TTL Schmitt Trigger Input and high power differential buffered and inverted outputs.
With the low active ENABLE pin it is possible to switch off all eight outputs (high-impedance state), thus this driver can be used in industrial bus systems.
In some rare applications it might be useful to disable the over temperature shutdown. This can be done by setting the ENABLE pin to a level between >7,5 V and <12 V. In this case the whole protection of the IC is disabled ! In case of any short circuits or thermal overdrive, the driver might be destroyed !
An internal ultra low drop voltage regulator with typical 5.0 V supplies the internal logic to reduce power dissipation. Some applications require additional 5V (i.e. for an LED driver in an optical encoder). This voltage can be sourced out of the line driver internal voltage regulator (5mA max.).
The over-temperature protection block is placed in the center of the chip. The thermal shutdown will be activated, when a overload condition (i.e. short circuit) has exceeded the over-temperature detection threshold.

In this case automatically all output drivers are switched off and (ET2068) an error signal is activated on a monitor pin. After the chip has cooled down (a few milliseconds) it automatically re-activates all functions and switches the MON output high again. In case the short circuit is still present, it switches off again and the same cycle starts from the beginning.
By using this line driver, the field returns of systems, which are accidentally shorted and blown by the end users, are dramatically reduced.

Power supply
The internal power supply is designed as a voltage regulator with a typical output voltage V_{CCI} = 5.0 V. The minimal voltage drop across the regulator transistors could not be lower than 0.3 V. In order to decouple V_{CCI} it has to be connected to an external capacitor of 100nF.

The V_{CCI} pin could be used as a reference voltage for LED drivers or is able to supply other external devices like sensors at a maximum current of I_{CCIE} = 5.0 mA. Please keep in mind, that by using this voltage regulator it will generate additional power dissipation = heat.

Under-voltage reset
If the system is switched on, the status of the line driver is, for a few microseconds, undefined. The same happens, if heavy power supply failures occur. To avoid wrong data transmitted, there is a supply voltage watchdog implemented.

The under-voltage reset block contains a comparator. The voltage V_{CCI} will be always compared with a reference voltage, provided by an internal bandgap cell.
If after a filter time (t_{FIL} LVR ~ 5 s) V_{CCI} drops below the typical voltage threshold of 3.5 V the output signal of this block switches off all output drivers to the high-impedance state until minimum 3.6 V are reappearing. In case of such a system fault also the output MON generates an error signal. This (inverted) signal can also be used as a "system ready" signal.

ESD / EMI
The chip is an ESD sensitive device and should be handled according to guideline EN100015 / part 1 (“The Protection of ESD Sensitive Devices”). All pins are ESD protected according to ESD standard MIL883, method 3015.7 (human body model). Unused Inputs should be connected to GND, as well as the pin ENABLE in case this function is not used. This will reduce the quiescent supply current.

Heatlink
For higher power dissipation, the part can be ordered with an added heatlink underneath the IC. This non conductive heatlink automatically gives an excellent thermal contact to the PCB, thus the driving capability can be upgraded up to 20% more driving current. No specific user assembly routines required - just solder the IC to your PCB and the heatlink is automatically making contact with the circuit board.

Life support clause
The schematics and in general the linedrivers are not intended for use in life support appliances, critical components or systems without the express written consent of Optolab Microsystems GmbH. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

Industrial 30 Volt 4-Channel Differential Power Line Driver - Short Circuit Proof -

Functional blocks

Figure 8

High voltage Data Inputs

All Data input pins with Schmitt trigger characteristics on CMOS/TTL level are protected against voltage overshoot up to 30 V. The input circuity will be powered by an internal low drop voltage regulator.

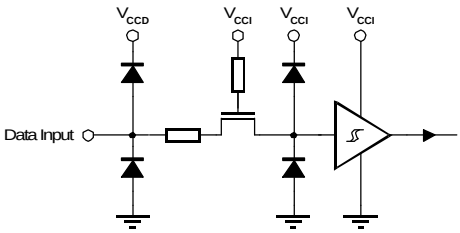

Figure 9

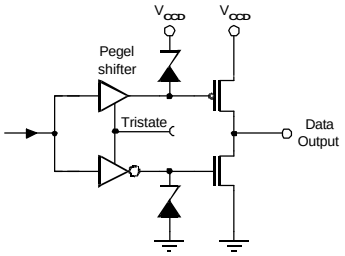
Push-pull Data outputs

For minimizing cross talk and maintaining the very high switching speed each driver stage has it's own level shift pre-driver. Therefore the digital waveform characteristics has a superior frequency response.



Over-temperature protection

An over-temperature detection and protection is implemented to prevent the output drivers from overheating and being destroyed.

If the temperature increases with growing power dissipation and the junction temperature exceeds the absolute maximum value with typical T_{JOP} ~ 165 °C then this condition causes the thermal shutdown by switching off all output drivers to their high-impedance state. After cooling down below the release point the driver will continue this operation. Upgrading power dissipation can be achieved by using our heatlink option.

The active over-temperature detection status will be also provided on the MON pin as low level.

Over-temperature disable

The only way to realize this function without a seperate pin is the use of a special voltage range on the ENABLE pin.

Figure 10

ENABLE Input with temp. disable signal generation

The implementation of one voltage threshold above the valid funtional range allows ther realization of an additional function. Again - by using this mode the line driver is no longer protected! If there is a voltage > 7,5V and < 12V applied to the ENABLE pin, the temperature shutdown will be desabled.

Industrial 30 Volt 4-Channel Differential Power Line Driver - Short Circuit Proof -

Line driver applications

For differential line driver applications it is recommended to use shielded twisted pair cable. Unfortunately this type of cable is not widely used. A more realistic load circuit is therefore shown in Figure 13. A long cable model is shown in Figure 14.

Figure 12

Twisted Pair transmission lines

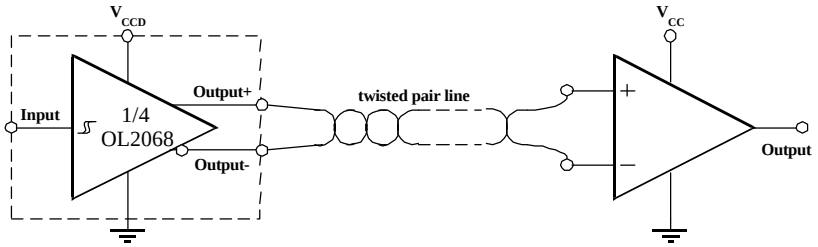

Figure 13

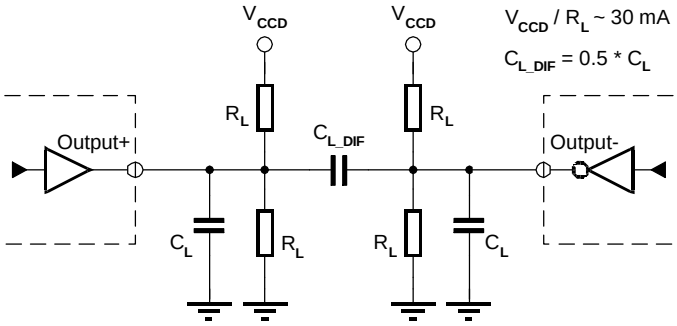
Load circuit for differential transmission Lines

RL	120 Ω	350 Ω	700 Ω
VCCD	5 V	12 V	24 V

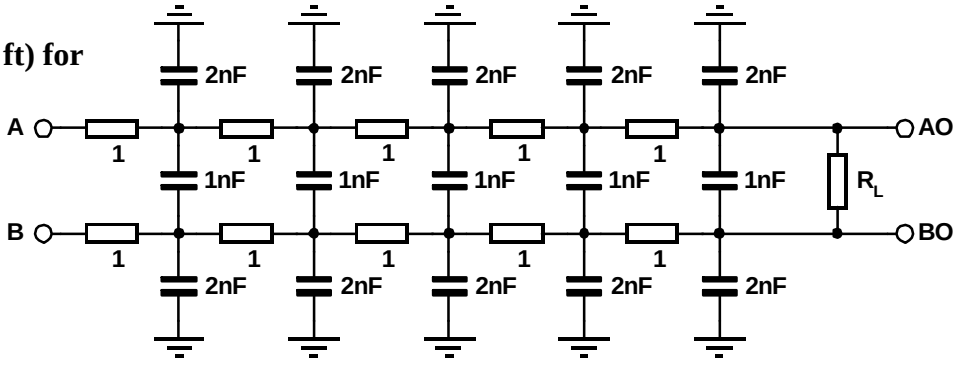


The variables for Figure 13 to meet the push-pull output drive DC characteristics are: C_L = 1000 pF, $C_{L\ DIF}$ = 500 pF

Figure 14

Long cable model (100 m/300 ft) for differential transmission lines

Parameter R_L	Condition	
	V_{CCD}	I_{LOAD}
225 Ω	4.5 V	20 mA
1 kΩ	30 V	30 mA



For easy application engineering there is a demo board available. Please call your representative for details.

For driving heavy loads, the line drivers may be used in parallel.

**Optolab Microsystems GmbH keeps the right to change and update this specification at any time without giving notice.*
