DESCRIPTION

The OP-77 represents a significant improvement in precision operational amplifiers. The low initial V_{OS} drift and exceptional TCV_{OS} of 0.3 μ V/ $^{\circ}$ C maximum and the low V_{OS} of 25 μ V maximum, eliminates the need for V_{OS} adjustment. With only 50mW power consumption, 110dB PSRR and 120dB CMRR virtually eliminate errors caused by power supply drifts and common mode signals. These characteristics combined with an impressive open loop gain of 5V/ μ V minimum and a great linearity, makes the OP-77 ideally suited for precision instrumentation applications.
