4. SIGNAL DESCRIPTIONS

Designation	I/O	Function	Description																				
CLK	I	Shift clock input	The clock for the internal shift registers.																				
U_D	I	Shift direction control pin	The shift direction of device internal shift register is controlled by this pin as shown below: U_D=H, STVD→G1→G2→...→G960→STVU U_D=L, STVU→G960→...→G2→G1→STVD																				
STVD STVU	I/O	Start pulse input/output pin	U_D=H, STVD is used for start pulse input STVU is used for start pulse output U_D=L, STVU is used for start pulse input STVD is used for start pulse output																				
OE	I	Output enable control	These pads are shorted internally, active high. When this pin is applied to "H", the channel outputs are disabled (= VEE). This condition will not affect the operation of the internal registers. OE control signal is independent with the CLK.																				
XOA	I	Output all-on control	When XOA is set to L, all outputs are fixed to VGG. Note that this pin has higher priority than OE. However, the content of shift register is not cleared. XOA is pulled high to VCC internally. When it is not used, connecting to VCC is recommended.

5. FUNCTIONAL DESCRIPTIONS

5.1. Device operation

When U_D=H, MODE0=H & MODE1=H, the STVD start pulse input is sensed on the rising edge of CLK and stored in the first stage of shift register, which makes the first scan signal output from the G1 pin. While stored data is transferred to the next stage shift register on the rising edge of next CLK, new data of STVD is sensed and stored simultaneously.

The output pin (G1 to G960) supplies VGG voltage or VEE voltage to the LCD panel depending on the data stored in the shift register. For normal operation, a VGG voltage is outputted one by one from G1 to G960 in synchronization with CLK pulse.

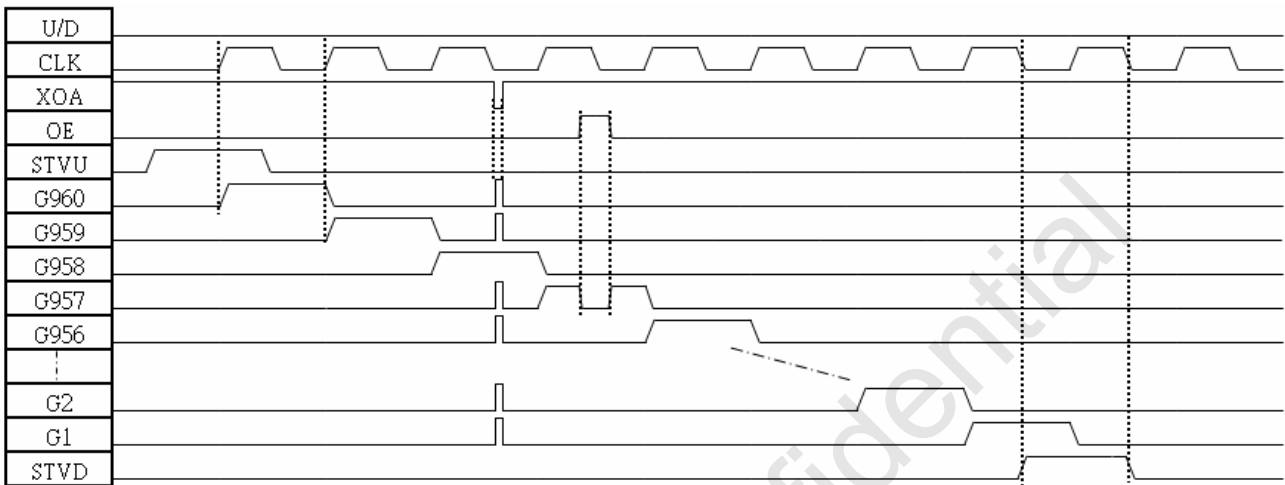

After 960 CLK rising edge are past, the STVU goes up to high level at the 960th falling edge of CLK and goes down to low level at the 961st falling edge of CLK. This STVU output signal becomes the STVD start pulse input of next cascaded gate driver.

When OE=H, the corresponding output channels are fixed to VEE level regardless of CLK. The channel output returns to normal status as soon as OE goes back to L.

Example of input/output timing (U_D=H, MODE0=H, MODE1=H, OE & XOA)

Example of input/output timing (U_D=L, MODE0=H, MODE1=H, OE & XOA)

5.2. Start Pulse Usage

The available start pulse is in the following diagram.

■ Signal Start Pulse Input

■ Long Start Pulse Input (2 CLK Period)

■ Dual Start Pulse Input

■ Long Start Pulse Input (More Than 2 CLK Period)

Note1: The Output Turn-On Timing will change following by Start Pulse Waveform.

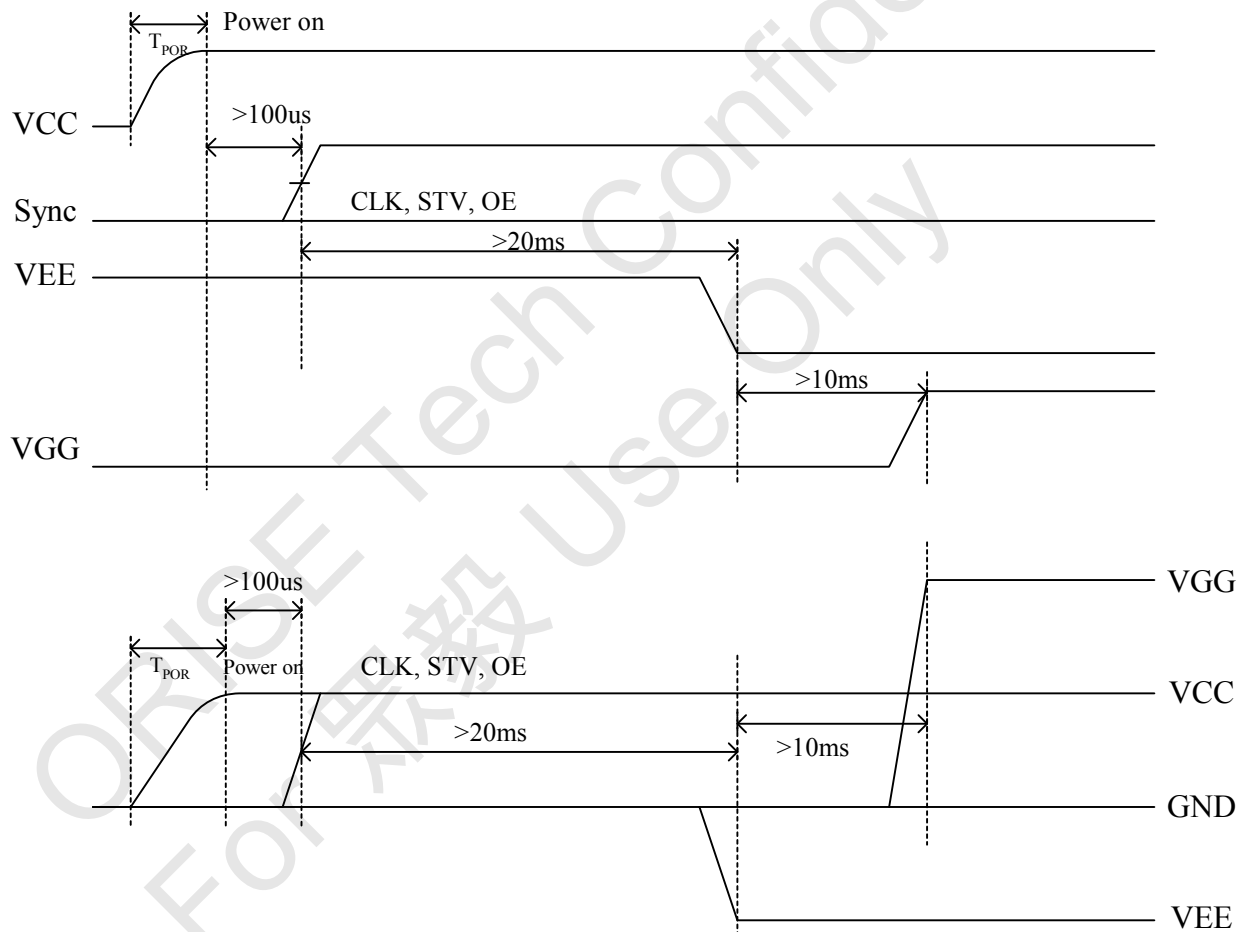

5.3. Power on sequence

This LSI has a high-voltage LCD drive circuits, so it may be permanently damaged by a high current which may flow if voltage is supplied to the LCD drive power supply while the logic system power supply is floating. Therefore, when connecting the power supply, observe the following sequence.

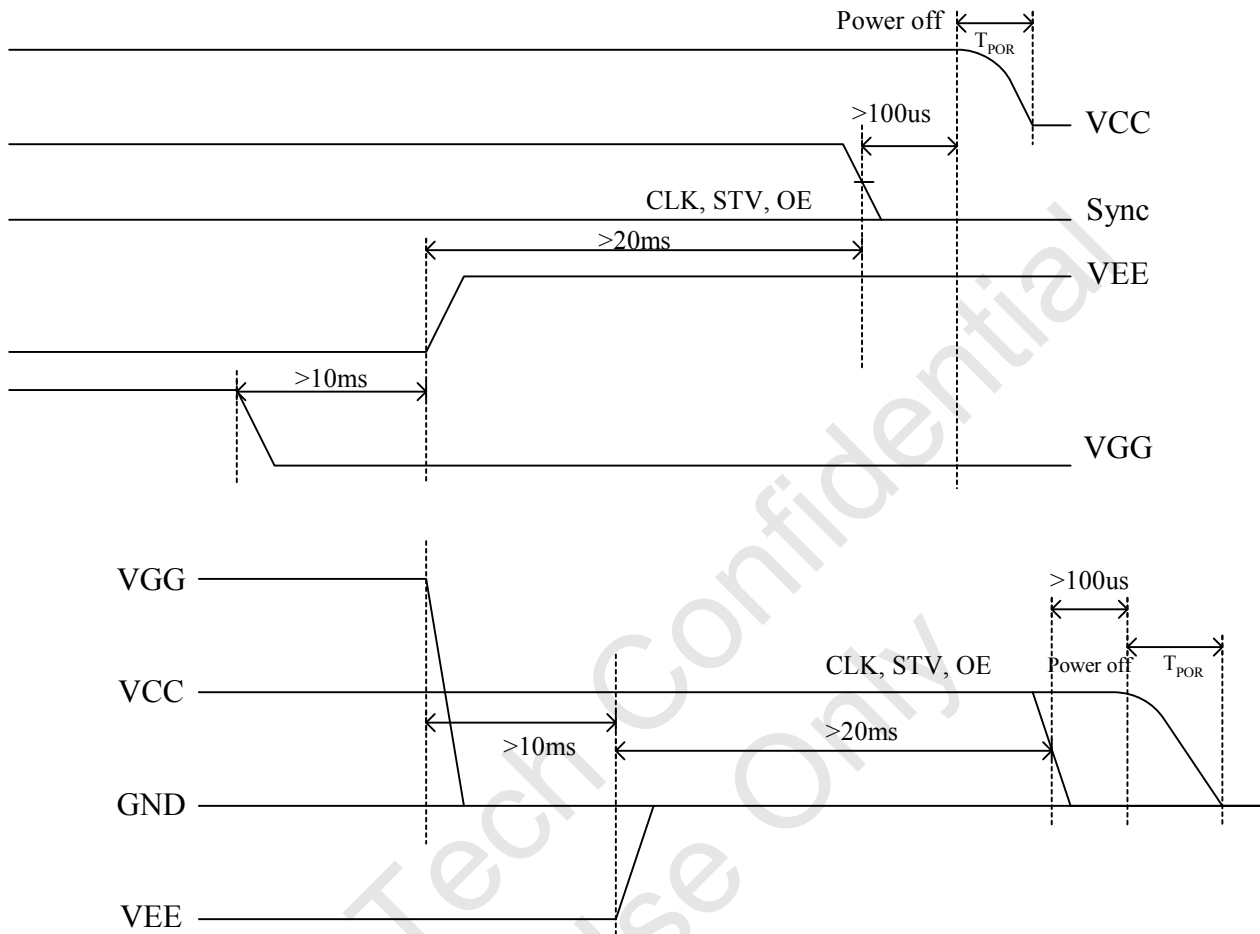

Logic system power supply (VCC), low-level LCD drive power supply (VEE) → Logic input → High-level LCD drive power supply (VGG)
When disconnecting the power supply, follow the reverse sequence.

Since the logic state of internal circuit is unstable immediately after the logic system power is supplied, input CLK and STVD/STVU while initializing the internal circuit (minimum input clock number is 600 CLK.)

Note: For the input signals: CLK, XOA, OE, U_D, STVD, STVU, "High" level=VCC, "Low" level=GND

This figure above is example for power supply sequence of power supply pin.
