

### Features

- 24 GHz to 40 GHz Frequency Range
- Digitally Tunable
- In Band IIP3: 42 dBm
- Power Supplies: +1.8 V, +2.5 V
- Single Chip Replacement for Discrete Filter Banks
- Flip Chip C4 Bump
- Die Dimension: 1.634 mm x 1.637 mm
- [MatLab Explorer App](#) Available

### Description

The OTFL301 is a digitally tunable bandpass filter. The wide range of control (many different combinations) provides flexibility of frequency tuning from 24 GHz to 40 GHz. The typical insertion loss is 7 dB.

This device delivers spur/interference removal techniques over multiple center frequencies to RF systems while providing 10x PCB area reduction in comparison to a switched filter bank or cavity tuned filter solution. These application areas include but not limited, radio, communication, military radar, and instrumentation.

MatLab Explorer App was developed to assist customers to use in system chain analysis and optimization. These data driven models predict amplitude and phase very accurately in response to the user defined input controls. This advanced capability enables intimate exploration of the device's degrees of freedom.

## Specifications

For all supplied data in the table below, the nominal conditions are defined as the following:

- Ambient Temperature: 25°C
- Voltages: V1P8 = 1.8V, V2P5 = 2.5V
- Measured on the OTFL301-EVAL evaluation board and de-embedded using Automatic Fixture Removal (AFR)

Table 1 – Specifications

Parameter	Test Configuration	Units	Min.	Typ.	Max.
<b>Operating Temperature</b>		°C	-40		85

RF Pins (HBM)	2000 V

## Typical Performance Plots

For the measured plots below, each of the five stage's capacitor banks are set to the same decimal value. Tuning of the center frequency and fine-tuning passband flatness are possible with the topology. Many combinations are possible with 8 states ( $2^3$ ) available at each of the five stages, but for simplicity, these values are tied together.

## Functional Information

### Filter Design

The OTFL301 is a digitally tunable frequency of operation bandpass filter. The IC features 3 bits (8 states) of digital control at every stage, with a total of 5 stages. This wide range of control (many different combinations) provides flexibility of frequency tuning from 24 GHz to 40 GHz.

### Serial Interface Design

A simple 3-wire serial interface is utilized to control the filter. The interface utilizes the following signals for communication:

- SCL: Single ended clock input to chip
- SDA: Single ended data input to chip
- SLA: Single ended latch input to chip (active low)

A diagram of the digital interface is provided below:

Figure 7 – Digital Interface Overview

A timing diagram is provided below for these signals:

Figure 8 – Interface Timing Diagram

The data message is 32 bits long. The OTFL301 utilizes the first 15 bits in the data stream, so bits 15-31 are not used in this chip design. The serial data is latched into the filter when the SLA pin goes low. The full list of the used functions is shown below:

Table 4 – Control Bit Description

## I/O Functional Description

Table 5 – Filter Pin Description

Pin	Name	Description
1	RF2	RF Port 2 (50Ω). External DC block is not required, except for when voltages are present.
2	RF1	RF Port 1 (50Ω). External DC block is not required, except for when voltages are present.
3	SLA	Serial latch input signal.
4	SCL	Serial clock input signal.
5	SDA	Serial data input signal.
6	V1P8	1.8V power supply. Place 0.1uF and 100pF decoupling capacitors close to pin.
7	V2P5	2.5V power supply. Place 0.1uF and 100pF decoupling capacitors close to pin.
8-19	GND	Common GND. Connect to PCB ground.

Table 6 – Pin Coordinates (Bumps Up)

Pin	Name	Pin Center (um)	
		X	Y
1	RF2	672.5	-100
2	RF1	-672.5	-100

## Pin Configuration

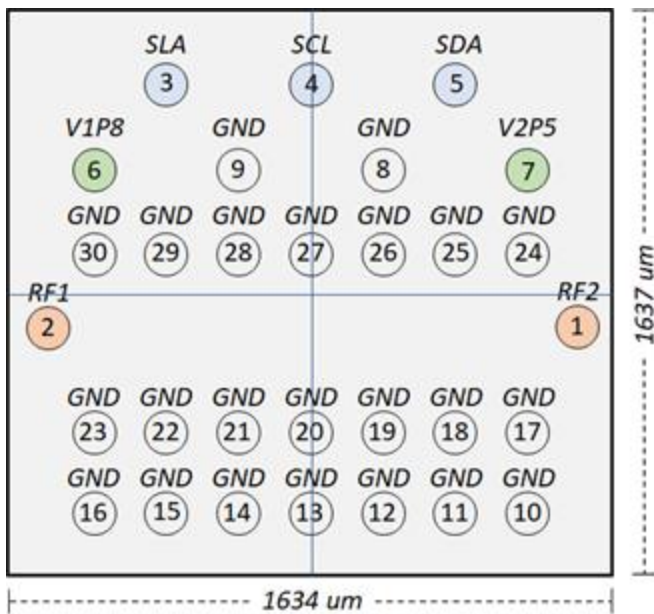

Figure 9 – Pin Configuration (Bumps Up)

Note: Drawing not drawn to scale.

Note: All coordinates are referenced to the die center and refer to the center of the pin.

## Die Mechanical Specifications

Table 7 - Die Mechanical Specifications

Parameter	Unit	Min	Typ	Max	Notes
Die size (x,y)	mm		1.634x1.637		+/- 10um
Die thickness	um		300		
Bump Material	-	SnAg			
Bump Pitch	um	280			
Bump Height	um		75		
Bump Diameter	um		90		

Soldermask defined pads are utilized for the bump landing areas. Please refer to the supplied Altium footprint file and the OTFL301-EVAL evaluation board artwork files for the exact landing pattern dimensions and implementation.
