

P4C1041

HIGH SPEED 256K x 16 (4 MEG)

STATIC CMOS RAM

FEATURES

- High Speed (Equal Access and Cycle Times)
 - 10/12/15/20 ns (Commercial)
 - 12/15/20 ns (Industrial/Military)
- Low Power
- Single 5.0V ± 10% Power Supply
- 2.0V Data Retention
- Easy Memory Expansion Using \overline{CE} and \overline{OE} Inputs
- Fully TTL Compatible Inputs and Outputs
- Advanced CMOS Technology
- Fast t_{OE}
- Automatic Power Down when deselected
- Packages
 - 44-Pin SOJ, TSOP II

DESCRIPTION

The P4C1041 is a 262,144 words by 16 bits high-speed CMOS static RAM. The CMOS memory requires no clocks or refreshing, and has equal access and cycle times. Inputs are fully TTL-compatible. The RAM operates from a single 5.0V ± 10% tolerance power supply.

Access times as fast as 10 nanoseconds permit greatly enhanced system operating speeds. CMOS is utilized to reduce power consumption to a low level. The P4C1041 is a member of a family of PACE RAM™ products offering fast access times.

The P4C1041 device provides asynchronous operation with matching access and cycle times. Memory locations are specified on address pins A_0 to A_{17} . Reading is accomplished by device selection (\overline{CE}) and output enabling (\overline{OE}) while write enable (\overline{WE}) remains HIGH. By presenting the address under these conditions, the data in the addressed memory location is presented on the data input/output pins. The input/output pins stay in the HIGH Z state when either \overline{CE} or \overline{OE} is HIGH or \overline{WE} is LOW.

Package options for the P4C1041 include 44-pin SOJ and TSOP packages.

TIMING WAVEFORM OF READ CYCLE NO. 2 (\overline{OE} CONTROLLED)^(5,6)

Notes:

1. Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to MAXIMUM rating conditions for extended periods may affect reliability.
2. Extended temperature operation guaranteed with 400 linear feet per minute of air flow.
3. Transient inputs with V_{IL} not more negative than $-2.0V$ and $V_{IH} \leq V_{CC} + 0.5V$, are permissible for pulse widths up to 20 ns.
4. This parameter is sampled and not 100% tested.
5. \overline{WE} is HIGH for READ cycle.
6. \overline{CE} is LOW and \overline{OE} is LOW for READ cycle.
7. ADDRESS must be valid prior to, or coincident with \overline{CE} transition LOW.
8. Transition is measured ± 200 mV from steady state voltage prior to change, with loading as specified in Figure 1. This parameter is sampled and not 100% tested.
9. Read Cycle Time is measured from the last valid address to the first transitioning address.

Note:

Because of the ultra-high speed of the P4C1041, care must be taken when testing this device; an inadequate setup can cause a normal functioning part to be rejected as faulty. Long high-inductance leads that cause supply bounce must be avoided by bringing the V_{CC} and ground planes directly up to the contactor fingers. A 0.01 μF high frequency capacitor is also required between V_{CC} and ground. To avoid signal reflections,

proper termination must be used; for example, a 50 Ω test environment should be terminated into a 50 Ω load with 1.73V (Thevenin Voltage) at the comparator input, and a 116 Ω resistor must be used in series with D_{OUT} to match 166 Ω (Thevenin Resistance).
