### DESCRIPTION

The P93U422 is a 1,024-bit high-speed Static RAM with a 256 x 4 organization. The P93U422 is a universal device designed to replace the entire 93 and 93L 256 x 4 static RAM families. The memory requires no clocks or refreshing and has equal access and cycle times. Inputs and outputs are fully TTL compatible. Operation is from a single 5 Volt supply. Easy memory expansion is provided by an active LOW chip select one ( $\overline{CS}_1$ ) and

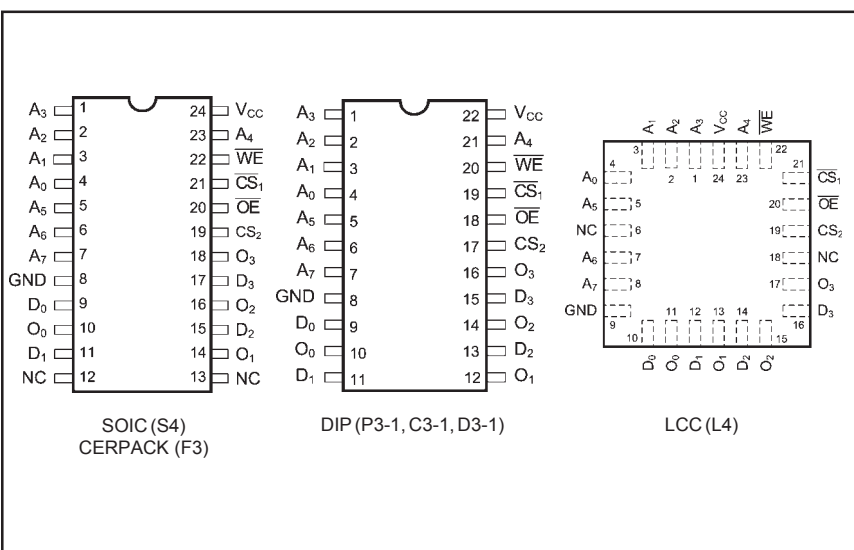

active HIGH chip select two ( $CS_2$ ) as well as 3-state outputs.

In addition to high performance, the device features latch-up protection, single event and upset protection. The P93U422 is offered in several packages: 22-pin 400 mil DIP (plastic and ceramic), 24-pin 300 mil SOIC, 24-pin square LCC and 24-pin CERPACK. Devices are offered in both commercial and military temperature ranges.

### Notes:

- Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to MAXIMUM rating conditions for extended periods may affect reliability.
- Extended temperature operation guaranteed with 400 linear feet per minute of air flow.
- For test purposes, not more than one output at a time should be shorted. Short circuit test duration should not exceed 30 seconds.
- This parameter is sampled and not 100% tested.

## FUNCTIONAL DESCRIPTION

An active LOW write enable ( $\overline{WE}$ ) controls the writing/reading operation of the memory. When chip select one ( $\overline{CS}_1$ ) and write enable ( $\overline{WE}$ ) are LOW and chip select two ( $CS_2$ ) is HIGH, the information on data inputs ( $D_0$  through  $D_3$ ) is written into the addressed memory word and preconditions the output circuitry so that true data is present at the outputs when the write cycle is complete. This preconditioning operation insures minimum write

recovery times by eliminating the “write recovery glitch.” Reading is performed with chip select one ( $\overline{CS}_1$ ) LOW, chip select two ( $CS_2$ ) HIGH, write enable ( $\overline{WE}$ ) HIGH and output enable ( $\overline{OE}$ ) LOW. The information stored in the addressed word is read out on the noninverting outputs ( $O_0$  through  $O_3$ ). The outputs of the memory go to an inactive high impedance state whenever chip select one ( $\overline{CS}_1$ ) is HIGH, or during the write operation when write enable ( $\overline{WE}$ ) is LOW.

## TRUTH TABLE

Mode	$CS_2$	$\overline{CS}_1$	$\overline{WE}$	$\overline{OE}$	Output
Standby	L	X	X	X	High Z
Standby	X	H	X	X	High Z
$D_{OUT}$ Disabled	H	L	X	H	High Z
Read	H	L	H	L	$D_{OUT}$
Write	H	L	L	X	High Z

Notes: H = HIGH

L = Low

X = Don't Care

HIGH Z = Implies outputs are disabled or off. This condition is defined as high impedance state for the P93U422.
