

Features

- o 2 independent switches
- o Individual open-drain fault flag pins
- o 2.7V to 5.5V input
- o 500mA continuous load current per port
- o 140mΩ maximum on-resistance
- o 1μA Maximum Standby Supply Current
- o Thermal shutdown
- o Undervoltage lockout (UVLO)
- o Active-high or active-low enable versions

Applications

- o USB Power Management
- o Hot plug-in power supplies
- o Battery - Charger circuits

Ordering Information

Part Number	Enable	Temperature Range
PA3526-H	Active High	-40°C to +85°C
PA3526-L	Active Low	-40°C to +85°C

Pin Description

Pin Number	Pin Name	Pin Function
1, 4	EN(A/B)	Enable (Input): Logic-compatible enable input. High input > 2.1V typical. Low input <1.9V typical (H active high, L active low).
2, 3	FLG(A/B)	Fault Flag (Output): Active-low, open-drain output. Indicates overcurrent, and thermal shutdown, UVLO, OVLO.
6	GND	Ground.
7	IN	Supply Input: Output MOSFET drain. Also supplies IC's internal circuitry.
8, 5	OUT(A/B)	Switch Output: Output MOSFET source. Typically connect to switched side of load.

Detailed description

Power switch

The power switch is an N-channel MOSFET with a maximum on-state resistance of 500 mΩ ($V_{IN}=5V$). The power switch supplies a minimum of 100 mA per switch.

Enable (EN or EN)

The logic enable disables the power switch and the bias for the charge pump, driver, and other circuitry to reduce the supply current to less than 1μA when a logic high is present on EN (PA3526-L) or a logic low is present on EN (PA3526-H). The enable input is compatible with both TTL and CMOS logic levels.

Driver

The driver controls the gate voltage of the power switch. To limit large current surges the driver incorporates circuitry that controls the rise times and fall times of the output voltage.

Charge pump

An internal charge pump supplies power to the driver circuit and provides the necessary voltage to pull the gate of the MOSFET above the source.

Fault Flag FLG (A/B)

FLG is an N-channel, open-drain MOSFET output. The fault-flag is active (low) for one or more of the following conditions: under-voltage, current limit, or thermal shutdown. The flag output MOSFET is capable of sinking a 10 mA load to typically 100mV above ground. Multiple FLG pins may be "wire NO Red" to a common pull-up resistor.

Thermal shutdown

An internal thermal-sense circuit shuts off the power switch when the junction temperature rises to approximately 150°C. Hysteresis is built into the thermal sense circuit.

Over-voltage lockout

OVLO (over-voltage lockout) prevents the output MOSFET from turning on if V_{IN} exceeds approximately 6.5V. Over voltage detection function: only when at least one switch is enabled

Current sense (CS)

A sense FET monitors the current supplied to the load. When an overload or short circuit is encountered, the current-sense circuitry sends a control signal to the driver. The driver in turn reduces the gate voltage and sends the power FET into its saturation region, which switches the output into a constant current mode.

Under-voltage lockout

UVLO (under-voltage lockout) prevents the output MOSFET from turning on until V_{IN} exceeds approximately 2.3V. In the under-voltage state, the FLAG will be low. After the switch turns on, if the voltage drops below approximately 2.1V, UVLO shuts off the output MOSFET and signals fault flag. Under-voltage detection functions only when at least one switch is enabled.

Absolute Maximum Ratings (Note1)

Parameter	Maximum	Units
Supply Voltage (V_{IN})	6	V
Fault Flag Voltage (V_{FLAG})	6	
Fault Flag Current (I_{FLAG})	50	mA
Output Voltage (V_{OUT})	6	V
