

### Features

- Accuracy within  $\pm 2\%$
- Quiescent Current:  $65\mu\text{A Typ.}$
- Excellent Line/Load Regulation
- Guaranteed 300mA Output Current
- Fast Response
- Current Limiting
- Short Circuit Protection
- Low Temperature Coefficient
- Thermal Shutdown
- Space Saving Package: SOT-23, SOT-89 and SC70
- Pb-Free Package

### Applications

- Cordless Phone
- Cellular Phone
- Bluetooth Earphone
- Digital Camera
- Portable Electronics
- WLAN
- MP3 Player

### General Description

The PAM3112 regulator features low quiescent current ( $65\mu\text{A Typ.}$ ) and excellent line/load regulation, making it ideal for battery powered applications. The output voltage can be 1.2V or 1.3V. Space-saving packages SOT-23, SOT-89 and SC70 are attractive for portable and handheld applications. It has both thermal shutdown and a current limit features to prevent device failure under extreme operating conditions. The device is stable with an output capacitance of  $2.2\mu\text{F}$  or greater.

## 300mA CMOS Linear Regulator

### Electrical Characteristic

$T_A=25^{\circ}\text{C}$ ,  $V_{IN}=3\text{V}$ ,  $C_{IN}=1\mu\text{F}$ ,  $C_O=2.2\mu\text{F}$ , unless otherwise noted.

Parameter	Symbol	Test Conditions	MIN	TYP	MAX	Units
Input Voltage	$V_{IN}$		2.5		5.5	V
Output Voltage Accuracy	$V_O$	$I_O=1\text{mA}$	-2		2	%
Output Current	$I_O$		300		Note 1	mA
Ground Current	$I_{GND}$	$I_O=1\text{mA}$ to 300mA		70	90	$\mu\text{A}$
Quiescent Current	$I_Q$	$I_O=0\text{mA}$		65	90	$\mu\text{A}$
Line Regulation	LNR	$V_{IN}=2.5\text{V}$ to 5.0V $I_O=10\text{mA}$	-0.15	0.1	0.15	%/V
Load Regulation	LDR	$I_O=1\text{mA}$ to 300mA		30	60	mV
Short Circuit Current	$I_{SC}$	$V_O=0\text{V}$		130		mA
Temperature Coefficient	$T_C$			40		ppm/ $^{\circ}\text{C}$
Over Temperature Shutdown	OTS	$I_O=1\text{mA}$		150		$^{\circ}\text{C}$
Over Temperature Hysteresis	OTH	$I_O=1\text{mA}$		30		$^{\circ}\text{C}$
Power Supply Ripple Rejection	PSRR	$I_O=100\text{mA}$ $C_{BYP}=10\text{nF}$	$f=100\text{Hz}$		70	dB
			$f=1\text{kHz}$		65	
Output Noise	$V_n$	$f=10\text{Hz}$ to 100kHz, $C_{BYP}=10\text{nF}$		50		$\mu\text{Vrms}$
EN Input High Threshold	$V_{IH}$	$V_{IN}=2.5\text{V}$ to 5V	1.5			V
EN Input Low Threshold	$V_{IL}$	$V_{IN}=2.5\text{V}$ to 5V			0.3	V
Shutdown Current	$I_{SD}$	$V_{EN}=0\text{V}$		0.01	1	$\mu\text{A}$

Note 1: Output current is limited by  $P_D$ , Maximum  $I_O=400\text{mW}/(V_{IN}(\text{MAX.})-V_O)$ .

### Typical Performance Characteristics

$T_A=25^\circ\text{C}$ ,  $C_{IN}=1\mu\text{F}$ ,  $C_O=2.2\mu\text{F}$ ,  $V_O=1.2\text{V}$ , unless otherwise noted.

## Application Information

### Capacitor Selection and Regulator Stability

www.datasheet4u.com

Similar to any low dropout regulator, the external capacitors used with the PAM3112 must be carefully selected for regulator stability and performance.

A capacitor  $C_{IN}$  of more than  $1\mu F$  can be used at the PAM3112 input pin, while there is no upper limit for the capacitance of  $C_{IN}$ . Please note that the distance between  $C_{IN}$  and the input pin of the PAM3112 should not exceed 0.5 inch. Ceramic capacitors are suitable for the PAM3112. Capacitors with larger values and lower ESR (equivalent series resistance) provide better PSRR and line-transient response.

The PAM3112 is designed specifically to work with low ESR ceramic output capacitors in order to save space and improve performance. Using an output ceramic capacitor whose value is  $>2.2\mu F$  with  $ESR > 5m\Omega$  ensures stability.

A 10nF bypass capacitor connected to BYP pin is suggested for suppressing output noise. The capacitor, in series connection with an internal 200k $\Omega$  resistor, forms a low-pass filter for noise reduction. Increasing the capacitance will slightly decrease the output noise, but increase the start-up time.

### Load Transient Considerations

Curve 7 of the PAM3112 load-transient response on page 6 shows two components of the output response, a DC shift from the output impedance due to the load current change and transient response. The DC shift is quite small due to excellent load regulation of the PAM3112. The transient spike, resulting from a step change in the load current from 1mA to 300mA, is 20mV. The ESR of the output capacitor is critical to the transient spike. A larger capacitance along with smaller ESR results in a smaller spike.

### Shutdown Input Operation

The PAM3112 is shut down by pulling the EN input low and turned on by tying the EN input to VIN or leaving the EN input floating.

### Internal P-Channel Pass Transistor

The PAM3112 features a 0.75 $\Omega$  P-Channel MOSFET device as a pass transistor. The P-MOS pass transistor enables the PAM3112 to consume only 65 $\mu A$  of ground current during low dropout, light-load, or heavy-load operation. These features increase the battery operation life time.

### Input-Output ( Dropout ) Voltage

A regulator's minimum input-output voltage difference (or dropout voltage) determines the lowest usable supply voltage. The PAM3112 has a typical 300mV dropout voltage. In battery-powered systems, this will determine the useful end-of-life battery voltage.

### Current Limit and Short Circuit Protection

The PAM3112 features a current limit, which monitors and controls the gate voltage of the pass transistor. The output current can be limited to 400mA by regulating the gate voltage. The PAM3112 also has a built-in short circuit current limit.

### Thermal considerations

Thermal protection limits power dissipation in the PAM3112. When the junction temperature exceeds 150 $^{\circ}C$ , the OTP (Over Temperature Protection) starts the thermal shutdown and turns the pass transistor off. The pass transistor resumes operation after the junction temperature drops below 120 $^{\circ}C$ .

For continuous operation, the junction temperature should be maintained below 125 $^{\circ}C$ . The power dissipation is defined as:

$$P_D = (V_{IN} - V_{OUT}) * I_O + V_{IN} * I_{GND}$$

The maximum power dissipation depends on the thermal resistance of IC package, PCB layout, the rate of surrounding airflow and temperature difference between junction and ambient. The maximum power dissipation can be calculated by the following formula:

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

Where  $T_{J(MAX)}$  is the maximum allowable junction temperature  $125^{\circ}C$ ,  $T_A$  is the ambient temperature and  $\theta_{JA}$  is the thermal resistance from the junction to the ambient.

For example, as  $\theta_{JA}$  is  $250^{\circ}C/W$  for the SOT-23 package based on the standard JEDEC 51-3 for a single-layer thermal test board, the maximum power dissipation at  $T_A=25^{\circ}C$  can be calculated by following formula:

$$P_{D(MAX)} = (125^{\circ}C - 25^{\circ}C) / 250 = 0.4W \text{ SOT-23}$$

It is also useful to calculate the junction temperature of the PAM3112 under a set of specific condition. Suppose the input voltage  $V_{IN}=3.3V$ , the output current  $I_O=150mA$  and the case temperature  $T_A=40^{\circ}C$  measured by a

thermal couple during operation, the power dissipation is defined as:

$$P_D = (3.3V - 1.2V) * 150mA + 3.3V * 70\mu A \cong 315mW$$

And the junction temperature  $T_J$  can be calculated as follows:

$$\begin{aligned} T_J &= T_A + P_D * \theta_{JA} \\ T_J &= 40^{\circ}C + 0.35W * 250^{\circ}C/W \\ &= 40^{\circ}C + 78.75^{\circ}C \\ &= 118.75^{\circ}C < T_{J(MAX)} = 125^{\circ}C \end{aligned}$$

For this application,  $T_J$  is lower than the absolute maximum operating junction temperature  $125^{\circ}C$ , so it is safe to use the PAM3112 in this configuration.
