

3W STEREO CLASS-D AUDIO AMPLIFIER AND CLASS AB HEADPHONE DRIVER WITH DC VOLUME CONTROL, NON-CLIP POWER LIMIT AND UVP
NEW PRODUCT

Description

The PAM8019 is a Stereo 3W Class D audio power amplifier for driving bridged-tied speakers and includes a Stereo Class AB amplifier for driving headphones. The advanced 64 step DC volume control minimizes external components allowing simple and accurate volume control over the gain range of +20dB (Volume=0V) to -60dB (Volume=5V).

Integrated non-clip power limit technology suppresses output automatically with programmable power limit, improving the sound quality and helping to protect the speakers. Programmable under voltage protection (UVP) can be used to shut down the PAM8019 at a pre-determined voltage level helping to eliminate speaker pop by shutting down before the power supply collapses.

The PAM8019 is available in the power efficient and space saving U-QFN4040-20.

Features

- 3W Stereo Class D Amplifier with Class AB Headphone Amplifier
- Filter Free and Low EMI Architecture
- Operating Voltage: 2.8V to 5.5V
- Low Quiescent Current of 7mA at a V_{DD} of 5V
- 64 Step DC Volume Control with Hysteresis from -60dB to +20dB
- Output Power
 - Class D Amplifier THD+N=1%
 $V_{DD}=5V, Load =4\Omega; P_o=2.4W / Load =8\Omega; P_o=1.4W$
 - Class D Amplifier THD+N=10%
 $V_{DD}=5V, Load =4\Omega; P_o=3.0W / Load =8\Omega; P_o=1.7W$
 - Class AB Headphone Amplifier
 $V_{DD}=5V, Load=32\Omega; P_o=60mW$
- Speaker or Headphone Select
- Non Clip Power Limit (NCPL) Function
- OVP and Programmable UVP Protection
- Thermal and Over-Current Protection with Auto-Recovery
- Power Enhance Package U-QFN4040-20
- Lead Free and Green Devices Available (RoHS Compliant)
- **Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)**
- **Halogen and Antimony Free. "Green Device (Note 3)**

Notes: 1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS) & 2011/65/EU (RoHS 2) compliant.
 2. See http://www.diodes.com/quality/lead_free.html for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
 3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.

Pin Assignments

Applications

- LCD Monitors and TVs
- Projectors / All-In-One Computers
- Portable / Active Speakers
- Portable DVD Players / Game Machines

Typical Applications Circuit

NEW PRODUCT

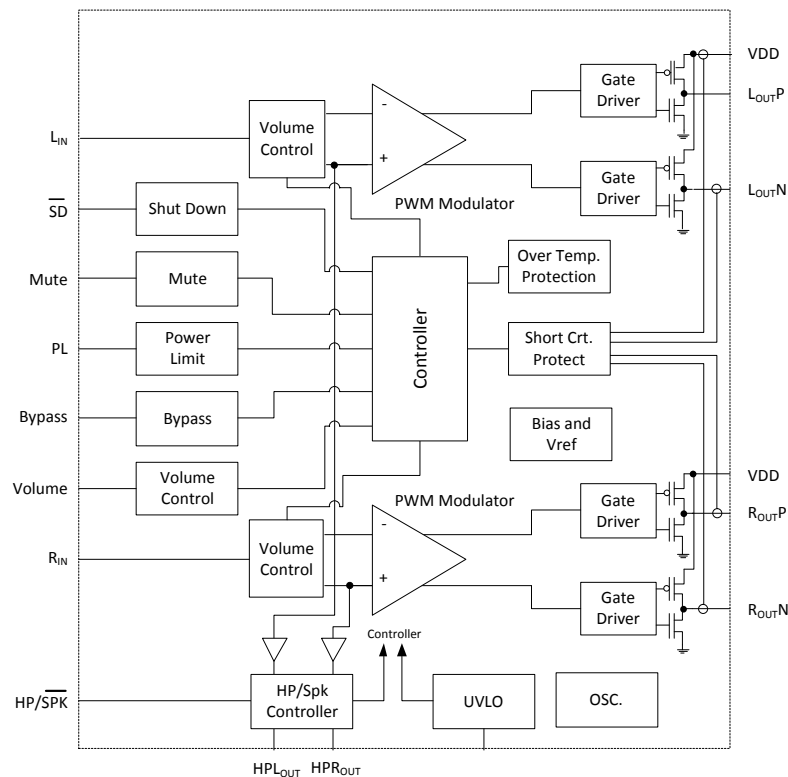

Pin Descriptions

Pin Number	Name	Function
3	\overline{SD}	Full Chip Shutdown Control Input (Active Low)
4	Bypass	Bias Voltage for Power Amplifier
5	R _{IN}	Negative Input of Right Channel Power Amplifier
6, 18	GND	Ground Connection
7	L _{IN}	Negative Input of Left Channel Power Amplifier
8	Volume	Internal Gain Setting Input Connect to VDD which Set Max. Gain = +20dB
9	Mute	Mute Control Signal Input (Active High)
10	HP/ \overline{SPK}	Output Mode Control Input High for Headphone Mode and Low for Speaker Mode
11	PL	Power limit reference voltage, see applications section for further details
12	UVP	Under Voltage Protection Input See applications section for further details
13,16,20	VDD	Supply Voltage
14	HPL _{OUT}	Headphone - Left Channel Output
2	HPR _{OUT}	Headphone - Right Channel Output
15	L _{OUTN}	Power Amplifier - Left Channel Negative Output
17	L _{OUTP}	Power Amplifier - Left Channel Positive Output
19	R _{OUTP}	Power Amplifier - Right Channel Negative Output
1	R _{OUTN}	Power Amplifier - Right Channel Positive Output
PAD	GND	Connect to ground (recommended) or No Connect.

NEW PRODUCT

Application Information

Non Clip Power Limit (NCPL) Function

When output reaches the maximum power setting value, the NCLP circuits will decrease the gain to prevent the output waveform from clipping helping to prevent speaker damage and maximizing audio performance. The PL pin is used to set and control the NCPL function.

Table 1: NCPL Setting Threshold vs. Output

AGC Function	Output Power
V_{DD} to $V_{DD} \times 0.45$ or PL pin floating	NCPL function disabled
$V_{DD} \times 0.45$ to $V_{DD} \times 0.27$	$P_O = \frac{8(1/2 V_{DD} - V_{PL})^2}{R_I} \times 0.95$
$V_{DD} \times 0.27$ to GND	$P_O = 2.3W$ (Max. output power 4Ω) $P_O = 1.2W$ (Max. output power 8Ω)

Mute Operation

The MUTE pin is an input for controlling the Class-D output state of the PAM8019. A logic low on this pin enables the outputs and logic high on this pin disables the outputs. This pin may be used to quickly disable or enable the outputs without a volume fade. Quiescent current is listed in the electrical characteristic table. The MUTE pin can be left floating due to the internal pull-down.

Shutdown Operation

In order to reduce power consumption while not in use, the PAM8019 contains shutdown circuit to turn off the amplifier's bias circuit. The amplifier is turned off when logic low is placed on the \overline{SD} pin. The \overline{SD} pin can be left floating due to the internal pull-up.

Under voltage Protection

External under voltage detection can be used to shut down the PAM8019 before an input device can generate a pop. The shutdown threshold at the UVP pin is 1.2V. The user selects a resistor divider to obtain the shutdown threshold and hysteresis for the specific application.

The threshold can be determined as below:

With the condition: $R_3 \gg R_1/R_2$

$$V_{UVP} = [1.2 - (6\mu A \times R_3)] \times (R_1 + R_2) / R_2$$

$$\text{Hysteresis} = 5\mu A \times R_3 \times (R_1 + R_2) / R_2$$

Power Supply Decoupling

The PAM8019 is a high performance CMOS audio-amplifier that requires adequate power supply decoupling to ensure the THD and PSRR are as low as possible. Power supply decoupling also prevents oscillation caused by long leads between the amplifier and the speaker. The optimum decoupling is achieved by using two capacitors of different types that target different types of noise on the power supply leads. A good Low-Equivalent-Series-Resistance (ESR) ceramic-capacitor of typically 0.1μF is recommended to be placed as close as possible to the V_{DD} pin to filter the higher frequency transients, spikes or digital hash on the line. Filtering lower-frequency noise signals a large capacitor of 10μF or greater should be placed near the audio amplifier.

Application Information (Cont.)

Input Capacitor (CI)

It is desirable to use a large input capacitor but in applications where the speaker lacks the ability to reproduce signals below 100Hz to 150Hz it may be possible to minimize CI without effecting system performance. Input Capacitor (CI) and Input Resistance (RI) of the amplifier form a high-pass filter with the corner frequency determined equation below:

$$F_c = 1 / 2\pi R_I \times C_I$$

In addition to system cost and size, click and pop performance is affected by the size of the coupling capacitors. A larger in/out coupling capacitor requires more charge to reach its quiescent DC voltage (Normally 1/2 V_{DD}). This charge comes from the internal circuit via the feedback and is more likely to create pops upon device enable. Minimizing the capacitor size based on necessary low frequency response can minimize the turn on pop.

Bypass Capacitor (C_{BYP})

Bypass Capacitor (C_{BYP}) is the most critical capacitor and serves several important functions. During start-up or recovery from shutdown mode, C_{BYP} determines the rate at which the amplifier starts up. The second function is to reduce noise produced by the power supply caused by coupling into the output signal. The noise is from the internal analog reference to the amplifier, which appears as degraded PSRR and THD+N.

A ceramic bypass capacitor (C_{BYP}) of 0.47µF to 1.0µF is recommended for the best THD and noise performance. Increasing the bypass capacitor reduces clicking and popping noise from power on/off and when entering and leaving shutdown.

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
