

BINARY UP/DOWN COUNTER

FEATURES

- Output capability: standard
- I_{CC} category: MSI

GENERAL DESCRIPTION

The 74HC/HCT4516 are high-speed Si-gate CMOS devices and are pin compatible with the "4516" of the "4000B" series. They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT4516 are edge-triggered synchronous up/down 4-bit binary counters with a clock input (CP), an up/down count control input (UP/DN), an active LOW count enable input (\overline{CE}), an asynchronous active HIGH parallel load input (PL), four parallel inputs (D₀ to D₃), four parallel outputs (Q₀ to Q₃), an active LOW terminal count output (TC), and an overriding asynchronous master reset input (MR).

Information on D₀ to D₃ is loaded into the counter while PL is HIGH, independent of all other input conditions except the MR input, which must be LOW. When PL and \overline{CE} are LOW, the counter changes on the LOW-to-HIGH transition of CP. UP/DN determines the direction of the count, HIGH for counting up, LOW for counting down. When counting up, TC is LOW when Q₀ to Q₃ are HIGH and \overline{CE} is LOW. When counting down, TC is LOW when Q₀ to Q₃ and \overline{CE} are LOW. A HIGH on MR resets the counter (Q₀ to Q₃ = = LOW) independent of all other input conditions.

Logic equation for terminal count:

$$TC = \overline{CE} \cdot \{ (UP/DN) \cdot Q_0 \cdot Q_1 \cdot Q_2 \cdot Q_3 + (UP/DN) \cdot \overline{Q_0} \cdot \overline{Q_1} \cdot \overline{Q_2} \cdot \overline{Q_3} \}$$

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t _{PHL} / t _{PLH}	propagation delay CP to Q _n	C _L = 15 pF V _{CC} = 5 V	19	19	ns
f _{max}	maximum clock frequency		45	57	MHz
C _I	input capacitance		3.5	3.5	pF
C _{PD}	power dissipation capacitance per package	notes 1 and 2	59	61	pF

GND = 0 V; T_{amb} = 25 °C; t_r = t_f = 6 ns

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \Sigma (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f_i = input frequency in MHz

C_L = output load capacitance in pF

f_o = output frequency in MHz

V_{CC} = supply voltage in V

Σ (C_L × V_{CC}² × f_o) = sum of outputs

2. For HC the condition is V_I = GND to V_{CC}

For HCT the condition is V_I = GND to V_{CC} - 1.5 V

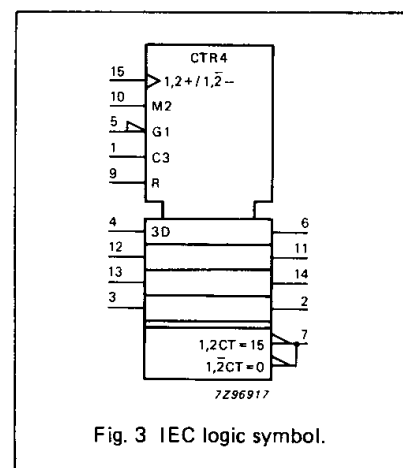

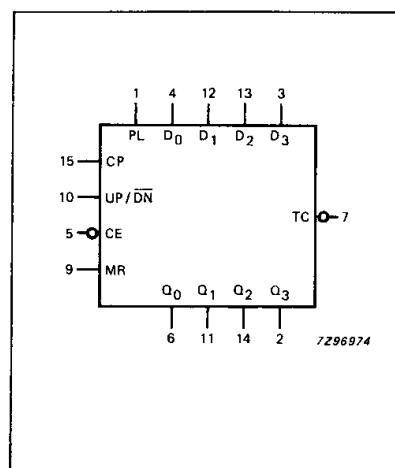

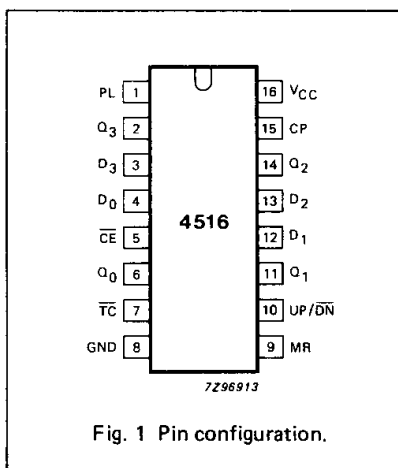

PACKAGE OUTLINES

16-lead DIL; plastic (SOT38Z).

16-lead mini-pack; plastic (SO16; SOT109A).

PIN DESCRIPTION

PIN NO.	SYMBOL	NAME AND FUNCTION
1	PL	parallel load input (active HIGH)
4, 12, 13, 3	D ₀ to D ₃	parallel inputs
5	\overline{CE}	count enable input (active LOW)
6, 11, 14, 2	Q ₀ to Q ₃	parallel outputs
7	TC	terminal count output (active LOW)
8	GND	ground (0 V)
9	MR	asynchronous master reset input (active HIGH)
10	UP/DN	up/down control input
15	CP	clock input (LOW-to-HIGH, edge-triggered)
16	V _{CC}	positive supply voltage

Fig. 4 Functional diagram.

FUNCTION TABLE

MR	PL	UP/DN	CE	CP	MODE
L	H	X	X	X	parallel load
L	L	X	H	X	no change
L	L	L	L	↑	count down
L	L	H	L	↑	count up
H	X	X	X	X	reset

H = HIGH voltage level
L = LOW voltage level
X = don't care
↑ = LOW-to-HIGH clock transition

DC CHARACTERISTICS FOR 74HCT

For the DC characteristics see chapter "HCMOS family characteristics", section "Family specifications".

Output capability: standard

I_{CC} category: MSI

Note to HCT types

The value of additional quiescent supply current (ΔI_{CC}) for a unit load of 1 is given in the family specifications. To determine ΔI_{CC} per input, multiply this value by the unit load coefficient shown in the table below.

INPUT	UNIT LOAD COEFFICIENT
D _n	0.75
PL, CE	1.00
UP/DN	1.00
CP	1.25
MR	1.50

AC CHARACTERISTICS FOR 74HCT

AC WAVEFORMS

Fig. 7 Waveforms showing the clock (CP) to output (Q_n) and terminal count (\overline{TC}) propagation delays, the clock pulse width and the maximum clock pulse frequency.

Fig. 8 Waveforms showing the set-up and hold times from count enable (\overline{CE}) and up/down (UP/\overline{DN}) control inputs to the clock pulse (CP), the propagation delays from $UP/\overline{DN}, \overline{CE}$ to \overline{TC} .

Fig. 9 Waveforms showing the preset enable pulse width, preset enable to output delays and output transition times.

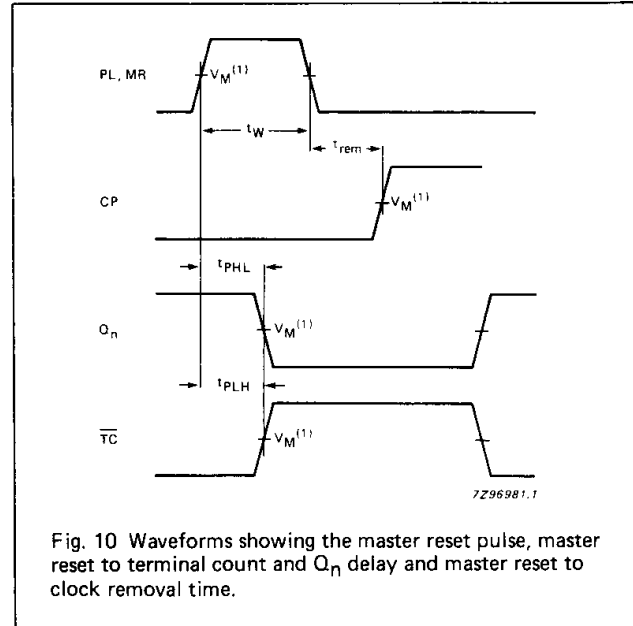

Fig. 10 Waveforms showing the master reset pulse, master reset to terminal count and Q_n delay and master reset to clock removal time.

Fig. 11 Waveforms showing the data set-up and hold times to parallel load (PL).

Note to AC waveforms

(1) HC : $V_M = 50\%$; $V_I = GND$ to V_{CC} .
HCT: $V_M = 1.3V$; $V_I = GND$ to $3V$.

APPLICATION INFORMATION

Fig. 12 Cascading counter packages (parallel clocking).

Note to Fig. 12

Terminal count (\overline{TC}) lines at the 2nd 3rd etc. Stages may have a negative-going glitch pulse resulting from differential delays of different 4516s. These negative-going glitches do not affect proper 4516 operation. However, if the terminal count signals are used to trigger other edge-sensitive logic devices, such as flip-flops or counters, the terminal count signals should be gated with the clock signal using a 2-input OR gate such as HC/HCT32.

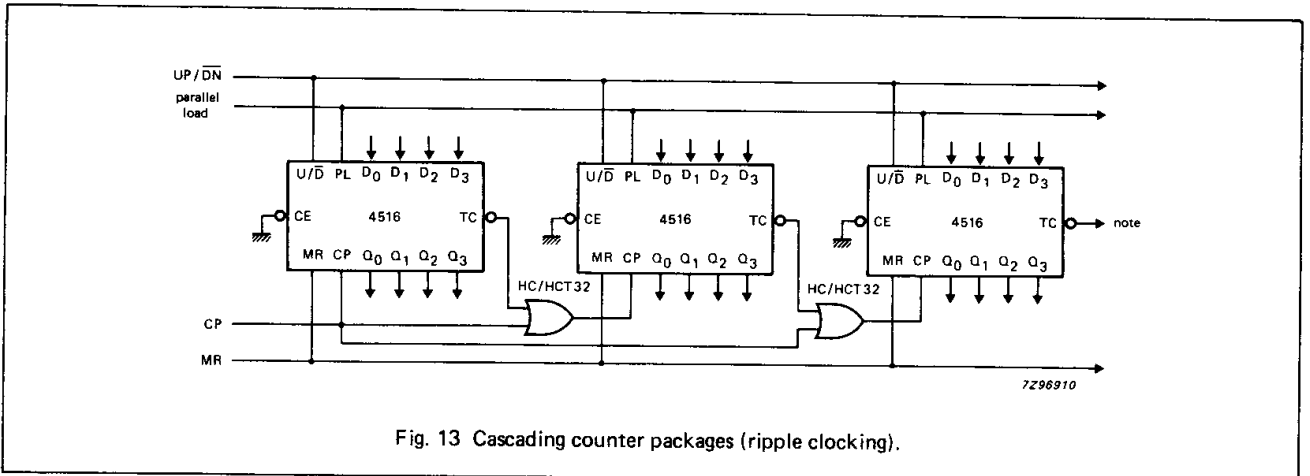

Fig. 13 Cascading counter packages (ripple clocking).

Note to Fig. 13

Ripple clocking mode: the UP/\overline{DN} control can be changed at any count. The only restriction on changing the UP/\overline{DN} control is that the clock input to the first counting stage must be "HIGH". For cascading counters operating in a fixed up-count or down-count mode, the OR gates are not required between stages and \overline{TC} is connected directly to the CP input of the next stage with \overline{CE} grounded.

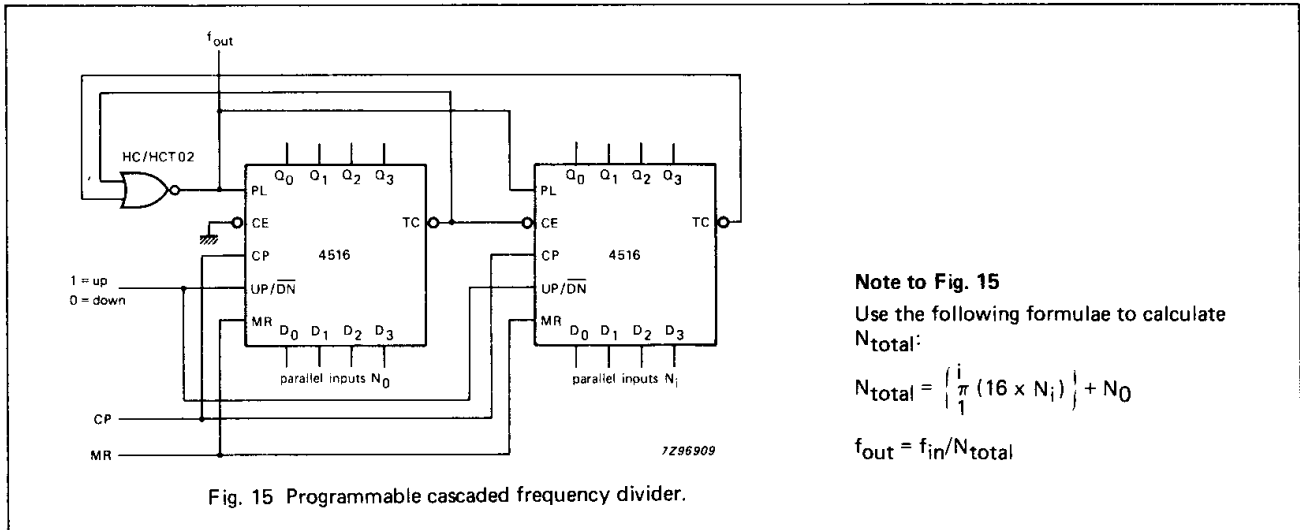

Fig. 14 State diagram.

Note to Fig. 15
Use the following formulae to calculate N_{total} :

$$N_{total} = \left\{ \prod_{i=1}^n (16 \times N_i) \right\} + N_0$$

$$f_{out} = f_{in} / N_{total}$$
