

PCA9460

13-channel power management integrated circuit (PMIC) for ultra-low power applications

Rev. 3.4 — 10 January 2024

Product data sheet

1 General description

The PCA9460 is a single chip Power Management IC (PMIC) designed to support ultra-low-power applications where standby power and overall power consumption of power management IC is critical. The PCA9460 is designed to be paired with i.MX 8ULP processor which enables such key applications. It provides power supply solutions for low power wearable application where size and efficiency are critical.

The PCA9460 comes equipped with four buck regulators, five LDOs and additional load switches. This design offers the most flexible configuration for i.MX 8ULP or other processors to enable the ultra-low-power system design. Each buck regulator has been designed with ultra-low I_q current to reduce standby current. Two buck regulators support smart Dynamic Voltage Scaling (DVS), which allows the system designed to set the right voltage on the processors the PCA9460 is powering. This process minimize power consumption that is controlled through the PMIC_STBY_REQ pin or MODE[2:0] pins. Five LDOs have 300 nA low quiescent current. One LDO is available for SNVS core power supply, one 250 mA LDO is to regulate to low output voltage from buck regulator output. Three 250 mA LDOs supply power to the processor and peripheral devices. Four 150 mΩ load switches switch power for peripheral devices. These switches can be configured as an LED driver with two different blink modes.

The PCA9460 is offered in a 42-bump wafer-level CSP package, 2.86 mm x 2.46 mm, 0.4 mm pitch.

2 Features and benefits

Ultra-low-power system design for long battery life or green offline performance using:

- Four buck regulators
 - Two 1 A buck regulators
 - Two 1 A buck regulator with DVS
 - Low I_q (1.5 μA at low power mode, 5.5 μA at normal mode)
- Five linear regulators
 - One 250 mA NMOS LDO
 - Three 250 mA PMOS LDO
 - 10 mA SNVS LDO
 - Built-in active discharge resistor
- Four Load Switches with active discharge resistor to allow easy connect/disconnect of multiple system rails
 - 150 mΩ R_{dson}
 - ON/OFF control in different modes
 - Configurable to LED driver with two blink patterns
- Power control IO for intelligent system design
 - Power ON/OFF control
 - Standby/Run mode control
 - Smart DVS control
- Flexible power ON/OFF sequence

13-channel power management integrated circuit (PMIC) for ultra-low power applications

- Fm+ 1 MHz I²C Interface allows continuous communication with the host
- ESD protection
 - Human Body Model (HBM) : ± 2000 V
 - Charged Device Model (CDM) : ± 500 V
- 7 x 6 bump array, 0.4 mm pitch, WL-CSP, 2.86 mm x 2.46 mm enables a small solution size

3 Applications

- Ultra-low-power portable devices
 - eReader
 - Tablet
 - Watch
 - Portable headset
 - Handheld printer/scanner
 - Bike computer

GND	A1	P	Analog ground pin

7 Functional description

7.1 Features

The PCA9460 is a power management integrated circuit (PMIC) designed to be the primary power management for NXP processors, 8ULP.

- Four buck regulators
 - Two 1A buck regulators
 - Two 1A buck regulator with DVS
 - Built-in active discharge resistor
 - Low I_q (1.5 μA at low power mode, 5.5 μA at normal mode)
- Five linear regulators
 - One 250 mA NMOS LDO
 - Three 250 mA PMOS LDO
 - Built-in active discharge resistor
 - 10 mA SNVS LDO
- Four load switches with active discharge resistor
 - 150 mΩ R_{dson}
 - ON/OFF control in different modes
 - Configurable to LED driver with two blink patterns
- Power control IO
 - Power ON/OFF control
 - Standby/Run mode control
 - Smart DVS control
- Flexible power ON/OFF sequence
- Fm+ 1 MHz I²C Interface
- ESD protection
 - Human Body Model (HBM) : +/- 2000 V
 - Charged Device Model (CDM) : +/-500 V
- 6 x 7 bump array, 0.4 mm pitch, WL-CSP, 2.86 mm x 2.46 mm

7.2 Functional diagram

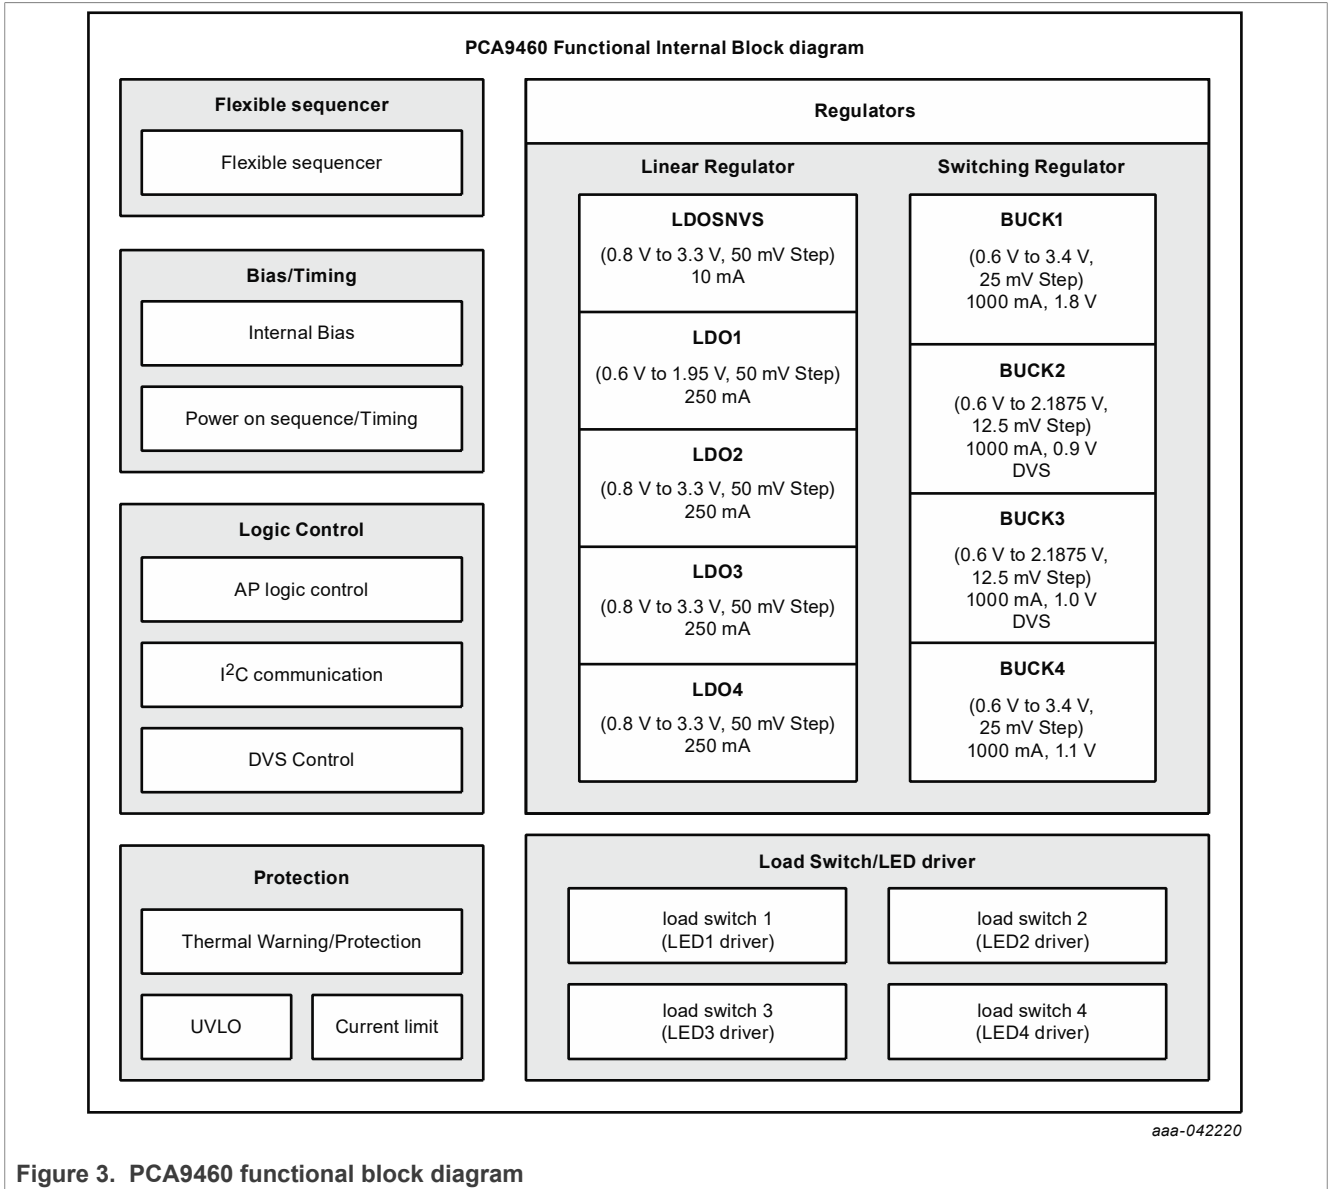

Figure 3. PCA9460 functional block diagram

7.3 PCA9460 version

The PCA9460 can be configured to each regulator default voltage and start-up sequence from the internal OTP configuration. [Table 2](#) shows each OTP configuration for all devices.

Table 2. OTP configuration

PCA9460A = i.MX 8ULP + LPDDR4; PCA9460B = i.MX 8ULP + LPDDR4X; PCA9460C = i.MX 8ULP + LPDDR3

0x43	LSW4_CTRL	0x11			Load Switch mode; Enable Active Discharge; Load SW4 ON at RUN State

7.4 Power states

PCA9460 has six power states: OFF, SNVS, RUN, PWRDN, PWRUP and FAULT_SD. Figure 4 shows the state transition diagram showing the conditions to enter and exit each state.

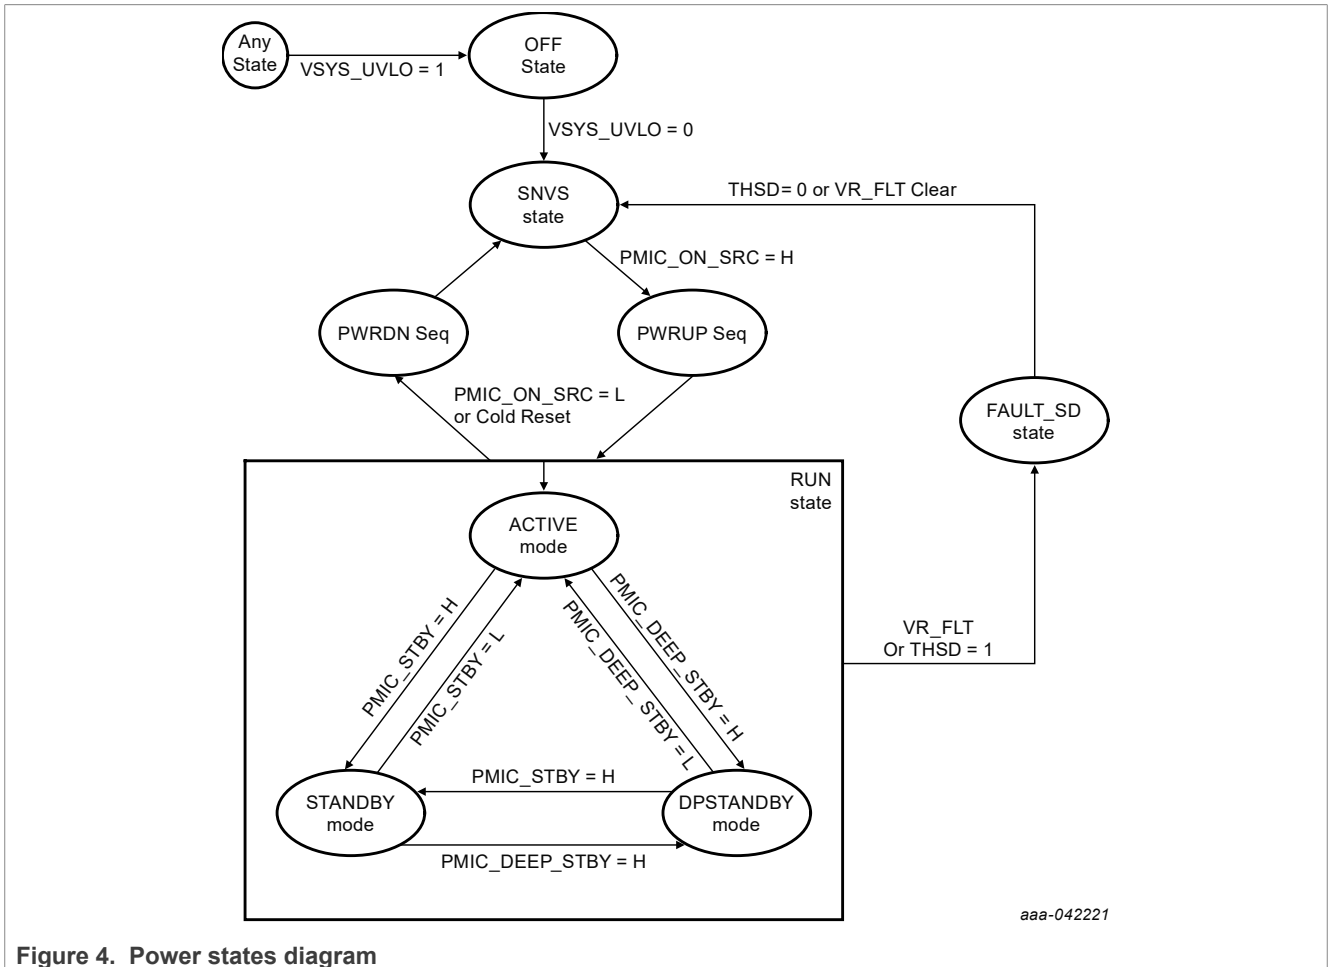

Figure 4. Power states diagram

7.4.1 Off state

PCA9460 enters OFF state from any state when V_{SYS} falls below V_{SYS_UVLO} threshold. All regulators including LDO_SNVS are off, and all registers get reset in the state.

7.4.2 SNVS state

PCA9460 enters SNVS (Secure Non-Volatile Storage mode) when V_{SYS} exceeds V_{SYS_UVLO} rising threshold. LDO_SNVS is turned on within t_{SNVS} . After turning LDO_SNVS on, it monitors power on source signals to move to PWRUP state.

Figure 5. SNVS state ON/OFF sequence

Time	Description	Value	Comment
t_{SNVS}	Maximum time to enable LDO_SNVS from VSYS UVLO detected	20 ms	

7.4.3 PWRUP state

7.4.3.1 Power ON sources

When internal signal, PMIC_ON_SRC, is asserted high in SNVS state, it starts powering up regulators with pre-defined power ON sequence. PMIC_ON_SRC signal is generated by below three signals.

- PMIC_ON_REQ after its debounce time
- PMIC_RST_B after its ONKEY debounce time. (It can be masked in PWR_SEQ_CTRL register)
- ACOK_B after its debounce time → OTP option to be disabled. (It can be masked in PWR_SEQ_CTRL register)

Figure 6 show the block diagram how PMIC_ON_SRC is generated.

Figure 6. PCA9460 power on source

When ACOK_B signal is configured as Power on source in PWR_SEQ_CTRL register, One shot signal is generated from the falling edge of ACOK_B and the signal is maintained high for $t_{ACOK_B_Oneshot}$. If PMIC_ON_REQ pin is asserted high before one shot timer is expired, PMIC is kept powered on. If not, PCA9460 takes power-off sequence after one shot timer.

ACOKB_S status bit in INT1_STATUS register is updated after its debounce timer, $t_{ACOK_B_DEB}$.

Figure 7. ACOK_B timing

PMIC_RST_B pin is used to turn on PCA9460 at SNVS state or to make PMIC reset at RUN state after detecting PMIC_RST_B falling edge. PMIC_RSTB_S status bit in INT1 STATUS register is updated in debounce time, $t_{DEB_PMIC_RST_B}$, after falling edge detection.

When PMIC_RST_B falls low at SNVS state, then it starts counting timer. After ONKEY timer expired, ONKEY_S status bit is updated and PMIC_ON_SRC signal is generated if PMIC_RST_B pin is configured to power on source in PWR_SEQ_CTRL register. PMIC_ON_SRC is generated by PMIC_RST_B pin only when PCA9460 is in SNVS state. If ONKEY timer is expired at RUN state, only ONKEY_S bit is updated.

When PMIC_RST_B pin falls low at RUN state and RESETKEY timer is expired, RESETKEY_S status bit is updated and perform reset function configured in RESET_CTRL register after t_{RESET_WAIT} , which is for AP to determine to proceed reset or not. For detail reset behavior, refer to [Section 7.5](#).

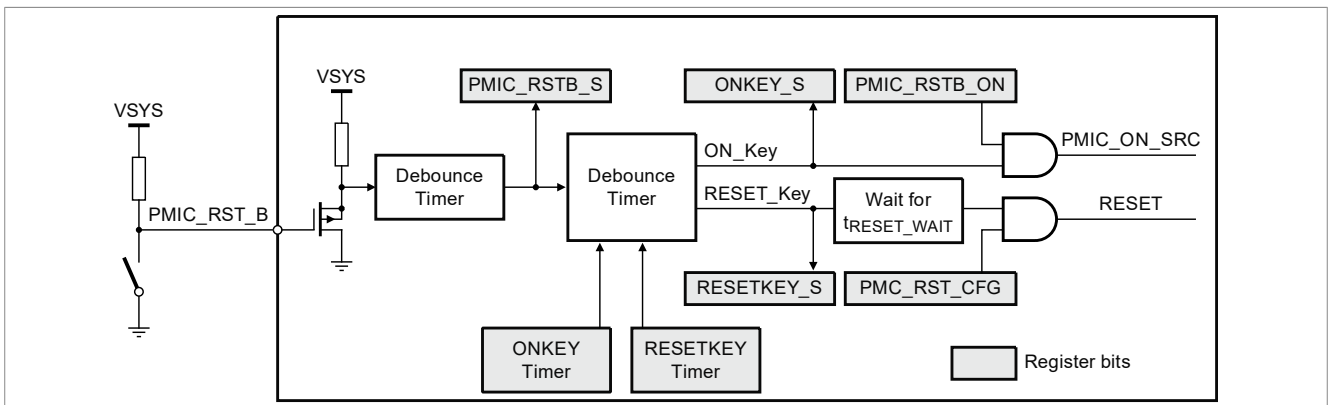

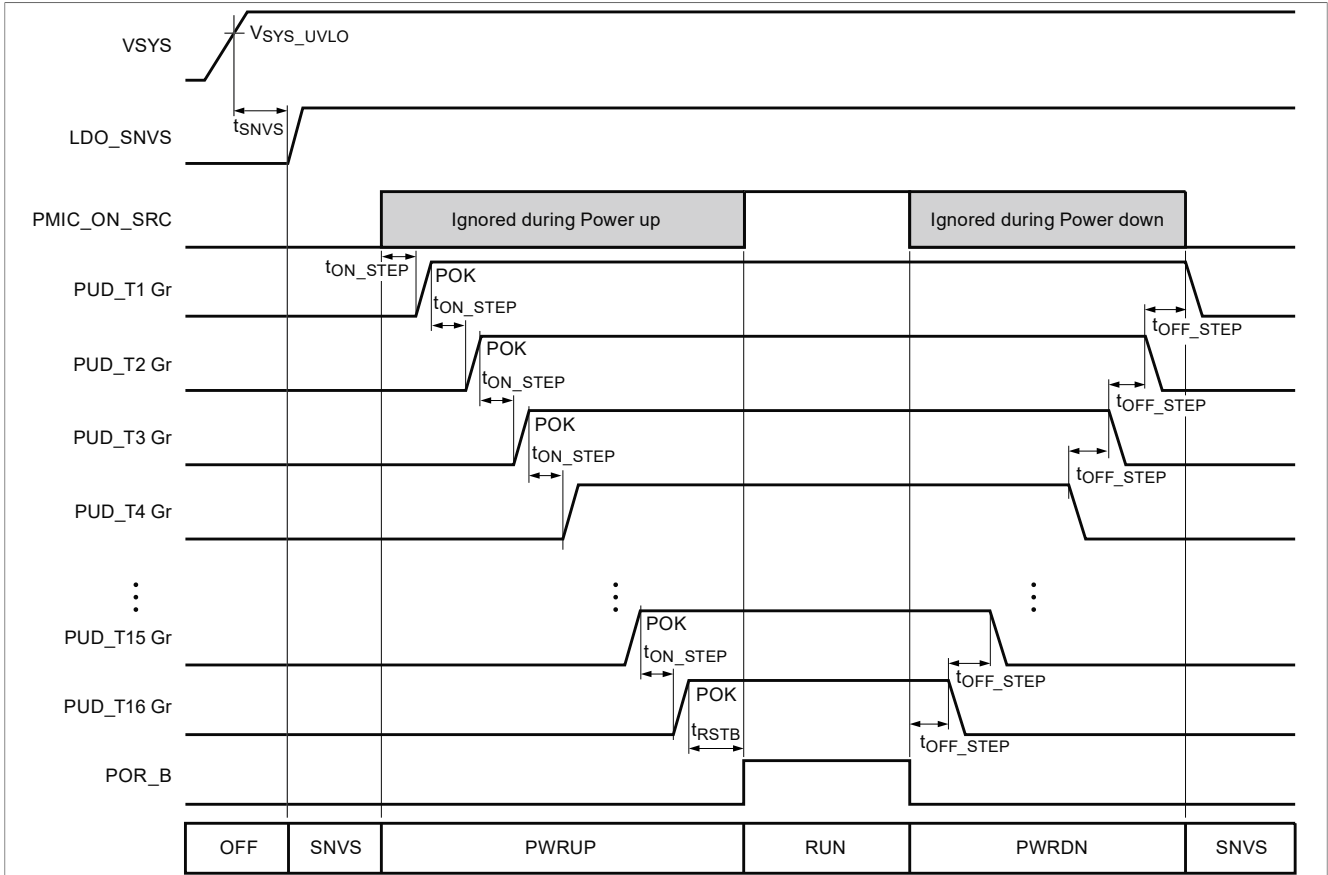

Figure 8. PMIC_RST_B block diagram

7.4.3.2 Power ON sequence

PCA9460 supports flexible power sequencer which power-on sequence can be pre-programmed in OTP.

When PMIC_ON_SRC is asserted high, PUD_T1 group is turned on at first in t_{ON_STEP} after PMIC_ON_SRC is high. The next group, PUD_T2 is turned on in t_{ON_STEP} after POK of PUD_T1 group regulator(s) is high. If the POK doesn't come up within t_{POK_EXP} , then the POK is ignored and the next group is turned ON in t_{ON_STEP} . This power on sequence ended up releasing POR_B pin high impedance in t_{RSTB} after the last group, PUD_T16 regulator is turned ON. PUD group which any regulator is not assigned, the next PUD group is turned on in t_{ON_STEP} .

LSW4	T9	T9	T9

7.4.4 PWRDN state

When PMIC_ON_SRC is asserted low in RUN state, PCA9460 enters PWRDN state, where it starts with pulling down POR_B, and then turning off each power rail in t_{OFF_STEP} and is transitioned to SNVS state.

7.4.5 RUN state

PCA9460 enters RUN state after PWRUP state. If PMIC_ON_SRC is asserted low, PCA9460 is transitioned to PWRDN state. When Cold reset event is triggered in RUN state, it is transitioned to PWRDN state. Regulator fault or Thermal shutdown happens in this state, it is transitioned to FAULT_SD state.

There are three kinds of modes in RUN state, ACTIVE, STANDBY and DPSTANDBY modes, depending on PMIC_STBY_REQ pin and STANDBY_CFG bit in SYS_CFG1 register.

Internal signals to change modes are generated as below.

1. PMIC_STBY = PMIC_STBY_REQ pin when STANDBY_CFG = 0b
 PMIC_STBY is set high only when PMIC_STBY_REQ pin is high and STANDBY_CFG bit is 0b.
2. PMIC_DEEP_STBY = PMIC_STBY_REQ pin when STANDBY_CFG = 1b
 PMIC_DEEP_STBY is set high only when PMIC_STBY_REQ pin is high and STANDBY_CFG bit is 1b.

Each regulator and load switch have enable configuration bits to turn on each mode.

00b = OFF

01b = ON at RUN State

10b = ON at ACTIVE mode or STANDBY mode, OFF at DPSTANDBY

11b = ON at ACTIVE mode, OFF at STANDBY or DPSTANDBY

7.4.5.1 ACTIVE mode

When PCA9460 enters RUN state from PWRUP state, it enter ACTIVE mode at first. And then it transitions to STANDBY mode or DPSTANDBY mode depending on PMIC_STBY or PMIC_DEEP_STBY signal.

7.4.5.2 STANDBY mode

PCA9460 is transitioned to STANDBY mode when PMIC_STBY is high. PMIC_STBY is determined by PMIC_STBY_REQ pin when STANDBY_CFG bit in SYS_CFG1 register is set to 0b. PCA9460 move to ACTIVE mode when PMIC_STBY_REQ pin is low. It transitioned to DPSTANDBY mode when STANDBY_CFG bit is changed to 1b.

7.4.5.3 DPSTANDBY mode

PCA9460 is transitioned to DPSTANDBY (Deep Standby) mode when PMIC_DEEP_STBY is high. PMIC_DEEP_STBY is determined by PMIC_STBY_REQ pin when STANDBY_CFG bit in SYS_CFG2 register is set to 1b. PCA9460 move to ACTIVE mode when PMIC_STBY_REQ pin is low. It transitioned to STANDBY mode when STANDBY_CFG bit is changed to 0b.

Table 4. States Summary

State	Mode	VSYS	PMIC_ON_SRC	STANDBY_CFG bit	PMIC_STBY_REQ
OFF	—	VSYS < V _{sys_UVLO}	X	X	X
SNVS	—	VSYS > V _{sys_UVLO}	Low	X	X
RUN	ACTIVE	VSYS > V _{sys_UVLO}	High	X	Low

Table 4. States Summary...continued

State	Mode	VSYS	PMIC_ON_SRC	STANDBY_CFG bit	PMIC_STBY_REQ
RUN	STANDBY	$V_{SYS} > V_{SYS_UVLO}$	High	0b	High
RUN	DPSTANDBY	$V_{SYS} > V_{SYS_UVLO}$	High	1b	High

X : Don't care

7.4.6 FAULT_SD state

PCA9460 has two Fault shutdown sources.

1. **Thermal shutdown:** Transition to SNVS state after FAULT_SD state

When junction temperature reaches T_{J_SHDN} , it enters FAULT_SD state after t_{FLT_THSD} , where all regulators are turned off immediately after pulling down POR_B. It stays at FAULT_SD until junction temperature falls below T_{J_SHDN} . When the temperature drops below T_{J_SHDN} , then it transitions to SNVS state.

Figure 10. PCA9460 FAULT_SD from Thermal shutdown

Table 5.

Time	Description	Value	Comment
t_{FLT_THSD}	Time to reset released from Fault event	20 μ s	

2. **Voltage regulator fault in RUN state:** Transition to FAULT_SD state in $t_{FLT_SD_WAIT}$ after Fault is detected and then transition to SNVS state in $t_{FLT_SD_STAY}$

VR Fault status bit in INT1_STATUS register is latched to "1" when corresponding regulator voltage falls below POK threshold for t_{DEB_POKB} .

If the fault status bit is masked in VRFLT1_MASK register, PCA9460 doesn't enter FAULT_SD state, instead, PCA9460 stays at RUN state. If the fault register bit is unmasked, it starts $t_{FLT_SD_WAIT}$ timer. Application processor can determine to enter FAULT_SD state by masking the VR Fault status bit in VRFLT1_MASK registers before the timer expires. PCA9460 enter FAULT_SD state when the timer is expired. PCA9460 stays at FAULT_SD state for $t_{FLT_SD_STAY}$ and moves to SNVS state from FAULT_SD mode after $t_{FLT_SD_STAY}$.

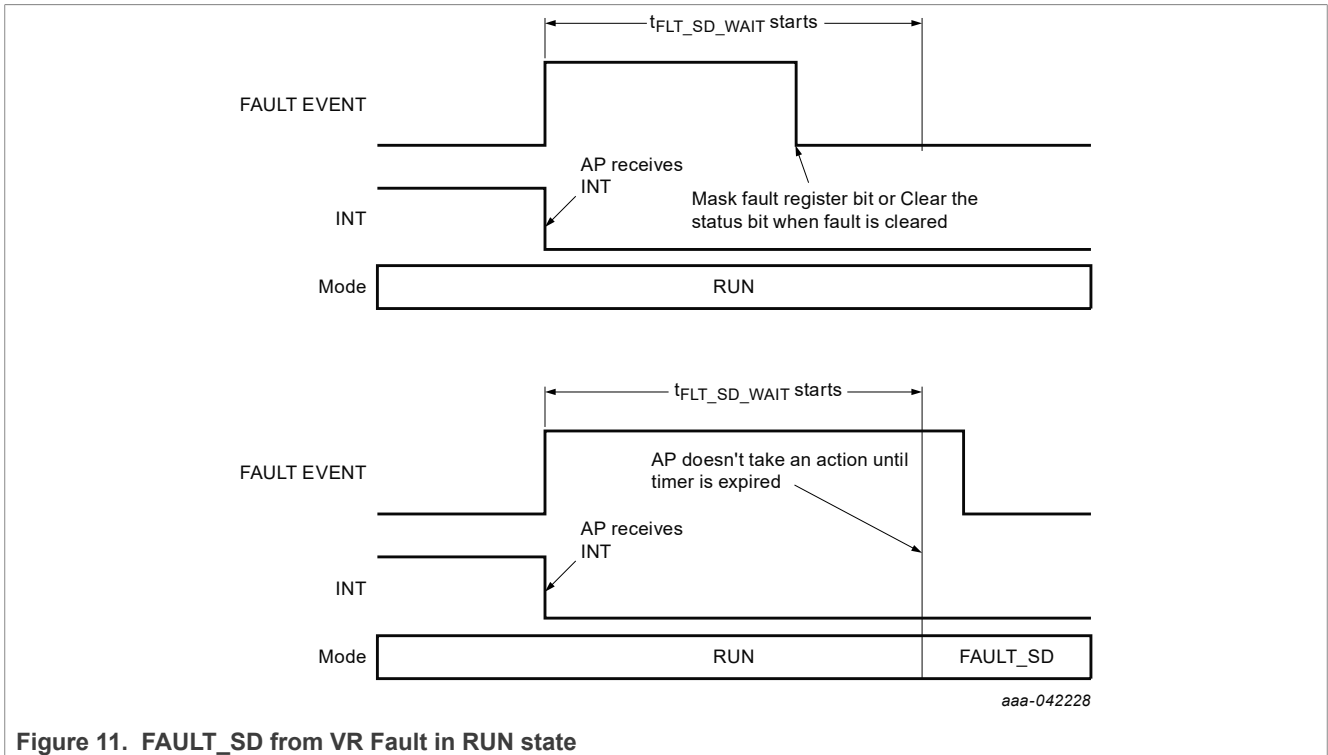

Figure 11. FAULT_SD from VR Fault in RUN state

Figure 12. PCA9460 FAULT_SD from VR Fault in RUN/STANDBY

Table 6. FAULT_SD description

Time	Description	Value	Comment
t _{FLT_SD_WAIT}	VR Fault wait time to enter fault shutdown	100 ms	20 μs, 100 ms option
t _{FLT_SD_STAY}	Time to stay at Fault_SD state	100 ms	

7.5 PMIC reset

The PCA9460 PMIC has three reset inputs, WDOG_B pin, PMIC_RST_B pin and I²C reset bit, The reset is executed only at RUN state.

The reset behavior is configured in 0x08 RESET_CTRL register for WDOG_B pin and PMIC_RST_B pin. I²C reset behavior is configured in 0x09 SW_RST register.

Table 7. PMIC Reset description

0x08 – RESET_CTRL				Reset Type	S
Bit	Name	Type	Reset	Description	
7 to 6	WDOG_B_CFG	R/W	00	When WDOG_B is asserted to L, PMIC behavior 00b = WDOG_B reset is disabled 01b = Warm Reset, POR_B pin is asserted low for t_{RSTB} 10b, 11b = Cold Reset, All voltage regulators are recycled	
5 to 4	PMIC_RST_CFG	R/W	10	When PMIC_RST_B is asserted to L, PMIC behavior 00b = PMIC_RST_B reset is disabled 01b = Warm Reset, POR_B pin is asserted low for t_{RSTB} 10b, 11b = Cold Reset, All voltage regulators are recycled	
0x09 – SW_RST				Reset Type	O
Bit	Name	Type	Reset	Description	
7 to 0	SW_RST_KEY	R/W	0x00	Software reset register. This register is read back to "0x00" right after writing the value. 0x00 = No action 0x05 = Reset O-type registers to default value 0x09 = Reset O-type registers and S-type registers 0x14 = Cold reset (Power recycle all regulators) 0x35 = Warm Reset (Toggle POR_B for t_{RSTB}) 0xEE = PMIC digital reset (Debug purpose only) Others = Forbidden	

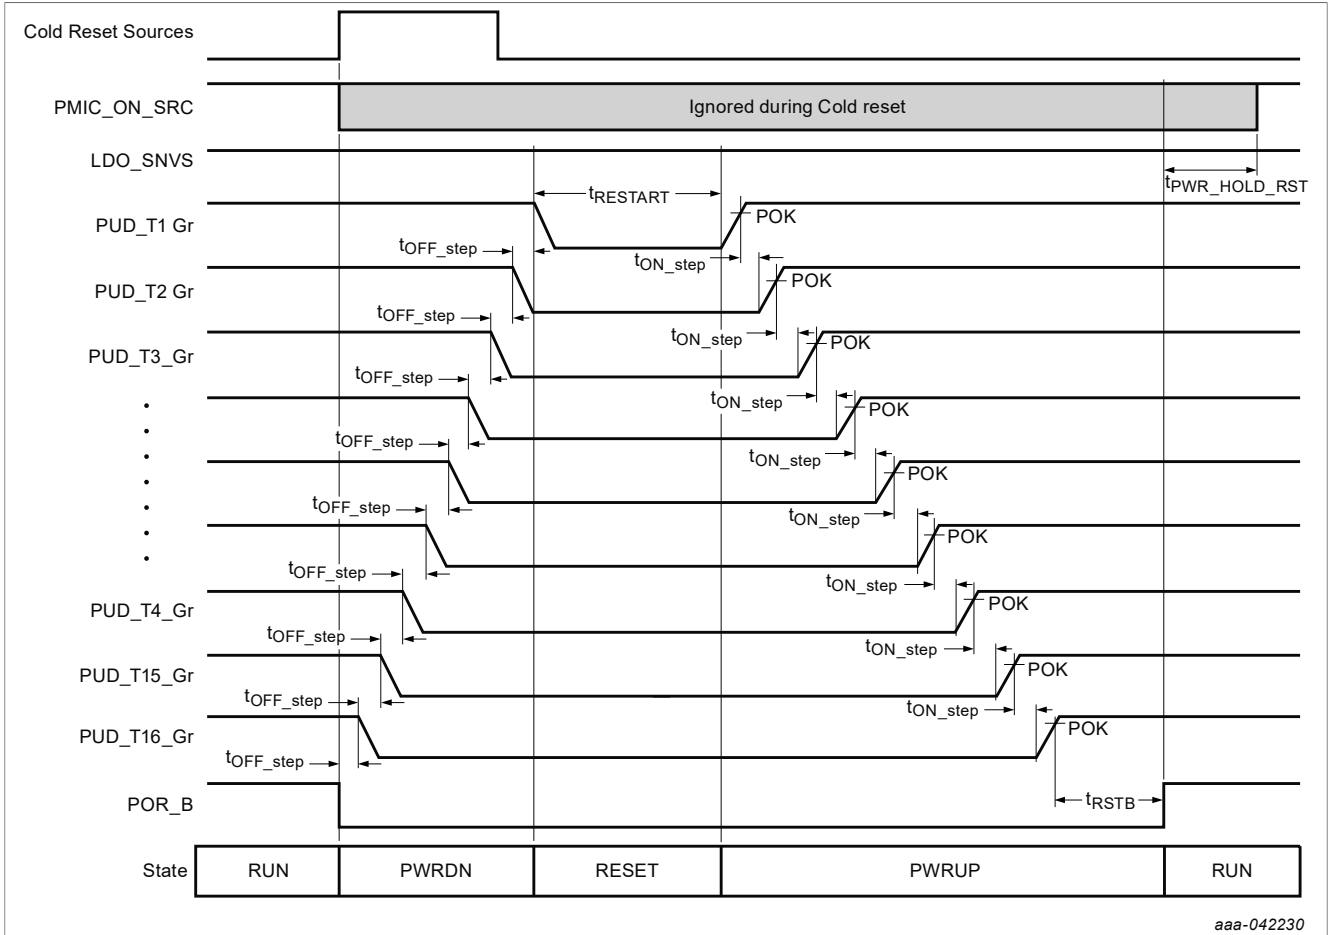

WDOG_B is asserted low, PCA9460 gets reset depending on WDOG_B_CFG bit configuration. When the bits are set to 2b00, the reset by WDOG_B pin is disabled. If the bits are set to 2b01, warm reset is performed, where pulling POR_B low for t_{RESET} and reset I²C O type registers to default value keeping power rails remaining ON. After reset, WDOG_B pin must be released high to get another reset from WDOG_B falling edge.

When PMIC_RST_B is asserted low and it stays low for RESETKEY timer configured in SYS_CFG1 register, PCA9460 waits for t_{RESET_WAIT} after issuing RESETKEY interrupt. If application processor doesn't disable reset by writing 00b in PMIC_RST_CFG bits, then PCA9460 gets reset depending on PMIC_RST_CFG bits configuration. When the bits are set to 2b00, any reset by PMIC_RST_B pin is disabled. If the bits are set to 2b01, warm reset is performed, in which pulling POR_B low for t_{RESET} and reset I²C O type registers to default value keeping power rails remaining ON. After reset, PMIC_RST_B pin must be released high to get another reset from PMIC_RST_B falling edge.

Cold reset event is generated by either of I²C reset, WDOG_B falling edge or PMIC_RST_B falling edge after debounce time. Once it is detected, POR_B is pulled low and takes power down sequence. PCA9460 stays at RESET for $t_{RESTART}$ and then start power on sequence even though WDOG_B pin is still low.

Figure 13 shows cold reset behavior. From any cold reset signal from either of PMIC_RST_B, WDOG_B or I²C, it starts with power down sequence and stays off for $t_{RESTART}$. It automatically proceed power ON sequence and then enters RUN state. PMIC_ON_SRC is ignored for $t_{PWR_HOLD_RST}$ after entering RUN state. If PMIC_ON_SRC doesn't come up until $t_{PWR_HOLD_RST}$ is expired, then PCA9460 is turned off.

13-channel power management integrated circuit (PMIC) for ultra-low power applications

aaa-042230

Figure 13. PCA9460 Cold reset

Table 8. PCA9460 Cold reset description

Time	Description	Value	Comment
tRESTART	Time to power ON seq from end of power OFF seq during cold reset	250 ms	
tPWR_HOLD_RST	Time to hold power-on after reset	100 ms	

Figure 14 shows warm reset behavior. From any warm reset signal from either of PMIC_RST_B, WDOG_B or I²C, it makes POR_B toggled for tRESET and all O type registers get reset. PMIC_ON_SRC is ignored for tPWR_HOLD_RST after entering RUN state as like cold reset behavior.

Figure 14. Warm reset

Table 9. Warm reset description

Time	Description	Value	Comment
t_{RESET}	POR_B low time at Warm reset	20 ms	

7.6 Regulator summary

The PCA9460 PMIC features four high efficiency low quiescent current buck regulators, four LDO regulators and low iq SNVS LDO to supply voltages for the application processor and peripheral devices.

7.6.1 BUCK regulator

The PCA9460 has four high-efficiency low Iq buck regulators. Each buck regulator features soft start and over-current protection. Buck regulator operates in two modes, PFM and PWM mode. Each buck regulator operates in PFM(Pulse Frequency Modulation) mode at light load that generates a single switching pulse to ramp up the inductor current and recharge the output capacitor, followed by a sleep period where most of the internal circuits are shutdown to achieve lowest operating quiescent current. During this time, the load current is supported by the output capacitor. The duration of the sleep period depends on the load current and the inductor peak current.

In PFM Mode, the switching frequency varies linearly with the load current. At medium and high load conditions, the device enters automatically PWM (Pulse Width Modulation) mode and operates in continuous conduction

mode with a nominal switch frequency f_{sw} of typically 2 MHz. The boundary between PWM and PFM mode is when the inductor current becomes discontinuous.

When the Bx_FPWM bits (Bit 2) on the BUCKxCTRL registers are set to 1, the buck regulator operates in only PWM mode, regardless of load current.

Internal active discharge resistor is installed in each buck regulator output to discharge voltage on output capacitors when regulator is off. It is configurable through the I²C register using Bx_AD bit (Bit 3) on BUCKxCTRL registers.

[Table 10](#) shows buck regulator summary.

Table 10. PCA9460 Buck Summary

Buck#	Input pin	Default VOUT [V]	VOUT range [V]	Step size [mV]	Default ON/OFF	Current rating [mA]
BUCK1	INB14	1.8	0.6 to 3.4	25	ON	1000
BUCK2	INB23	1.0	0.6 to 2.1875	12.5	ON	1000
BUCK3	INB23	1.0	0.6 to 2.1875	12.5	ON	1000
BUCK4	INB14	[1]	0.6 to 3.4	25	ON	1000

[1] PCA9460A and PCA9450B: 1.1 V, PCA9460C: 1.2 V

BUCK1 and BUCK4 output voltages are programmable from 0.60 V to 3.40 V in 25 mV steps. This is done by setting the B1_OUT[6:0], and B4_OUT[6:0] bits on registers BUCK1OUT and BUCK4OUT respectively. [Table 108](#) shows the output voltage coding for these regulators.

BUCK2 and BUCK3 output voltages are programmable from 0.60 V to 2.1875 V in 12.5 mV steps. Setting Bx_DVS_CTRL bits to 00b, DVS is controlled by Bx_DVS0[6:0] bits on BUCKxOUT_DVS0 register through I²C. [Table 107](#) shows the output voltage coding for these regulators.

7.6.1.1 ON/OFF control

Each buck regulator can be turned ON/OFF through I²C or PMIC_STBY_REQ pin, which can be configured in each Bx_ENMODE bits in BUCKxCTRL register.

- BxENMODE = 00b : the buck regulator is forcedly OFF
- BxENMODE = 01b : the buck regulator is ON in RUN state (ACTIVE / STANDBY / DPSTANDBY mode)
- BxENMODE = 10b : the buck regulator is ON in ACTIVE or STANDBY mode and it is OFF in DPSTANDBY mode
- BxENMODE = 11b : the buck regulator is ON in ACTIVE mode and it is OFF in STANDBY or DPSTANDBY mode

7.6.1.2 Dynamic voltage scaling

BUCK2 and BUCK3 support dynamic voltage scaling (DVS) through MODE[2:0] pins or PMIC_STBY_REQ pin depending on Bx_DVS_CTRL bits in BUCK23_DVS_CFG2 register.

Table 11. 0x13 – BUCK23_DVS_CFG2

Reset Type: 0

Bit	Name	Type	Reset	Description
7 to 6	B2_DVS_CTRL	R/W	00	BUCK2 DVS Control 00b = DVS control BUCK2OUT_DVS0 Reg through I²C 01b = DVS control through PMIC_STBY_REQ pin

Table 11. 0x13 – BUCK23_DVS_CFG2...continued

Reset Type: 0

Bit	Name	Type	Reset	Description
				10b = DVS control through MODE[2:0] pins in ACTIVE mode and the voltage set to BUCK2OUT_STBY when PMIC_STBY_REQ = H 11b = DVS control through MODE[2:0] pins in RUN state
5 to 4	B3_DVS_CTRL	R/W	00	BUCK3 DVS Control 00b = DVS control BUCK3OUT_DVS0 Reg through I²C 01b = DVS control through PMIC_STBY_REQ pin 10b = DVS control through MODE[2:0] pins in ACTIVE mode and the voltage set to BUCK3OUT_STBY when PMIC_STBY_REQ = H 11b = DVS control through MODE[2:0] pins in RUN state
3 to 0	RSVD	R/W	0000	Reserved

When Bx_DVS_CTRL bits are set to 00b, DVS is controlled by Bx_DVS0 bits on the BUCKxOUT_DVS0 register through I²C. If BUCKxOUT_DVS0 register is overwritten with different voltage through I²C, the output voltage is changed accordingly without ramping up/down.

When the Bx_DVS_CTRL bits are set to 01b, the buck regulator output voltage is determined by BUCKxOUT_DVS0 and BUCKxOUT_STBY registers through PMIC_STBY_REQ pin.

When the bits are set to 10b, the output voltage is controlled by MODE[2:0] pins in ACTIVE mode (PMIC_STBY_REQ pin = L) and the voltage is set to BUCKxOUT_STBY register in STANDBY mode or DPSTANDBY mode (PMIC_STBY_REQ pin = H), where MODE[2:0] pins should not be changed.

When the bits are set to 11b, the buck voltage is always controlled by MODE[2:0] pins.

[Figure 15](#) shows DVS function block diagram and [Table 12](#) show how buck voltage is determined by MODE[2:0] pins.

Table 12. MODE[2:0] pins configuration

I ² C bits		PMIC MODE pins			Buck output voltage
SMART_MODE	MODE2_EN	MODE2	MODE1	MODE0	
0	X	0	0	0	BUCKxOUT_DVS0
0	X	0	0	1	BUCKxOUT_DVS1

1	0	X	1	0	Increment by Bx_DVS_UP mV, select BUCK through BUCK_SEL bit
1	0	X	1	1	No voltage Change
1	1	0	0	0	No voltage Change

Table 12. MODE[2:0] pins configuration...continued

I ² C bits		PMIC MODE pins			Buck output voltage
SMART_MODE	MODE2_EN	MODE2	MODE1	MODE0	
1	1	0	0	1	Decrement BUCK2 by Bx_DVS_DN mV
1	1	0	1	0	Increment BUCK2 by Bx_DVS_UP mV
1	1	0	1	1	No voltage Change
1	1	1	0	0	No voltage Change
1	1	1	0	1	Decrement BUCK3 by Bx_DVS_DN mV
1	1	1	1	0	Increment BUCK3 by Bx_DVS_UP mV
1	1	1	1	1	No voltage Change

When SMART_MODE bit in BUCK23_DVS_CFG1 register is set to 0b, MODE[2:0] pins are used to select buck DVS output voltage configuration, BUCKxOUT_DVSx registers, which should be pre-configured by application processor. PCA9460 detects the first level change among MODE[2:0] pins, 3 internal clock later, the output voltage is updated. The maximum latency of these MODE pins is specified to t_{MAX_DIFF}.

Figure 16 shows DVS operation through MODE[2:0] pins when SMART_MODE bit is set to 0b.

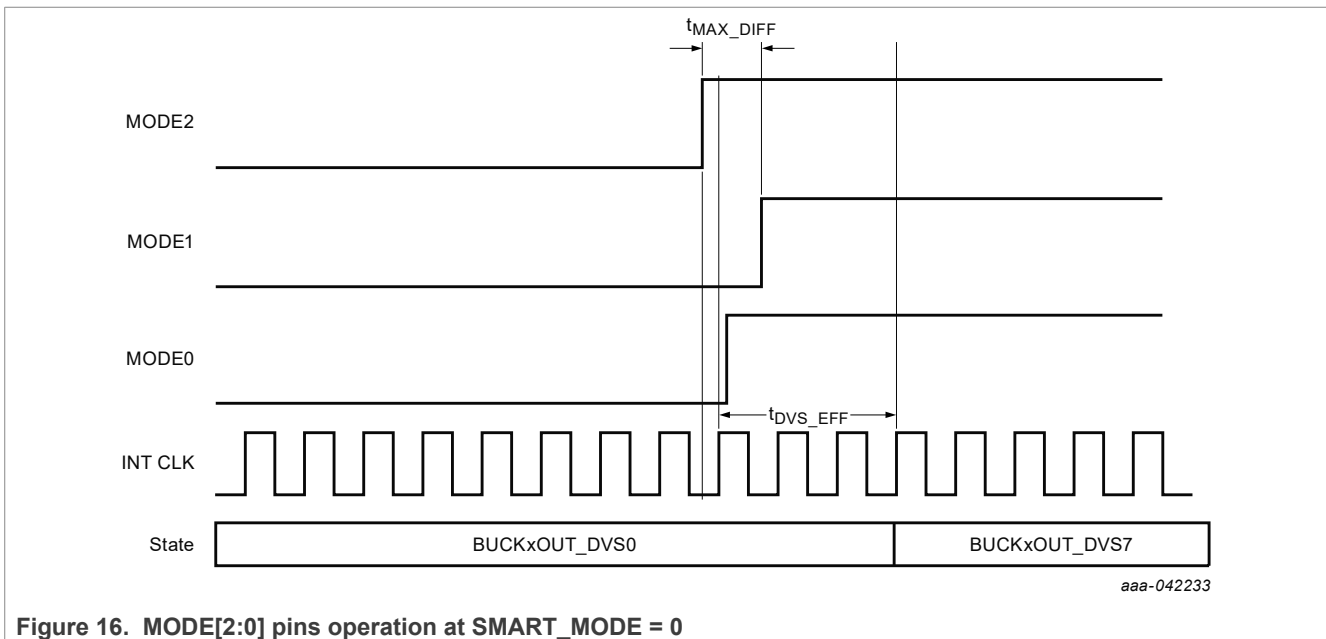

Figure 16. MODE[2:0] pins operation at SMART_MODE = 0

When SMART_MODE is set to 1b and MODE2_EN bit is set to "0", MODE2 pin is ignored in DVS function, MODE1 pin is used to increase buck regulator as much as Bx_DVS_UP bit by issuing one pulse. And MODE0 pin is used to decrease buck regulator as much as Bx_DVS_DN bit by issuing one pulse. The pulse width is controlled through MODE_PULSE bit (bit 3) of the BUCK23_DVS_CFG1 register. Buck regulator should be selected through BUCK_SEL bit in this mode. Whenever the voltage is updated through MODE pin, the voltage is updated in BUCKxOUT_DVS0 register so as application processor can check the current output voltage setting. When both pin has same logic level, then the buck voltage is not changed.

When SMART_MODE is set to 1b and MODE2_EN bit is set to 1b, MODE2 pin is used to select BUCK regulator to be increased or decreased through MODE1 and MODE0 pins.

Figure 17 shows DVS operation through MODE[2:0] pins when SMART_MODE bit is set to 1b.

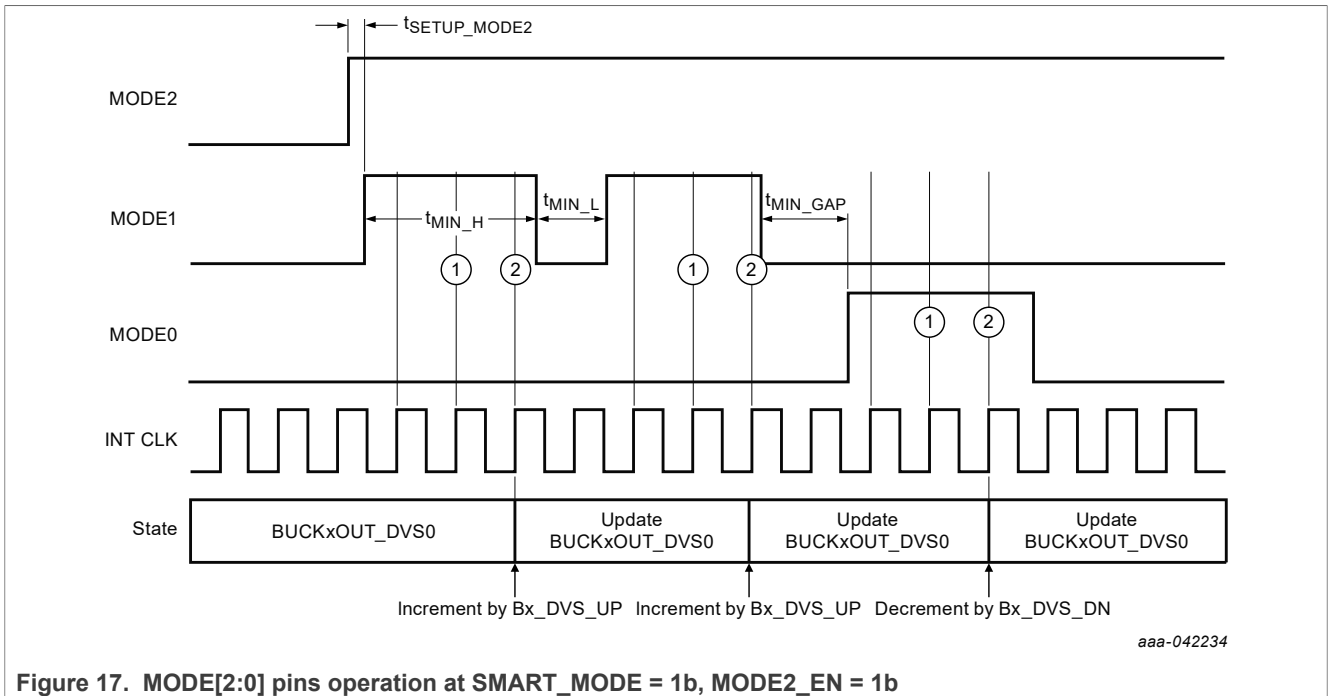

Figure 17. MODE[2:0] pins operation at SMART_MODE = 1b, MODE2_EN = 1b

MODE pins control requirements in SMART_MODE = 1b are:

1. MODE2 pin should be set within t_{SETUP_MODE2} before MODE1 or MODE0 pin is toggled
2. High Pulse hold time should be longer than t_{MIN_H}
3. Low pulse hold time should be longer than t_{MIN_L}
4. When MODE1 pin is toggled after MODE0 pin toggled and vice versa, it should be longer than t_{MIN_GAP} .
5. Once detecting high pulse, the voltage is updated in BUCKxOUT_DVS0 register after two internal clocks.
6. Either MODE1 or MODE0 pin stay high, the buck regulator voltage is updated only once after two clocks.

The programmable voltage ramp-up and ramp-down are applied during the DVS voltage transition. The ramp rate is configured by Bx_RAMP[7:6] bits in each BUCKxCTRL registers.

Figure 18. DVS timing

7.6.1.3 Overshoot improvement from PWM to PFM mode transient

The load transient response in PWM mode is improved compared to PFM mode, since the converter reacts faster on the load step and actively sinks energy on the load release. PCA9460 Buck regulator automatically enters PWM mode for 16 cycles after a heavy load release in order to bring the output voltage back to the regulation level faster. After 16 cycles of PWM mode, it automatically returns to PFM mode.

Figure 19. Transition from PWM to PFM

7.6.1.4 Low power mode

If BUCK is configured in low power mode, it turns internal circuitry off to minimize quiescent current. The current is limited to IOUT_Max in Low Power Mode. BUCK2 and BUCK3 DVS feature also disabled in this mode. Therefore, low power mode should be used carefully not to exceed IOUT_Max current.

Each buck regulator has low power mode configuration bits in BUCKx_CTRL register.

Table 13. Low power mode

BUCK_CTRL				Reset Type	O
Bit	Name	Type	Reset	Description	
5 to 4	Bx_LPMODE	R/W	11	BUCK power mode 00b = Automatic transition mode 01b = Low power mode at STANDBY mode and DPSTANDBY mode 10b = Low power mode at DPSTANDBY mode 11b = Normal mode	

If Bx_LPMODE bits are set to 00b, the buck regulator runs automatic transition mode between low power mode and normal mode depending on load current. When it is set to 01b, buck operates in normal mode at ACTIVE mode and in low power mode at STANDBY mode and DPSTANDBY mode. If it is set to 10b, the buck is in low power mode only at DPSTANDBY mode.

7.6.1.5 BUCK output limiting

Application processor may accidentally write higher voltage than absolute maximum voltage rating of its power input, it may cause significant damage on application processor. PCA9460 has registers to limit the maximum voltage to prevent such an incident.

BUCK2 and BUCK3 maximum / minimum output are limited by BUCKxOUT_MAX_LIMIT and BUCKxOUT_MIN_LIMIT registers, respectively. Even if Buck output is configured to higher than the limit voltage configured in BUCKxOUT_MAX_LIMIT registers or lower than the min limit voltage configured in BUCKxOUT_MIN_LIMIT registers, the actual buck output is clamped to the limiting voltage set by BUCKxOUT_MAX_LIMIT or BUCKxOUT_MIN_LIMIT registers.

7.6.2 LDO

The PCA9460 has five low quiescent LDOs. LDO_SVNS is supposed to supply SNVS core in application processor. This LDO features ultra-low quiescent current, 0.25 μA typical, since it is always ON when VSYS is valid. Each LDO is fully controlled through its respective LDOxCFG and LDOx_OUT registers. LDOxCFG registers enable the user to individually set the LDO configuration and enable and set the operational mode on each regulator using Lx_ENMODE bits [1:0]. While LDOx_OUT registers enable the user to individually set the output voltage according to [Table 113](#) for LDO1; [Table 118](#) for LDO2; [Table 125](#) for LDO3; and [Table 130](#) for LDO4.

Users can set LDO1 into Low Power Mode by setting the L1_LPMODE [1:0] bits on LDO1_CFG register (0x30).

The internal active discharge resistor is installed in each LDO regulator output to discharge voltage on output capacitors when the regulator is off. It is configurable through I²C register using the following:

- L1_AD bit (bit 7) on LDO1_OUT (0x31)
- Lx_AD bit (bit 4) on LDO2_CFG (0x32), LDO3_CFG (0x35), and LDO4_CFG (0x37)

Table 14. LDO summary (PCA9460A)

LDO#	Input pin	Default VOUT (V)	VOUT range (V)	Step size (mV)	Default ON/OFF	Current rating (mA)
LDO1	INL1	[1]	0.6 to 1.95	50	ON	250
LDO2	INL	3.3	0.8 to 3.3	50	ON	250
LDO3	INL	3.3	0.8 to 3.3	50	ON	250
LDO4	INL	1.8	0.8 to 3.3	50	ON	250
LDO_SVNS	VSYS	3.0	0.8 to 3.3	50	ON	10

[1] PCA9460A: 1.1 V, PCA9460B:0.6 V, PCA9460C: 1.2 V

The LDOSNVNS regulator is fully controlled through the LDOSNVNS_CFG register. Users can enable/disable the internal active discharge resistor using LSNVS_AD bit (Bit 7); enable/disable the regulator using LS_ENMODE bit (bit 6); and use the L_SNVNS_OUT bits [5:0] to set the output voltage according to [Table 133](#).

7.6.3 Regulator protection

Each regulator output voltage configuration register is protected by lock key. Unlock key must be written with 01011100 (0x5C) to UNLOCK_KEY [7:0] bits in REG_LOCK (0x4E) register before updating the registers. Below are protected registers.

1. BUCK output configuration registers : BUCK1OUT, BUCK4OUT
2. BUCK2, 3 Min/Max output configuration registers : BUCK2OUT_MAX_LIMIT, BUCK2OUT_MIN_LIMIT, BUCK3OUT_MAX_LIMIT, BUCK3OUT_MIN_LIMIT.
3. LDO output configuration registers : LDO1_OUT, LDO2_OUT_L, LDO2_OUT_H, LDO3_OUT, LDO4_OUT

7.6.4 Current limit protection

In case a regulator exceeds the current limit (ILIM parameter for the BUCK regulators or ILIMIT for the linear regulators) of each target, the output of the regulator will fall below POK (Output Power good) threshold caused by overcurrent limit, then VRFLT1_INT register will generate an interrupt and system transitions to Fault_SD state. Please refer to “Voltage regulator fault in RUN state” fault source in [Section 7.4.6 "FAULT_SD state"](#) for details.

7.7 Load switch and LED driver

PCA9460 integrates four 150mΩ PMOS switch configurable to Load switch or LED driver through I²C.

When an LSWx_CFG bit in LSW_CFG register is set to 0b, the LSW is configured as Load switch. It is controlled by each LSWx_EN bits in LSW_EN_CTRL register, which provides ON/OFF control automatically in different modes. When it is enabled, it soft-starts to reduce inrush current.

Table 15. Load SW Enable table

LSWx_EN	SNVS State	RUN state		
		Active Mode	STANDBY	DPSTANDBY
00	OFF	OFF	OFF	OFF
01	OFF	ON	ON	ON
10	OFF	ON	ON	OFF
11	OFF	ON	OFF	OFF

When an LSWx_CFG bit is set to 1b, the LSW is configured as LED driver, and its behavior is determined by LEDx_CFG registers including enable mode and brightness configuration.

Figure 20. LED Driver block diagram

Each LED channel can be assigned to one of constant ON, blinking pattern 1 and blinking pattern 2. Constant ON is to turn ON LED with configured LED brightness until it is forcedly off though I²C.

PCA9460 supports two independent blink patterns which is generated by each LEDRAMP register and LEDBLNK register. The Blink pattern always start with OFF time, and then ramp up to I_{LED_BRT} by increasing PWM duty cycle from 0 % to 100 % configured in LEDRAMP register. The ramp up time is determined by PWM duty step size(Px_UP_STEP) and delay time(Px_UP_DLY). Once the current reach the target, the LED channel stays for T_{ON}. a blink pattern ends up with Ramping down by decreasing PWM duty cycle from 100 % to 0 % configured in LEDRAMP register. The ramp down time is determined by PWM duty step size(Px_DN_STEP) and delay time(Px_DN_DLY). This pattern is repeated until any LED channel doesn't select the pattern any longer. Update on the pattern like brightness change or ON/OFF time change during a BLINK mode takes place in next period.

Figure 21. LED Blink Pattern

7.8 Mode selection

7.8.1 MODE0, MODE1, MODE2

MODE[2:0] pins are purposed to control DVS(Dynamic voltage scaling) for BUCK 2 and BUCK3 by default. Those pins can be configured to control LDO2 voltage selection or each load switch ON/OFF through MODEPIN_CFG register as well.

If any MODE pin is configured to any bits other than 00b in MODEPIN_CFG register, the internal MODE pin in DVS control block is set low. For example, if MODE2_CFG bits are configured to 001b, then MODE2 pin is used to control LDO2 voltage selection, and the pin in DVS control block is set low.

If any MODE pin is not configured to LDO2 voltage selection, internal LDO2_VSEL is set low.

Load switch which is not configured to any MODE pin is controlled by only I²C register bits, LSWx_EN[1:0] bits.

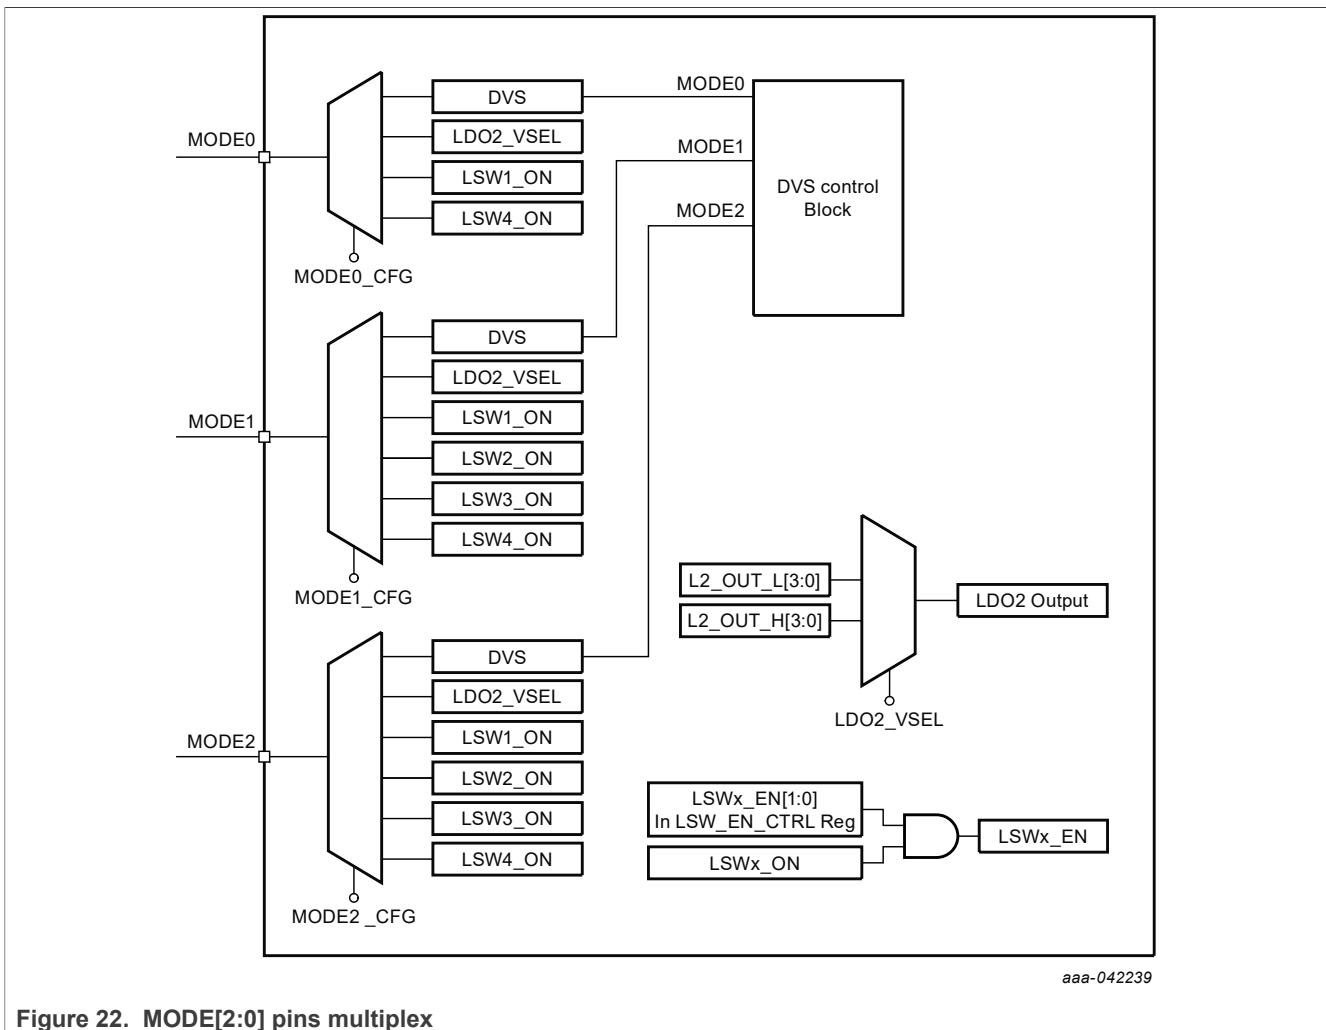

Figure 22. MODE[2:0] pins multiplex

7.9 Interrupt management

The IRQ_B pin is an interface to the software-controlled system that indicates any interrupt bit status change of INT1 register. The IRQ_B pin is pulled low when any unmasked interrupt bit status is changed, and it is released high once application processor read INT1 register.

The INT1 bits are latched to 1 whenever corresponding INT1_STATUS1 bit is changed and the latch is cleared when the INT1 register is read. The INT1_MASK bits are used to enable or disable individual interrupt bits of INT1 register. The INT1_STATUS1 register indicates the current status and is not latched.

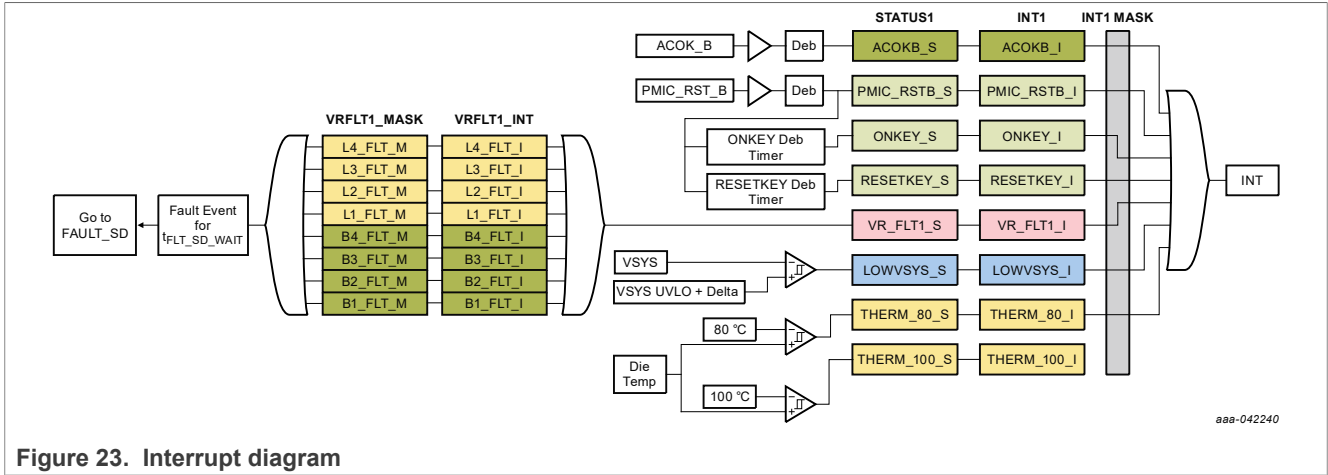

Figure 23. Interrupt diagram

8 Software interface

PCA9460 implements I²C-bus slave interface and it interfaces with the host system. The host processor can issue commands, monitor status and receive response through this bus. A detailed description of the I²C-bus specification, with applications, is given in UM10204, <https://www.nxp.com/docs/en/user-guide/UM10204.pdf>[Ref. 4]. PCA9460 supports I²C-bus data transfers in Standard-mode (100 kbit/s), Fast-mode (400 kbit/s) and Fast-mode plus (1 Mbit/s). See [Table 17](#).

Table 17. I²C address at Power-On Reset

	7-bit Slave Address	8-bit Write Address	8-bit Read Address
Default	0x32, 0b 011 0010	0x64, 0b 0110 0100	0x65, 0b 0110 0101

I²C register reset type

There are two type of registers: type O and type S. The differences between them relates to the different conditions that RESET the contents and its corresponding functionality to the default values for those specific registers. Those conditions are shown below for each register type. For more details on whether a register is type S or O refer to [Table 18](#).

Type S : (VSYS < V_{VSYS_UVLO}) || (VINT_POK) || (SW_RST_KEY = 0x09)

Type O : (VSYS < V_{VSYS_UVLO}) || (VINT_POK) || (Cold Reset) || (Warm Reset) || (Falling edge of PMIC_ON_SRC) || (SW_RST_KEY=0x05) || (SW_RST_KEY=0x09) || (FAULT_SD) || (Thermal SD)

8.2 Register details

8.2.1 Device_ID

The device identification code stores a unique identifier for each version and/or revision of a PCA9460, so that the connected processor recognizes it automatically.

Table 19. Device_ID register (address 00h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	CHIP_ID				CHIP_REV			
Reset	0	0	1	1	0	0	0	0
Access	R	R	R	R	R	R	R	R

Table 20. Device_ID register (address 00h) bit descriptions

Bit	Symbol	Description
7 to 4	CHIP_ID	Chip ID 0011 — PCA9460 (default)
3 to 0	CHIP_REV	Chip Revision 0000 — revision 0 (default)

8.2.2 OTP_VER

OTP version information

13-channel power management integrated circuit (PMIC) for ultra-low power applications

Table 21. OTP_VER register (address 01h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	OTP_VER				OTP_REV			
Reset ^[1]	—	—	—	—	—	—	—	—
Access	R	R	R	R	R	R	R	R

[1] The reset value depends on the specific otp version as shown in Table 22.

Table 22. OTP_VER register (address 01h) bit descriptions

Bit	Symbol	Description
7 to 4	OTP_VER	OTP version for each PCA9460 variance 0000 — PCA9460A 0001 — PCA9460B 0010 — PCA9460C ... 1111 — Reserved
3 to 0	OTP_REV	OTP minor change update 0000 — revision 0 0001 — revision 1 ... 1111 — Reserved

8.2.3 INT1

Interrupt source register. Either of unmasked register bits is set to 1, IRQB pin is pulled low. This register is Read and Clear.

Table 23. INT1 register (address 02h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	ACOKB_I	PMIC_RSTB_I	ONKEY_I	RESETKEY_I	VR_FLT1_I	LOWVSYS_I	THERM_80_I	THERM_100_I
Reset	0	0	0	0	0	0	0	0
Access	R/C	R/C	R/C	R/C	R/C	R/C	R/C	R/C

Table 24. INT1 register (address 02h) bit descriptions

Bit	Symbol	Description
7	ACOKB_I	ACOKB interrupt 0 — ACOKB_S bit has not been changed (default) 1 — ACOKB_S bit has been changed
6	PMIC_RSTB_I	PMIC_RSTB_I interrupt 0 — PMIC_RSTB_S bit has not been changed (default) 1 — PMIC_RSTB_S bit has been changed
5	ONKEY_I	ON Key timer interrupt 0 — ONKEY_S bit has not been changed (default) 1 — ONKEY_S bit has been changed
4	RESETKEY_I	RESET Key timer interrupt 0 — RESETKEY_S bit has not been changed (default) 1 — RESETKEY_S bit has been changed

13-channel power management integrated circuit (PMIC) for ultra-low power applications

Table 24. INT1 register (address 02h) bit descriptions...continued

Bit	Symbol	Description
3	VR_FLT1_I	Voltage regulator Group1 Fault 0 — VR_FLT1_S bit has not been changed (default) 1 — VR_FLT1_S bit has been changed
2	LOWVSYS_I	Low-SYS Voltage interrupt 0 — LOWVSYS_S bit has not been changed (default) 1 — LOWVSYS_S bit has been changed
1	THERM_80_I	Die temperature 80 °C interrupt 0 — THERM_80_S bit has not been changed (default) 1 — THERM_80_S bit has been changed
0	THERM_100_I	Die temperature 100 °C interrupt 0 — THERM_100_S bit has not been changed (default) 1 — THERM_100_S bit has been changed

8.2.4 INT1_MASK

Table 25. INT1_MASK register (address 03h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	ACOKB_M	PMIC_RSTB_M	ONKEY_M	RESETKEY_M	VR_FLT1_M	LOWVSYS_M	THERM_80_M	THERM_100_M
Reset	1	1	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26. INT1_MASK register (address 03h) bit descriptions

Bit	Symbol	Description
7	ACOKB_M	ACOKB_I interrupt mask bit 0 — Enable ACOKB_I interrupt 1 — Mask ACOKB_I interrupt (default)
6	PMIC_RSTB_M	PMIC_RSTB_I interrupt mask bit 0 — Enable PMIC_RSTB_I interrupt 1 — Mask PMIC_RSTB_I interrupt (default)
5	ONKEY_M	ONKEY_I interrupt mask bit 0 — Enable ONKEY_I interrupt 1 — Mask ONKEY_I interrupt (default)
4	RESETKEY_M	RESETKEY_I interrupt mask bit 0 — Enable RESETKEY_I interrupt 1 — Mask RESETKEY_I interrupt (default)
3	VR_FLT1_M	VR_FLT1I interrupt mask bit 0 — Enable VR_FLT1I interrupt 1 — Mask VR_FLT1I interrupt (default)
2	LOWVSYS_M	LOWVINI interrupt mask bit 0 — Enable LOWVINI interrupt 1 — Mask LOWVINI interrupt (default)
1	THERM_80_M	THERM_80 interrupt mask bit 0 — Enable THERM_80 interrupt 1 — Mask THERM_80 interrupt (default)
0	THERM_100_M	THERM_100 interrupt mask bit 0 — Enable THERM_100 interrupt

Table 26. INT1_MASK register (address 03h) bit descriptions...continued

Bit	Symbol	Description
		1 — Mask THERM_100 interrupt (default)

8.2.5 INT1_STATUS

STATUS register shows current status. Any status bit change sets corresponding interrupt bit to 1.

Table 27. INT1_STATUS register (address 04h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	ACOKB_S	PMIC_RSTB_S	ONKEY_S	RESETKEY_S	VR_FLT1_S	LOWVSYS_S	THERM_80_S	THERM_100_S
Reset	—	—	—	—	—	—	—	—
Access	R	R	R	R	R	R	R	R

Table 28. INT1_STATUS register (address 04h) bit descriptions

Bit	Symbol	Description
7	ACOKB_S	ACOK_B pin status after debounce time 0 — ACOK_B pin is low 1 — ACOK_B pin is high
6	PMIC_RSTB_S	PMIC_RST_B pin status 0 — PMIC_RST_B pin is low 1 — PMIC_RST_B pin is high
5	ONKEY_S	ONKEY status bit 0 — PMIC_RST_B pin is not low for ONKEY timer 1 — PMIC_RST_B pin is low for ONKEY timer
4	RESETKEY_S	RESETKEY status bit 0 — PMIC_RST_B pin is not low for RESETKEY timer 1 — PMIC_RST_B pin is low for RESETKEY timer
3	VR_FLT1_S	Voltage Regulator Fault status, See 0x40 Register. 0 — All voltage regulators are OK 1 — Either of voltage regulators is in Fault state
2	LOWVSYS_S	VSYS low voltage status 0 — Enable LOWVINI interrupt 1 — Mask LOWVINI interrupt
1	THERM_80_S	Die temperature 80 °C status 0 — Die temperature is below 80 °C 1 — Die temperature is above 80 °C
0	THERM_100_S	Die temperature 100 °C status 0 — Die temperature is below 100 °C 1 — Die temperature is above 100 °C

8.2.6 VRFLT1_INT

Voltage regulator fault interrupt register. It is latched to 1 once corresponding regulator is detected until overwriting "1" to the register. If "1" is overwritten, the corresponding bit is newly updated by current status.

13-channel power management integrated circuit (PMIC) for ultra-low power applications

Table 29. VRFLT1_INT register (address 05h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	L4_FLT_I	L3_FLT_I	L2_FLT_I	L1_FLT_I	B4_FLT_I	B3_FLT_I	B2_FLT_I	B1_FLT_I
Reset	0	0	0	0	0	0	0	0
Access	R/W/C	R/W/C	R/W/C	R/W/C	R/W/C	R/W/C	R/W/C	R/W/C

Table 30. VRFLT1_INT register (address 05h) bit descriptions

Bit	Symbol	Description
7	L4_FLT_I	LDO4 Fault interrupt, deglitched with t_{DEB_POKB} 0 — LDO4 output is good or LDO4 is OFF (default) 1 — LDO4 output falls below 80 % of target
6	L3_FLT_I	LDO3 Fault interrupt, deglitched with t_{DEB_POKB} 0 — LDO3 output is good or LDO3 is OFF (default) 1 — LDO3 output falls below 80 % of target
5	L2_FLT_I	LDO2 Fault interrupt, deglitched with t_{DEB_POKB} 0 — LDO2 output is good or LDO2 is OFF (default) 1 — LDO2 output falls below 80 % of target
4	L1_FLT_I	LDO1 Fault interrupt, deglitched with t_{DEB_POKB} 0 — LDO1 output is good or LDO1 is OFF (default) 1 — LDO1 output falls below 80 % of target
3	B4_FLT_I	BUCK4 Fault interrupt, deglitched with t_{DEB_POKB} 0 — BUCK4 output is good or BUCK4 is OFF (default) 1 — BUCK4 output is below 80 %
2	B3_FLT_I	BUCK3 Fault interrupt, deglitched with t_{DEB_POKB} 0 — BUCK3 output is good or BUCK3 is OFF (default) 1 — BUCK3 output falls below 80 % of target
1	B2_FLT_I	BUCK2 Fault interrupt, deglitched with t_{DEB_POKB} 0 — BUCK2 output is good or BUCK2 is OFF (default) 1 — BUCK2 output falls below 80 % of target
0	B1_FLT_I	BUCK1 Fault interrupt, deglitched with t_{DEB_POKB} 0 — BUCK1 output is good or BUCK1 is OFF (default) 1 — BUCK1 output falls below 80 % of target

8.2.7 VRFLT1_MASK

VR fault mask bit. Once the bit is masked, PCA9460 doesn't enter Fault shutdown even if fault condition of corresponding regulator happens

Table 31. VRFLT1_MASK register (address 06h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	L4_FLT_M	L3_FLT_M	L2_FLT_M	L1_FLT_M	B4_FLT_M	B3_FLT_M	B2_FLT_M	B1_FLT_M
Reset	1	1	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32. VRFLT1_MASK register (address 06h) bit descriptions

Bit	Symbol	Description
7	L4_FLT_M	LDO4 FLT mask

Table 32. VRFLT1_MASK register (address 06h) bit descriptions...continued

Bit	Symbol	Description
		0 — Unmask 1 — Masked (default)
6	L3_FLT_M	LDO3 FLT mask 0 — Unmask 1 — Masked (default)
5	L2_FLT_M	LDO2 FLT mask 0 — Unmask 1 — Masked (default)
4	L1_FLT_M	LDO1 FLT mask 0 — Unmask 1 — Masked (default)
3	B4_FLT_M	BUCK4 FLT mask 0 — Unmask 1 — Masked (default)
2	B3_FLT_M	BUCK3 FLT mask 0 — Unmask 1 — Masked (default)
1	B2_FLT_M	BUCK2 FLT mask 0 — Unmask 1 — Masked (default)
0	B1_FLT_M	BUCK1 FLT mask 0 — Unmask 1 — Masked (default)

8.2.8 PWR_STATE

Power state register shows current PCA9460 power states and modes.

Table 33. PWR_STATE register (address 07h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	PWR_STAT				PWR_MODE			
Reset	0	0	0	0	0	0	0	0
Access	R	R	R	R	R	R	R	R

Table 34. PWR_STATE register (address 07h) bit descriptions

Bit	Symbol	Description
7 to 4	PWR_STAT	Current PCA9460 STATES 0000 — OFF (default) 0100 — SNVS 0101 — PWRUP 1000 — RUN 1100 — PWRDN 1110 — FAULT_SD others — Reserved
3 to 0	PWR_MODE	Current PCA9460 MODE, only effective at RUN state 0000 — Active mode – DVS0 (default) 0001 — Active mode – DVS1 0010 — Active mode – DVS2

Table 34. PWR_STATE register (address 07h) bit descriptions...continued

Bit	Symbol	Description
		0011 — Active mode – DVS3 0100 — Active mode – DVS4 0101 — Active mode – DVS5 0110 — Active mode – DVS6 0111 — Active mode – DVS7 1000 — STANDBY MODE 1010 — DP_STANDBYMODE others — Reserved

8.2.9 RESET_CTRL

Reset behavior configuration register

Table 35. RESET_CTRL register (address 08h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	WDOGB_CFG		PMIC_RST_CFG		TRESTART	RSVD		
Reset	0	0	1	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 36. RESET_CTRL register (address 08h) bit descriptions

Bit	Symbol	Description
7 to 6	WDOGB_CFG	When WDOG_B is asserted to low, PMIC reset behavior 00 — WDOG_B reset is disabled (default) 01 — Warm reset, POR_B pin is asserted low for 20 ms 10 and 11 — Cold Reset, all voltage regulators are recycled
5 to 4	PMIC_RST_CFG	When PMIC_RST_B is asserted to low, PMIC reset behavior 00 — PMIC_RST_B reset is disabled 01 — Warm Reset, POR_B pin is asserted low for 20 ms 10 and 11 — Cold Reset, all voltage regulators are recycled (default)
3	TRESTART	Time to stay regulators off during Cold reset 0 — 250 ms (default) 1 — 500 ms
2 to 0	RSVD	Reserved

8.2.10 SW_RST

Software reset register

Table 37. SW_RST register (address 09h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	SW_RST_KEY							
Reset	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 38. SW_RST register (address 09h) bit descriptions

Bit	Symbol	Description
7 to 0	SW_RST_KEY	Software reset register. This register is read back to "0x00" right after writing the value. 0000 0000 — No action (default) 0000 0101 — Reset O-type registers to default value 0000 1001 — Reset O-type registers and S-type registers 0000 1110 — Cold reset (Power recycle all regulators) 0010 0011 — Warm Reset (Toggle POR_B for 20 ms) 1110 1110 — PMIC digital reset (Debug purpose only) others — Forbidden

8.2.11 PWR_SEQ_CTRL

Debounce timer configuration register

Table 39. PWR_SEQ_CTRL register (address 0Ah) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	PMIC_RST_B_ON	ACOK_B_ON	PMIC_RST_B_DEB	ACOK_B_OSTMR	PSQ_TON_STEP		PSQ_TOFF_STEP	
Reset	0	0	0	0	0	1	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40. PWR_SEQ_CTRL register (address 0Ah) bit descriptions

Bit	Symbol	Description
7	PMIC_RST_B_ON	Configure PMIC_RST_B pin as Power ON source 0 — Mask (default) 1 — Power ON Source
6	ACOK_B_ON	Configure ACOK_B pin as Power ON source 0 — Mask (default) 1 — Power ON Source
5	PMIC_RST_B_DEB	Debounce time for PMIC_RST_B pin for falling edge. (rising edge doesn't have debounce time) 0 — 20 ms (default) 1 — 100 ms
4	ACOK_B_OSTMR	Oneshot timer for ACOK_B, Oneshot timer works only at SNVS state 0 — 2.5 sec (default) 1 — 5 sec
3 to 2	PSQ_TON_STEP	Time step configuration during power on sequence 00 — 1 ms 01 — 2 ms (default) 10 — 4 ms 11 — 8 ms
1 to 0	PSQ_TOFF_STEP	Time step configuration during power down sequence 00 — 2 ms 01 — 4 ms 10 — 8 ms (default) 11 — 16 ms

8.2.12 SYS_CFG1

VSYS_UVLO and LOW VSYS configuration register

13-channel power management integrated circuit (PMIC) for ultra-low power applications

Table 41. SYS_CFG1 register (address 0Bh) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	LOW_VSYS		STANDBY_CFG	RESETKEY_TIMER			TFLT_SD_WAIT	THERM_SD_DIS
Reset	0	1	0	1	0	1	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 42. SYS_CFG1 register (address 0Bh) bit descriptions

Bit	Symbol	Description
7 to 6	LOW_VSYS	Low VSYS threshold above V_{SYS_UVLO} 00 — 100 mV 01 — 200 mV (default) 10 — 300 mV 11 — 400 mV
5	STANDBY_CFG	Mode configuration bit when PMIC_STBY_REQ pin is High 0 — STANDBY mode (default) 1 — DPSTANDBY mode
4 to 2	RESETKEY_TIMER	RESETKEY timer configuration after PMIC_RST_B pin falls low 000 — 100 ms 001 — 1 sec 010 — 2 sec 011 — 4 sec 100 — 6 sec 101 — 8 sec (default) 110 — 10 sec 111 — 12 sec
1	TFLT_SD_WAIT	Wait time for AP action when regulator fault occurs 0 — 100 ms (default) 1 — 20 μ s
0	THERM_SD_DIS	Thermal shutdown disable bit 0 — Enable Thermal shutdown (default) 1 — Disable Thermal shutdown

8.2.13 SYS_CFG2

ONKEY timer, power save mode and VSYS UVLO configuration register

Table 43. SYS_CFG2 register (address 0Ch) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	ONKEY_TIMER		PWR_SAVE		RSVD	POK_PU	VSYS_UVLO	
Reset	0	1	1	1	0	0	0	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 44. SYS_CFG2 register (address 0Ch) bit descriptions

Bit	Symbol	Description
7 to 6	ONKEY_TIMER	ONKEY timer configuration after PMIC_RST_B pin falls low 00 — 1 sec 01 — 2 sec (default)

13-channel power management integrated circuit (PMIC) for ultra-low power applications

Table 44. SYS_CFG2 register (address 0Ch) bit descriptions...continued

Bit	Symbol	Description
		10 — 4 sec 11 — 8 sec
5 to 4	PWR_SAVE	Power save mode (Disabling High accuracy BG and Thermal shutdown) 00 — Use Low Iq BG and enable Thermal shutdown 01 — Power save mode at STANDBY/DPSTANDBY mode 10 — Power save mode at DPSTANDBY mode 11 — Normal Power mode (default)
3	RSVD	Reserved
2	POK_PU	POK reference during power up 0 — POK is reference to turn on next power group (default) 1 — POK is ignored during power up
1 to 0	VSYS_UVLO	VSYS UVLO threshold, rising threshold 00 — 2.65 V 01 — 2.85 V (default) 10 — 3.0 V 11 — 3.3V

8.2.14 MODEPIN_CFG

MODE0, MODE1, MODE2 pin control configuration

Table 45. MODEPIN_CFG register (address 0Dh) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	MODE0_CFG		MODE1_CFG			MODE2_CFG		
Reset	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 46. MODEPIN_CFG register (address 0Dh) bit descriptions

Bit	Symbol	Description
7 to 6	MODE0_CFG	MODE0 pin configuration 00 — DVS control (default) 01 — LDO2 voltage selection 10 — LSW1 ON/OFF control 11 — LSW4 ON/OFF control
5 to 3	MODE1_CFG	MODE1 pin configuration 000 — DVS control (default) 001 — LDO2 voltage selection 010 — LSW1 ON/OFF control 011 — LSW2 ON/OFF control 100 — LSW3 ON/OFF control 101 and 111 — LSW4 ON/OFF control
2 to 0	MODE2_CFG	MODE2 pin configuration 000 — DVS control (default) 001 — LDO2 voltage selection 010 — LSW1 ON/OFF control 011 — LSW2 ON/OFF control 100 — LSW3 ON/OFF control 101 and 111 — LSW4 ON/OFF control

8.2.15 BUCK1CTRL

BUCK1 control register for Active discharge, FPWM and Enable.

Table 47. BUCK1CTRL register (address 10h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD		B1_LPMODE		B1_AD	B1_FPWM	B1_ENMODE	
Reset	0	0	1	1	1	0	0	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 48. BUCK1CTRL register (address 10h) bit descriptions

Bit	Symbol	Description
7 to 6	RSVD	Reserved
5 to 4	B1_LPMODE	BUCK1 Low power mode 00 — Automatic transition mode 01 — Low power mode at STANDBY mode and DPSTANDBY mode 10 — Low power mode at DPSTANDBY mode 11 — Normal mode (default)
3	B1_AD	Buck1 Active discharge 0 — Always disable Active discharge resistor 1 — Enable Active discharge resistor when regulator is OFF(default)
2	B1_FPWM	Forced PWM mode 0 — Automatic PFM and PWM mode transition (default) 1 — Forced PWM mode
1 to 0	B1_ENMODE	Buck1 enable mode 00 — OFF 01 — ON at RUN State (default) 10 — ON at ACTIVE mode or STANDBY mode, OFF at DPSTANDBY 11 — ON at ACTIVE mode, OFF at STANDBY or DPSTANDBY

8.2.16 BUCK1OUT

BUCK1 output voltage configuration register. This register is protected by Lock key, 0x4E register should be written with unlock key before updating this register.

Table 49. BUCK1OUT register (address 11h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD	B1_OUT						
Reset	0	0	1	1	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 50. BUCK1OUT register (address 11h) bit descriptions

Bit	Symbol	Description
7	RSVD	Reserved
6 to 0	B1_OUT	BUCK1 Output voltage Programmable from 0.60 V to 3.40 V in 25 mV steps 011 0000 — 1.8 V (default)

Table 50. BUCK1OUT register (address 11h) bit descriptions...continued

Bit	Symbol	Description
		See Table 108

8.2.17 BUCK23_DVS_CFG1

BUCK2, BUCK3 DVS control configuration register

Table 51. BUCK23_DVS_CFG1 register (address 12h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	B2_DVS_UP	B2_DVS_DN	B3_DVS_UP	B3_DVS_DN	MODE_PULSE	SMART_MODE	MODE2_EN	BUCK_SEL
Reset	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 52. BUCK23_DVS_CFG1 register (address 12h) bit descriptions

Bit	Symbol	Description
7	B2_DVS_UP	BUCK2 increment step from MODE[1:0] pins pulse 0 — 12.5 mV (default) 1 — 25 mV
6	B2_DVS_DN	BUCK2 decrement step from MODE[1:0] pins pulse 0 — 12.5 mV (default) 1 — 25 mV
5	B3_DVS_UP	BUCK3 increment step from MODE[1:0] pins pulse 0 — 12.5 mV (default) 1 — 25 mV
4	B3_DVS_DN	BUCK3 decrement step from MODE[1:0] pins pulse 0 — 12.5 mV (default) 1 — 25 mV
3	MODE_PULSE	Mode pin pulse width configuration 0 — 0 μs (default) 1 — 2 μs
2	SMART_MODE	DVS smart mode configuration 0 — Smart mode disabled. BUCK2/3 output voltage is determined by BUCKx_OUT_DVSx from MODE[2:0] pin logic combination (default) 1 — Smart mode enabled
1	MODE2_EN	MODE2 pin enable bit (Only when SMART_MODE bit = 1b) 0 — Mode2 pin is ignored (default) 1 — Mode2 pin is used to select BUCK2 or BUCK3 for DVS control
0	BUCK_SEL	BUCK selection in Smart DVS mode when MODE2_EN bit = 0b. 0 — BUCK2 (default) 1 — BUCK3

8.2.18 BUCK23_DVS_CFG2

BUCK2, BUCK3 DVS control configuration register

13-channel power management integrated circuit (PMIC) for ultra-low power applications

Table 53. BUCK23_DVS_CFG2 register (address 13h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	B2_DVS_CTRL		B3_DVS_CTRL		RSVD			
Reset	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 54. BUCK23_DVS_CFG2 register (address 13h) bit descriptions

Bit	Symbol	Description
7 to 6	B2_DVS_CTRL	BUCK2 DVS Control 00 — DVS control BUCK2OUT_DVS0 Reg through I2C (default) 01 — DVS control through PMIC_STBY_REQ pin 10 — DVS control through MODE[2:0] pins in Active mode and the voltage set to BUCK2OUT_STBY when PMIC_STBY_REQ = H 11 — DVS control through MODE[2:0] pins in RUN state
5 to 4	B3_DVS_CTRL	BUCK3 DVS Control 00 — DVS control BUCK3OUT_DVS0 Reg through I2C (default) 01 — DVS control through PMIC_STBY_REQ pin 10 — DVS control through MODE[2:0] pins in Active mode and the voltage set to BUCK3OUT_STBY when PMIC_STBY_REQ = H 11 — DVS control through MODE[2:0] pins in RUN state
3 to 0	RSVD	Reserved

8.2.19 BUCK2CTRL

BUCK2 control register for Ramp, DVS control, Active discharge, FPWM and Enable.

Table 55. BUCK2CTRL register (address 14h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	B2_RAMP		B2_LPMODE		B2_AD	B2_FPWM	B2_ENMODE	
Reset	0	1	1	1	1	0	0	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 56. BUCK2CTRL register (address 14h) bit descriptions

Bit	Symbol	Description
7 to 6	B2_RAMP	BUCK2 DVS speed 00 — 25 mV / 1 μ s 01 — 25 mV / 2 μ s (default) 10 — 25 mV / 4 μ s 11 — 25 mV / 8 μ s
5 to 4	B2_LPMODE	BUCK2 power mode 00 — Automatic transition mode 01 — Low power mode at STANDBY mode and DPSTANDBY mode 10 — Low power mode at DPSTANDBY mode 11 — Normal mode (default)
3	B2_AD	BUCK2 Active discharge 0 — Always disable Active discharge resistor 1 — Enable Active discharge resistor when regulator is OFF (default)
2	B2_FPWM	Forced PWM mode

Table 56. BUCK2CTRL register (address 14h) bit descriptions...continued

Bit	Symbol	Description
		0 — Automatic PFM and PWM mode transition (default) 1 — Forced PWM mode
1 to 0	B2_ENMODE	BUCK2 enable mode 00 — OFF 01 — ON at RUN State (default) 10 — ON at ACTIVE mode or STANDBY mode, OFF at DPSTANDBY 11 — ON at ACTIVE mode, OFF at STANDBY or DPSTANDBY

8.2.20 BUCK2OUT_DVS0

BUCK2 DVS output voltage when MODE[2:0] = 000 && PMIC_STBY_REQ = L

Table 57. BUCK2OUT_DVS0 register (address 15h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD	B2_DVS0						
Reset	0	0	1	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 58. BUCK2OUT_DVS0 register (address 15h) bit descriptions

Bit	Symbol	Description
7	RSVD	Reserved
6 to 0	B2_DVS0	BUCK2 DVS0 Output voltage Programmable from 0.60 V to 2.1875 V in 12.5 mV steps 010 0000 — 1.0 V (default) See Table 107

8.2.21 BUCK2OUT_DVS1

BUCK2 DVS output voltage when MODE[2:0] = 001 && PMIC_STBY_REQ = L

Table 59. BUCK2OUT_DVS1 register (address 16h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD	B2_DVS1						
Reset	0	0	0	1	1	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 60. BUCK2OUT_DVS1 register (address 16h) bit descriptions

Bit	Symbol	Description
7	RSVD	Reserved
6 to 0	B2_DVS1	BUCK2 DVS1 Output voltage Programmable from 0.60 V to 2.1875 V in 12.5 mV steps 001 1000 — 0.9 V (default) See Table 107

8.2.22 BUCK2OUT_DVS2

BUCK2 DVS output voltage when MODE[2:0] = 010 && PMIC_STBY_REQ = L

Table 61. BUCK2OUT_DVS2 register (address 17h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD	B2_DVS2						
Reset	0	0	0	1	1	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 62. BUCK2OUT_DVS2 register (address 17h) bit descriptions

Bit	Symbol	Description
7	RSVD	Reserved
6 to 0	B2_DVS2	BUCK1 DVS2 Output voltage Programmable from 0.60 V to 2.1875 V in 12.5 mV steps 001 1000 — 0.9 V (default) See Table 107

8.2.23 BUCK2OUT_DVS3

BUCK2 DVS output voltage when MODE[2:0] = 011 && PMIC_STBY_REQ = L

Table 63. BUCK2OUT_DVS3 register (address 18h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD	B2_DVS3						
Reset	0	0	0	1	1	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 64. BUCK2OUT_DVS3 register (address 18h) bit descriptions

Bit	Symbol	Description
7	RSVD	Reserved
6 to 0	B2_DVS3	BUCK2 DVS3 Output voltage Programmable from 0.60 V to 2.1875 V in 12.5 mV steps 001 1000 — 0.9 V (default) See Table 107

8.2.24 BUCK2OUT_DVS4

BUCK2 DVS output voltage when MODE[2:0] = 100 && PMIC_STBY_REQ = L

Table 65. BUCK2OUT_DVS4 register (address 19h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD	B2_DVS4						
Reset	0	0	0	1	1	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

8.2.39 BUCK3OUT_DVS7

BUCK3 DVS output voltage when MODE[2:0] = 111 && PMIC_STBY_REQ = L

Table 95. BUCK3OUT_DVS7 register (address 29h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD	B3_DVS7						
Reset	0	0	1	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 96. BUCK3OUT_DVS7 register (address 29h) bit descriptions

Bit	Symbol	Description
7	RSVD	Reserved
6 to 0	B3_DVS7	BUCK3 DVS7 Output voltage Programmable from 0.60 V to 2.1875 V in 12.5 mV steps 010 0000 — 1.0 V (default) See Table 107

8.2.40 BUCK3OUT_STDBY

BUCK3 DVS output voltage PMIC_STBY_REQ = H

Table 97. BUCK3OUT_STDBY register (address 2Ah) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD	B3_DVS_STBY						
Reset	0	0	1	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 98. BUCK3OUT_STDBY register (address 2Ah) bit descriptions

Bit	Symbol	Description
7	RSVD	Reserved
6 to 0	B3_DVS_STBY	BUCK3 Output voltage at Standby mode Programmable from 0.60 V to 2.1875 V in 12.5 mV steps 010 0000 — 1.0 V (default) See Table 107

8.2.41 BUCK3OUT_MAX_LIMIT

BUCK3 output voltage max limit register. This register is protected by Lock key, 0x4E register should be written with unlock key before updating this register.

Table 99. BUCK3OUT_MAX_LIMIT register (address 2Ch) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD	B3_MAX_LIMIT						
Reset	0	0	1	1	1	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 100. BUCK3OUT_MAX_LIMIT register (address 2Ch) bit descriptions

Bit	Symbol	Description
7	RSVD	Reserved
6 to 0	B3_MAX_LIMIT	BUCK3 output voltage max limit Programmable from 0.60 V to 2.1875 V in 12.5 mV steps 011 1000 — 1.3 V (default) See Table 107

8.2.42 BUCK3OUT_MIN_LIMIT

BUCK3 output voltage lower limit register. This register is protected by Lock key, 0x4E register should be written with unlock key before updating this register.

Table 101. BUCK3OUT_MIN_LIMIT register (address 2Dh) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD	B3_MIN_LIMIT						
Reset	0	0	0	0	1	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 102. BUCK3OUT_MIN_LIMIT register (address 2Dh) bit descriptions

Bit	Symbol	Description
7	RSVD	Reserved
6 to 0	B3_MIN_LIMIT	BUCK3 output voltage minimum limit Programmable from 0.60 V to 2.1875 V in 12.5 mV steps 000 1000 — 0.7 V (default) See Table 107

8.2.43 BUCK4CTRL

BUCK4 control register for Active discharge, FPWM and Enable.

Table 103. BUCK4CTRL register (address 2Eh) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD		B4_LPMODE		B4_AD	B4_FPWM	B4_ENMODE	
Reset	0	0	1	1	1	0	0	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

13-channel power management integrated circuit (PMIC) for ultra-low power applications

Table 104. BUCK4CTRL register (address 2Eh) bit descriptions

Bit	Symbol	Description
7 to 6	RSVD	Reserved
5 to 4	B4_LPMODE	BUCK4 power mode 00 — Automatic transition mode 01 — Low power mode at STANDBY mode and DPSTANDBY mode 10 — Low power mode at DPSTANDBY mode 11 — Normal mode (default)
3	B4_AD	Buck4 Active discharge 0 — Always disable Active discharge resistor 1 — Enable Active discharge resistor when regulator is OFF (default)
2	B4_FPWM	Forced PWM mode 0 — Automatic PFM and PWM mode transition (default) 1 — Forced PWM mode
1 to 0	B4_ENMODE	Buck4 enable mode 00 — OFF 01 — ON at RUN State (default) 10 — ON at ACTIVE mode or STANDBY mode, OFF at DPSTANDBY 11 — ON at ACTIVE mode, OFF at STANDBY or DPSTANDBY

8.2.44 BUCK4OUT

BUCK4 output voltage configuration register. This register is protected by Lock key, 0x4E register should be written with unlock key before updating this register.

Table 105. BUCK4OUT register (address 2Fh) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD	B4_OUT						
Reset ^[1]	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

[1] The reset value depends on the specific otp version as shown in [Table 106](#).

Table 106. BUCK4OUT register (address 2Fh) bit descriptions

Bit	Symbol	Description
7	RSVD	Reserved
6 to 0	B4_OUT	BUCK4 Output voltage Programmable from 0.60 V to 3.4 V in 25 mV steps Note: PCA9460A and PCA9450B: 001 0100b (1.1 V), PCA9460C: 001 1000b (1.2 V) See Table 108

8.2.45 LDO1_CFG

LDO1 enable control and active discharge resistor configuration register

Table 109. LDO1_CFG register (address 30h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	L1_CSEL		L1_LLSEL		L1_LPMODE		L1_ENMODE	
Reset	1	0	0	1	1	1	0	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 110. LDO1_CFG register (address 30h) bit descriptions

Bit	Symbol	Description
7 to 6	L1_CSEL	Total Output capacitor selection 00 — Setting for Cout < 5 µF 01 — Setting for Cout < 5 µF 10 and 11 — Auto Cout detection (default)
5 to 4	L1_LLSEL	Output trace resistance compensation 00 — No Compensation 01 — 15 mΩ (default) 10 — 30 mΩ 11 — 45 mΩ
3 to 2	L1_LPMODE	LDO1 power mode 00 — Low power mode at RUN state 01 — Low power mode at STANDBY mode and DPSTANDBY mode 10 — Low power mode at DPSTANDBY mode 11 — Normal mode (default)
1 to 0	L1_ENMODE	LDO1 Enable mode 00 — OFF 01 — ON at RUN State (default) 10 — ON at ACTIVE mode or STANDBY mode, OFF at DPSTANDBY 11 — ON at ACTIVE mode, OFF at STANDBY or DPSTANDBY

8.2.46 LDO1_OUT

LDO1 output voltage register. This register is protected by Lock key, 0x4E register should be written with unlock key before updating this register.

Table 111. LDO1_OUT register (address 31h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	L1_AD	L1_INL1_MDET	L1_INL1_VSEL	L1_OUT				
Reset	1	0	0					
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 112. LDO1_OUT register (address 31h) bit descriptions

Bit	Symbol	Description
7	L1_AD	LDO1 Active discharge enable 0 — Always disable Active discharge resistor 1 — Enable Active discharge resistor when regulator is OFF (default)
6	L1_INL1_MDET	Manual detection for INL1 supply 0 — Auto detection (default) 1 — Manual configuration
5	L1_INL1_VSEL	INL1 voltage selection, effective only when L1_INL1_MDET = 1b 0 — (VSYS – VINL1) ≤ 0.7 (default) 1 — (VSYS – VINL1) > 0.7
4 to 0	L1_OUT	LDO1 output voltage Programmable from 0.6 V to 1.95 V in 50 mV steps See Table 113 ^[1]

[1] • PCA9460A: 0 1010 (1.1 V)
 • PCA9460B: 0 0000 (0.6 V)
 • PCA9460C: 0 1100 (1.2 V)

Table 113. L1_OUT values

0x00 : 0.60 V	0x8 : 1.00 V	0x10 : 1.40 V	0x18 : 1.80 V

8.2.49 LDO2_OUT_H

LDO2 output voltage register when LDO2_VSEL is High. This register is protected by Lock key, 0x4E register should be written with unlock key before updating this register.

Table 119. LDO2_OUT_H register (address 34h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD			L2_OUT_H				
Reset	0	0	0	1	0	1	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 120. LDO2_OUT_H register (address 34h) bit descriptions

Bit	Symbol	Description
7 to 6	RSVD	Reserved
5 to 0	L2_OUT_H	LDO2 output voltage when LDO2_VSEL = High Programmable from 0.8 V to 3.3 V in 50 mV steps 01 0100 — 1.8 V (default) See Table 118

8.2.50 LDO3_CFG

LDO3 enable control and active discharge resistor configuration register

Table 121. LDO3_CFG register (address 35h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD			L3_AD	RSVD		L3_ENMODE	
Reset	0	0	0	1	0	0	0	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 122. LDO3_CFG register (address 35h) bit descriptions

Bit	Symbol	Description
7 to 5	RSVD	Reserved
4	L3_AD	LDO3 Active discharge enable 0 — Always disable Active discharge resistor 1 — Enable Active discharge resistor when regulator is OFF (default)
3 to 2	RSVD	Reserved
1 to 0	L3_ENMODE	LDO3 Enable mode 00 — OFF 01 — ON at RUN State (default) 10 — ON at ACTIVE mode or STANDBY mode, OFF at DPSTANDBY 11 — ON at ACTIVE mode, OFF at STANDBY or DPSTANDBY

8.2.51 LDO3_OUT

LDO3 output voltage register. This register is protected by Lock key, 0x4E register should be written with unlock key before updating this register.

Table 123. LDO3_OUT register (address 36h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	RSVD			L3_OUT				
Reset	0	0	1	1	0	0	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 124. LDO3_OUT register (address 36h) bit descriptions

Bit	Symbol	Description
7 to 6	RSVD	Reserved
5 to 0	L3_AD	LDO3 output voltage Programmable from 0.8 V to 3.3 V in 50 mV steps

13-channel power management integrated circuit (PMIC) for ultra-low power applications

Table 124. LDO3_OUT register (address 36h) bit descriptions...continued

Bit	Symbol	Description
		11 0010 — 3.3 V (default) See Table 125

Table 125. L3_OUT values

8.2.55 LSW1_CTRL

Load switch 1 configuration register

Table 134. LSW1_CTRL register (address 40h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	LSW1_CFG	RSVD		LSW1_AD	RSVD		LSW1_EN	
Reset	0	0	0	1	0	0	0	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 135. LSW1_CTRL register (address 40h) bit descriptions

Bit	Symbol	Description
7	LSW1_CFG	Load SW 1 Configuration 0 — Load switch (default) 1 — LED driver
6 to 5	RSVD	Reserved
4	LSW1_AD	Load SW 1 active discharge, if it is configured to LED, active discharge resistor is always off. 0 — Disabled 1 — Enabled when Load SW1 is off (default)
3 to 2	RSVD	Reserved
1 to 0	LSW1_EN	Load SW 1 Enable mode 00 — OFF 01 — ON at RUN State (default) 10 — ON at ACTIVE mode or STANDBY mode, OFF at DPSTANDBY 11 — ON at ACTIVE mode, OFF at STANDBY or DPSTANDBY

8.2.56 LSW2_CTRL

Load switch 2 configuration register

Table 136. LSW2_CTRL register (address 41h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	LSW2_CFG	RSVD		LSW2_AD	RSVD		LSW2_EN	
Reset	0	0	0	1	0	0	0	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 137. LSW2_CTRL register (address 41h) bit descriptions

Bit	Symbol	Description
7	LSW2_CFG	Load SW 2 Configuration 0 — Load switch (default) 1 — LED driver
6 to 5	RSVD	Reserved
4	LSW2_AD	Load SW 2 active discharge, if it is configured to LED, active discharge resistor is always off. 0 — Disabled 1 — Enabled when Load SW1 is off (default)
3 to 2	RSVD	Reserved
1 to 0	LSW2_EN	Load SW 2 Enable mode

13-channel power management integrated circuit (PMIC) for ultra-low power applications

Table 137. LSW2_CTRL register (address 41h) bit descriptions...continued

Bit	Symbol	Description
		00 — OFF 01 — ON at RUN State (default) 10 — ON at ACTIVE mode or STANDBY mode, OFF at DPSTANDBY 11 — ON at ACTIVE mode, OFF at STANDBY or DPSTANDBY

8.2.57 LSW3_CTRL

Load switch 3 configuration register

Table 138. LSW3_CTRL register (address 42h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	LSW3_CFG	RSVD			LSW3_AD	RSVD		LSW3_EN
Reset	0	0	0	1	0	0	0	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 139. LSW3_CTRL register (address 42h) bit descriptions

Bit	Symbol	Description
7	LSW3_CFG	Load SW 3 Configuration 0 — Load switch (default) 1 — LED driver
6 to 5	RSVD	Reserved
4	LSW3_AD	Load SW 3 active discharge, if it is configured to LED, active discharge resistor is always off. 0 — Disabled 1 — Enabled when Load SW1 is off (default)
3 to 2	RSVD	Reserved
1 to 0	LSW3_EN	Load SW 3 Enable mode 00 — OFF 01 — ON at RUN State (default) 10 — ON at ACTIVE mode or STANDBY mode, OFF at DPSTANDBY 11 — ON at ACTIVE mode, OFF at STANDBY or DPSTANDBY

8.2.58 LSW4_CTRL

Load switch 4 configuration register

Table 140. LSW4_CTRL register (address 43h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	LSW4_CFG	RSVD			LSW4_AD	RSVD		LSW4_EN
Reset	0	0	0	1	0	0	0	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 141. LSW4_CTRL register (address 43h) bit descriptions

Bit	Symbol	Description
7	LSW4_CFG	Load SW 4 Configuration 0 — Load switch (default)

Table 141. LSW4_CTRL register (address 43h) bit descriptions...continued

Bit	Symbol	Description
		1 — LED driver
6 to 5	RSVD	Reserved
4	LSW4_AD	Load SW 4 active discharge, if it is configured to LED, active discharge resistor is always off. 0 — Disabled 1 — Enabled when Load SW1 is off (default)
3 to 2	RSVD	Reserved
1 to 0	LSW4_EN	Load SW 4 Enable mode 00 — OFF 01 — ON at RUN State (default) 10 — ON at ACTIVE mode or STANDBY mode, OFF at DPSTANDBY 11 — ON at ACTIVE mode, OFF at STANDBY or DPSTANDBY

8.2.59 LED1_CTRL

LED1 Enable and brightness configuration

Table 142. LED1_CTRL register (address 44h) bit allocation

Bit	7	6	5	4	3	2	1	0
Symbol	LED1_EN		RSVD	LED1_BRT				
Reset	0	0	0	0	0	0	0	0

9.2 Typical application

The PCA9460 devices have only a few design requirements. Use the following parameters for the design

- 1 μ F bypass capacitor on VINT and VSYS, located as close as possible to those pins to ground
- Input capacitors must be present on the INB and INL supplies if used
- Output inductors and capacitors must be used on the outputs of the BUCK converters if used
- Output capacitors must be used on the outputs of the LDOs

9.2.1 Detailed design procedure

9.2.2 Inductor selection for buck converters

Each of the converters in the PCA9460 typically use a 0.47 μ H output inductor which has to be rated for its DC resistance and saturation current. The DC resistance of the inductance influences directly the efficiency of the converter. Therefore, an inductor with lowest DC resistance must be selected for highest efficiency.

Equation 1 calculates the peak-to-peak inductor ripple current under static load conditions. The saturation current of the inductor must be rated higher than the maximum inductor current as calculated with Equation 2. This is needed because during heavy load transient the inductor current rises above the calculated value.

$$\Delta I_L = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in,max}}}{L \times f} \quad (1)$$

$$I_{L,max} = I_{out,max} + \frac{\Delta I_L}{2} \quad (2)$$

Where

f = switching frequency (2 MHz)

L = Inductance

ΔI_L = Peak to peak inductor ripple current

$I_{L,max}$ = Maximum inductor current

$I_{out,max}$ = Maximum output DC current

A conservative approach is to select the inductor current rating just for the maximum switch current of the PCA9460

9.2.3 Output capacitor selection for buck converters

The fast response adaptive constant ON time control scheme of the buck converters implemented in the PCA9460 allow the use of small ceramic capacitors with a typical value of 22 μ F for each converter without having large output voltage under and overshoots during heavy load transients. Ceramic capacitors having low ESR values have the lowest output voltage ripple and are recommended. See Table 19 for recommended.

If ceramic output capacitors are used, the capacitor RMS ripple current rating always meets the application requirements. Just for completeness, the RMS ripple current is calculated in Equation 3.

$$I_{RMS,COUT} = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \times \frac{1}{2\sqrt{3}} \quad (3)$$

At nominal load current, the inductive converters operate in PWM mode. The overall output voltage ripple is the sum of the voltage spike caused by the output capacitor ESR plus the voltage ripple caused by charging and discharging the output capacitor:

$$\Delta V_{out} = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \times \left(\frac{1}{8 \times C_{out} \times f} + ESR \right) \quad (4)$$

Where

The highest output voltage ripple occurs at the highest input voltage V_{in} .

At light load currents, the converters operate in PFM mode and the output voltage ripple is dependent on the output capacitor value. The output voltage ripple is set by the internal comparator delay and the external capacitor. The typical output voltage ripple is less than 1 % of the nominal output voltage.

9.2.4 Input capacitor selection for buck converters

Low ESR input capacitor is highly recommended for best input voltage filtering and minimizing the interference with other circuits caused by high input voltage spikes because of the nature of buck converter. Each DC-DC

converter requires a 10 μF ceramic input capacitor on its input pins. The input capacitor could be increased without any limit for better input voltage filtering.

9.3 Layout guide

Figure 25 shows layout guidance.

Figure 25. PCA9460 layout

12 Thermal characteristics

Table 171. Thermal characteristics

Symbol	Parameter	Board Type ^[1]	Typ	Unit
R _{θJA}	Thermal resistance from junction to ambient ^[2]	JESD51-9, 2s2p	46	°C/W

Table 171. Thermal characteristics...continued

Symbol	Parameter	Board Type ^[1]	Typ	Unit
Ψ_{JT}	Junction to Top of package Thermal Characterization Parameter ^[2]	JESD51-9, 2s2p	2	°C/W

[1] Thermal test board meets JEDEC specification for this package (JESD51-9)

[2] Determined in accordance to JEDEC JESD51-2A natural convection environment. Thermal resistance data in this report is solely for a thermal performance comparison of one package to another in a standardized specified environment. It is not meant to predict the performance of a package in an application-specific environment

12.1 Rating data

Junction to ambient thermal resistance nomenclature: the JEDEC specification reserves the symbol R θ JA or θ JA (Theta-JA) strictly for junction-to-ambient thermal resistance on a 1s test board in a natural convection environment. R θ JMA or θ JMA (Theta-JMA) is used for both junction-to-ambient on a 2s2p test board in natural convection and for junction-to-ambient with forced convection on both 1s and 2s2p test boards. It is anticipated the generic name, Theta-JA, continues to be commonly used. The JEDEC standards can be consulted at <http://www.jedec.org>.

12.2 Estimation of junction temperature

An estimation of the chip junction temperature T_J can be obtained from the equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

with:

T_A = Ambient temperature for the package in °C

R θ JA = Junction to ambient thermal resistance in °C/W

P_D = Power dissipation in the package in W

The junction-to-ambient thermal resistance is an industry standard value providing a quick and easy estimation of thermal performance. Unfortunately, there are two values in common usage: the value determined on a single-layer board R θ JA and the value obtained on a four-layer board R θ JMA. Actual application PCBs show a performance close to the simulated four-layer board value, although this may be somewhat degraded in case of significant power dissipated by other components placed close to the device.

At a known board temperature, the junction temperature T_J is estimated using the following equation:

$$T_J = T_B + (R_{\theta JB} \times P_D)$$

with:

T_B = Board temperature at the package perimeter in °C

R θ JB = Junction to board thermal resistance in °C/W

P_D = Power dissipation in the package in W

Legal information

Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <https://www.nxp.com>.

Definitions

Draft — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <https://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

13-channel power management integrated circuit (PMIC) for ultra-low power applications

Quick reference data — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Suitability for use in non-automotive qualified products — Unless this document expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Translations — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

NXP B.V. — NXP B.V. is not an operating company and it does not distribute or sell products.
