Description

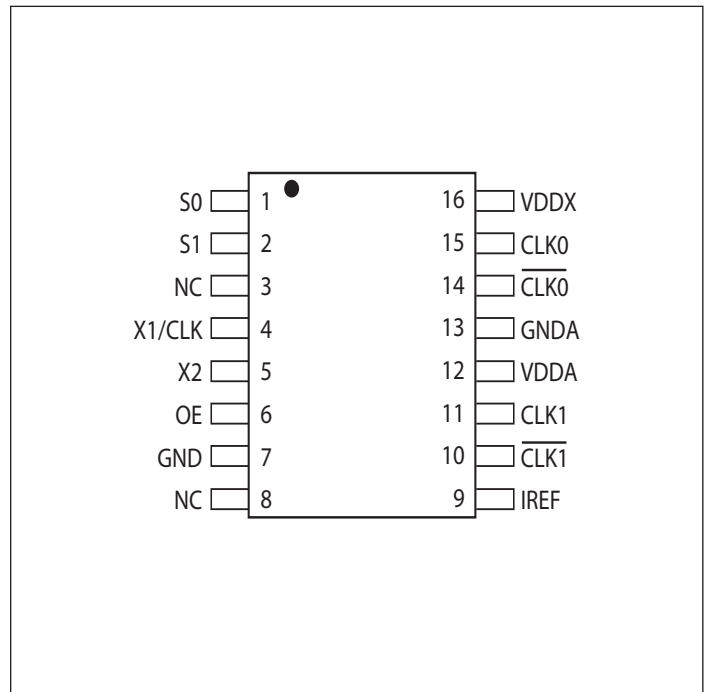

The PI6LC48H02 is a clock generator compliant to PCI Express® 3.0/2.0/1.0 and Ethernet requirements. The device is used for PC or embedded systems.

The PI6LC48H02 provides two differential (HCSL) or LVDS outputs. Using Pericom's patented Phase Locked Loop (PLL) techniques, the device takes a 25MHz crystal input and produces two pairs of differential outputs (HCSL) at 25MHz, 100MHz, 125MHz, 200MHz clock frequencies.

Application Information

Decoupling Capacitors

Decoupling capacitors of 0.01μF should be connected between each V_{DD} pin and the ground plane and placed as close to the V_{DD} pin as possible.

Crystal

Use a 25MHz fundamental mode parallel resonant crystal with less than 300PPM of error across temperature.

Crystal Capacitors

C_L = Crystals's load capacitance in pF

Crystal Capacitors (pF) = $(C_L - 8) * 2$

For example, for a crystal with 16pF load caps, the external effective crystal cap would be 16 pF. $(16-8)*2=16$.

Current Source (IREF) Reference Resistor - R_R

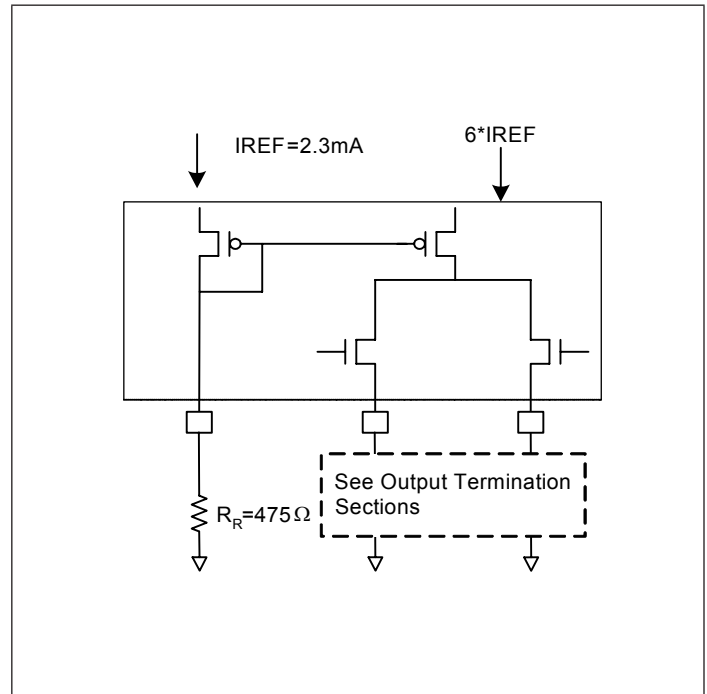

If board target trace impedance is 50Ω, then $R_R = 475\Omega$ providing an IREF of 2.32 mA. The output current (I_{OH}) is 6*IREF.

Output Termination

The PCI Express differential clock outputs of the PI6LC48H02 are open source drivers and require an external series resistor and a resistor to ground. These resistor values and their allowable locations are shown in detail in the PCI Express Layout Guidelines section.

The PI6LC48H02 can be configured for LVDS compatible voltage levels. See the LVDS Compatible Layout Guidelines section.
