Description

Pericom Semiconductor's PI74AUC series of logic circuits are produced using the Company's advanced submicron CMOS technology, achieving industry leading speeds.

The PI74AUC16244 is a 16-bit buffer driver designed specifically to improve both the performance and density of 3-state memory address drivers, clock drivers and bus-oriented receivers and transmitters.

The device can be used as four 4-bit buffers, two 8-bit buffers, or one 16-bit buffer. It provides non-inverting outputs and symmetrical active-low output-enable $\overline{OE}$ inputs.

To ensure the high-impedance state during power-up or power-down, $\overline{OE}$ should be tied to V_{CC} through a pull-up resistor; the minimum value of the resistor is determined by the current-sinking ability of the driver.

The PI74AUC16244 is specified for partial power down applications using I_{OFF} . The I_{OFF} circuitry disables the outputs preventing current backflow through the device when it is powered down.

Notes:

1. Input negative voltage & output voltage ratings may be exceeded if the input and output current rating are observed.
2. This value is limited to 3.6V maximum.
3. The package thermal impedance is calculated in accordance with JESD 51.
4. Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
