

PI74LVTCH16245

3.3V 16-Bit Bi-Directional Transceiver with 3-State Outputs

Product Features

- Advanced low power CMOS design for 2.7V to 3.6V V_{CC} operation
- Supports 5V input/output tolerance in mixed signal mode operation
- Function compatible with LVT family of products
- Balanced $\pm 24\text{mA}$ output drive
- Typical V_{OLP} (Output Ground Bounce) $< 0.8\text{V}$ at $V_{CC}=3.3\text{V}$, $T_A=25^\circ\text{C}$
- I_{off} and Power Up/Down 3-State support live insertion
- Bus Hold on data inputs eliminates the need for external pull-up/down resistors
- Latch-up performance exceeds 200mA Per JESD78
- ESD protection exceeds JESD 22
 - 2000V Human-Body Model (A114-B)
 - 200V Machine Model (A115-A)
- Industrial Temperature: -40°C to $+85^\circ\text{C}$
- Packaging (Pb-free & Green available):
 - 48-pin 240-mil wide plastic TSSOP (A)

Product Description

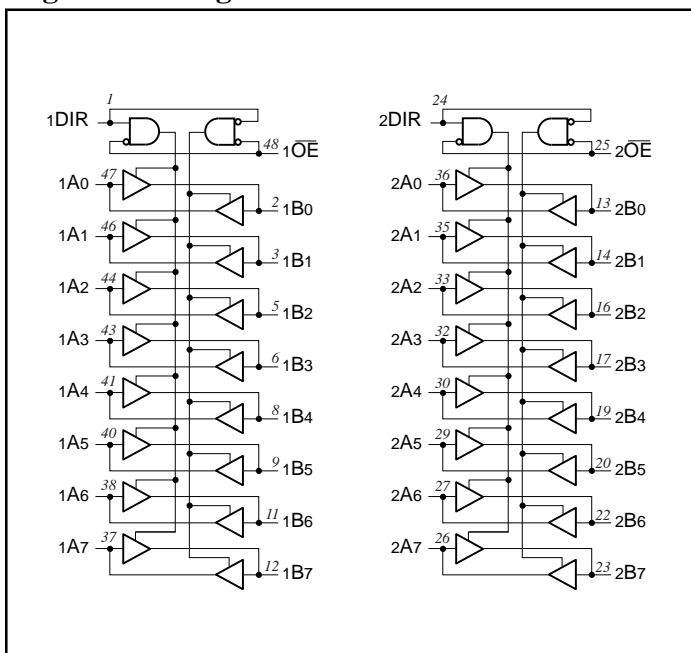

The PI74LVTCH16245 is a non-inverting 16-bit Bidirectional Transceiver designed for low-voltage 2.7V to 3.6V V_{CC} operation, with the capability of interfacing to the 5V system environment. This transceiver is designed for asynchronous two-way communication between data buses. The direction control input pin ($x\text{DIR}$) determines the direction of the data flow through the bidirectional transceiver. The Direction and Output Enable controls are designed to operate this device as either two independent 8-bit transceivers or one 16-bit transceiver. The output enable ($x\overline{\text{OE}}$) input, when HIGH, disables both A and B ports by placing them in HIGH Z condition.

The PI74LVTCH16245 has "Bus Hold" which retains the data input's last valid logic state whenever the data input goes to high-impedance, preventing "floating" inputs and eliminating the need for pull-up/down resistors.

When V_{CC} is between 0 to 1.5V during power up or power down, the outputs of the device are in the high-impedance state. To ensure the high-impedance state above 1.5V, $\overline{\text{OE}}$ should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current sinking capability of the driver.

The device fully supports live-insertion with its I_{off} and power-up/down 3-state. The I_{off} circuitry disables the outputs when the power is off, preventing the backflow of damaging current through the device. Power-up/down 3-state places the outputs in the high-impedance state during power up or power down, preventing driver conflict.

Maximum Ratings

(Above which the useful life may be impaired.
 For user guidelines, not tested.)

Supply voltage range, V_{CC}	-0.5V to +6.5V
Input voltage range, $V_I^{(1)}$	-0.5V to +6.5V
Voltage range applied to any output in the high-impedance or power-off state, $V_O^{(1)}$	-0.5V to +6.5V
Voltage range applied to any output in the active state, $V_O^{(1,2)}$	-0.5V to $V_{CC}+0.5V$
Input clamp current, I_{IK} ($V_I < 0$)	-50mA
Output clamp current, I_{OK} ($V_O < 0$)	-50mA
Continous Output Current I_O	$\pm 50mA$
Continous Current through each VCC or GND pin	$\pm 100mA$
Package thermal impedance, $\theta_{JA}^{(3)}$	104°C/W
Storage Temperature range, T_{stg}	-65°C to 150°C

Notes:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

1. The input negative-voltage and output voltage ratings may be exceeded if the input and output clamp current ratings are observed.
2. This value is limited to 6.5V maximum.
3. The package thermal impedance is calculated in accordance with JESD 51.

Truth Table⁽¹⁾

Notes:

- For I/O ports, Input Leakage Current (I_I) includes the 3-state Output Leakage Current. Unused pins are at V_{CC} or GND.
- This is the maximum bus-hold dynamic current. It is the minimum overdrive current required to switch the input from one state to another.
- This applies in the disabled state only.
- This is the increase in supply current for each input that is at the specified TTL voltage level rather than V_{CC} or GND.

Capacitance

Parameters	Description	Test Conditions	Typ. ⁽¹⁾	Units
C _I	Control Input Capacitance	V _{CC} = 3.3V, V _I = V _{CC} or GND	3.4	pF
C _{IO}	Output/Capacitance	V _{CC} = 3.3V, V _O = V _{CC} or GND	8	
C _{PD}	Power Dissipation Capacitance ⁽²⁾	V _{CC} = 3.3V, V _I = 0V or V _{CC} , f=10 MHz	23	

Notes:

- All typical values are measured at V_{CC} = 3.3V, T_A = 25°C.
- C_{PD} is defined as the value of the internal equivalent capacitance which is derived from dynamic operating current consumption (I_{CCD}) at no output loading, and operating at 50% duty cycle, C_{PD} is related to I_{CCD} dynamic operating current by the expression: I_{CCD} = (C_{PD})(V_{CC})(f_{IN}) + (I_{CCstatic})

Notes:

- A. C_L includes probe and jig capacitance.
- B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
- All input impulses are supplied by generators having the following characteristics: $PRR \leq 10$ MHz, $Z_O = 50\Omega$, $t_R \leq 2.5$ ns, $t_F \leq 2.5$ ns.
- The outputs are measured one at a time with one transition per measurement.
