

## 3-Terminal Negative Output Voltage Regulators

These voltage regulators are intended as complements to the popular PJ7900 Series devices. These negative regulators are available in the same seven-voltage options as the PJ7900 devices. In addition, one extra voltage option commonly employed in MECL systems is also available in the negative PJ7900 Series.

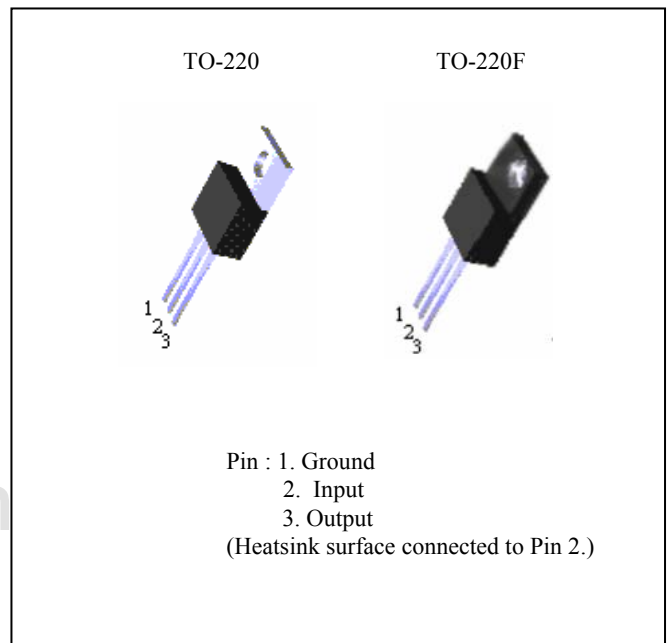

### FEATURES

- Output Current up to 1 Ampere
- No External Components Required
- Internal Thermal Overload Protection
- Internal Short-Circuit Current Limiting
- Output Transistor Safe-Area Compensation
- Available in 4% Voltage Tolerance

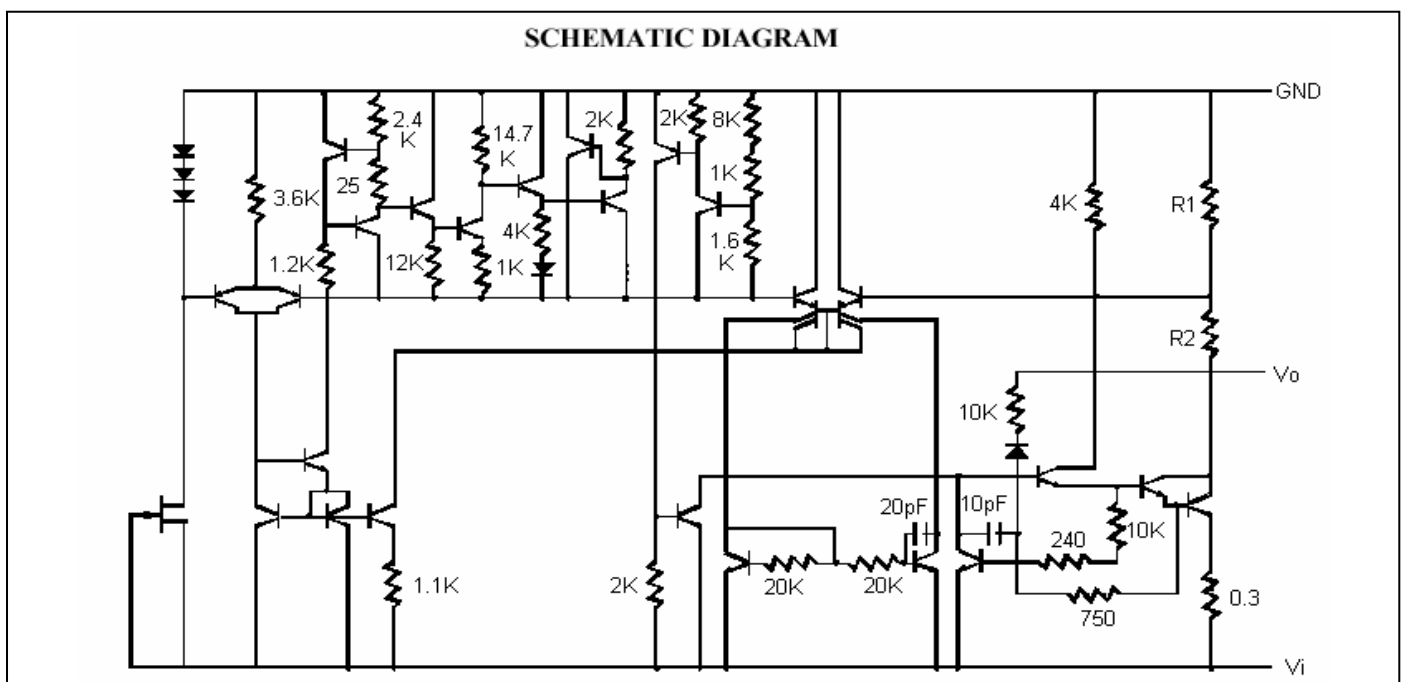

### ORDERING INFORMATION

| Device   | Operating Temperature (Ambient) | Package |
|----------|---------------------------------|---------|
| PJ79xxCZ | -20 °C to +85°C                 | TO-220  |
| PJ79xxCI |                                 | TO-220F |

Available in fixed output voltage options from -5.0 to -24 volts, these regulators employ current limiting, thermal shutdown, and safe-area compensation--making them remarkably rugged under most operating conditions. With adequate heatsinking they can deliver output currents in excess of 1 ampere.

### CIRCUIT SCHEMATIC

**ABSOLUTE MAXIMUM RATINGS** ( $T_a=25^\circ\text{C}$ )

| RATING  | SYMBOL           | PJ7900 Series | UNIT                      |
|---|------------------|---------------|---------------------------|
| Input Voltage *(-5V $\geq$ $V_o \geq$ -18V)<br>**(-24V) | $V_{in}$         | -35<br>-40    | V                         |
| Power Dissipation TO-220                                | Without heatsink | 2             | $^\circ\text{C}/\text{W}$ |
| TO-220  | Pt ***           | 15            |                           |
| TO-220F   | With heatsink    | 10            |                           |
| Operating Ambient Temperature                           | $T_{opr}$        | -20 to +85    | $^\circ\text{C}$          |
| Operating Junction Temperature                          | $T_j$            | 0 to +125     | $^\circ\text{C}$          |
| Storage Temperature                                     | $T_{stg}$        | -25 to +150   | $^\circ\text{C}$          |

Note: \*1: PJ7905 to PJ7918

\*\*2: PJ7924

\*\*\*3: Follow the derating curve. When  $T_j$  exceeds  $150^\circ\text{C}$ , the internal circuit cuts off the output.

| Output Voltage Temperature Coefficient | $\Delta V_o/T_a$    | 1            | $I_o=5\text{mA}$ , $T_j=0$ to $125^\circ\text{C}$                              | --                                | -0.4 | --    | $\text{mV}/^\circ\text{C}$ |    |

Note: The specified condition  $T_j=25^\circ\text{C}$  means that the test should be carried out with the test time so short (within 10mS), that the drift in characteristic value due to the rise in chip junction temperature can be ignored.

**STANDARD APPLICATION**

A common ground is required between the input and the output voltages. The input voltage must remain typically 2.0 V more negative even during the high point on the input ripple voltage.

XX = these two digits of the type number indicate voltage.

\* =  $C_{in}$  is required if regulator is located an appreciable distance from power supply filter.

\*\* =  $C_o$  improves stability and transient response.
