

## 2.5V to 3.3V, Low-Skew, 1:4 Differential PECL Fanout Buffer

### Features

- Four Differential 2.5V/3.3V LVPECL Output Pairs
- Output Frequency:  $\leq 800$  MHz
- Two Selectable Differential Input Pairs
- Translates Any Standard Single-Ended or Differential Input Format to LVPECL Output. It Can Accept the Following Standard Input Formats and More:
  - LVPECL, LVCMOS, LVDS, HCSL, SSTL, LVHSTL, CML
- Output Skew: 25 ps (typ.)
- Part-to-Part Skew: 140 ps (typ.)
- Propagation Delay: 1.5 ns (typ.)
- Additive Jitter:  $< 100$  fs (max.)
- Operating Supply Voltage: 2.375V ~ 3.63V
- Operating Temperature Range from  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$
- Package Availability: 16-Pin QFN and 20-Pin TSSOP

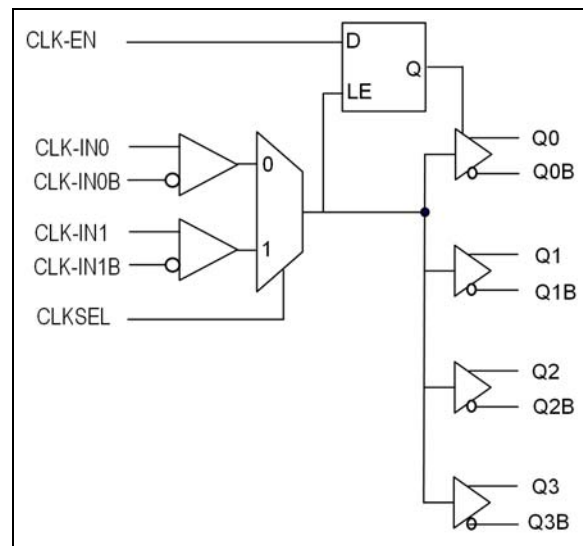

### General Description

The PL138-48 is a high performance low-cost 1:4 outputs differential LVPECL fanout buffer.

Microchip's family of differential LVPECL buffers are designed to operate from a single power supply of 2.5V  $\pm 5\%$  or 3.3V  $\pm 10\%$ . The differential input pairs are designed to accept most standard input signal levels, using an appropriate resistor bias network, and produce a high quality set of outputs with the lowest possible skew on the outputs, which is guaranteed for part-to-part or lot-to-lot skew.

Designed to fit in a small form-factor package, the PL138-48 offers up to 800 MHz of output operation with very low-power consumption and lowest additive jitter of any comparable device.

### Block Diagram

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

Supply Voltage ( $V_{DD}$ )	.....+4.6V
Input Voltage, DC ( $V_I$ )	.....-0.5V to $V_{DD}+0.5V$
Output Voltage, DC ( $V_O$ )	.....-0.5V to $V_{DD}+0.5V$
ESD Protection (HBM)	.....2 kV

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

### DC ELECTRICAL CHARACTERISTICS

Specifications:  $V_{CC} = 3.3V$ ;  $V_{EE} = 0V$ . Input and output parameters vary 1:1 with  $V_{CC}$  when  $V_{CC}$  varies  $\pm 10\%$ .

Parameters	Symbol	Min.	Typ.	Max.	Units	Conditions
Output High Voltage, (Note 1)	$V_{OH}$	2.215	2.320	2.420	V	At -40°C
		2.275	2.350	2.420		At +25°C
		2.275	2.350	2.420		At +85°C
Output Voltage Low, (Note 1)	$V_{OL}$	1.470	1.610	1.745	V	At -40°C
		1.490	1.585	1.680		At +25°C

## AC ELECTRICAL CHARACTERISTICS

$V_{CC} = -3.8V$  to  $-2.375$  or  $V_{CC} = 2.375V$  to  $3.8V$ ;  $V_{EE} = 0V$ ;  $T_A = -40^{\circ}C$  to  $+85^{\circ}C$ . All parameters are measured at  $f \leq 800$  MHz unless otherwise noted.

Parameters	Symbol	Min.	Typ.	Max.	Units	Conditions
Output Frequency	$f_{MAX}$	—	—	800	MHz	At all temperatures
Propagation Delay, (Note 1)	$t_{PD}$	600	680	750	ps	At $-40^{\circ}C$
		650	725	790		At $+25^{\circ}C$
		690	790	890		At $+85^{\circ}C$
Output Skew, (Note 2, Note 4)	$t_{SK(O)}$	—	25	37	ps	At all temperatures
Part-to-Part Skew, (Note 3, Note 4)	$t_{SK(PP)}$	—	85	225	ps	At all temperatures
Buffer Additive Phase Jitter, RMS	$t_{APJ}$	—	—	0.10	ps	At all temperatures; refer to <a href="#">Noise Characteristics</a> section
Peak-to-Peak Input Voltage (Differential Configuration)	$V_{PP}$	150	800	1200	mV	At all temperatures
Peak-to-Peak Output Voltage	$V_{SWING}$	470	800	950	mV	At $-40^{\circ}C$
		600	800	930		At $+25^{\circ}C$
		600	800	930		At $+85^{\circ}C$
Output Rise/Fall Time	$t_R/t_F$	200	—	550	ps	At all temperatures; 20% to 80% at full output swing.

- Note 1:** Measured from the differential input crossing point to the differential output crossing point.
- Note 2:** Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at the output differential cross points.
- Note 3:** Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.
- Note 4:** This parameter is defined in accordance with JEDEC Standard 65.

## TEMPERATURE SPECIFICATIONS (Note 1)

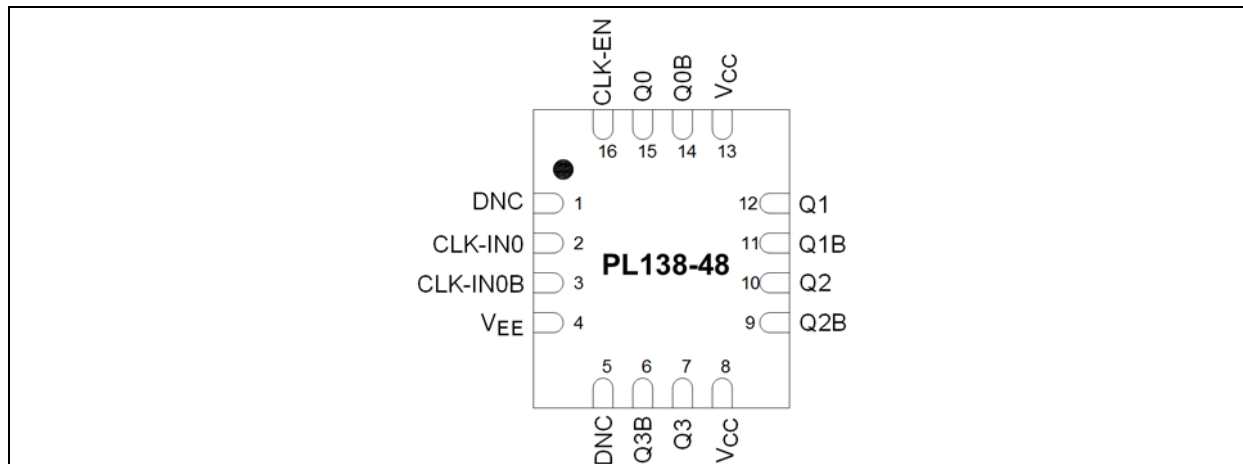

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
<b>Temperature Ranges</b>						
Ambient Operating Temperature	$T_A$	-40	—	+85	°C	Note 2
Junction Temperature	$T_J$	—	—	+110	°C	—
Storage Temperature Range	$T_S$	-65	—	+150	°C	—
Soldering Temperature	—	—	—	+260	°C	10 sec.

**Note 1:** The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature, and the thermal resistance from junction to air (i.e.,  $T_A$ ,  $T_J$ ,  $\theta_{JA}$ ). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +125°C rating. Sustained junction temperatures above +125°C can impact the device reliability.

**2:** Operating temperature is guaranteed by design for all parts (commercial and industrial), but tested for commercial grade only.

**FIGURE 2-2:** Pin Configuration, 20-Pin TSSOP.

The descriptions of the pins are listed in [Table 2-1](#).

**TABLE 2-1: PIN FUNCTION TABLE**

Pin Number QFN-16	Pin Number TSSOP-20	Pin Name	Type	Description
4	1	$V_{EE}$	P	Power supply pin connection.
16	2	CLK-EN	I	Synchronizing clock enable. When HIGH, clock outputs follow clock input. When LOW, Q outputs are forced low, QB outputs are forced high. LVTTTL/LVCMOS interface levels. 50 k $\Omega$ internal pull-up resistor.
—	3	CLK-SEL	I	Clock select input. When HIGH, selects CLK1 input. When LOW, selects CLK0 input. LVTTTL/LVCMOS interface levels. 50 k $\Omega$ internal pull-down resistor.
2	4	CLK-IN0	I	True part of differential clock input signal. 75 k $\Omega$ internal pull-down resistor.
3	5	CLK-IN0B	I	Complementary part of differential clock input signal. 100 k $\Omega$ internal pull-up and pull-down resistors.

**TABLE 2-1: PIN FUNCTION TABLE (CONTINUED)**

Pin Number QFN-16	Pin Number TSSOP-20	Pin Name	Type	Description
—	6	CLK-IN1	I	True part of differential clock input signal. 75 kΩ internal pull-down resistor.
—	7	CLK-IN1B	I	Complementary part of differential clock input signal. 100 kΩ internal pull-up and pull-down resistors.
1, 5	8, 9	DNC	—	Do Not Connect.
8, 13	10, 13, 18	V <sub>CC</sub>	P	Power supply pin connection.
6, 9, 11, 14	11, 14, 16, 19	QB0 ~ QB3	O	LVPECL Complementary output.
7, 10, 12, 15	12, 15, 17, 20	Q0 ~ Q3	O	LVPECL True output.

# PL138-48

## 3.0 NOISE CHARACTERISTICS

When a buffer is used to pass a signal, the buffer adds a little bit of its own noise. The phase noise on the output of the buffer will be a little bit more than the phase noise of the input signal. To quantify the noise addition in the buffer we compare the Phase Jitter numbers from the input and the output. The difference is called "Additive Phase Jitter". The formula for the Additive Phase Jitter is as follows:

**EQUATION 3-1:**

$$AdditivePhaseJitter = \sqrt{OutputPhaseJitter^2 - InputPhaseJitter^2}$$

**TABLE 3-1: PL138-48 NOISE CHARACTERISTICS**

Parameters	Symbol	Min.	Typ.	Max.	Units	Conditions
Additive Phase Jitter	t <sub>APJ</sub>	—	20	40	fs	V <sub>DD</sub> = 3.3V, Frequency = 622.08 MHz Offset = 12 kHz ~ 20 MHz
		—	50	100		V <sub>DD</sub> = 3.3V, Frequency = 156.25 MHz Offset = 12 kHz ~ 20 MHz
		—	50	100		V <sub>DD</sub> = 3.3V, Frequency = 50 MHz Offset = 1 kHz ~ 1 MHz
		—	50	100		V <sub>DD</sub> = 3.3V, Frequency = 25 MHz Offset = 1 kHz ~ 1 MHz

**FIGURE 3-1:** PL138-48 Additive Phase Jitter Plot, 622 MHz.

## 5.0 APPLICATION INFORMATION

### 5.1 Input Logic Configurations

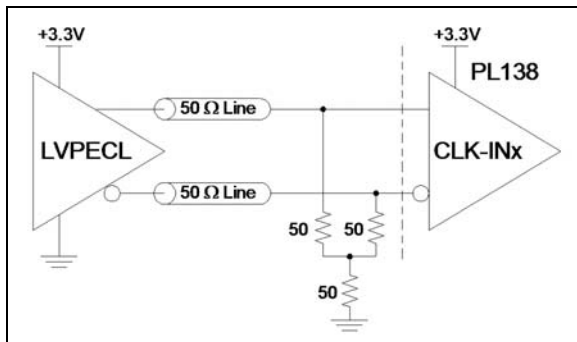

The following circuits show different configurations for different input logic type signals. For good signal integrity at the PL138 input, the signals need to be properly terminated according to the logic type requirements. The signals need to be presented at the PL138 input according to  $V_{CMR}$ ,  $V_{PP}$  and other input requirements.

**FIGURE 5-1:** CLK-IN Input Driven by a 3.3V LVPECL Driver.

**FIGURE 5-5:** CLK-IN Input Driven by an LVDS Driver.

**FIGURE 5-2:** 3.3V LVPECL Driver, Alternative Termination.

**FIGURE 5-6:** LVDS Driver, Alternative AC-Coupling.

This circuit is for compatibility only. AC-coupling is not really required for LVDS. The  $V_{CMR}$  range of the PL138 reaches low enough that LVDS signals can be connected directly to the PL138 input like in the circuit in [Figure 5-5](#).

**FIGURE 5-3:** CLK-IN Input Driven by a CML Driver.

**FIGURE 5-7:** CLK-IN Input Driven by a CMOS Driver.

**FIGURE 5-4:** CLK-IN Input Driven by an SSTL Driver.

**FIGURE 5-8:** CLK-IN Input Driven by a Single-Ended LVPECL.

**FIGURE 5-9:** CLK-IN Input Driven by an HCSL Driver.

HCSL presents its signals very close to the ground rail, below the  $V_{CMR}$  range, so the HCSL signals cannot be connected to the PL138 input directly. AC-coupling is required for HCSL signals on the PL138 input.

**FIGURE 5-10:** Input Logic Block Diagram.

**TABLE 5-1: INPUT PIN CHARACTERISTICS**

Input	Parameter	Min.	Typ.	Max.	Units

1	0	CLK-IN0	Enabled	Enabled
1	1	CLK-IN1	Enabled	Enabled

## 5.2 Termination for LVPECL Outputs

The required termination for LVPECL is 50 $\Omega$  to a  $V_{CC}-2V$  DC voltage level. Below are two schematics to implement this termination.

**FIGURE 5-11:** LVPECL Termination Schematic #1.

- $V_{CC} = 3.3V$ 
  - Ideal values:  $R1 = 127\Omega$ ,  $R2 = 82.5\Omega$
  - Commercial values (E24):  $R1 = 130\Omega$ ,  $R2 = 82\Omega$
- $V_{CC} = 2.5V$ 
  - Ideal values:  $R1 = 250\Omega$ ,  $R2 = 62.5\Omega$
  - Commercial values (E24):  $R1 = 240\Omega$ ,  $R2 = 62\Omega$

# PL138-48

**FIGURE 5-12:** LVPECL Termination Schematic #2.

Schematic #2 is an alternative simplified termination.

- $V_{CC} = 3.3V$ 
  - Ideal value:  $RT = 48.7\Omega$
  - Commercial value:  $RT = 50\Omega$  (E24:  $51\Omega$ )
- $V_{CC} = 2.5V$ 
  - Ideal value:  $RT = 18.7\Omega$
  - Commercial value:  $RT = 18\Omega$

## 5.3 Power Considerations

Driving LVPECL outputs requires an amount of power that can warm up the chip significantly.

The general requirement for the chip is that the junction temperature should not exceed  $+110^{\circ}C$ .

The power consumption can be divided into two parts:

1. Core power dissipation
2. Output buffer power dissipation

### 5.3.1 CORE POWER DISSIPATION

The chip core power is equal to  $V_{CC} \times I_{EE}$ . With a worst case  $V_{CC}$  and  $I_{EE}$ , the power dissipation in the core is  $3.63V \times 45\text{ mA} = 163\text{ mW}$ .

### 5.3.2 OUTPUT BUFFER POWER DISSIPATION

The output buffers are not exposed to the full  $V_{CC} - V_{EE}$  voltage. On the differential output, one line is at logic 1 with a small voltage across the buffer and a large output current. The other line is at logic 0 with a larger voltage across the buffer and a smaller output current. The power dissipation per output buffer is 32 mW. Only buffers that are loaded will have power dissipation. With all 4 buffers loaded the worst case output buffer power dissipation will be 128 mW.

Total chip power dissipation, worst case, is  $163\text{ mW} + 128\text{ mW} = 291\text{ mW}$ .

### 5.3.3 JUNCTION TEMPERATURE

How much the chip is warmed up from the power dissipation depends upon the thermal resistance from the chip to the environment, also known as "junction to

ambient". The thermal resistance depends upon the type of package, how the package is assembled to the PCB and if there is additional air flow for improved cooling.

**TABLE 5-4: 20-PIN TSSOP THERMAL RESISTANCE**

Air Flow Velocity in Linear Feet/Minute	$\theta_{JA}$ Value for JEDEC Standard Multi-Layer PCB
0	$73^{\circ}C/W$
200	$67^{\circ}C/W$
500	$64^{\circ}C/W$

The temperature of the chip (junction) will be higher than the environment (ambient) with an amount equal to  $\theta_{JA} \times \text{Power}$ . For an ambient temperature of  $+85^{\circ}C$ , all outputs loaded and no air flow, the junction temperature  $T_J = 85^{\circ}C + 73 \times 0.291 = 106^{\circ}C$ .

**TABLE 5-5: 16-PIN QFN THERMAL RESISTANCE**

Air Flow Velocity in Linear Feet/Minute	$\theta_{JA}$ Value for JEDEC Standard Multi-Layer PCB
0	$60^{\circ}C/W$
200	$53^{\circ}C/W$
500	$46^{\circ}C/W$

The temperature of the chip (junction) will be higher than the environment (ambient) with an amount equal to  $\theta_{JA} \times \text{Power}$ . For an ambient temperature of  $+85^{\circ}C$ , all outputs loaded and no air flow, the junction temperature  $T_J = 85^{\circ}C + 60 \times 0.291 = 102^{\circ}C$ .

## **APPENDIX A: REVISION HISTORY**

### **Revision A (May 2016)**

- Converted Micrel data sheet PL138-48 to Microchip DS20005543A.
- Minor text changes throughout.

### **Revision B (June 2016)**

- Updated output frequency tolerances to 800 MHz.

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

### Trademarks

The Microchip name and logo, the Microchip logo, AnyRate, dsPIC, FlashFlex, flexPWR, Heldo, JukeBlox, KeeLoq, KeeLoq logo, Klear, LANCheck, LINK MD, MediaLB, MOST, MOST logo, MPLAB, OptoLyzer, PIC, PICSTART, PIC32 logo, RightTouch, SpyNIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

ClockWorks, The Embedded Control Solutions Company, ETHERSYNCH, Hyper Speed Control, HyperLight Load, IntelliMOS, mTouch, Precision Edge, and QUIET-WIRE are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, BodyCom, chipKIT, chipKIT logo, CodeGuard, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, EtherGREEN, In-Circuit Serial Programming, ICSP, Inter-Chip Connectivity, JitterBlocker, KlearNet, KlearNet logo, MiWi, motorBench, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, PureSilicon, RightTouch logo, REAL ICE, Ripple Blocker, Serial Quad I/O, SQL, SuperSwitcher, SuperSwitcher II, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademarks of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.
