

Low-Power DC to 160 MHz 1:9 Fanout Buffer IC for Automotive

Features

- Automotive AEC-Q100 Qualified
- 1:9 LVCMOS Output Fanout Buffer from DC to 160 MHz
- Low Additive Phase Jitter of 60 fs RMS
- 8 mA Output Drive Strength
- Low Power Consumption for Portable Applications
- Automotive Applications Grade 1 Compliant
- Low Input-Output Delay
- Output-Output Skew <250 ps
- 2.5V to 3.3V, $\pm 10\%$ Operation
- 1.8V $+10\%/-5\%$ Operation up to 67 MHz
- Wide Temperature Range: -40°C to $+125^{\circ}\text{C}$
- Available in 16-Pin Wettable Flanks VQFN Package

Applications

- Automotive Applications
 - ADAS Vision System
 - Infotainment and Dashboard

General Description

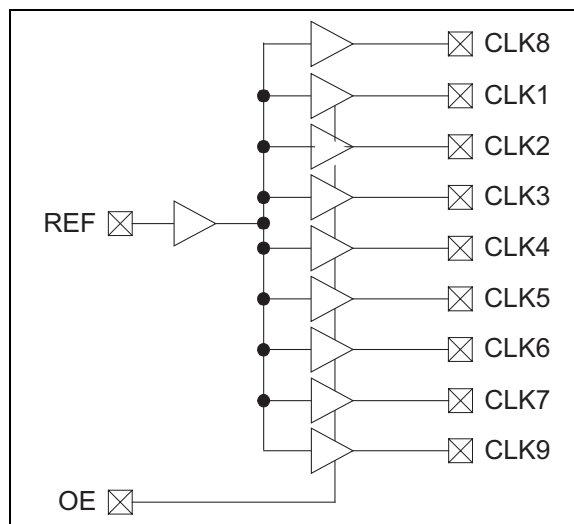

The PLA133-97 is an advanced fanout buffer designed for automotive applications and other high performance, low-power, small form factor applications. The PLA133-97 accepts a reference clock input from DC to 160 MHz and provides nine outputs of the same frequency with ultra-low additive jitter. The device is AEC-Q100 qualified.

The PLA133-97 is offered in a small 3 mm x 3 mm wettable flanks VQFN-16L package.

The PLA133-97 outputs can be disabled to a high impedance (tri-state) by pulling low the OE pin. When the OE pin is high, the outputs are enabled and follow the REF input signal. When the OE pin is left open, a pull-up resistor on the chip will default the OE pin to logic 1 so the outputs are enabled.

CLK8 is a free running output that remains enabled when the OE pin is pulled low.

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

Supply Voltage to Ground Potential	-0.5V to +4.6V
DC Input Voltage	V_{SS} -0.5V to +4.6V
Static Discharge Voltage (Per MIL-STD-883, Method 3015).....	>2000V

Operating Ratings †

Supply Voltage, V_{DD}	1.71V to 3.63V
--------------------------------	----------------

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

TEMPERATURE SPECIFICATIONS (Note 1)

Parameters	Symbol	Min.	Typ.	Max.	Units	Conditions
Temperature Ranges						
Ambient Operating Temperature (T)	T_A	-40	—	+125	°C	—
Junction Temperature	T_J	—	—	+150	°C	—
Storage Temperature Range	T_S	-65	—	+150	°C	—
Package Thermal Resistance						
16-Lead VQFN	$R_{\theta JA}$	—	—	82.3	°C/W	—

Note 1: The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air (i.e., T_A , T_J , θ_{JA}). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +150°C rating. Sustained junction temperatures above +150°C can impact the device reliability.

3.0 NOMINAL PERFORMANCE CHARACTERISTICS

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

FIGURE 3-1: PLA133-97 Additive Phase Jitter: $V_{DD} = 3.3V$, CLK-100 MHz, Integration Range 12 kHz - 20 MHz.

When a buffer is used to pass a signal then the buffer will add a little bit of its own noise. The phase noise on the output of the buffer will be a little bit more than the phase noise in the input signal. The noise added by the buffer to the input signal is quantified by the additive phase jitter defined by the following formula:

EQUATION 3-1:

$$AdditivePhaseJitter = \sqrt{(OutputPhaseJitter)^2 - (InputPhaseJitter)^2}$$

6.0 LAYOUT RECOMMENDATIONS

The following guidelines are to assist you with a performance optimized PCB design:

6.1 Signal Integrity and Termination Considerations

- Keep traces short
- Trace = Inductor. With a capacitive load this equals ringing
- Long trace = Transmission Line. Without proper termination this will cause reflections ringing and waveforms and degradations.
- Use stripline or microstrip with defined impedance for long traces (> 1 inch)
- Match traces on one side of the board to avoid reflections bouncing back and forth.

6.2 Decoupling and Power Supply Considerations

- Place decoupling capacitors as close as possible to the VDD pin(s) to limit noise from the power supply
- Addition of a ferrite bead in series with VDD can help prevent noise from other board sources
- Value of decoupling capacitor is frequency dependant. Typical values to use are 0.1 μF for designs using frequencies <50 MHz and 0.01 μF for designs using frequencies >50 MHz

7.0 PACKAGING INFORMATION

7.1 Package Marking Information

16-Lead VQFN*

Example

Legend:	XX...X	Product code, customer-specific information, or frequency in MHz without printed decimal point
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC® designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.
	•, ▲, ▼	Pin one index is identified by a dot, delta up, or delta down (triangle mark).
Note:	In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. Package may or may not include the corporate logo.	
	Underbar (¯) and/or Overbar (¯) symbol may not be to scale.

NOTES:

APPENDIX A: REVISION HISTORY

Revision A (May 2020)

- Initial release of PLA133-97 as Microchip data sheet DS20006359A.

Revision B (July 2020)

- Added the thermal spec. for the 16-lead VQFN package.
- Updated with the VQFN 16-lead Wettable Flanks package diagram.

Revision C (October 2020)

- Changed the operating frequency to 160 MHz which was wrongly input as 150 MHz.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods being used in attempts to breach the code protection features of the Microchip devices. We believe that these methods require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Attempts to breach these code protection features, most likely, cannot be accomplished without violating Microchip's intellectual property rights.
- Microchip is willing to work with any customer who is concerned about the integrity of its code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable." Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
