

# Programmable logic sequencer (16 × 45 × 12)

PLS155

## DESCRIPTION

The PLS155 is a 3-State output, registered logic element combining AND/OR gate arrays with clocked J-K flip-flops. These J-K flip-flops are dynamically convertible to D-type via a "fold-back" inverting buffer and control gate  $F_C$ . It features 4 registered I/O outputs (F) in conjunction with 8 bidirectional I/O lines (B). These yield variable I/O gate and register configurations via control gates (D, L) ranging from 16 inputs to 12 outputs.

The AND/OR arrays consist of 32 logic AND gates, 13 control AND gates, and 21 OR gates with fusible link connections for programming I/O polarity and direction. All AND gates are linked to 4 inputs (I), bidirectional I/O lines (B), internal flip-flop outputs (Q), and Complement Array output ( $\bar{C}$ ). The Complement Array consists of a NOR gate optionally linked to all AND gates for generating and propagating complementary AND terms.

On-chip T/C buffers couple either True (I, B, Q) or Complement ( $\bar{I}$ ,  $\bar{B}$ ,  $\bar{Q}$ ,  $\bar{C}$ ) input polarities to all AND gates, whose outputs can be optionally linked to all OR gates. Any of the 32 AND gates can drive bidirectional I/O lines (B), whose output polarity is individually programmable through a set of Ex-OR gates for implementing AND-OR or AND-NOR logic functions. Similarly, any of the AND gates can drive the J-K inputs of all flip-flops. The Asynchronous Preset and Reset lines (P, R), are driven from the OR matrix.

All flip-flops are positive edge-triggered and can be used as input, output or I/O (for interfacing with a bidirectional data bus) in conjunction with load control gates (L), steering inputs (I), (B), (Q) and programmable output select lines (E).

The PLS155 is field programmable, enabling the user to quickly generate custom patterns using standard programming equipment.

Order codes are listed below.

## FEATURES

- $f_{MAX} = 14\text{MHz}$   
– 18.2MHz clock rate
- Field-Programmable (Ni-Cr link)
- 4 dedicated inputs
- 13 control gates
- 32 AND gates
- 21 OR gates
- 45 product terms:  
– 32 logic terms  
– 13 control terms
- 8 bidirectional I/O lines
- 4 bidirectional registers
- J-K, T, or D-type flip-flops
- Asynchronous Preset/Reset
- Complement Array
- Active-High or -Low outputs
- Programmable  $\bar{O}E$  control
- Positive edge-triggered clock
- Input loading:  $-100\mu\text{A}$  (max.)
- Power dissipation: 750mW (typ.)
- TTL compatible
- 3-State outputs

## APPLICATIONS

- Random sequential logic
- Synchronous up/down counters
- Shift registers
- Bidirectional data buffers
- Timing function generators
- System controllers/synchronizers
- Priority encoder/registers

## PIN CONFIGURATIONS

## FUNCTIONAL DIAGRAM

### FLIP-FLOP TRUTH TABLE

OE	L	CK	P	R	J	K	Q	F
H								Hi-Z
L	X	X	H	L	X	X	H	L
L	X	X	L	H	X	X	L	H
L	L	↑	L	L	L	L	Q	Q̄
L	L	↑	L	L	L	H	L	H
L	L	↑	L	L	H	L	H	L
L	L	↑	L	L	H	H	Q̄	Q
H	H	↑	L	L	L	H	L	H*
H	H	↑	L	L	H	L	H	L*
+10V	X	↑	X	X	L	H	L	H**
	X	↑	X	X	H	L	H	L**

### NOTES:

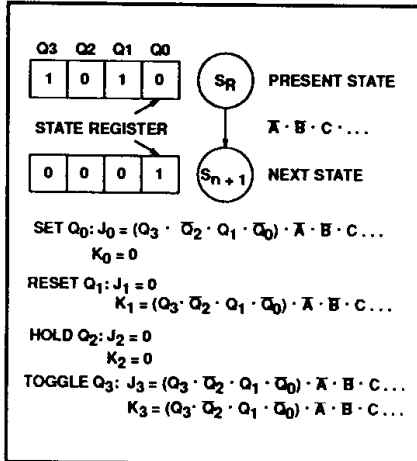

- Positive Logic:  
 $J-K = T_0 + T_1 + T_2 \dots T_{31}$   
 $T_n = C \cdot (I_0 \cdot I_1 \cdot I_2 \dots) \cdot (Q_0 \cdot Q_1 \dots) \cdot (B_0 \cdot B_1 \dots)$
- ↑ denotes transition from Low to High level.
- X = Don't care
- \* = Forced at F<sub>n</sub> pin for loading the J-K flip-flop in the Input mode. The load control term, L<sub>n</sub> must be enabled (HIGH) and the p-terms that are connected to the associated flip-flop must be forced LOW (disabled) during Preload.
- At P = R = H, Q = H. The final state of Q depends on which is released first.
- \*\* = Forced at F<sub>n</sub> pin to load J-K flip-flop independent of program code (Diagnostic mode), 3-State B outputs.

# Programmable logic sequencer

## (16 × 45 × 12)

PLS155

### LOGIC FUNCTION

#### NOTE:

Similar logic functions are applicable for D and T mode flip-flops.

### VIRGIN STATE

The factory shipped virgin device contains all fusible links intact, such that:

1. OE is always enabled.
2. Preset and Reset are always disabled.
3. All transition terms are disabled.
4. All flip-flops are in D-mode unless otherwise programmed to J-K only or J-K or D (controlled).
5. All B pins are inputs and all F pins are outputs unless otherwise programmed.

### THERMAL RATINGS

TEMPERATURE	
Maximum junction	150°C
Maximum ambient	75°C
Allowable thermal rise ambient to junction	75°C

### ABSOLUTE MAXIMUM RATINGS<sup>1</sup>

SYMBOL	PARAMETER	RATINGS		UNIT
		Min	Max	
V <sub>CC</sub>	Supply voltage		+7	V <sub>DC</sub>
V <sub>IN</sub>	Input voltage		+5.5	V <sub>DC</sub>
V <sub>OUT</sub>	Output voltage		+5.5	V <sub>DC</sub>
I <sub>IN</sub>	Input currents	-30	+30	mA
I <sub>OUT</sub>	Output currents		+100	mA
T <sub>amb</sub>	Operating temperature range	0	+75	°C
T <sub>stg</sub>	Storage temperature range	-65	+150	°C

#### NOTES:

1. Stresses above those listed may cause malfunction or permanent damage to the device. This is a stress rating only. Functional operation at these or any other condition above those indicated in the operational and programming specification of the device is not implied.

C <sub>OUT</sub>	Output	V <sub>OUT</sub> = 2.0V		15		pF

**NOTES:**

- All typical values are at V<sub>CC</sub> = 5V, T<sub>amb</sub> = +25°C.
- All voltage values are with respect to network ground terminal.
- Test one at a time.
- I<sub>CC</sub> is measured with the  $\overline{OE}$  input grounded, all other inputs at 4.5V and the outputs open.
- Leakage values are a combination of input and output leakage.
- Measured with V<sub>IH</sub> applied to  $\overline{OE}$ .
- Duration of short circuit should not exceed 1 second.

$t_{\text{PRO}}$	Preset/Reset	(I,B) +	F $\pm$	$C_L = 30\text{pF}$		50	55	ns

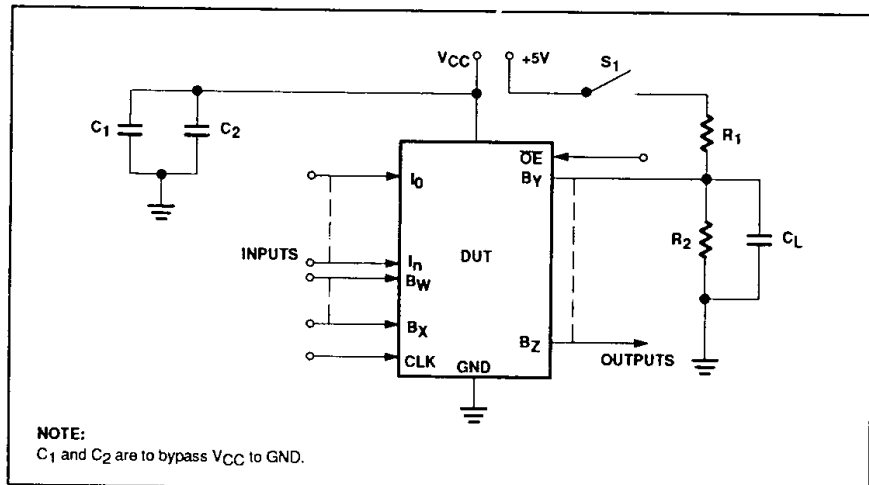

### NOTES:

- All typical values are at  $V_{\text{CC}} = 5\text{V}$ ,  $T_{\text{amb}} = +25^{\circ}\text{C}$ .
- To prevent spurious clocking, clock rise time (10% - 90%)  $\leq 10\text{ns}$ .
- For 3-State output; output enable times are tested with  $C_L = 30\text{pF}$  to the 1.5V level, and  $S_1$  is open for high-impedance to High tests and closed for high-impedance to Low tests. Output disable times are tested with  $C_L = 5\text{pF}$ . High-to-High impedance tests are made to an output voltage of  $V_T = (V_{\text{OH}} - 0.5\text{V})$  with  $S_1$  open, and Low-to-High impedance tests are made to the  $V_T = (V_{\text{OL}} + 0.5\text{V})$  level with  $S_1$  closed.
- When using the Complement Array  $t_{\text{CKP}} = 95\text{ns}$  (min).
- Limits are guaranteed with 12 product terms maximum connected to each sum term line.
- For test circuits, waveforms and timing diagrams see the following pages.

## TIMING DIAGRAMS

## TIMING DEFINITIONS

SYMBOL	PARAMETER
$t_{CKH}$	Width of input clock pulse.
$t_{CKL}$	Interval between clock pulses.
$t_{CKP}$	Clock period.
$t_{PRH}$	Width of preset input pulse.
$t_{S1}$	Required delay between beginning of valid input and positive transition of clock.
$t_{S2}$	Required delay between beginning of valid input forced at flip-flop output pins, and positive transition of clock.
$t_{IH1}$	Required delay between positive transition of clock and end of valid input data.
$t_{IH2}$	Required delay between positive transition of clock and end of valid input data forced at flip-flop output pins.
$t_{CKO}$	Delay between positive transition of clock and when outputs become valid (with OE Low).
$t_{OE1}$	Delay between beginning of Output Enable Low and when outputs become valid.
$t_{OD1}$	Delay between beginning of Output Enable High and when outputs are in the OFF-State.
$t_{PD}$	Propagation delay between combinational inputs and outputs.
$t_{OE2}$	Delay between predefined Output Enable High, and when combinational outputs become valid.
$t_{OD2}$	Delay between predefined Output Enable Low and when combinational outputs are in the OFF-State.
$t_{PRO}$	Delay between positive transition of predefined Preset/Reset input, and when flip-flop outputs become valid.

Programmable logic sequencer  
(16 × 45 × 12)

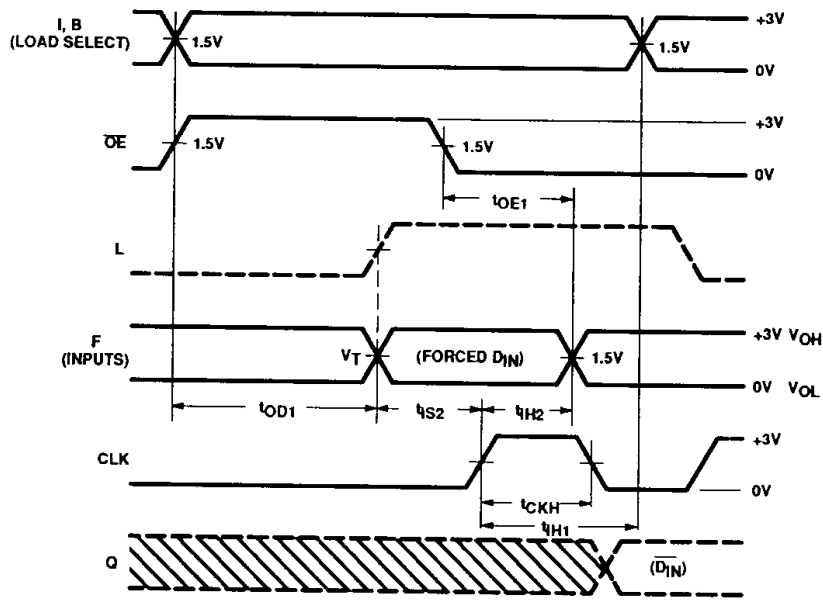

PLS155

TIMING DIAGRAMS (Continued)

\* The leading edge of preset/reset must occur only when the input clock is "low", and must remain "high" as long as required to override clock. The falling edge of preset/reset can never go "low" when the input clock is "high".

Asynchronous Preset/Reset

Flip-Flop Input Mode

PLS155

### LOGIC PROGRAMMING

The PLS155 is fully supported by industry standard (JEDEC compatible) PLD CAD tools, including Philips' Semiconductors SNAP, Data I/O Corporation's ABEL™ and Logical Devices Inc.'s CUPL™ design software packages.

All packages allow Boolean and state equation entry formats. SNAP, ABEL and CUPL also accept, as input, schematic capture format.

PLS155 logic designs can also be generated using the program table entry format detailed on the following pages. This program table entry format is supported by the Philips Semiconductors SNAP PLD design software package only.

To implement the desired logic functions, the state of each logic variable from logic equations (I, B, O, P, etc.) is assigned a symbol. The symbols for TRUE,

COMPLEMENT, INACTIVE, PRESET, etc., are defined below.

### PROGRAMMING AND SOFTWARE SUPPORT

Refer to Section 9 (*Development Software*) and Section 10 (*Third-party Programmer/Software Support*) of this data handbook for additional information.

Notes on following page.

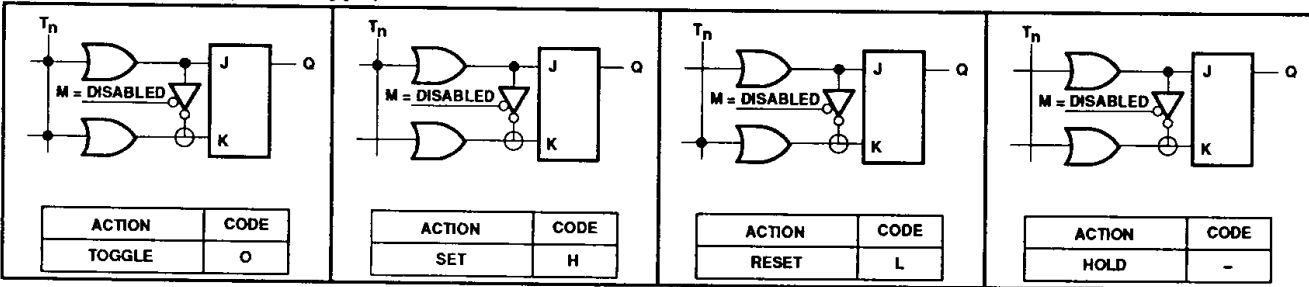

# Programmable logic sequencer (16 × 45 × 12)

PLS155

## “OR” ARRAY – ( $Q_n = D$ -Type)

## “OR” ARRAY – ( $Q_n = J$ -K Type)

## “OR” ARRAY – (S or B), (P), (R)

## “EX-OR” ARRAY – (B)

## “OE” ARRAY – (E)

**NOTES:**

1. This is the initial unprogrammed state of all link pairs. It is normally associated with all unused (inactive) AND gates.
2. Any gate ( $T, F_C, L, P, R, D$ )<sub>n</sub> will be unconditionally inhibited if both of the I, B, or Q links are left intact.
3. To prevent oscillations, this state is not allowed for C link pairs coupled to active gates  $T_n, F_C$ .
4.  $E_n = O$  and  $E_n = \bullet$  are logically equivalent states, since both cause  $F_n$  outputs to be unconditionally enabled.
5. These states are not allowed for control gates ( $L, P, R, D$ )<sub>n</sub> due to their lack of “OR” array links.
