Programmable logic sequencer (16 × 45 × 12)

PLS159A

DESCRIPTION

The PLS159A is a 3-State output, registered logic element combining AND/OR gate arrays with clocked J-K flip-flops. These J-K flip-flops are dynamically convertible to D-type via a "fold-back" inverting buffer and control gate F_C. It features 8 registered I/O outputs (F) in conjunction with 4 bidirectional I/O lines (B). These yield variable I/O gate and register configurations via control gates (D, L) ranging from 16 inputs to 12 outputs.

The AND/OR arrays consist of 32 logic AND gates, 13 control AND gates, and 21 OR gates with fusible link connections for programming I/O polarity and direction. All AND gates are linked to 4 inputs (I), bidirectional I/O lines (B), internal flip-flop outputs (Q), and Complement Array output ($\overline{C}$). The Complement Array consists of a NOR gate optionally linked to all AND gates for generating and propagating complementary AND terms.

On-chip T/C buffers couple either True (I, B, Q) or Complement ($\overline{I}$, $\overline{B}$, $\overline{Q}$, $\overline{C}$) input polarities to all AND gates, whose outputs can be optionally linked to all OR gates. Any of the 32 AND gates can drive bidirectional I/O lines (B), whose output polarity is individually programmable through a set of Ex-OR gates for implementing AND-OR or AND-NOR logic functions. Similarly, any of the 32 AND gates can drive the J-K inputs of all flip-flops. There are 4 AND gates for the Asynchronous Preset/Reset functions.

All flip-flops are positive edge-triggered and can be used as input, output or I/O (for interfacing with a bidirectional data bus) in conjunction with load control gates (L), steering inputs (I), (B), (Q) and programmable output select lines (E).

The PLS159A is field-programmable, enabling the user to quickly generate custom patterns using standard programming equipment.
FEATURES

- High-speed version of PLS159
- f_{MAX} = 18MHz
  - 25MHz clock rate
- Field-Programmable (Ni-Cr link)
- 4 dedicated inputs
- 13 control gates
- 32 AND gates
- 21 OR gates
- 45 product terms:
  - 32 logic terms
  - 13 control terms
- 4 bidirectional I/O lines
- 8 bidirectional registers
- J-K, T, or D-type flip-flops
- Power-on reset feature on all flip-flops (F_n = 1)
- Asynchronous Preset/Reset
- Complement Array
- Active-High or -Low outputs
- Programmable $\overline{OE}$ control
- Positive edge-triggered clock
- Input loading: −100µA (max.)
- Power dissipation: 750mW (typ.)
- TTL compatible
- 3-State outputs

APPLICATIONS

- Random sequential logic
- Synchronous up/down counters
- Shift registers
- Bidirectional data buffers
- Timing function generators
- System controllers/synchronizers
- Priority encoder/registers

NOTES:

1. Positive Logic:
   J-K = $T_0 + T_1 + T_2 \ldots\ldots\ldots\ldots\ldots T_{31}$
   $T_n = \overline{C} \cdot (I0 \cdot I1 \cdot I2 \ldots) \cdot (Q_0 \cdot Q_1 \ldots) \cdot (B0 \cdot B1 \cdot \ldots)$
2. ↑ denotes transition from Low to High level.
3. X = Don't care
4. * = Forced at F_n pin for loading the J-K flip-flop in the Input mode. The load control term, L_n must be enabled (HIGH) and the p-terms that are connected to the associated flip-flop must be forced LOW (disabled) during Preload.
5. At P = R = H, Q = H. The final state of Q depends on which is released first.
6. ** = Forced at F_n pin to load J-K flip-flop independent of program code (Diagnostic mode), 3-State B outputs.

VIRGIN STATE

The factory shipped virgin device contains all fusible links intact, such that:

1. $\overline{OE}$ is always enabled.

2. Preset and Reset are always disabled.

3. All transition terms are disabled.

4. All flip-flops are in D-mode unless otherwise programmed to J-K only or J-K or D (controlled).

5. All B pins are inputs and all F pins are outputs unless otherwise programmed.

CAUTION: PLS159A PROGRAMMING ALGORITHM

The programming voltage required to program the PLS159A is higher (17.5V) than that required to program the PLS159 (14.5V). Consequently, the PLS159 programming algorithm will not program the PLS159A. Please exercise caution when accessing programmer device codes to insure that the correct algorithm is used.

NOTES:
1. All typical values are at $V_{CC} = 5V$, $T_{amb} = +25°C$.
2. To prevent spurious clocking, clock rise time (10% − 90%) $\leq$ 10ns.
3. For 3-State output; output enable times are tested with $C_L = 30pF$ to the 1.5V level, and S_1 is open for high-impedance to High tests and closed for high-impedance to Low tests. Output disable times are tested with $C_L = 5pF$. High-to-High impedance tests are made to an output voltage of $V_T = (V_{OH} - 0.5V)$ with S_1 open, and Low-to-High impedance tests are made to the $V_T = (V_{OL} + 0.5V)$ level with S_1 closed.
4. When using the Complement Array $t_{CKP} = 75ns$ (min).
5. Limits are guaranteed with 12 product terms maximum connected to each sum term line.

LOGIC PROGRAMMING

The PLS159A is fully supported by industry standard (JEDEC compatible) PLD CAD tools, including Philips Semiconductors' SNAP, Data I/O Corporation's ABEL™ and Logical Devices Inc.'s CUPL™ design software packages.

All packages allow Boolean and state equation entry formats. SNAP, ABEL and CUPL also accept, as input, schematic capture format.

PLS159A logic designs can also be generated using the program table entry format detailed on the following pages. This program table entry format is supported by the Philips Semiconductors SNAP PLD design software package.

To implement the desired logic functions, the state of each logic variable from logic equations (I, B, O, P, etc.) is assigned a symbol. The symbols for TRUE,

COMPLEMENT, INACTIVE, PRESET, etc., are defined below.

NOTES:
1. This is the initial unprogrammed state of all link pairs. It is normally associated with all unused (inactive) AND gates.
2. Any gate (T, F_C, L, P, R, D)$_n$ will be unconditionally inhibited if both of the I, B, or Q links are left intact.
3. To prevent oscillations, this state is not allowed for C link pairs coupled to active gates T_n, F_C.
4. E_n = O and E_n = ● are logically equivalent states, since both cause F_n outputs to be unconditionally enabled.
5. These states are not allowed for control gates (L, P, R, D)$_n$ due to their lack of "OR" array links.
