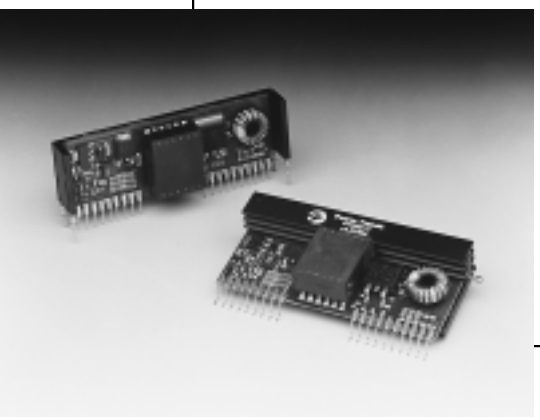
PT3300 Series

30 WATT POSITIVE STEP-DOWN INTEGRATED SWITCHING REGULATOR

Revised 5/15/98

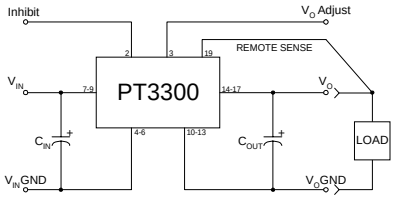


The PT3300 is a new series of high-input voltage, 30 Watt, non-isolated Integrated Switching Regulators (ISRs) housed in a 19-pin SIP package. The 20 to 60 V input range allows easy integration into many distributed power applications which utilize 24, 28, or 48V bus architechures.

The PT3300 series is available with 3.3, 5, 12, or 15V outputs. The output voltage is adjustable from 90 to 110% of nominal with the addition of an external resistor. Other easy to use features include an inhibit function and remote sense which automatically compensates for any voltage drop from the ISR to the load. As with other Power Trends' products, the PT3300 includes built in current limit, short circuit protection and over-temperature shutdown.

The PT3300 requires a 330µF output capacitor for proper operation.

Standard Application



C_{in} = Optional 100µF/100V electrolytic
C_{out} = Required 330µF electrolytic

Note: Pins 4,5,6 and pins 10,11,12,13 are connected internally.

Features

- 30W Output Power
- Input Voltage Range: 20V to 60V
- High Efficiency
- V_o Inhibit
- V_o Adjust
- Remote Sense
- Current Limit
- Short-Circuit Protection
- Over-Temperature Shutdown
- 19-pin SIP Package

Adjusting the Output Voltage of the PT3300 Wide Input Range Switching Regulator

The output voltage of the Power Trends PT3300 Series ISRs may be adjusted over a ±10% range from the factory trimmed pre-set voltage. This is accomplished with the addition of a single external resistor. Table 1 accordingly gives the allowable adjustment range for each model in the series as V_a (min) and V_a (max).

Adjust Up: An increase in the output voltage is obtained by adding a resistor R2, between pin 3 (V_o adjust) and pins 10-13 (V_o GND)

Adjust Down: Add a resistor (R1), between pin 3 (V_o adjust) and pins 14-17 (V_{out}).

Refer to Figure 1 and Table 2 for both the placement and value of the required resistor, either (R1) or R2 as appropriate.

Notes:

1. Use only a single 1% resistor in either the (R1) or R2 location. Place the resistor as close to the ISR as possible.
2. Never connect capacitors from V_o adjust to either GND or V_{out} . Any capacitance added to the V_o adjust pin will affect the stability of the ISR.
3. V_{in} GND and V_o GND are connected internally and may be treated as common on the PT3300 ISR series.
4. If the Remote Sense feature is being used, connecting the resistor (R1) between pin 3 (V_o adjust) and pin 19 (Remote Sense) can benifit load regulation.
5. Adjusting V_{out} higher than that defined for the model raises the minimum input voltage by the same percentage.

PT3300 ADJUSTMENT AND FORMULA PARAMETERS

Series Pt #	PT3301	PT3302	PT3303	PT3304
V_o (nom)	3.3V	5.5V	12.0V	15.0V
V_a (min)	3.0V	4.5V	10.8V	13.5V
V_a (max)	3.6V	5.5V	13.2V	16.5Vs
R_o (kΩ)	23.7	13.7	4.99	3.65

The values of (R1) [adjust down], and R2 [adjust up], can also be calculated using the following formulae.

$$(R1) = \frac{R_o\,(V_o - 1)(V_a - 1)}{(V_o - V_a)} - 0.48 \quad k\Omega$$

$$R2 = \frac{R_o\,(V_o - 1)}{Va - V_o} - 0.48 \quad k\Omega$$

Where: V_o = Original output voltage
V_a = Adjustd output voltage
R_o = The value in Table 1
