QN8025

Single-Chip Low-Power FM Receiver for Portable Devices

General Description

The QN8025 is a high performance, low power, full-featured single-chip stereo FM receiver designed for cell phones, MP3 players, and portable radios. The QN8025 also supports RDS/RBDS data reception.

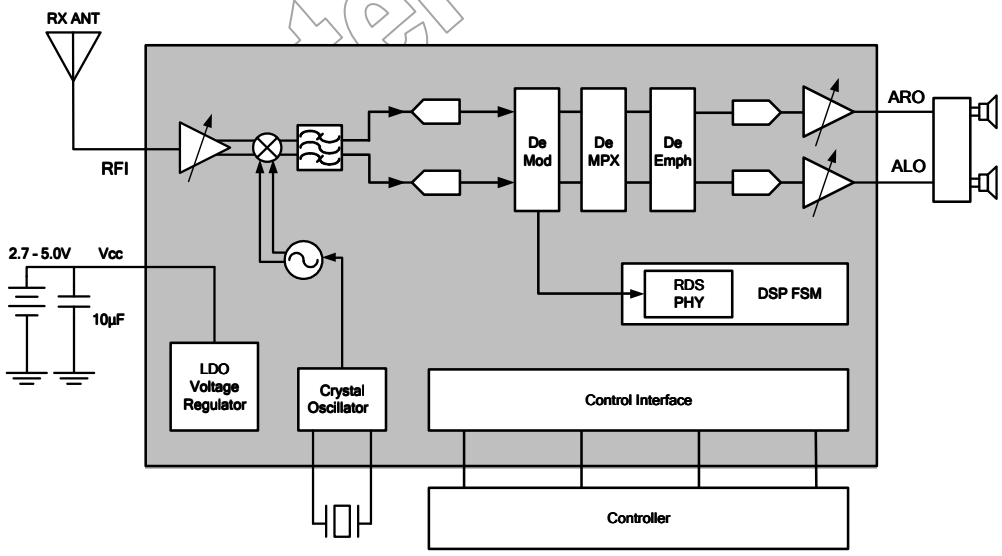
Typical Applications

- *Cell Phones / PDAs / Smart Phones*
- *Portable Audio & Media Players*
- *MP3/MP4 player, PMP, PND*
- *GPS Personal Navigation Devices*
- *Automotive and Accessories*

Key Features

- **Worldwide FM Band Coverage**
  - *62 MHz to 108 MHz full band tuning in 50/100/200 kHz step sizes*
  - *50/75μs de-emphasis*
- **Ease of Integration**
  - *Small footprint, available in 2.5 x2.5 QFN16 and 4x4 QFN24 packages*
  - *32.768 kHz and MHz crystal and direct clock input supported*
  - *I^2C control interface*
- **Very Low Power Consumption**
  - *15 mA typical*
  - *Integrated LDO*
  - *V_{IO}: 1.6~3.3V, V_{CC}: 2.7~5.0V*
  - *Power saving IDLE and Standby modes*
  - *Low shutdown leakage current*
  - *Volume control*
- **Adaptive Noise Cancellation**
  - *Mono/stereo blend*
  - *High cut*
  - *Soft mute*
- **High Performance**
  - *Superior sensitivity, better than 1.78μV_{EMF}*
  - *62dB stereo SNR, 0.05% THD*
  - *Integrated audio processing (SNC, HCC, SM)*
  - *Auto channel seek*
  - *L/R separation 45dB*
- **RDS/RBDS**
  - *Supports US and European data services*
- **Robust Operation**
  - *-25^0C to +85^0C operation*
  - *ESD protection on all input and output pads*

QN8025 Functional Blocks:



Ordering Information appears at Section 7.

3 FUNCTIONAL DESCRIPTION

The QN8025 is a high performance low power single chip FM receiver IC supports worldwide FM broadcast band (61.75 to 108MHz). RDS/RBDS data service is also supported.

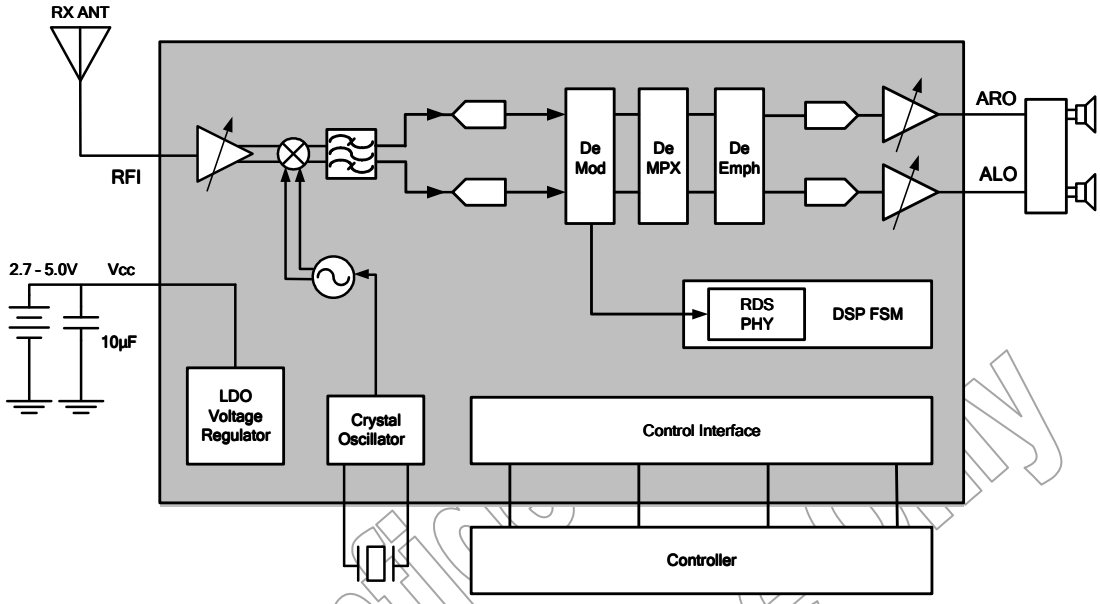

Figure 4 QN8025 Functional Blocks

The QN8025 integrates FM receive functions, including RF front-end circuits (LNA, Mixer and channel selective filter etc), a fully digitized FM demodulator, MPX decoder, de-emphasis and audio processing (SM, HCC, and SNC). Advanced digital architecture enables superior receiver sensitivity and crystal clear audio. The QN8025's Auto Seek function enables automatic channel selection for better sound quality.

The QN8025 is a small footprint, high level of integration and supports multiple clock frequencies. These features make it easy to be integrated into a variety of small form-factor low-power portable applications. Integrated low phase noise digital synthesizers and extensive on-chip auto calibration ensures robust consistent performance over temperature and process variations. An integrated voltage regulator enables direct connection to a Li-ion battery and provides high PSRR for superior noise suppression. A low-power IDLE and Standby mode extends battery life.

3.1 FM Receiver

The QN8025 receiver uses a highly digitized low-IF architecture, allowing the elimination of external components and factory adjustments.

The received RF signal is first amplified by an integrated LNA and then down converts to intermediate frequency (IF) via a quadrature mixer. To improve image rejection (IMR), the quadrature mixer can be programmed to be at high-side or low-side rejection. When the RF frequency is greater than the local oscillator (LO), image is at low side; otherwise, image is at high side (Refer to Reg02h for more information). An integrated IF channel filter rejects out-of-channel interference signal. AGC is also performed simultaneously to optimize the signal to noise ratio as well as linearity and interference rejection. The filtered signal is digitized and further processed with a digital FM demodulator and MPX decoder. Audio processing is then performed based on received signal quality and channel condition. Two high-quality audio DACs are integrated on chip to drive the audio output. The RDS signal will also be decoded if RDS reception is enabled.

A receive signal strength indicator (RSSI) is provided and can be read from RSSIDB [7:0]. The figure blow shows the curve of RSSI vs different RF input level. Auto seek utilizes RSSI to search good channel.

The following figure is measured at FM=88MHz . The RSSI Curve is not varied by FM frequency.

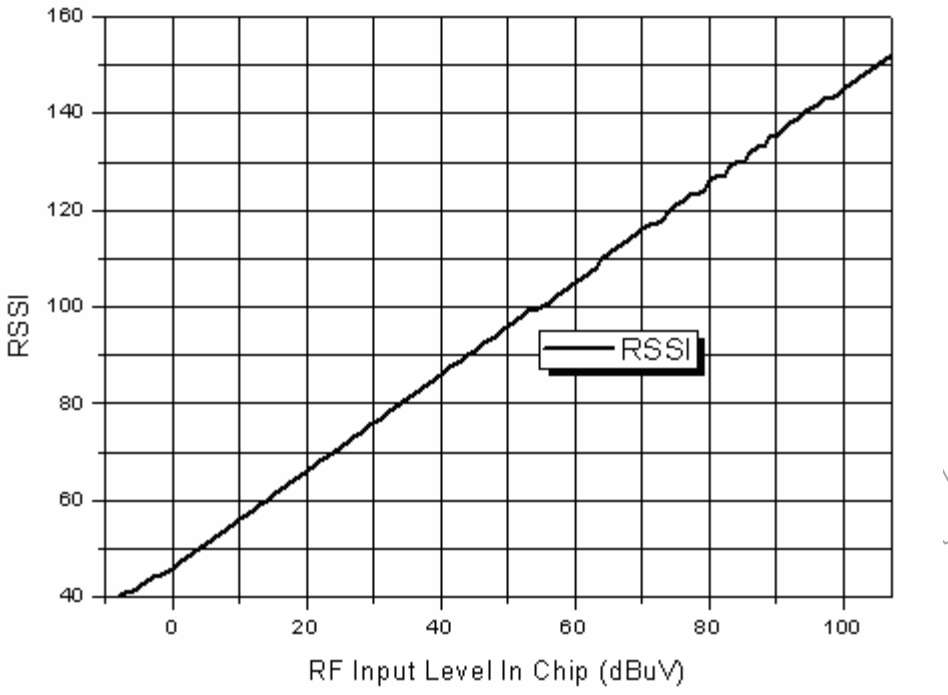

Figure 5 RSSI vs RF Input

3.2 Audio Processing

The MPX signal after FM demodulation is comprised of left and right channel signal, pilot and RDS signal in the following way:

$$m(t) = [L(t) + R(t)] + [L(t) - R(t)]\cos(4\pi ft + 2\theta_0) + \alpha\cos(2\pi ft + \theta_0) + d(t)\cos(6\pi ft + 3\theta_0)$$

Here, L(t) and R(t) correspond to the audio signals on the left and right channels respectively, f = 19 kHz, θ is the initial phase of pilot tone and α is the magnitude of the pilot tone, and d(t) is the RDS signal. In stereo mode, both L and R are recovered by de-MPX. In mono mode, only the L+R portion of audio signal exists. L(t) and R(t) are recovered by de-MPX.

In receive mode, stereo noise cancellation (SNC) for FM only, high cut control (HCC) and soft mute (SM) are supported. Stereo noise suppression is achieved by gradually combining the left and right signals to be a mono signal as the received signal quality degrades. SNC, HCC and SM are controlled by SNR and multipath channel estimation results. The three functions will be archived automatically in the device.

The QN8025 has an integrated mono or stereo audio status indicator. There is also a Read ST_MO_RX (Reg04h [0]) bit to get sound information. In addition, there also is a force mono function to constrain output mono in Reg04h.

To improve the signal-to-noise ratio of the FM receiver by reducing the effect of high frequency interference and noise, the device integrates a technique called de-emphasis. There are two selectable time constants (75us and 50us) supported.

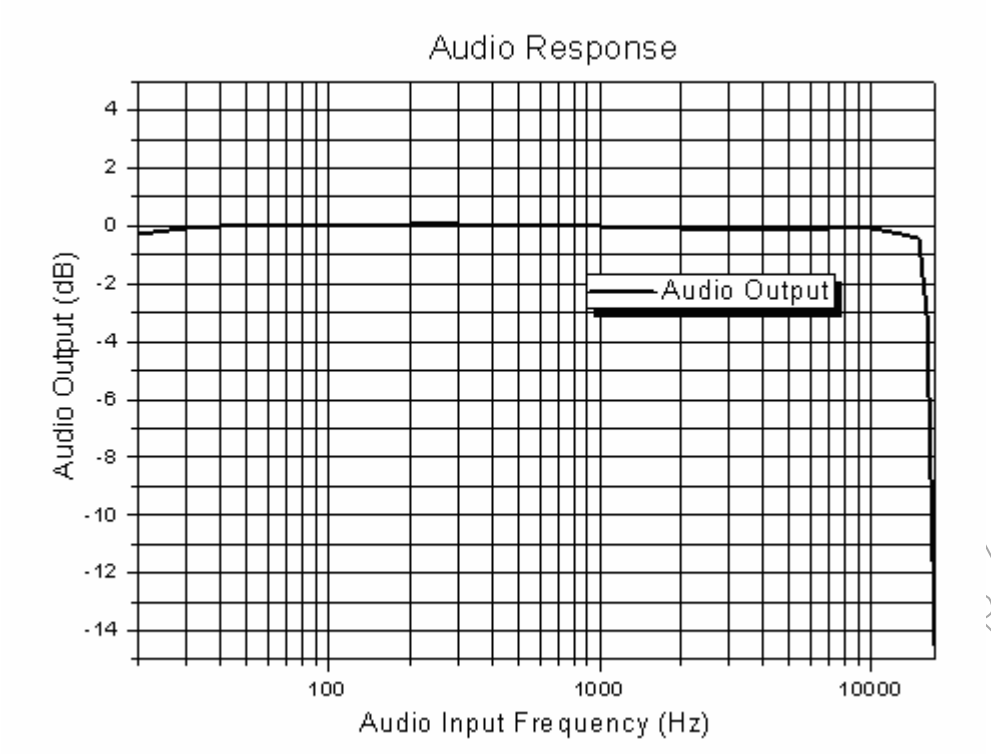

Figure 6 Audio Response

The audio output can be muted with the MUTE_EN (Reg14h[7]) bit and the output can also be replaced by an internally generated 1KHz tone whenever the RFI has a RF signal input.

3.3 RDS/RBDS

The QN8025 supports RDS/RBDS data receiption in FM mode, including station ID, Meta data, TMC information, etc. The integrated RDS processor performs all symbol encoding/decoding, block synchronization, error detection and correction functions. RDS/RBDS data communicates with an external MCU through the serial control interface.

3.4 Auto Seek (CCA)

In receive mode, the QN8025 can automatically tune to stations with good signal quality. For the auto seek function, it's also named CCA (Clear Channel Assessment).

4 CONTROL INTERFACE PROTOCOL

The QN8025 supports the standard I²C serial interfaces. At power-on, all register bits are set to default values.

I²C Serial Control Interface

The I²C bus is a simple bi-directional bus interface. The bus requires only serial data (SDA) and serial clock (SCL) signals. The bus is 8-bit oriented. Each device is recognized with a unique address. Each register is also recognized with a unique address. The I²C bus operates with a maximum frequency of 400 kHz. Each data put on the SDA must be 8 bits long (Byte) from MSB to LSB and each byte sent should be acknowledged by an "ACK" bit. In case a byte is not acknowledged, the transmitter should generate a stop condition or restart the transmission. If a stop condition is created before the whole transmission is completed, the remaining bytes will keep their old setting. In case a byte is not completely transferred, it will be discarded.

Data transfer to and from the QN8025 can begin when a start condition is created. This is the case if a transition from HIGH to LOW on the SDA line occurs while the SCL is HIGH. The first byte transferred represents the address of the IC plus the data direction. The default IC address is 0010000. A LOW LSB of this byte indicates data transmission (WRITE) while a HIGH LSB indicates data request (READ). This means that the first byte to be transmitted to the QN8025 should be "20" for a WRITE operation or "21" for a READ operation.

The second byte is the starting register address (N) for write/read operation. The following bytes are register data for address N, N+1, N+2, etc. There is no limit on the number of bytes in each transmission. A transmission can be terminated by generating a stop condition, which is SDA transition from LOW to HIGH while SCL is HIGH. For write operation, master stops transmission after the last byte. For read operation, master doesn't send ACK after receiving the last read back byte; then stops the transmission

.

The timing diagrams below illustrate both write and read operations.

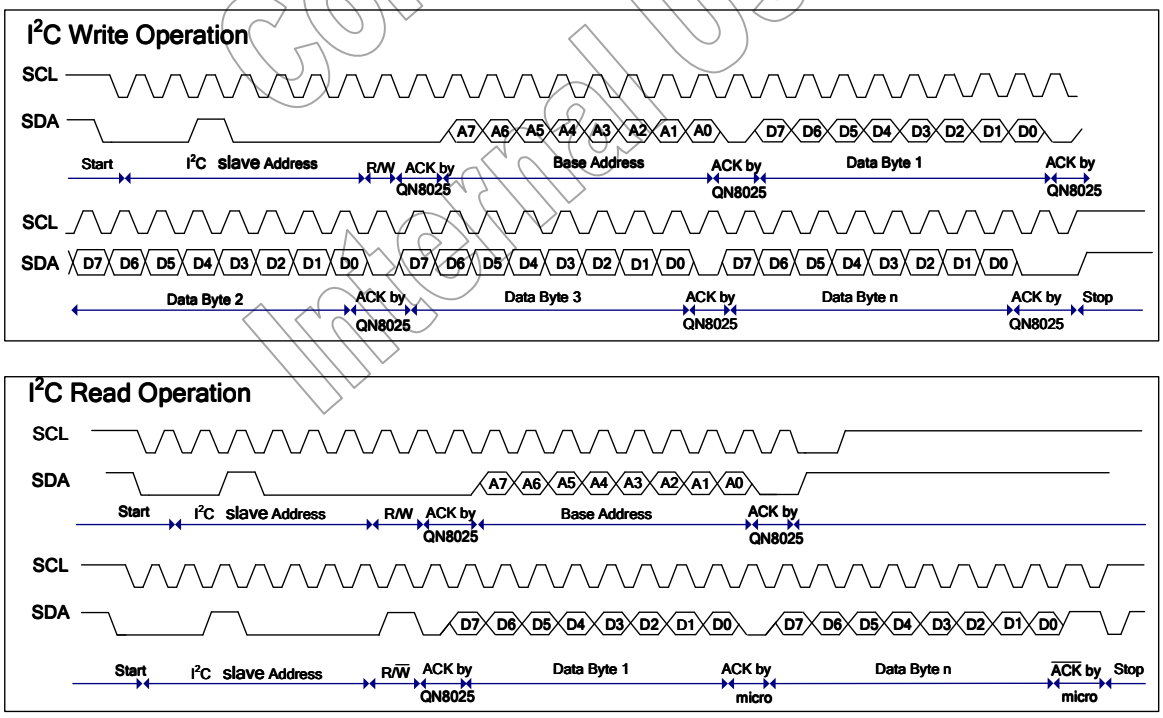

Figure 7 I2C Serial Control Interface Protocol

Notes:

1. The default IC address is 0010000.
2. "20" for a WRITE operation, "21" for a READ operation.

5 APPLICATIONS

5.1 Typical Application Schematic

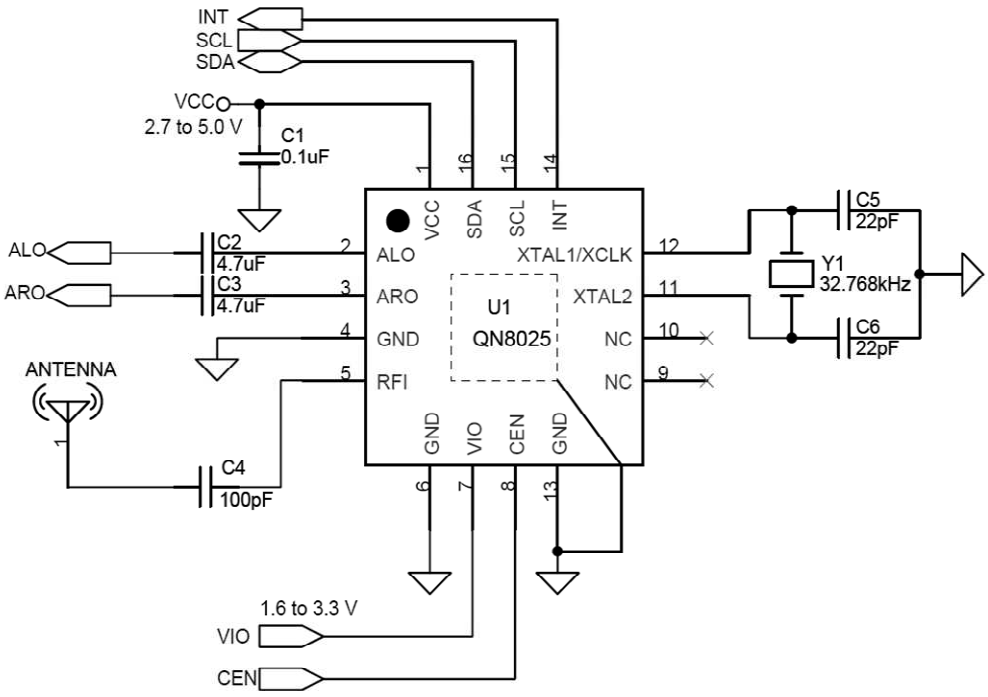

Figure 8 Typical Application Schematic

5.2 Power Supply

The QN8025 provides an integrated voltage regulator. There needs to be only one decoupling capacitor of about 0.1uF on the battery power supply. A 10uF capacitor can be added for best performance. The supported power supply voltage range is 2.7 to 5.0V.

5.3 Chip Enable

To enable the device, the CEN pin should be connected to high level (greater than 0.7*VIO). If the driving voltage is less than 0.6V to the CEN pin will be disabled. When CEN is low, the device will stop at the off state, with the system current at only 10uA.

5.4 Clock Selection and Setting

The QN8025 has an integrated crystal oscillator and supports various crystal frequencies. Alternatively, the QN8025 can be driven externally by various clock frequencies through a coupling capacitor.

1) Clock Source Selection;

When a crystal is used as the system clock input, two load capacitors need to be added in the application circuit and their values can be used to tune oscillator frequency. When external clock input is used, there are three types of input clock waveforms supported (single ended, differential sine wave, and digital clock). In Reg18h[7:6], two bits are used for selecting the different clock sources. The default value selects the crystal as clock input.

2) Crystal Starting Current Setting:

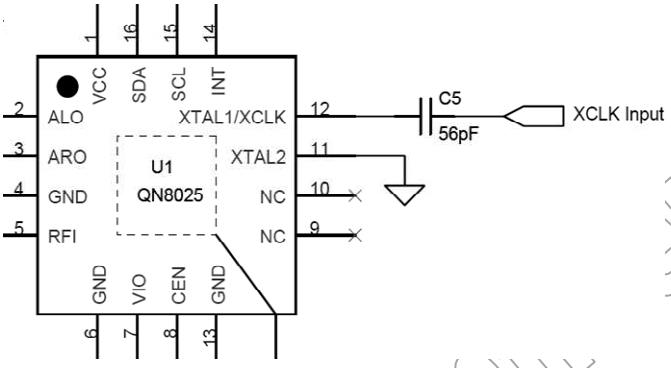
The following bits should be optimized for stable crystal oscillation and low power consumption. (Refer to the description of Reg18h for details.)

			Crystal Oscillator Current Control.

5:0	XISEL[5:0]	100000	crystal frequency (mhz)	crystal oscillator current setting
			0.032768	0.078*XISEL[5:0]
			⩾1MHz	6.25*XISEL[5:0]

Note: If crystal can't oscillate normally, it is necessary to increase XISEL[5:0]. Its default value is 100000.

3) External Clock Application:



Note: 32.768KHz or greater than or equal to 1MHz Clock can be supported

Figure 9 External Clock Input Circuit

When external clock is used, XTAL2 pin should be connected to ground.

When input clock is digital clock, its valid amplitude is determined by VIO, and for sine wave clock, the valid amplitude of clock should be about 500mVp.

4) PLL Configuration:

To select the clock frequency, set the PLL frequency divider according to the following formula:

PLL_DIV[19:0]=Clock frequency /64

For example: If clock frequency is 32.768KHZ, then so PLL_DIV[19:0] =32768/64=512.

This number can be translated into a hex result of 0x0200. So Write 0x02 into Reg16h , write 0x00 into Reg15h, and write 0x00 into Reg17h[3:0]. The default value of this parameter PLL_DIV[19:0] is 0x0200 for 32.768 KHz.

5.5 Audio Interface

The QN8025 has a highly flexible analog audio interface. The maximum single-ended audio output level is 1.4V peak-to-peak and is AC coupled to external audio driver. An external audio driver should be used when driving the headphone or speaker directly.

5.6 Antenna

The following circuit is a typical application utilizing the earphone line as a FM antenna. Three ferrite beads are used to prevent interference of the FM signal with the audio signal. A typical ferrite bead value is about 2.5K@100MHz.

For more information on FM antenna design, please refer to related application notes.

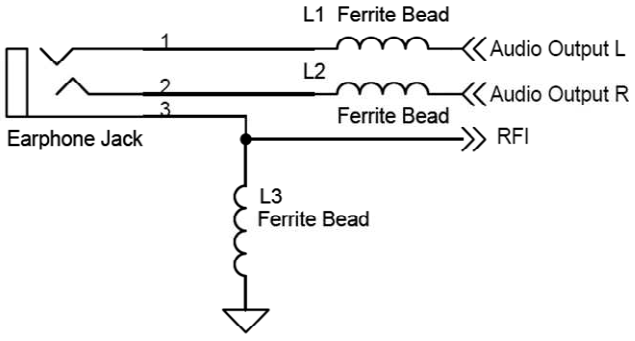


Figure 10 Earphone Line as FM Antenna

5.7 Reset

The QN8025 has three ways to achieve system reset: power down, lowering CEN(refer to Section 5.3), and software reset.

For software reset, set Reg00h[7] bit low to reset the device.

After reset, the device will enter idle mode. Before start to receive, system initialization should be executed.

5.8 Receive Mode

After going through hardware and software initialization (refer to Section 5.14), set RXREQ (Reg00h[4]) bit high, and then the device enters receive mode.

To configure the FM receiver, programmability through registers are provided to select frequency, set channel index, select de-emphasis constants (75us or 50us), enable audio mute and volume control.

5.9 Idle and Standby Modes

The QN8025 features low power idle and standby modes for fast state transition and power saving. After power up, the QN8025 will enter idle mode automatically.

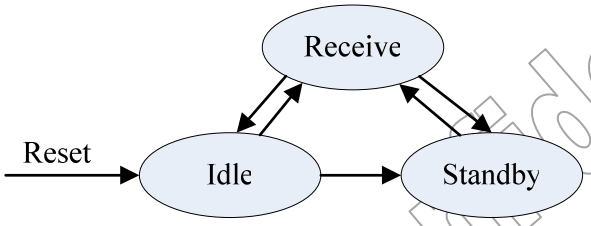

Figure 11 Three Modes Switching

As shown in Figure 11, standby mode can not directly enter idle mode.

The receive mode is the highest priority mode. If both STNBY (Reg00h[5]) and RXREQ (Reg00h[4]) bits are high, the device will enter the receive mode.

STNBY and RXREQ bits of the Reg00h are used for setting all three modes. Refer to Reg00h for detail information.

If there is no receiving requirement in a pre-determined time period, the QN8025 will enter standby mode automatically. The auto-standby function can be enabled or disabled through register setting. Enabling and disabling of auto-standby can be set in TMOUT bit (refer to Reg01h).

5.10 Volume Control

The QN8025 integrates an analog volume controller and a digital volume controller to set audio output gain. The digital gain step is 1dB, and the analog gain step is 6dB. The total gain range is -41 dB to 6 dB. Refer to Reg14h for more descriptions.

5.11 Channel Setting

Manual Channel Setting

By programming channel index CH[9:0], the RF channel can be set to any frequency between 61.75 MHz ~ 108 MHz in 50 kHz steps. The channel index and RF frequency have the following relationship:

F_{RF} = *(61.75 + 0.05* x *Channel Index),* where F_{RF} is *the RF frequency in MHz.*

For example: To set the receiver at 106.9MHz, the channel index can be calculated with the upper formula as shown in following.

Channel index =(106.9-61.75)/0.05
=903

This translates into a hex number 0x0387. So write 0x87 to Reg07h[7:0] and write 0x03 to Reg0Ah[1:0] to tune to the desired channel.

Auto Seek

After setting start frequency, stop frequency, searching step and search threshold, the auto seek function can be enabled by setting CHSC (Reg00h[1]) to one. (Refer to section 5.14-3 for programming guide).

Also, auto-seek supports a hardware interrupt function. Refer to section 5.12 for more descriptions.

5.12 Hardware Interrupt

The QN8025 supports a hardware interrupt function. It can generate an interrupt signal to a MCU during auto seek or RDS reception, in order to relieve the MCU from continuous polling on the QN8025's registers.

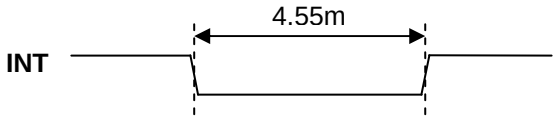

Figure 12 Interrupt Output

If RDS_INT_EN (Reg17h[7])) is set to high, a low pulse of roughly 4.55ms will be produced on the INT pin when a new group of data is received and stored into RDS registers in RDS mode.

Similarly, in CCA mode, after CCA_INT_EN (Reg17h[6]) is set to high, the same low pulse will be generated on the INT pin when a good quality channel is found in the CCA mode.

5.13 RDS/RBDS

In receive mode, setting RDSEN (Reg00h[3]) bit high will enable the RDS function. Once the device receives RDS signal, the RDSSYNC (Reg13h[4]) will be high. On reception of a RDS signal, if RDS_RXTXTUPD (Reg13h[7]) bit is toggled, or the INT pin will output a

4.55ms low pulse when hardware interrupt function is enabled by RDS_INT_EN, RDS data buffer (Reg0Bh to Reg12h) will be filled.

The results of error check-sum on four RDS blocks are then available in STATUS2[3:0] (Reg13h[3:0]). If any check-sum bit is non-zero, the corresponding RDS block is not valid. Check the register map for detailed definition of STATUS2[3:0].

E_DET bit (Reg13h[6]) is used for distinguishing whether the received RDS group contains E (MMBS) block, and RDSC0C1 (Reg13h[5]) bit is used for judging whether the received group is A group or B group.

5.14 Programming Guide

1) System Initialization:

To initialize the device, the following steps need to be executed.

a. Supply power to VCC and interface supply voltage level to VIO input. VCC, VIO and CEN should be sequenced in following order.

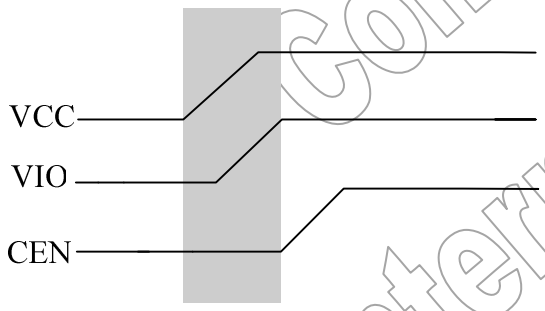

Figure 13 CEN Start Up Sequence

As shown in Figure 13, to make sure the device is working normally, CEN must be active after VCC and VIO are stable. If this start up sequence is not followed, a software reset operation will be necessary.

b. Select clock frequency (32.768KHz or other frequencies), then set the PLL divider (Reg15h to Reg17h).

c. Select clock source (crystal or external clock), and crystal starting current setting (crystal use only). For detailed configuration, refer to section 5.4.

d. Software initialization. Refer to QN8025 application note.

2) Manual Channel Tuning

a. According to the formula on Section 5.11, derive channel index of the desired channel.

b. Write channel index to Reg07h and Reg0Ah[1:0].

c. Set CHCS (Reg00h[1]) bit low to disable the CCA function and select manual operation.

d. Set the CCA_CH_DIS (Reg00h[0]) bit high to select manual tuning channel.

e. Set RXREQ (Reg00[4]) bit high to enter receive mode.

3) Auto Seek (CCA)

a. Set start frequency of CCA. Using the formula on Section 5.11, calculate channel index of start frequency, then write its hex value to Reg08h and Reg0Ah[3:2].

b. In the same way calculate channel index of stop frequency, then write its hex value to Reg09h and Reg0Ah[5:4].

c. Select step of CCA, 50KHz, 100KHz or 200KHz, write corresponding value to Reg0Ah[7:6] bits.

d. Write suitable value to RXCCAD[5:0] to set CCA searching threshold in Reg01h.

e. Set CCA_INT_EN (Reg17h[6]) bit high to enable interrupt for CCA. (optional)

f. Set the CCA_CH_DIS (Reg00h[0]) bit low to select CCA result as tuning channel.

g. Set CHSC (Reg00h[1]) bit high to enable CCA.

h. Set RXREQ (Reg00h[4]) bit high to enter receive mode.

i. Read the CH (Reg07h) and CH_STEP (Reg0Ah[1:0]) after the CHSC (Reg00h[1]) bit is low, or when interrupt function is enabled and the INT pin outputs a low pulse.

j. Read the STATUS1 (Reg04h[3]) bit. If it is low, the CCA result is valid, otherwise, discard the result. **Note**: If interrupt function is used, don't need to check STATUS1 bit.

k. According to the values of CH (Reg07h) and CH_STEP (Reg0Ah [1:0]), then calculate channel result of CCA.

l. Repeat step **g** to **k** for scanning all good channels in a frequency band.

Note: When the start frequency is greater than the stop frequency, the device will search down, and when the start frequency is less than the stop frequency, the device will search up.

4) RDS

a. Configure QN8025 channel as described in "Manual Channel Tuning".

b. Set the RDS_INT_EN (Reg17h[7]) bit high to enable the RDS interrupt function. (optional)

c. Set the RDS_ONLY(Reg17h[5]) bit high or low (default is low) to select the RDS working mode. (optional)

d. Set the RDSEN (Reg00h[3]) bit high to enable the RDS function.

e. Check the RDSSYNC (Reg13h[4]) bit. If it is high, the device has received RDS signal, otherwise keep waiting or exit the RDS mode.

f. Look for the RDS reception indicators. Check the RDS_RXTXUPD (Reg13h[7]) bit to monitor whether it is toggled in Reg13h. If the RDS interrupt function is enabled, low pulse on the INT pin is another indicator of the RDS reception. If no RDS reception, keep waiting.

g. After RDS indicators in step **f** are triggered, read out Reg13h[3:0] four bits values to judge whether they are all zeros. If so, RDS data in registers Reg0Bh to Reg12h (RDSD0 ~ RDSD7) are valid.

h. Read out RDS data from registers Reg0Bh to Reg12h (RDSD0 ~ RDSD7) for further decoding.

i. Repeat steps **e** to **h** for continuous reception of RDS data.

6 USER CONTROL REGISTERS

-------- THIS IS A PREVIEW LIST. Number and content of registers subject to change without notice --------

There are 25 user accessible control registers. All registers not listed below are for manufacturing use only.

Table 16: Summary of User Control Registers

REGISTER	NAME	USER CONTROL FUNCTIONS
00h	SYSTEM1	Sets device modes.
01h	CCA	Sets CCA parameters.
02h	DEV_ADD	Sets device address.
03h	RSSISIG	In-band signal RSSI dBμV value.
04h	STATUS1	System status.
05h	CID1	Device ID numbers.
06h	CID2	Device ID numbers.
07h	CH	Lower 8 bits of 10-bit channel index.
08h	CH_START	Lower 8 bits of 10-bit channel scan start channel index.
09h	CH_STOP	Lower 8 bits of 10-bit channel scan stop channel index.
0Ah	CH_STEP	Channel scan frequency step. Highest 2 bits of channel indexes.
0Bh	RDSD0	RDS data byte 0.
0Ch	RDSD1	RDS data byte 1.
0Dh	RDSD2	RDS data byte 2.
0Eh	RDSD3	RDS data byte 3.
0Fh	RDSD4	RDS data byte 4.
10h	RDSD5	RDS data byte 5.
11h	RDSD6	RDS data byte 6.
12h	RDSD7	RDS data byte 7.
13h	STATUS2	RDS status indicators.
14h	VOL_CTL	Audio controls.
15h	PLL_DIV0	PLL divider bits
16h	PLL_DIV1	PLL divider bits
17h	PLL_DIV2	PLL divider bits, interrupt enables.
18h	REG_XTL1	XCLK pin control, crystal oscillator current control.

Register Bit R/W Status:

RO - *R*ead *O*nly: You can not program these bits.
WO - *W*rite *O*nly: You can write and read these bits; the value you read back will be the same as written.
R/W - *R*ead/*W*rite: You can write and read these bits; the value you read back can be different from the value written. Typically, the value is set by the chip itself. This could be a calibration result, AGC FSM result, etc.

Word: SYSTEM1 Address: 00h

Bit 7 (MSB)	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0 (LSB)
swrst	recal	stnby	rxreq	rdsen	force_mo	chsc	cca_ch_dis
wo	wo	wo	wo	wo	wo	wo	wo

Bit	Symbol	Default	Description	
7	SWRST	0	Reset all registers to default values:	
			0	Keep the current values.
			1	Reset to the default values.
6	RECAL	0	Reset the state to initial states and recalibrate all blocks:	
			0	No reset. FSM runs normally.
			1	Reset the FSM. After this bit is de-asserted, FSM will go through all the power up and calibration sequence.
5	STNBY	0	Request immediately to enter Standby mode if the chip is in IDLE and no RXREQ is received. If we want exit standby mode and enter idle mode, we need to enter Rx mode as an intermediate stage.	
			0	Non standby mode. Either IDLE or RX mode.
			1	Enter standby mode.
4	RXREQ	0	Receiving request (overwrites STNBY):	
			0	Non RX mode. Either IDLE or standby mode.
			1	Enter receive mode.
3	RDSEN	0	RDS enable:	
			0	No RDS.
			1	RDS enable.
2	FORCE_MO	0	Force receiver in MONO mode:	
			0	Not forced. ST/MONO auto selected
			1	Forced in MONO mode
1	CHSC	0	Channel Scan mode enable: Combined with RXREQ, chip scans for occupied channel for receiving. After completing channel scanning, this bit will be cleared automatically.	

			For RX Scan, the FIRST valid channel will be selected. So, if we want to start CCA, we should set CHSC (REG0 [1]) as 1, when CCA is completed, CHSC will be cleared to 0 automatically. If we want to use the scanned channel, we need to set CCA_CH_DIS as 0. (Of course we can set CCA_CH_DIS=0 at the same time with setting CHSC=1).	
			0	Normal operation
			1	Channel scan mode operation.
0	CCA_CH_DIS	1	CH (channel index) selection method: See description for CH register at 07h and 0Ah for more information.	
			0	CH is determined by internal CCA (channel scan).
			1	CH is determined by the content in CH[9:0].

Note: STNBY has the lowest priority.

Word: CCA **Address: 01h**

Bit 7 (MSB)	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0 (LSB)
tmout[1]	tmout[0]	rxccad[5]	rxccad[4]	rxccad[3]	rxccad[2]	rxccad[1]	rxccad[0]
wo	wo	wo	wo	wo	wo	wo	wo

Bit	Symbol	Default	Description	
7:6	TMOUT[1:0]	01	Time out setting for IDLE to standby state transition: (min)	
			0 0	1
			0 1	3
			1 0	5
			1 1	Infinity (never)
5:0	RXCCAD[5:0]	00 1001	RXCCAD[5:0] is used to set the threshold for RX CCA. Channel with RSSI(dBuv) > (RXCCAD-10) dBuv is selected as valid channel.	

Word: DEV_ADD Address: 02h

Bit 7 (MSB)	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0 (LSB)
0	rsvd	rsvd	rsvd	rsvd	rsvd	rsvd	rsvd
rw	ro	ro	ro	ro	ro	ro	ro

Bit	Symbol	Default	Description	
7	IMR	0	Image Rejection. In CCA disabled mode (CCA_DIS=1), this is user set value. In CCA mode, this is CCA selection read out	
			imr	Image rejection status
			0	LO<RF, image is in lower side
			1	LO>RF, image is in upper side
6:0	rsvd	rrrrr	Reserved	

Word: RSSISIG Address: 03h (RO)

Bit 7 (MSB)	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0 (LSB)
rssidb[7]	rssidb[6]	rssidb[5]	rssidb[4]	rssidb[3]	rssidb[2]	rssidb[1]	rssidb[0]
ro	ro	ro	ro	ro	ro	ro	ro

Bit	Symbol	Default	Description
7:0	RSSIDB[7:0]	rrrr rrrr	In-band signal RSSI (*R*eceived *S*ignal *S*trength *I*ndicator) dBμV value: dBμV = RSSI (with AGC correction) - 46

Word: STATUS1 Address: 04h (RO)

Bit 7 (MSB)	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0 (LSB)

ro	ro	ro	ro	ro	ro	ro	ro

Bit	Symbol	Default	Description	
7	RDS_RXTXUPD	r	RDS RX: RDS received group updated. Each time a new group is received, this bit will be toggled. If RDS_INT_EN=1, then at the same time this bit is toggled, the interrupt output pin (INT) will output a 4.5 ms low pulse.	
			0->1 or 1->0	A new set (8 bytes) of data is received.
			0->0 or 1->1	New data is in receiving.
6	E_DET	r	‘E’ block (MMBS block) detected:	
			0	not detected

			1	detected
5	RDSC0C1	r	Type indicator of the RDS third block in one group:	
			0	C0
			1	C1
4	RDSSYNC	r	RDS block synchronous indicator:	
			0	non-synchronous
			1	synchronous
3	RDS0ERR	r	Received RDS block 0 status indicator:	
			0	no error
			1	error
2	RDS1ERR	r	Received RDS block 1 status indicator:	
			0	no error
			1	error
1	RDS2ERR	r	Received RDS block 2 status indicator:	
			0	no error
			1	error
0	RDS3ERR	r	Received RDS block 3 status indicator:	
			0	no error
			1	error

Word: VOL_CTL Address: 14h

wo	wo	wo	wo	wo	wo	wo	wo

Bit	Symbol	Default	Description	
7:6	XINJ[1:0]	00	Select the reference clock source	
			XINJ[1:0]	Clock source
			00	Use internal oscillator on XTAL1/XTAL2 pins
			01	Inject digital clock from XTAL1/XCLK pin.
			10	Single end sine-wave injection on XTAL1/XCLK pin.
			11	Differential sine-wave injection on XTAL1//XCLK pin.
5:0	XISEL[5:0]	100000	XCLK pin control, Crystal oscillator current control.	
			Frequency (MHz)	Crystal oscillator current (uA)
			0.032768	0.078*XISEL[5:0]
			≥1MHz	6.25*XISEL[5:0]

7 ORDERING INFORMATION

Part Number	Description	Package
QN8025-NCNB	The QN8025 is Single-Chip Low-Power FM Receiver for Portable Devices.	2.5x2.5 mm Body [QFN16]
QN8025-NGNB	The QN8025-NGNB pin is compatible with the QN8005/8005B.	4x4 mm Body [QFN24]

8 PACKAGE DESCRIPTION

16-Lead plastic Quad Flat, No Lead Package (ML) – 2.5x2.5 mm Body [QFN]

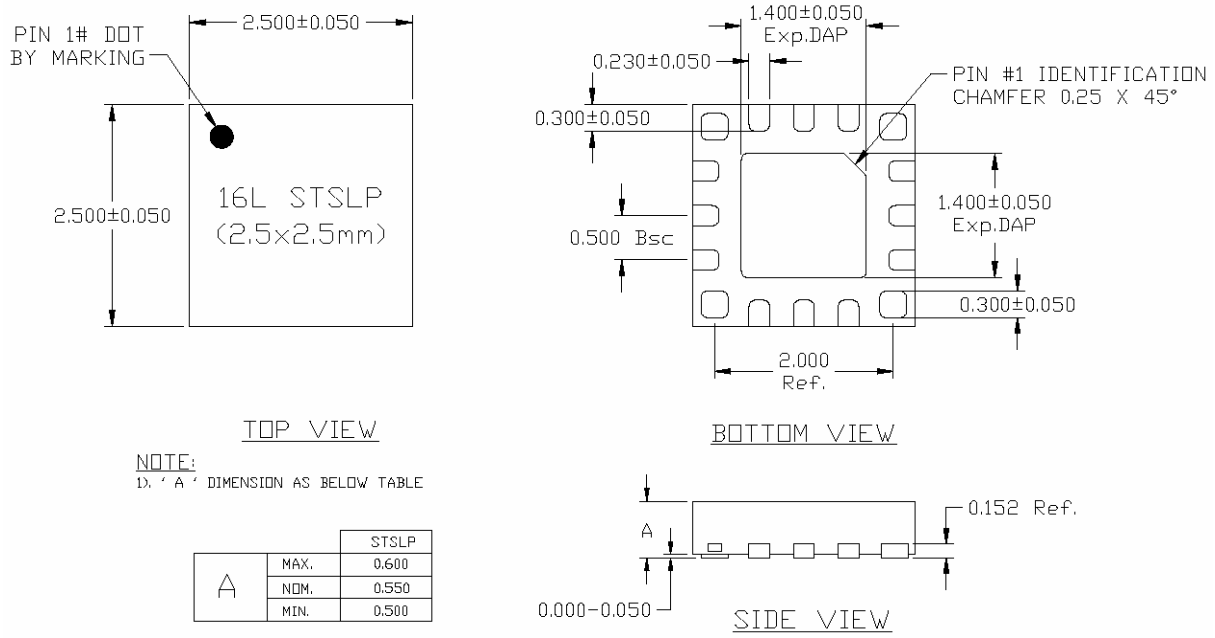

Figure 1: QN8025 Mechanical Drawing

Units	Millimeters		
Dimension Limits	**MIN**	**NOM**	**MAX**
Number of pins		16	
Pitch		0.50 BSC	
Overall Height （SLP）	0.70	0.75	0.80
Standoff	0.00		0.05
Contact Thickness		0.152 REF	
Overall Width		2.50 BSC	
Exposed Pad Width	1.35	1.40	1.45
Overall Length		2.50 BSC	
Exposed Pad Length	1.35	1.40	1.45
Corner Contact Height & Width	0.25	0.30	0.35
Side Contact Width	0.18	0.23	0.28
Side Contact Length	0.25	0.30	0.35
Contact-to-Exposed Pad	-	0.25	-

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Package is saw singulated.

3. Dimensioning and tolerance per ASME Y 14.5M.
   BSC: Basic Dimension. The theoretically exact value is shown without tolerance.
   REF: Reference Dimension, usually without tolerance, for information purpose only.

24-Lead plastic Quad Flat, No Lead Package (ML) – 4x4 mm Body [QFN]

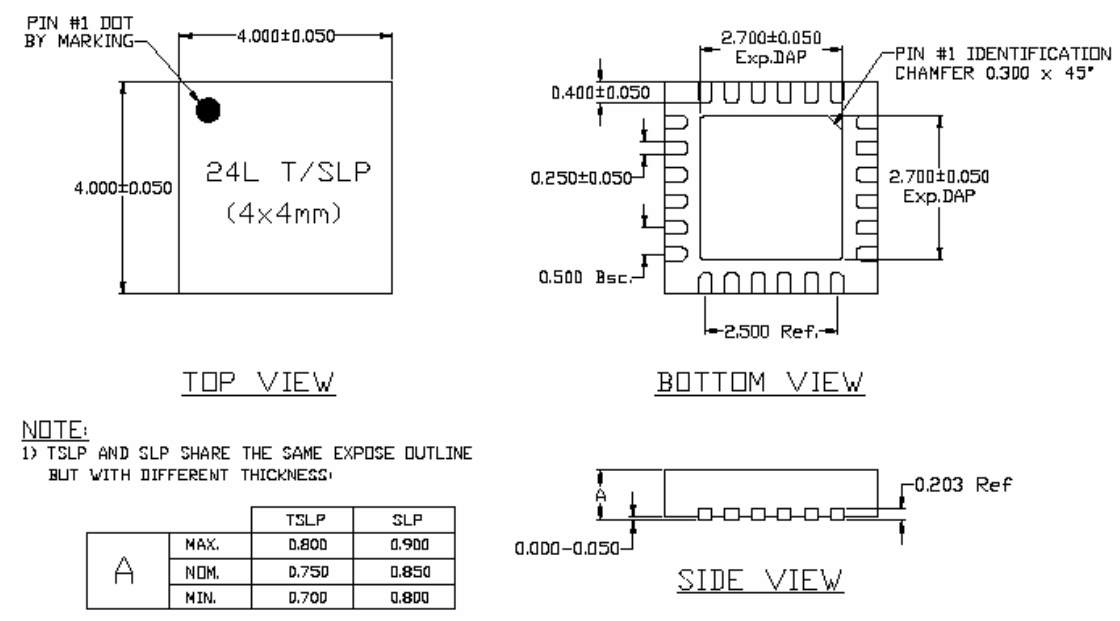

Figure 2: QN8025 Mechanical Drawing

Units	Millimeters		
Dimension Limits	**MIN**	**NOM**	**MAX**
Number of pins		24	
Pitch		0.50 BSC	
Overall Height （SLP）	0.80	0.85	0.90
Standoff	0.00		0.05
Contact Thickness		0.203 REF	
Overall Width		4.00 BSC	
Exposed Pad Width	2.65	2.70	2.75
Overall Length		4.00 BSC	
Exposed Pad Length	2.65	2.70	2.75
Contact Width	0.20	0.25	0.30
Contact Length	0.35	0.40	0.45
Contact-to-Exposed Pad	-	0.25	-

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Package is saw singulated.
3. Dimensioning and tolerance per ASME Y 14.5M.
4. BSC: Basic Dimension. The theoretically exact value is shown without tolerance.
5. REF: Reference Dimension, usually without tolerance, for information purpose only.

Carrier Tape Dimensions

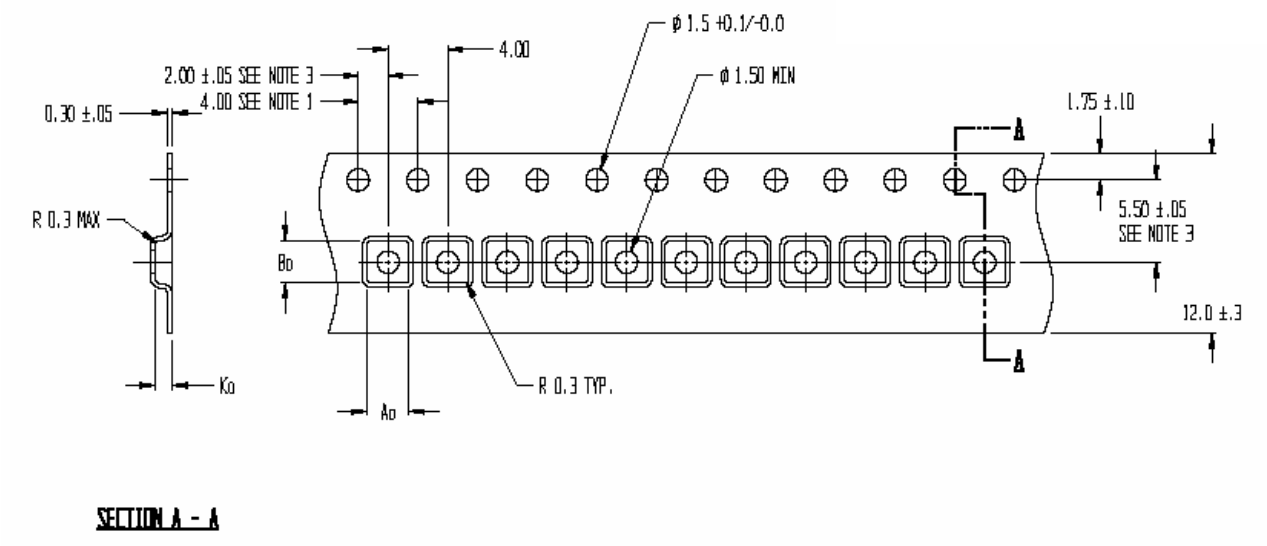

Figure 3: 2.5X2.5 QFN16 Carrier Tape

Notes:

1. 10 sprocket hole pitch cumulative tolerance +U0.2.
2. Camber in compliance with EIA-481.
3. Pocket position relative to sprocket hole measured as true position of pocket, not pocket hole.
4. A0 = 2.80
   B0 = 2.80
   K0 = 1.10

4X4 QFN24 Carrier Tape

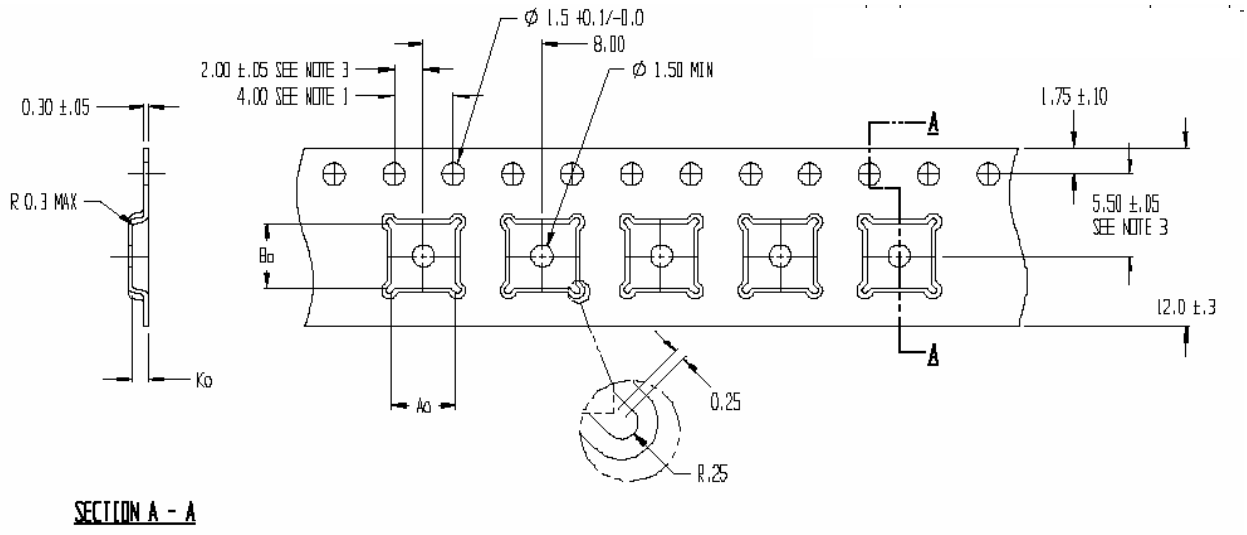

Figure 4: 4X4 QFN24 Carrier Tape

Notes:

1. 10 sprocket hole pitch cumulative tolerance ±U0.2.
2. Camber in compliance with EIA-481.
3. Pocket position relative to sprocket hole measured as true position of pocket, not pocket hole.
4. A_0 = 4.35
   B_0 = 4.35
   K_0 = 1.10

9 SOLDER REFLOW PROFILE

9.1 Package Peak Reflow Temperature

QN800X is assembled in a lead-free QFN24 package. Since the geometrical size of QN800X is 4 mm × 4 mm × 0.85 mm, the volume and thickness is in the category of volume<350 mm^3 and thickness<1.6 mm in Table 4-2 of IPC/JEDEC J-STD-020C. The peak reflow temperature is:

$$T_p = 260^o C$$

The temperature tolerance is +0°C and -5°C. Temperature is measured at the top of the package.

9.2 Classification Reflow Profiles

Profile Feature		Specification*
Average Ramp-Up Rate (tsmax to tP)		3℃/second max.
Pre-heat:	Temperature Min (Tsmin)	150℃
	Temperature Max (Tsmax)	200℃
	Time (ts)	60-180 seconds
Time maintained above:	Temperature (T_L)	217℃
	Time (t_L)	60-150 seconds
Peak/Classification Temperature (Tp)		260℃
Time within 5℃ of Actual Peak Temperature (tp)		20-40 seconds
Ramp-Down Rate		6℃/second max.
Time 25℃ to Peak Temperature		8 minutes max.

*Note: All temperatures are measured at the top of the package.

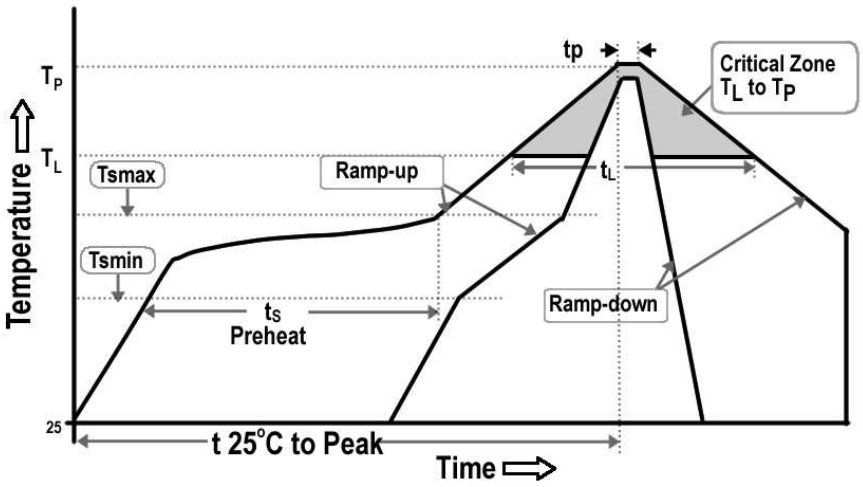

Figure 5: Reflow Temperature Profile

9.3 Maximum Reflow Times

All package reliability tests were performed and passed with a pre-condition procedure that repeat a reflow profile, which conforms to the requirements in Section 9.2, **three (3)** times.
