

Product Description

Qorvo’s QPA1010 is a X-band high power MMIC amplifier fabricated on Qorvo’s production 0.15um GaN on SiC process (QGaN15). The QPA1010 operates from 7.9 – 11 GHz and typically provides 15 W saturated output power with power-added efficiency of 38% and large-signal gain of 18 dB. This combination of wideband performance provides the flexibility designers are looking for to improve system performance while reducing size and cost.

QPA1010 can also support a variety of operating conditions to best support system requirements. With good thermal properties, it can support a range of bias voltages and will perform well under both CW and pulse operations.

The QPA1010 is matched to 50Ω with integrated DC blocking capacitors on both RF I/O ports simplifying system integration. The wideband performance and operational flexibility allow it support satellite communication and data links, as well as, military and commercial radar systems.

Lead-free and RoHS compliant.

Power Dissipation and Maximum Gate Current

Applications Circuit for Linear and Pulsed Operations

Note: $V_{\Delta} = V_{REF} - V_{DET}$

- QPA1010 can be biased from either the top side or bottom side.
- V_{D1} and V_{D2} need to be tied together.
- V_{D1} / V_{D2} and V_{REF} / V_{DET} have to be on the same side for V_{Δ} to work.
- Bypassing components required for the side(s) being biased.
- The extra bias components (R6, R17, C5 and C14) are required for optimum linearity.

Bias Up Procedure

1. Set I_D limit to 2000 mA, I_G limit to 20 mA
2. Apply -5 V to V_G
3. Apply +24 V to V_D ; ensure I_{DQ} is approx. 0 mA
4. Adjust V_G until $I_{DQ} = 600$ mA ($V_G \sim -1.8$ V Typ.).
5. Turn on RF supply

Bias Down Procedure

1. Turn off RF supply
2. Reduce V_G to -5 V; ensure I_{DQ} is approx. 0 mA
3. Set V_D to 0 V
4. Turn off V_D supply
5. Turn off V_G supply
