Evaluation Board Programming Using USB Interface

Serial Mode
All programming jumpers on the evaluation board are set to the default values indicated in the table. Refer to the Control Bit Generator (CBG) Software Reference Manual for instructions on how to setup the software for use. Apply supply voltage to P6. Select ‘QPC3624’ for serial operation from the parts list of the CBG user interface. Set the attenuation value using the CBG user interface.

Direct Parallel Mode
Evaluation board programming jumper S2 is set to ‘0’. Refer to the Control Bit Generator (CBG) Software Reference Manual for instructions on how to setup the software for use. Apply the supply voltage to P6. Select ‘QPC3624-P’ from the parts list of the CBG user interface. Set the attenuation value using the CBG user interface.

Evaluation Board Programming Using External Bus

Serial Mode
This configuration allows the user to control the attenuator through the P5 connector using an external harness. Remove the USB interface board if it is currently installed on the evaluation board. Connect a user-supplied harness to the P5 connector. Note that the top row of P5 contains the serial bus signals and the bottom row is ground. Programming jumper S2 is set to ‘1’ to select serial mode. Jumper S6 is installed and allows the LE signal to be routed from the P5 connector to the attenuator. Apply the supply voltage to P6. Send the appropriate signals onto the serial bus lines in accordance with the Serial Addressable Mode Timing Diagram.

Latched Parallel Mode
This configuration allows the user to control the attenuator through the P1 connector using an external harness. Remove the USB interface if it is currently installed on the evaluation board. Connect a user-supplied harness to the P1 connector. The parallel bus signal names for P1 are indicated on the evaluation board. Programming jumper S2 is set to ‘0’ to select parallel mode. Apply the supply voltage to P6. Send the appropriate signals onto the parallel bus lines in accordance with the Latched Parallel Mode Timing Diagram.

Direct Parallel Mode
This configuration allows the user to control the attenuator through the P1 connector using an external harness. When using this mode the LE signal is held at logic high so that the attenuation will change immediately when there is a change in logic state for any of the parallel bus signals. Remove the USB interface if it is currently installed on the evaluation board. Connect a user-supplied harness to the P1 connector. The parallel bus signal names for P1 are indicated on the evaluation board. Programming jumper S2 is set to ‘0’ to select parallel mode. Apply the supply voltage to P6. Send the appropriate signals onto the parallel bus lines.

Default Power-up State

This default attenuation state is maximum (31.5 dB) when supply voltage is applied to the attenuator in both serial and parallel modes. If a different attenuation state is desired during power-up, this can be accomplished by applying signals according to the Parallel Mode Truth Table. The attenuator will power-up to the state applied to the parallel bus during turn on. The LE signal must be held to logic ‘0’ during power-up. Note that the FDTI controller can interfere with the default power-up state – removing the plug in module will allow normal expected power default operation.
