

1.2 A, 30 V Step Down DC/DC Converter for Automotive Applications

NO. EC-269-140311

OUTLINE

The R1245x is a Step-down DC/DC converter with internal N-channel high side Tr. That is developed with CMOS process technology. The ON resistance of the built-in high-side transistor is 0.35Ω and the R1245x can provide the maximum 1.2 A output current. Each of the ICs consists of an oscillator, a PWM control circuit, a voltage reference unit, an error amplifier, a phase compensation circuit, a slope compensation circuit, a soft-start circuit, protection circuits, an internal voltage regulator, and a switch for bootstrap circuit. The ICs can make up a step-down DC/DC converter with an inductor, resistors, a diode, and capacitors.

The R1245x is a current mode operating type DC/DC converter without an external current sense resistor, and realizes fast response and high efficiency. As an output capacitor, a ceramic type capacitor can be used with the R1245x. The options of the internal oscillator frequency are preset at 330 kHz for version A and B, 500 kHz for version C and D, 1000 kHz for version E and F, 2400 kHz for version G and H.

As for protection, an Lx peak current limit circuit cycle by cycle, a thermal shutdown function and an under voltage lockout (UVLO) function are built in. Furthermore, there are two types for short protection, for A/C/E/G version, a latch protection function which makes the output latch off if the output voltage keeps lower than the set output voltage for a certain time after detecting current limit is built in, for B/D/F/H version, a fold-back protection function which changes the oscillator frequency slower after detecting short circuit or equivalent.

As for the packages of the R1245x, HSOP-8E and DFN2020-8 are available.

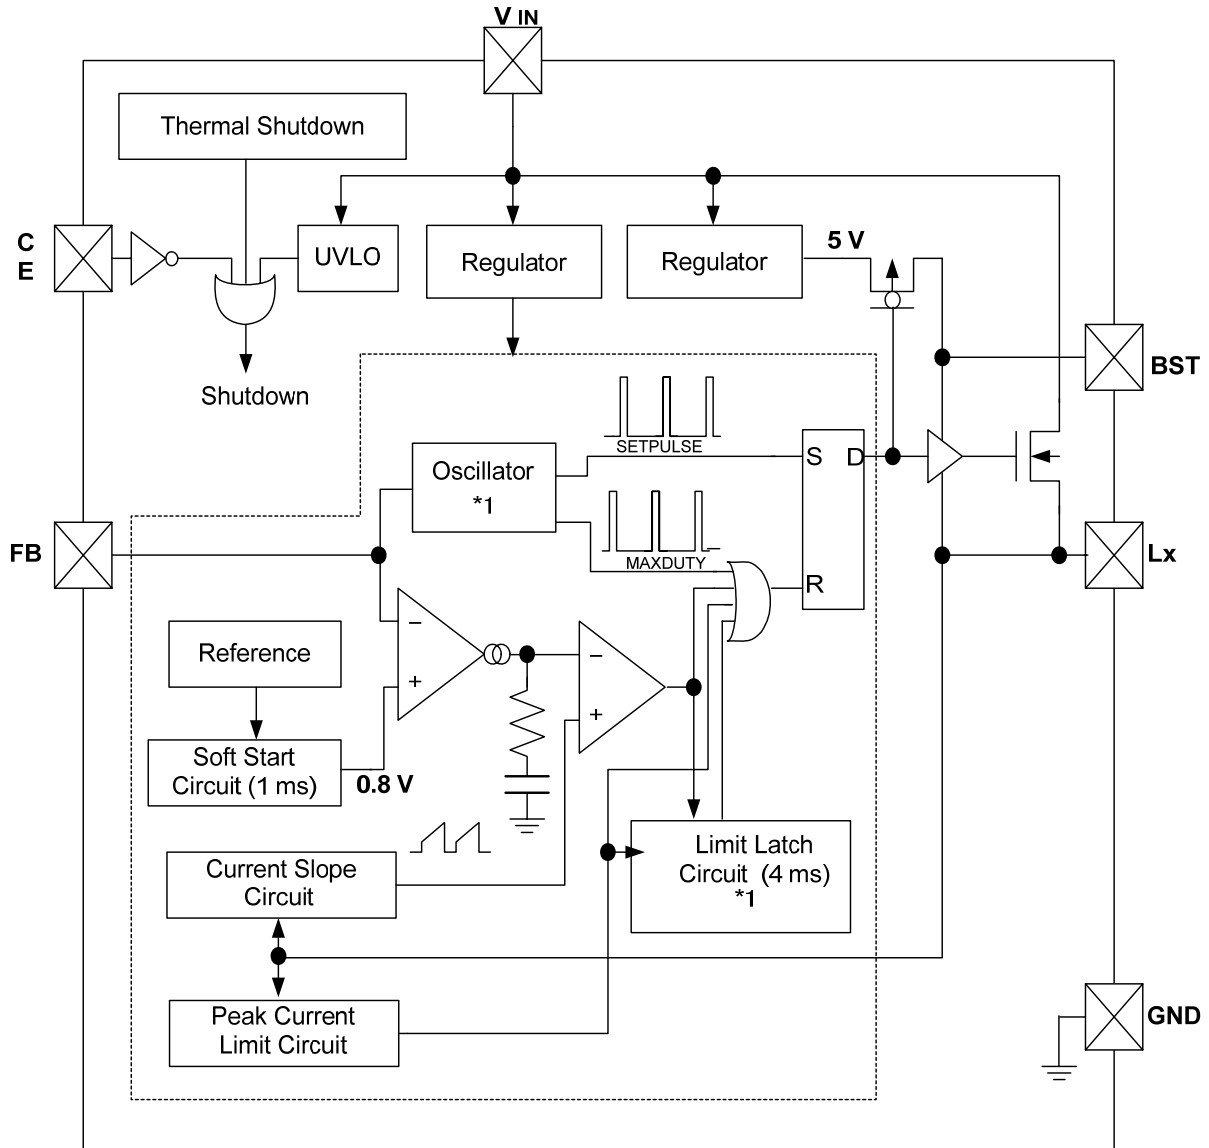

FEATURES

- Input Voltage Range (Maximum Rating) 4.5 V to 30 V (32 V)
- Operating Temperature -40°C to 105°C
- Internal N-channel MOSFET Driver $R_{\text{ON}} = 0.35 \Omega$ Typ.
- Adjustable Output Voltage with External Resistor 0.8 V or more
- Feedback Voltage and Tolerance $0.8 \text{ V} \pm 1.0\%$
- Peak Current Limit Typ. 2.0 A
- UVLO Function Released Voltage Typ. 4.0 V
- Operating Frequency 330 kHz (A/B version), 500 kHz (C/D version),
1000 kHz (E/F version), 2400 kHz (G/H version)
- Fold-back Protected Frequency 170 kHz (B/D version), 250 kHz (F version),
400 kHz (H version)
- Latch Protection Delay Time Typ. 4 ms for A/C/E/G version
- Built-in Thermal Shutdown Circuit Typ. 160°C
- Ceramic Capacitors Recommended for Input and Output
- Stand-by Current Typ. $0 \mu\text{A}$
- Packages HSOP-8E, DFN2020-8
- AEC-Q100 Certified Product Package Type HSOP-8E

APPLICATIONS

- Power source for car accessories including car audio equipment, car navigation system, and ETC system.
- Power source for control units including EV inverter and charge control.

BLOCK DIAGRAMS

*1

Version	Oscillator frequency	Short protection type
A	330 kHz	Latch
B	330 kHz	Fold-back
C	500 kHz	Latch
D	500 kHz	Fold-back
E	1000 kHz	Latch
F	1000 kHz	Fold-back
G	2400 kHz	Latch
H	2400 kHz	Fold-back

SELECTION GUIDE

In the R1245x, the package, type of short protection (Latch or Fold-back), and the oscillator frequency can be selected with the user's request.

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free	AEC-Q100
R1245S003*-E2-#E	HSOP-8E	1,000 pcs	Yes	Yes	Yes
R1245L003*-TR-AE	DFN2020-8	3,000 pcs	Yes	Yes	

*: Designation of the oscillator frequency and the protection function option.

Symbol	Oscillator frequency	Latch protection	Fold-back protection
A 330	kHz	✓	
B 330	kHz		✓
C 500	kHz	✓	
D 500	kHz		✓
E 1000	kHz	✓	
F 1000	kHz		✓
G 2400	kHz	✓	
H 2400	kHz		✓

#: Designated Automotive Class Code

	Operating Temperature Range	Guaranteed Specs Temperature Range	Screening
A	-40°C to 105°C	25°C	High temperature
J	-40°C to 105°C	-40°C to 105°C	High and low temperature

Automotive class code (A, J) varies depending on the package and function.

Package Function		Automotive Class Code	
		A	J
HSOP-8E	A, B, G, H	✓	✓
	C, D, E, F	✓	
DFN2020-8	A, B, C, D, E, F, G, H	✓	

PIN DESCRIPTIONS

• HSOP-8E

Pin No.	Symbol	Description
1	L _x	L _x Switching Pin
2	V _{IN}	Power Supply Pin
3	CE	Chip Enable Pin (Active with "H")
4	TEST	TEST pin (must be open for user side.)
5	GND ^{*1}	Ground Pin
6	FB	Feedback Pin
7	NC	No connection
8	BST	Bootstrap Pin

^{*1} Connect the backside heat radiation tab to GND or same as GND level (recommendation).
The tab is connected to the GND pin.

• DFN2020-8

Pin No.	Symbol	Description
1	L _x	L _x Switching Pin
2	V _{IN}	Power Supply Pin
3	V _{IN}	Power Supply Pin
4	CE	Chip Enable Pin (Active with "H")
5	GND ^{*2}	Ground Pin
6	FB	Feedback Pin
7	TEST	Test Pin (must be open for user side)
8	BST	Bootstrap Pin

^{*2} Connect the backside heat radiation tab to GND or same as GND level (recommendation).
The tab is connected to the GND pin.

ABSOLUTE MAXIMUM RATINGS

(GND = 0 V)

Symbol Item		Rating	Unit
V_{IN}	Input Voltage	-0.3 to 32	V
V_{BST}	BST Pin Voltage	$V_{LX} - 0.3$ to $V_{LX} + 6$	V
V_{LX}	Lx Pin Voltage	-0.3 to $V_{IN} + 0.3$	V
V_{CE}	CE Pin Input Voltage	-0.3 to $V_{IN} + 0.3$	V
V_{FB}	Feedback Pin Voltage	-0.3 to 6	V
P_D	Power Dissipation (Ultra High Wattage Land Pattern)* ¹	HSOP-8E 3600	mW
	Power Dissipation (Standard Land Pattern)* ¹	DFN2020-8	
T_j	Junction Temperature	-40 to 150	°C
T_{stg}	Storage Temperature Range	-55 to 150	°C

*¹ Refer to *PACKAGE INFORMATION* for detailed information.

ABSOLUTE MAXIMUM RATINGS

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the lifetime and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

RECOMMENDED OPERATING CONDITIONS

Symbol Item		Rating	Unit
V_{IN}	Input Voltage	4.5 to 30	V
T_a	Operating Temperature Range	-40 to 105	°C

RECOMMENDED OPERATING CONDITIONS

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

TYPICAL APPLICATION

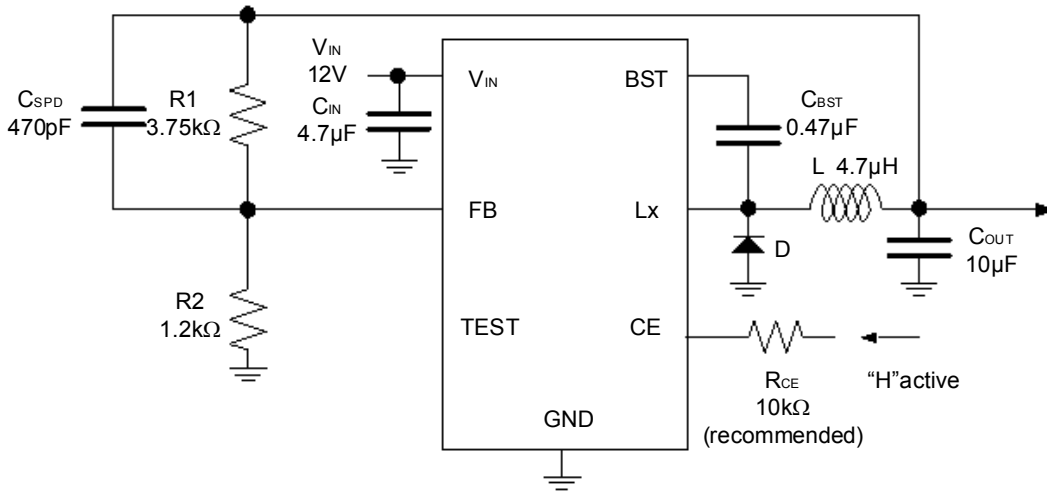

*TEST pin must be open.

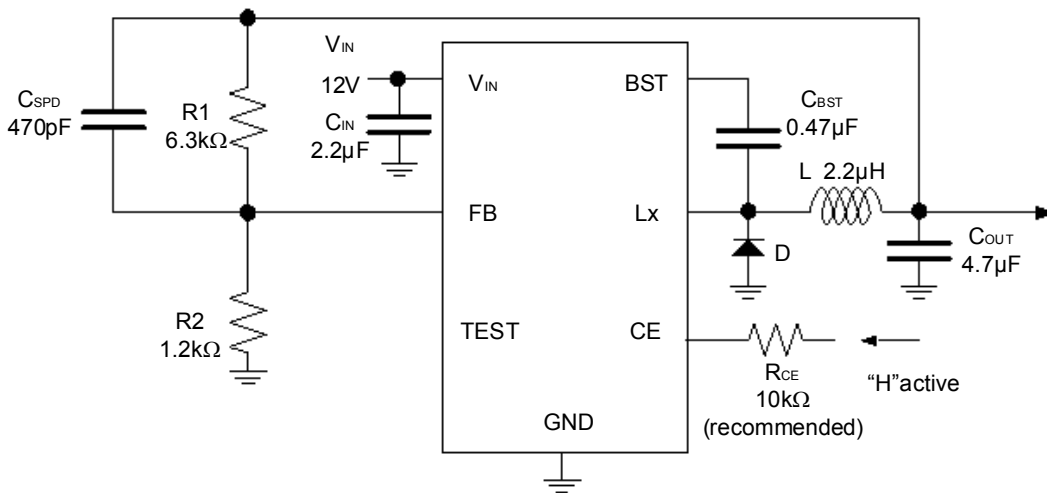

R1245x

NO. EC-269-140311

R1245x00xE/F 1000 kHz $V_{OUT} = 3.3\text{ V}$ $V_{IN} = 12\text{ V}$

R1245x00xG/H 2400 kHz $V_{OUT} = 5.0\text{ V}$ $V_{IN} = 12\text{ V}$

*TEST pin must be open.

TECHNICAL NOTES

*External components must be connected as close as possible to the ICs and make wiring as short as possible. Especially, the capacitor connected in between V_{IN} pin and GND must be wiring the shortest. If their impedance is high, internal voltage of the IC may shift by the switching current, and the operating may be unstable. Make the power supply and GND lines sufficient. In the wiring of the power supply, GND, L_X , V_{OUT} and the inductor, large current by switching may flow. To avoid the bad influence, the wiring between the resistance, “ R_{UP} ” for setting the output voltage and loading, and the wiring between the inductor and loading must be separated.

*The ceramic capacitors have low ESR (Equivalent Series Resistance) and recommended for the ICs. The recommendation of C_{IN} capacitor between V_{IN} and GND is 10 μ F or more for A/B/C/D version, 4.7 μ F or more for E/F version, and 2.2 μ F or more for G/H version. Verify the bias dependence and the temperature characteristics of the ceramic capacitors. Recommendation conditions are written based on the case which the recommendation parts are used with the R1245x.

*The R1245x is designed with the recommendation inductance value and ceramic capacitor value and phase compensation has been made. If the inductance value is large, due to the lack of current sensing amount of the current mode, unstable operation may result. On the contrary, if the inductance value is small, the current sensing amount may increase too much, low frequency oscillation may occur when the on duty ratio is beyond 50%. Not only that, if the inductance value is small, according to the increase of the load current, the peak current of the switching may increase, as a result, the current may reach the current limit value and the current limit may work.

*As for the diode, use the Schottky diode with small capacitance between terminals. The reference characteristic of the capacitance between terminals is around 100 pF or less at 10 V. If the capacitance between terminals is large, excess switching current may flow and the operation of the IC may be unstable. If the capacitance between terminals of the Schottky diode is beyond 100 pF at 10 V or unknown, verify the load regulation, line regulation, and the load transient response.

*Output voltage can be set by adjustment of the values of R1 and R2. The equation of setting the output voltage is $V_{OUT} = V_{FB} \times (R1 + R2)/R2$. If the values of R1 and R2 are large, the impedance of FB pin increases, and pickup the noise may result. The recommendation value range of R2 is approximately between 1.0 k Ω to 16 k Ω . If the operation may be unstable, reduce the impedance of FB pin.

*For the CE pin, as an ESD protection element, a diode to V_{IN} pin is formed internal of the IC. If CE pin voltage may become higher than V_{IN} pin voltage, to prevent flowing large current from CE pin to V_{IN} pin, connect 10 k Ω or more resistor between CE and V_{IN} pin.

*Connect the backside heat radiation tab to the GND. As for multi-layered boards, to make better power dissipation, putting some thermal vias on the thermal tab in the land pattern and radiation of the heat to another layer is effective.

*After the soft-start operation, the latch function is enabled for version A/C/E/G. The latch protection starts the internal counter when the internal current limit protection circuit detects the current limit. When the internal counter counts up to the latch timer limit, typically 4 ms, the output is latched off. To reset the latch function, make the CE pin “L”, or make V_{IN} pin voltage lower than UVLO detector threshold. Then in the case that the output voltage or FB voltage becomes setting voltage within the latch timer preset time, counter is initialized. If the slew rate of the power supply is too slow and after the soft-start time, the output voltage does not reach the set output voltage even if the latch timer preset time is over, the latch function may work unexpectedly.

*After the soft-start operation, fold-back protection function is enabled for version B/D/F/H. The fold-back function will limit the oscillator frequency if the FB pin voltage becomes lower than typically 0.56 V. For B/D version, the oscillator frequency will be reduced typically into 170 kHz, for F version, into 250 kHz, for H version, into 400 kHz. If the slew rate of the power supply is too slow, and even after the soft-start time, the output voltage is still less than 70% of the set output voltage, or FB pin voltage is less than typically 0.56 V, then this function may work unexpectedly.

R1245xNO. EC-269-140311

The performance of power circuit using this IC largely depends on external components. Selection of external components is very important, especially, do not exceed each rating value (voltage/current/power).

R _{CE}	The Up Diode is connected between the CE pin and the V _{IN} pin as the ESD protection element. If there is the possibility that the voltage of the CE pin becomes higher than the voltage of the V _{IN} pin, it is recommended to connect the 10 kohm resistance with the CE pin for preventing a large current flows into the V _{IN} pin from the CE pin.			

OPERATION OF THE BUCK CONVERTER AND THE OUTPUT CURRENT

The DC/DC converter charges energy in the inductor when the switch turns on, and discharges the energy from the inductor when the switch turns off and controls with less energy loss, so that a lower output voltage than the input voltage is obtained. Refer to the following figures.

Step 1: The switch turns on and current $I_L (= i_1)$ flows, and energy is charged into C_{OUT} . At this moment, I_L increases from $I_{Lmin} (= 0)$ to reach I_{Lmax} in proportion to the on-time period (t_{on}) of the switch.

Step 2: When the switch turns off, the diode turns on in order to maintain I_L at I_{Lmax} , and current $I_L (= i_2)$ flows.

Step 3: $I_L (= i_2)$ decreases gradually and reaches $I_L = I_{Lmin} = 0$ after a time period of t_{open} , and the diode turns off. This case is called as discontinuous mode. If the output current becomes large, next switching cycle starts before I_L becomes 0 and the diode turns off. In this case, I_L value increases from $I_{Lmin} (> 0)$, and this case is called continuous mode.

In the case of PWM control system, the output voltage is maintained by controlling the on-time period (t_{on}), with the oscillator frequency (f_{osc}) being maintained constant.

OUTPUT CURRENT AND SELECTION OF EXTERNAL COMPONENTS

The calculation method of output current and the relation between the output current and external components are as follows:

When the switch of L_x turns on:

(Wherein, the peak to peak value of the ripple current is described as I_{RP} , the ON resistance of the switch is described as R_{ONH} , and the diode forward voltage as V_F , and the DC resistance of the inductor is described as R_L , and on time of the switch is described as t_{on})

$$V_{IN} = V_{OUT} + (R_{ONH} + R_L) \times I_{OUT} + L \times I_{RP} / t_{on} \dots\dots\dots \text{Equation 1}$$

When the switch turns off (the diode turns on) as t_{off} :

$$L \times I_{RP} / t_{off} = V_F + V_{OUT} + R_L \times I_{OUT} \dots\dots\dots \text{Equation 2}$$

Put Equation 2 to Equation 1 and solve for ON duty of the switch, $t_{on} / (t_{off} + t_{on}) = D_{ON}$,

$$D_{ON} = (V_{OUT} + V_F + R_L \times I_{OUT}) / (V_{IN} + V_F - R_{ONH} \times I_{OUT}) \dots\dots\dots \text{Equation 3}$$

Ripple Current is as follows:

$$I_{RP} = (V_{IN} - V_{OUT} - R_{ONH} \times I_{OUT} - R_L \times I_{OUT}) \times D_{ON} / f_{osc} / L \dots\dots\dots \text{Equation 4}$$

wherein, peak current that flows through L, and the peak current I_{Lmax} is as follows:

$$I_{Lmax} = I_{OUT} + I_{RP} / 2 \dots\dots\dots \text{Equation 5}$$

As for the valley current I_{Lmin} ,

$$I_{Lmin} = I_{OUT} - I_{RP} / 2 \dots\dots\dots \text{Equation 6}$$

If $I_{Lmin} < 0$, the step-down DC/DC converter operation becomes current discontinuous mode.

Therefore the current condition of the current discontinuous mode, the next formula is true.

$$I_{OUT} < I_{RP} / 2 \dots\dots\dots \text{Equation 7}$$

Consider I_{Lmax} and I_{Lmin} , conditions of input and output and select external components.

Ripple Current and Lx current limit

The ripple current of the inductor may change according to the various reasons. In the R1245x, as an Lx current limit, Lx peak current limit is used. Therefore the upper limit of the inductor current is fixed.

The peak current limit is not the average current of the inductor (output current). If the ripple current is large, peak current becomes also large. The characteristic is used for the fold-back current limit of version B/D/F/H. In other words, the peak current limit is maintained and the switching frequency is reduced, as a result, the average current of the inductor is reduced. To release this condition, at 170 kHz for version B/D, at 250 kHz for version F, at 400 kHz for version H must not be beyond the peak current limit. In the Figure 1, the sequence of the Lx current limit function is described.

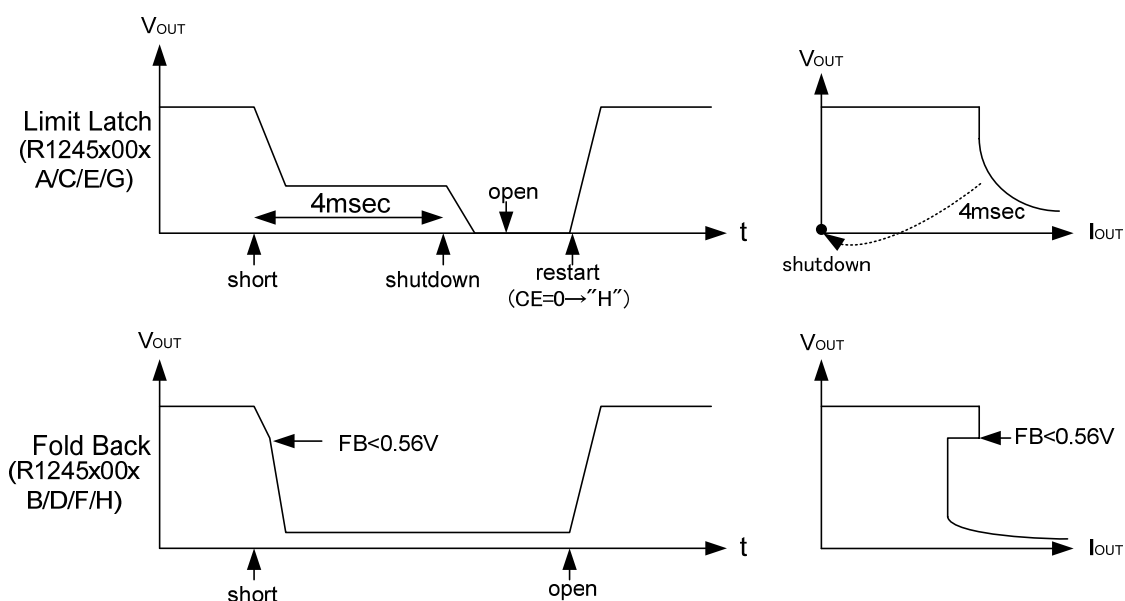

Figure 1. Lx Limit Function Sequence

Latch protection function for version A/C/E/G

The latch function works after detecting current limit and if the output voltage becomes low for a certain time, the output is latched off. Refer to the *TECHNICAL NOTES*.

Fold-back protection function for version B/D/F/H

If FB voltage becomes lower than approximately 0.56 V, the fold-back protection function limits the oscillator frequency to typically 170 kHz for version B/D, typically 250 kHz for version F, typically 400 kHz for version H.

By reducing frequency, the ripple current increases. The R1245x has the peak current limit function, therefore as in the Equation 8, the Lx average current decreases by the increase of the ripple current.

$$I_{OUT} = I_{Lmax} + I_{RP} / 2$$

Equation 8

If FB voltage becomes less than 0.56 V, the oscillator frequency is reduced. At heavy load, if the R1245x becomes into the fold-back protection mode, the situation may not be released by increase the ripple current. In terms of other notes on this protection function, refer to the *TECHNICAL NOTES*.

MAXIMUM OUTPUT CURRENT

The output current of the R1245x is limited by the power dissipation P_D of the package and the maximum specification 1.2 A. The loss of the IC includes the switching loss, and it is difficult to estimate. To estimate the maximum output, using the efficiency data is one method.

By using the efficiency data, the loss including the external components can be calculated with the equation, $(100/\text{efficiency}(\%) - 1) \times (V_{OUT}(\text{V}) \times I_{OUT}(\text{A}))$. From this equation, by reducing the loss of external components, the loss of the IC can be estimated. The main loss of the external components is composed by the rectifier diode and DCR of the inductor. Supposed that the forward voltage of the diode is described as V_F , the loss of the diode can be described as follows:

$$(V_{IN}(\text{V}) - R_{ON}(\Omega) \times I_{OUT}(\text{A}) - V_{OUT}(\text{V}) - V_F(\text{V})) / V_{IN}(\text{V}) \times V_F(\text{V}) \times I_{OUT}(\text{A})$$

The loss by the DCR of the inductor can be calculated by the formula $\text{DCR}(\Omega) \times I_{OUT}^2(\text{A})$.

Thus,

$$\begin{aligned} \text{The loss of the IC} &= (100 / \text{efficiency}(\%) - 1) \times (V_{OUT}(\text{V}) \times I_{OUT}(\text{A})) \\ &\quad - (V_{IN}(\text{V}) - R_{ON}(\Omega) \times I_{OUT}(\text{A}) - V_{OUT}(\text{V}) - V_F(\text{V})) / V_{IN}(\text{V}) \times V_F(\text{V}) \times I_{OUT}(\text{A}) \\ &\quad - \text{DCR}(\Omega) \times I_{OUT}^2(\text{A}) \end{aligned}$$

The efficiency of the R1245x at $T_a = 25^\circ\text{C}$, $V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 600\text{ mA}$ is approximately 89.5% for version A/B (Oscillator frequency 330 kHz). Supposed that the On resistance of the internal driver is $0.35\ \Omega$, the DCR of the inductor is $65\text{ m}\Omega$, the V_F of the rectifier diode is 0.3 V and applied to the formula above,

$$\begin{aligned} \text{The loss of the IC} &= (100\% / 89.5\% - 1) \times (3.3\text{ V} \times 0.6\text{ A}) \\ &\quad - (12\text{ V} - 0.35\ \Omega \times 0.6\text{ A} - 3.3\text{ V} - 0.3\text{ V}) / 12\text{ V} \times 0.3\text{ V} \times 0.6\text{ A} \\ &\quad - 0.065\ \Omega \times 0.6^2\text{ A} = 86\text{ mW} \end{aligned}$$

The power dissipation P_D of the package is specified at $T_a = 25^\circ\text{C}$ based on the $T_{j\text{max}} = 150^\circ\text{C}$. Thus the thermal resistance of the package $\theta_{ja} = (T_{j\text{max}}(^\circ\text{C}) - T_a(^\circ\text{C})) / P_D(\text{W})$, therefore the thermal resistance of the each available package is as follows:

$$\begin{aligned} \text{HSOP-8E: } &(150^\circ\text{C} - 25^\circ\text{C}) / 3.6\text{ W} = 35^\circ\text{C/W} \\ \text{DFN2020-8: } &(150^\circ\text{C} - 25^\circ\text{C}) / 1.1\text{ W} = 114^\circ\text{C/W} \end{aligned}$$

Due to the loss of the IC is 86 mW for this example, therefore T_j increase of the each package is as follows:

$$\begin{aligned} \text{HSOP-8E: } &35^\circ\text{C/W} \times 86\text{ mW} = 3.01^\circ\text{C} \\ \text{DFN2020-8: } &114^\circ\text{C/W} \times 86\text{ mW} = 9.80^\circ\text{C} \end{aligned}$$

For all the packages, even if the ambient temperature is at 105°C , T_j can be suppressed less than 150°C . By the increase of the temperature, on resistance and switching loss increases, therefore, temperature margin is not enough, measure the efficiency at the actual maximum temperature and recalculation is necessary.

At the same condition, if the preset frequency is 2400 kHz, the efficiency will be down to approximately 81%. The result of the loss calculation is 310 mW, therefore the T_j increase of each package is as follows:

$$\begin{aligned} \text{HSOP-8E: } &35^\circ\text{C/W} \times 310\text{ mW} = 10.85^\circ\text{C} \\ \text{DFN2020-8: } &114^\circ\text{C/W} \times 310\text{ mW} = 35.34^\circ\text{C} \end{aligned}$$

All packages can be used at the ambient temperature 105°C . However as for DFN2020-8 package, be sure to note the power dissipation when using at 2400 kHz since its temperature margin is not sufficient when $T_{j\text{max}} = 150^\circ\text{C}$.

R1245xNO. EC-269-140311

The following graphs are the output current and estimated ambient temperature limit.

Maximum output current $V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $f_{osc} = 330\text{ kHz}$ **Maximum output current** $V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $f_{osc} = 2400\text{ kHz}$ 

SHUTDOWN BY INPUT VOLTAGE CONTROL

If the set output voltage is more than UVLO detector threshold (Typ. 3.8 V) and on/off control is made by V_{IN} voltage-e.g. in the case of V_{IN} pin and CE pin are connected -, when the circuit is shutdown, the relation between input and output may be beyond the specified maximum duty cycle. If the ratio of input and output is beyond the maximum duty cycle, switching operation stops and the output voltage goes down, but depending on the V_{IN} decreasing speed, the ratio of V_{IN} and V_{OUT} could become equal or less than the maximum duty cycle, as a result, the output may be resumed and fluctuate.

Further, if the input voltage goes down faster than the output voltage as shown in Figure 2, large reverse current may flow.

In order to avoid the conditions above, or to maintain the input voltage being larger than the output voltage in the power off process, set CE signal "L" while the input voltage is enough larger than the output voltage, or add a discharge circuit.

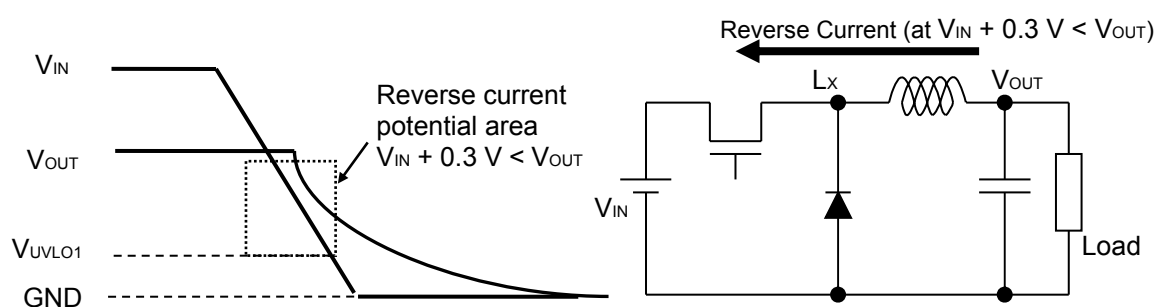

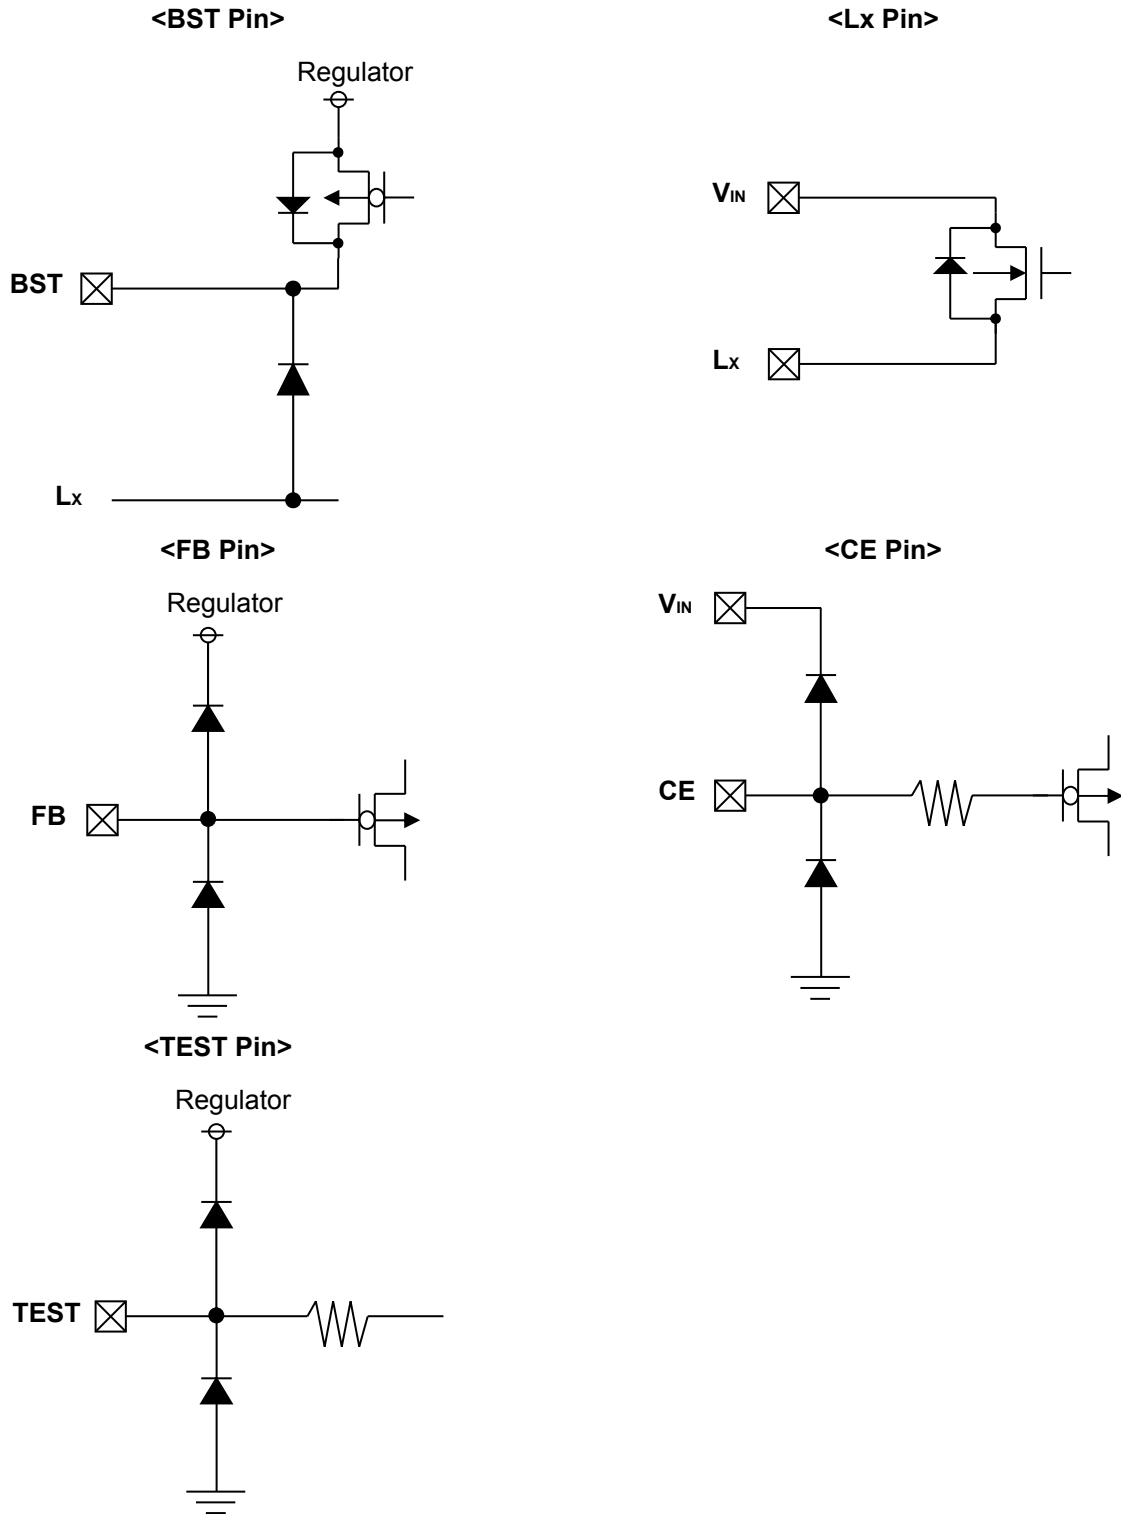

Figure 2. Conditions for reverse current generation at shutdown by input voltage control

INTERNAL EQUIVALENT CIRCUIT FOR EACH PIN

PACKAGE INFORMATION

POWER DISSIPATION (HSOP-8E)

Power Dissipation (P_D) depends on conditions of mounting on board.

This specification is based on the measurement at the condition below:

Measurement Conditions

	Ultra High Wattage Land Pattern
Environment	Mounting on board (Wind velocity 0 m/s)
Board Material	Glass cloth epoxy plastic (4 layers)
Board Dimensions	76.2 mm x 114.3 mm x 0.8 mm
Copper Ratio	Top side, Back side : 50 mm square : Approx. 95% 2nd, 3rd Layer : : 50 mm square : Approx. 100%
Through - hole	ϕ 0.4 mm x 21 pcs

Measurement Results

($T_a = 25^\circ\text{C}$, $T_{j\text{max}} = 150^\circ\text{C}$)

	Ultra High Wattage Land Pattern
Power Dissipation	3.6 W
Thermal Resistance	$\theta_{ja} = (150-25^\circ\text{C})/3.6 \text{ W} = 35^\circ\text{C/W}$
	$\theta_{jc} = 10^\circ\text{C/W}$

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products in this document are designed for automotive applications. However, when using the products for automotive applications, please make sure to contact Ricoh sales representative in advance due to confirming the quality level.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, firecontainment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

For the conservation of the global environment, Ricoh is advancing the decrease of the negative environmental impact material.
After Apr. 1, 2006, we will ship out the lead free products only. Thus, all products that will be shipped from now on comply with RoHS Directive.
Basically after Apr. 1, 2012, we will ship out the Power Management ICs of the Halogen Free products only. (RicoH Halogen Free products are also Antimony Free.)
