

Features

- 8kV Robust ESD Protection at Antenna Port
- Enhanced Performance Transmit Module
- No External Routing
- High Efficiency at rated P_{OUT}
V_{BATT} = 3.5V
GSM850 42%
EGSM900 40%
DCS1800 36%
PCS1900 37%
- Low RX Insertion Loss
- Symmetrical RX Ports
- 0dBm to 6dBm Drive Level, >50dB of Dynamic Range
- Integrated Power Flattening Circuit

Applications

- 3V Dual-Band GSM/GPRS Handsets
- GSM850/PCS1900 or EGSM900/DCS1800 Products
- GPRS Class 12 Compliant
- Portable Battery-Powered Equipment

Functional Block Diagram

Product Description

The RF7182 is a dual band (GSM850/PCS1900 or EGSM900/DCS1800) GSM/GPRS Class 12 compliant transmit module with two symmetrical receive ports. This transmit module builds upon RFMD's leading power amplifier with PowerStar® integrated power control technology, pHEMT switch technology, and integrated transmit filtering for best-in-class harmonic performance. The results are high performance, a reduced solution size, and ease of implementation. The device is designed for use as the final portion of the transmitter section in a GSM900/DCS1800 handset and eliminates the need for PA-to-antenna switch module matching network.

The RF7182 features RFMD's latest integrated power-flattening circuit, which significantly reduces current and power variation into load mismatch. The RF7182 also integrates an ESD filter to provide excellent ESD protection at the antenna port. The RF7182 is designed to provide maximum efficiency at rated P_{OUT}.

RF7182	QUAD-BAND TX, DUAL-BAND RX GSM, GPRS TRANSMIT MODULE
RF7182SB	Transmit Module 5-Piece Sample Pack
RF7182PCBA-41X	Fully Assembled Evaluation Board

Absolute Maximum Ratings

Parameter	Rating	Unit
Supply Voltage	-0.3 to +6.0	V
Power Control Voltage (V_{RAMP})	-0.3 to +1.8	V
Input RF Power	+10	dBm
Max Duty Cycle	50	%
Output Load VSWR	20:1	
Operating Temperature	-30 to +85	°C
Storage Temperature	-55 to +150	°C

Caution! ESD sensitive device.

Exceeding any one or a combination of the Absolute Maximum Rating conditions may cause permanent damage to the device. Extended application of Absolute Maximum Rating conditions to the device may reduce device reliability. Specified typical performance or functional operation of the device under Absolute Maximum Rating conditions is not implied.

RoHS status based on EU Directive 2002/95/EC (at time of this document revision).

Switch Leakage P_{OUT} at RX Port GSM850/EGSM900 ANT-RX0/RX1		-1	6	dBm	GSM850/EGSM900 TX mode: Freq = 824MHz to 849MHz or 880MHz to 915MHz, GpCtrl1 = High, GpCtrl0 = Low, $V_{RAMP} = V_{RAMP}$ rated for $P_{OUT} = 33dBm$ at antenna port. See Note 2.
Switch Leakage P_{OUT} at RX Port DCS1800/PCS1900 ANT-RX0/RX1		2	6	dBm	DCS1800/PCS1900 TX mode: Freq = 1710MHz to 1785MHz or 1850MHz to 1910MHz, GpCtrl1 = High, GpCtrl0 = High, $V_{RAMP} = V_{RAMP}$ rated for $P_{OUT} = 30dBm$ at antenna port. See Note 2.

Note:

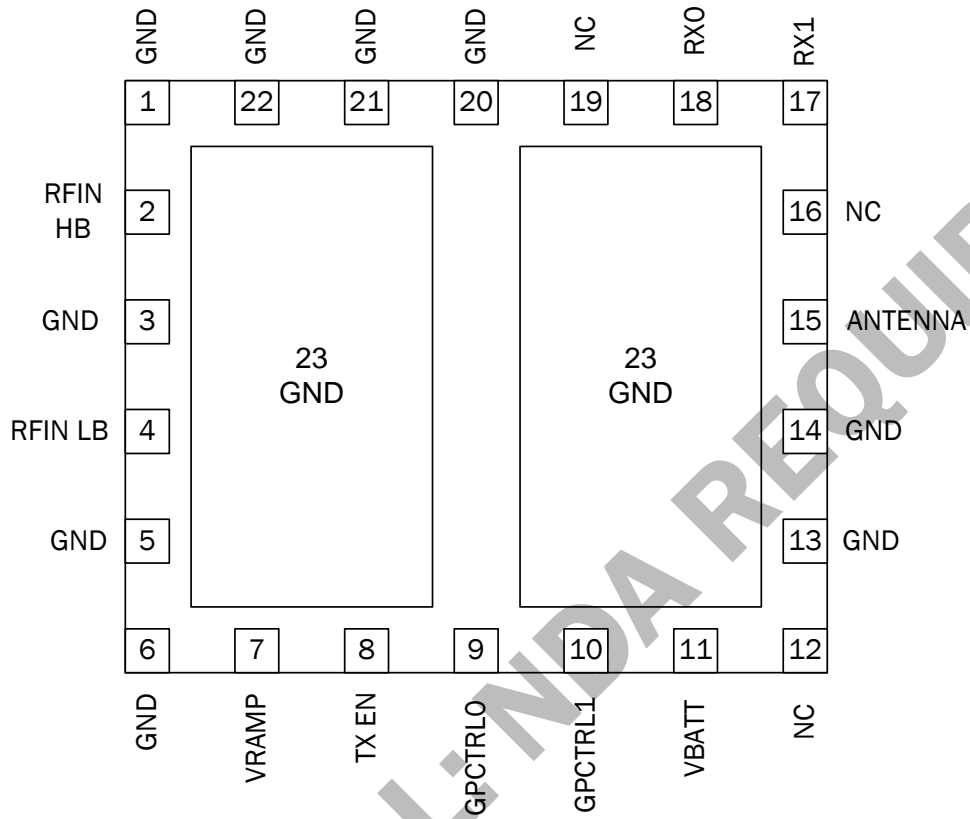

1. Better performance can be obtained in the high band with optimized matching..

2. Isolation specification set to ensure at least the following isolation at rated power:

Calculation Example: Isolation = $P_{OUT} @ Antenna - P_{OUT} @ RX Port$. Isolation LB = $33 - (-1) = 34dB$, HB = $30 - (-2) = 28dB$.

Pin	Function	Description
1	GND	Ground.
2	RF IN HB	RF input to the DCS1800/PCS1900 bands. This is a 50Ω input.
3	GND	Ground.
4	RF IN LB	RF input to the GSM850/EGSM900 bands. This is a 50Ω input.
5	GND	Ground.
6	GND	Ground.
7	VRAMP	VRAMP ramping signal from DAC. A simple RC filter is integrated into the RF7172 module. VRAMP may or may not require additional filtering depending on the baseband selected.
8	TX ENABLE	This signal enables the PA module for operation with a logic high. The switch is put in TX mode determined by GpCtrl0 and GpCtrl1.
9	GPCTRL0	Control pin that together with GpCtrl1 selects the band of operation.
10	GPCTRL1	Control pin that together with GpCtrl0 selects the band of operation.
11	VBATT	Power supply for the module. This should be connected to the battery terminal using as wide a trace as possible.
12	NC	No internal connection; may be grounded on PCB.
13	GND	Ground.
14	GND	Ground.
15	Antenna	Antenna port. This is a 50Ω output.
16	NC	No internal connection; may be grounded on PCB.
17	RX1	This port is interchangeable with any other RX port.
18	RX0	This port is interchangeable with any other RX port.
19	NC	No internal connection; may be grounded on PCB.
20	GND	Ground.
21	GND	Ground.
22	GND	Ground.
23	GND	Ground.

Theory of Operation

Product Description

The RF7182 is a dual-band, transmit module (TXM) with fully-integrated power control functionality, harmonic filtering, band selectivity, and TX/RX switching. The TXM is self-contained, having 50Ω I/O terminals and two symmetrical RX ports allowing dual-band operation. The power control function eliminates all power control circuitry, including directional couplers, diode detectors, and power control ASICs, etc. The power control capability provides 50dB of continuous control range and 70dB of total control range, using a DAC-compatible, analog voltage input. The TX Enable feature provides for PA activation (TX mode) or RX mode/standby. Internal switching provides a low-loss, low-distortion path from the antenna port to the TX path (or RX port), while maintaining proper isolation. Integrated filtering provides ETSI-compliant harmonic suppression at the antenna port even under high mismatch conditions, which is important as modern antennas often present a load that significantly deviates from nominal impedance.

Overview

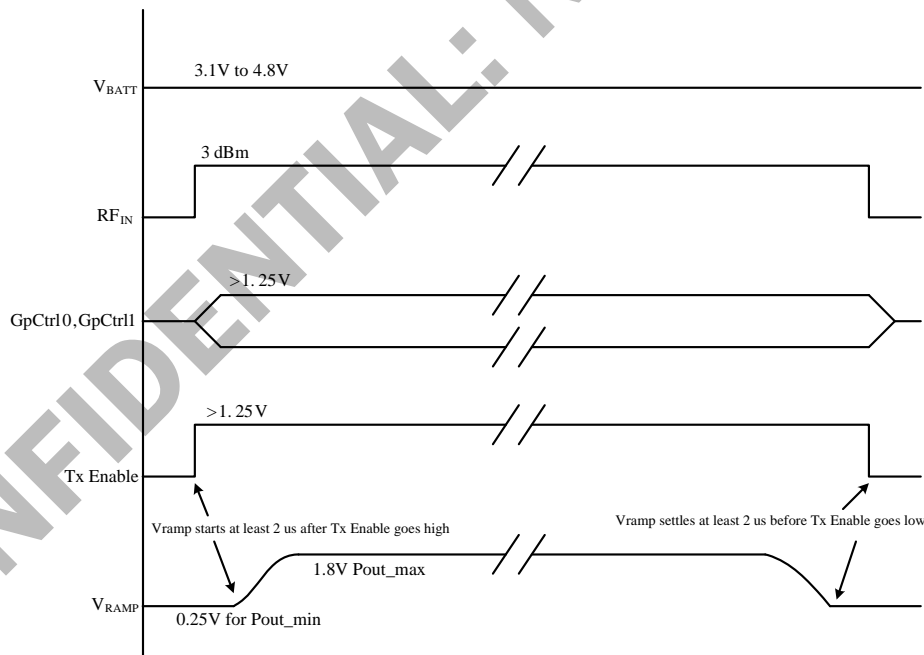

The RF7182 simplifies the phone design by eliminating the need for the complicated control loop, harmonic filters, and TX/RX switch along with their associated matching components. The power control loop can be driven directly from the DAC output in the baseband circuit. The module has two RX ports for GSM850/EGSM900 and DCS1800/PCS1900 bands of operation. The two RX ports are symmetrical; they can be used either as GSM850/EGSM900 or DCS1800/PCS1900. To control the mode of operation, there are three logic control signals: TX Enable, GpCtrl0, and GpCtrl1. The RF7182 offers high efficiency at the rated P_{OUT} as backed-off efficiency is improved in this TXM.

Power Ramping and Timing

The RF7182 should be powered-on according to the power-on sequence below. It is designed to prevent operation of the amplifier under conditions that could cause damage to the device or erratic operation.

There are some setup times associated with the control signals of the RF7182. The most important of these is the settling time between TXEN going high and when VRAMP can begin to increase. This time is often referred to as the "pedestal." It is required so that the internal power control loop and bias circuitry can settle after being turned on. The RF7182 requires at least two seconds or two quarter-bit times for proper settling of the power control loop.

The power-down sequence is the reverse of the power-on sequence. As described in the figure below, VBATT is applied first to provide bias to the silicon control chip. Next, the RF drive is applied. Next, when TXEN is high the VRAMP signal is held at a constant 0.25V. Two seconds later, VRAMP begins to ramp up. The shape of VRAMP is important for maintaining the switching transients. The basic shape of the ramping function should be raised cosine to achieve best transient performance.

1. Apply V_{BATT}
2. Apply GpCtrl0, GpCtrl1, RFIN and TX Enable
3. Apply V_{RAMP} at least 2 μs after TX Enable
4. The Power Down Sequence is in opposite order of the Power On Sequence

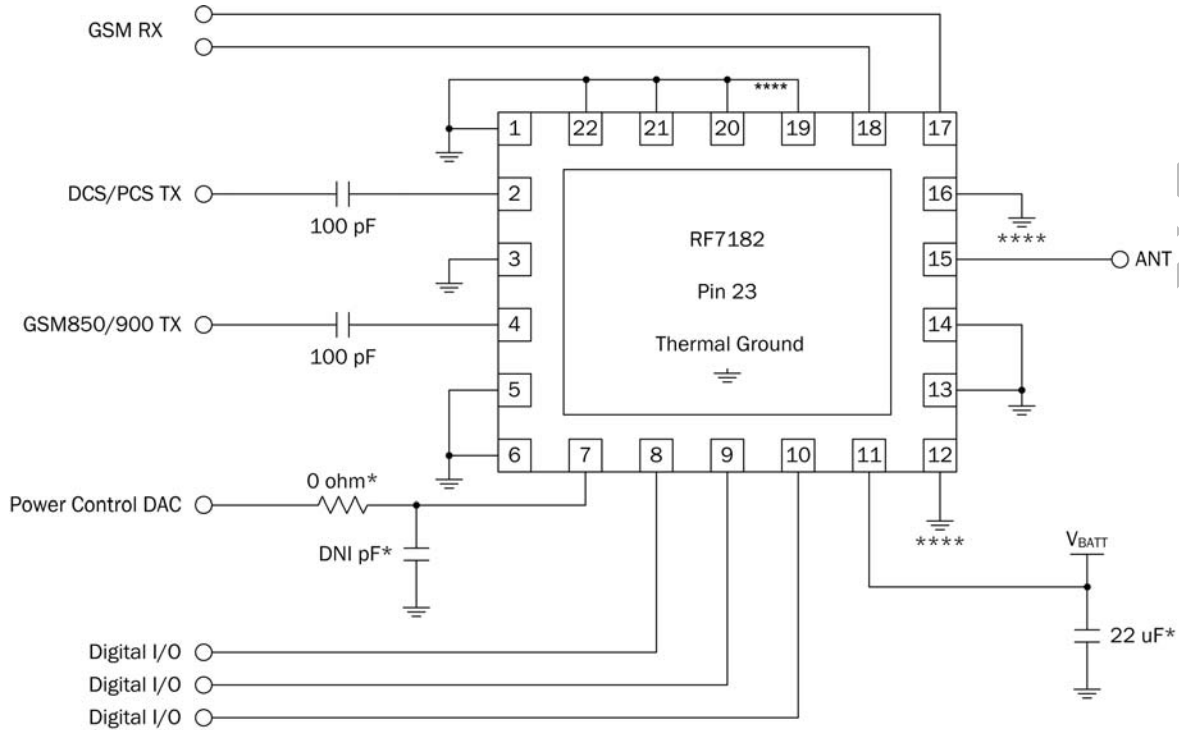

The RF7182 has an integrated power flattening circuit that reduces the amount of current variation when a mismatch is presented to the output of the PA. When a mismatch is presented to the output of the PA, its output impedance is varied and could present a load that will increase output power. As the output power increases, so does current consumption. The current consumption can become very high if not monitored and limited. The power flattening circuit is integrated onto the CMOS controller and requires no input from the user.

Into a mismatch, the current varies as the phase changes. The power flattening circuit monitors current through an internal sense resistor. As the current changes, the loop is adjusted in order to maintain current. The result is flatter power and reduced current into mismatch. The transceiver/baseband to regulate the ramping signal as the supply voltage decreases. The internal circuit monitors the supply voltage and adjusts the ramping signal such that the switching spectrum is minimally impacted.

The RF7182 also incorporates a V_{BATT} tracking feature that eliminates the need for the transceiver/baseband to regulate the ramping signal as the supply voltage decreases. The internal circuit monitors the supply voltage and adjusts the ramping signal such that the switching spectrum is minimally impacted.

CONFIDENTIAL: NDA REQUIRED

Application Schematic

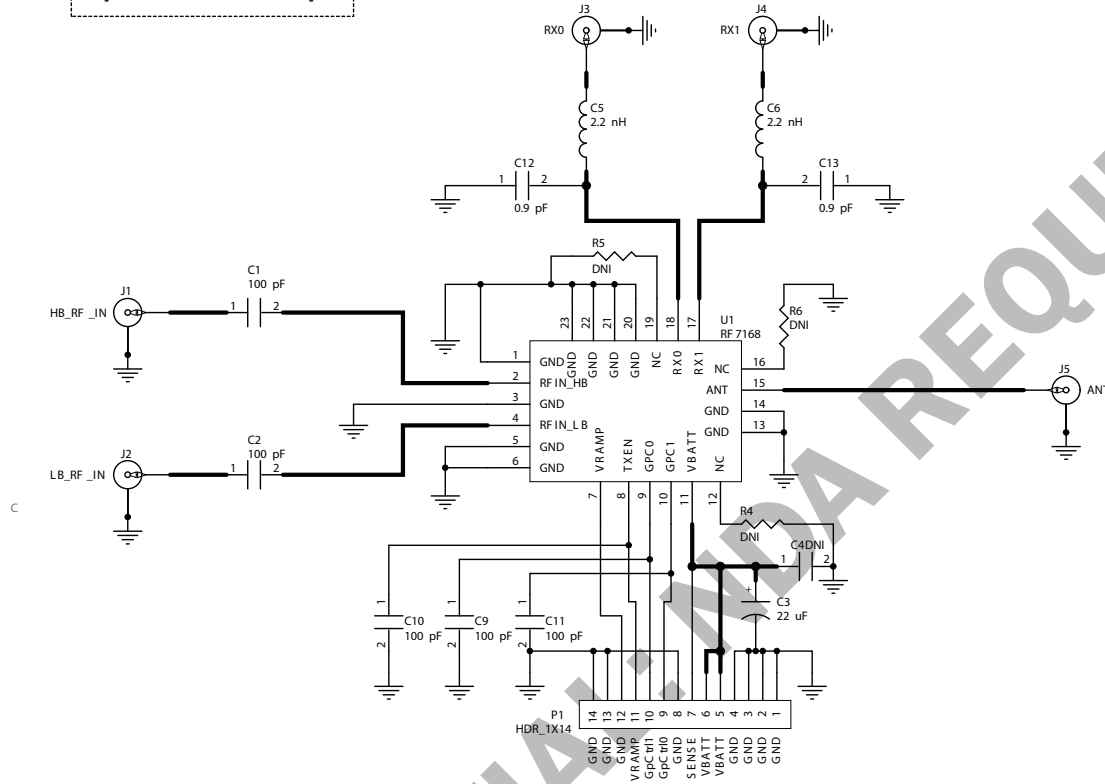

Notes:

- * Suggested values only. Actual requirements will vary with application.
- **All RF paths should be designed as 50 ohm microstrip or stripline.
- ***If a resistive attenuator network is used on the RF input to the power amplifier, it must be positioned on the transceiver side of the DC blocking capacitors (100 pF) to prevent adversely affecting amplifier biasing.
- ****NC pins on this module can be connected to ground.
- *****RX0 and RX1 usually connect to SAW filters. A matching network may be used to provide a transformation from SAW impedance to RX port impedance.

PCB Design Requirements

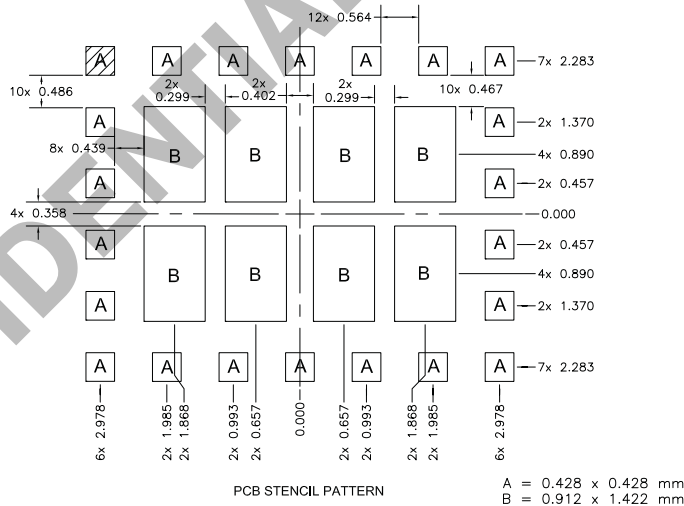

PCB Surface Finish

The PCB surface finish used for RFMD's qualification process is electroless nickel, immersion gold. Typical thickness is 3µinch to 8µinch gold over 180µinch nickel.

PCB Land Pattern Recommendation

PCB land patterns for RFMD components are based on IPC-7351 standards and RFMD empirical data. The pad pattern shown has been developed and tested for optimized assembly at RFMD. The PCB land pattern has been developed to accommodate lead and package tolerances. Since surface mount processes vary from company to company, careful process development is recommended.

PCB Metal Land and Solder Mask Pattern

Notes:

1. Shaded area represents Pin 1 location.
2. All dimensions are TYP for reference only.

Tape and Reel

Carrier tape basic dimensions are based on EIA 481. The pocket is designed to hold the part for shipping and loading onto SMT manufacturing equipment, while protecting the body and the solder terminals from damaging stresses. The individual pocket design can vary from vendor to vendor, but width and pitch will be consistent.

Carrier tape is wound or placed onto a shipping reel either 330mm (13 inches) in diameter or 178mm (7 inches) in diameter. The center hub design is large enough to ensure the radius formed by the carrier tape around it does not put unnecessary stress on the parts.

Prior to shipping, moisture sensitive parts (MSL level 2a-5a) are baked and placed into the pockets of the carrier tape. A cover tape is sealed over the top of the entire length of the carrier tape. The reel is sealed in a moisture barrier ESD bag with the appropriate units of desiccant and a humidity indicator card, which is placed in a cardboard shipping box. It is important to note that unused moisture sensitive parts need to be resealed in the moisture barrier bag. If the reels exceed the exposure limit and need to be rebaked, most carrier tape and shipping reels are not rated as bakeable at 125 °C. If baking is required, devices may be baked according to section 4, table 4-1, of Joint Industry Standard IPC/JEDEC J-STD-033.

The table below provides information for carrier tape and reels used for shipping the devices described in this document.

Tape and Reel

RFMD Part Number	Reel Diameter Inch (mm)	Hub Diameter Inch (mm)	Width (mm)	Pocket Pitch (mm)	Feed	Units per Reel
RF7182TR13	13 (330)	4 (102)	12	8	Single	2500
RF7182TR7	7 (178)	2.4 (61)	12	8	Single	750

Unless otherwise specified, all dimension tolerances per EIA-481.
