## Chapter 1 Introduction

### 1.1 Overview

The RK809 is a complex power-management integrated circuit (PMIC) integrated CODEC for multi-core system applications powered by an external power supply. The RK809 can provide a complete power management solution with very few external components.

The RK809 provides five fast load transient synchronous step-down converters. The device also contains 9 LDO regulators, two switches and a battery fuel gauge. Power-up/power-down controller is configurable and can support any customized power-up/power-down sequences (OTP based). A real-time clock (RTC) is also integrated to provide a 32.768-kHz output buffer, and real time function. The RK809 supports 32.768-kHz clock generation based on a crystal oscillator. It also includes Audio CODEC, real ground Head phone driver and ClassD driver.

The RK809 integrates four channels step-down DC-DC converters. All of them adopt ripple base control to achieve very fast load transient response. Meanwhile, all of them can dynamically adjust the output voltage, as required by the processor based on the processor's operation status so as to maximize the system efficiency. The output voltages of most channels can be configured through the I2C interface. The inputs of all channels have soft start function, which greatly reduces the inrush current at the startup. 2.5MHz switching frequency and good control method decrease the external inductance and capacitance. The RK809 also integrate a peak current mode control high efficiency buck converter, maximum current up to 2.5A, it's usually used to power LDOs.

The RK809 integrates nine channels LDO regulators. The LDO3 is high PSRR (75dB @1Khz) high accuracy low drop-out regulator. The inputs of all LDO regulators could be decrease to 2V for high convert efficiency. The output voltages of all LDO regulators can be configured through the I2C interface.

A "battery fuel gauge" is integrated in the RK809. Using the proprietary algorithms and the sensed battery current and voltage, the gauge can accurately calculate the battery capacity based on the charging/discharging characteristics of the battery preloaded in the system. The gauge then sends the battery capacity information to the processor through the I2C interface.

The RK809 also integrates complete audio system. The single end or differential mode Micro-phone can be connected to RK809 through two AC-couple capacitors. 24-bits ADC and gain adjustable PGA would convert the micro-phone signal to digital signal. The sound recording path has very low THD (-75dB @1KHz@580mV source). 24 bits DAC would convert digital signal to analog signal, and Class-AB driver adopt real-ground structure for Head-phone application, has very low THD (-90dB @1KHz@-3dBFS source). Meanwhile, Class-D driver integrated for speaker application. The speaker and head-phone can be used at the same time. I2S interface is integrated to communicate with processor.

The RK809 is available in a QFN68 7.0 mm x 7.0 mm package, with a 0.35-mm pin pitch.

## Chapter 4 Function Description

### 4.1 Top State Machine

#### 4.1.1 State Machine Description

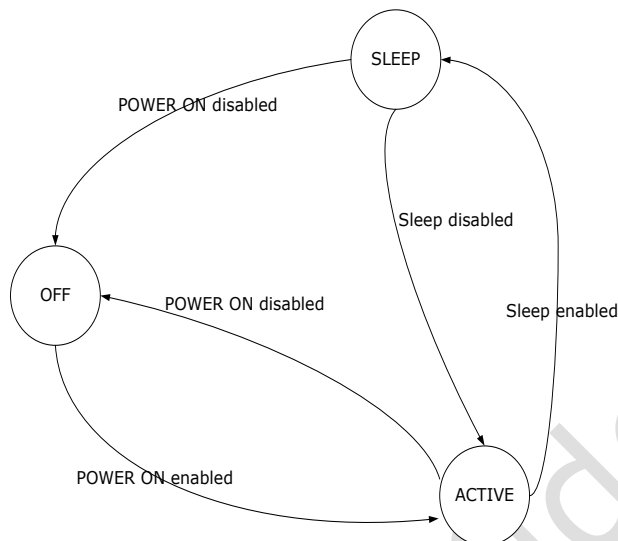

Fig. 4-1 State Machine

The RK809 state machine shown as above. The state shift by “power on”, “power down”, “reset”, “active to sleep” and “sleep to active”.

#### 4.1.2 Power on Description

There are three kinds of method to power on the PMIC.

**Note that: When EXT\_EN rising edge comes, the voltage of VCC9 must be higher than VB\_OK threshold during 1.5mS.**

##### 1. Press “PWRON” key

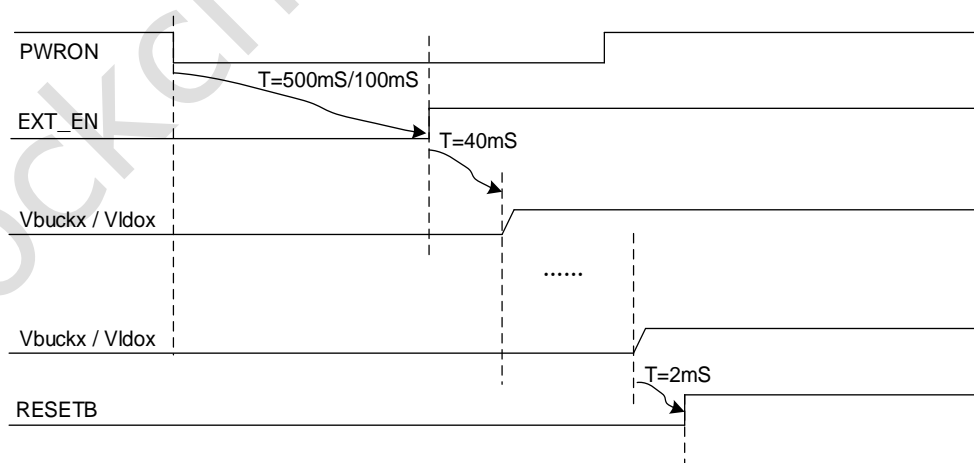

Fig. 4-2 Press “PWRON” key to turn on the PMIC

When the PMIC powered by VCC9 which voltage is higher than “VB\_OK” threshold, keeping low level at “PWRON” pin for 500/100mS would turn on the PMIC. The “PWRON” pin de-bounce time (500mS/100mS) can be adjusted by I2C.

All the power channels start up at the default output voltages with a preset power up sequence, which has 2mS intervals between the channels. When the power up process is

done, the RESETB turns to high logic level to inform the processor that all the power rails are up and stable.

**2. RTC Alarm**

When the PMIC powered by VCC9 which voltage is higher than "VB\_OK" threshold (typical 3.4V), Setting RTC alarm would turn on the PMIC. The power on sequence is the same with the first one.

For example, set RTC alarm registers: 0x07, 0x08, 0x09, 0x0A, 0x0B, 0x0C. And then set register 0x0F=2FH.

**3. VDC voltage Rising-edge**

When the PMIC powered by VCC9/VCC8, and then VDC plug in for 140mS, the PMIC would be turn on. The power on sequence shown as below.

Fig. 4-3 VDC voltage Rising-edge to turn on the PMIC

**4.1.3 Power down Description**

There are 7 kinds of method to power down the PMIC.

**1. Long press "PWRON" key**

Fig. 4-4 Long press "PWRON" key to turn off the PMIC

When the PMIC work in the "ON" state or "SLEEP" state, Writing register bit 0xF7<6>="0", and then keeping low level at "PWRON" pin for 6/8/10/12S would turn off the PMIC. The "PWRON" pin de-bounce time (6/8/10/12S) can be adjusted by I2C.

When power down enable, The RESETB pin would be pulled low to reset the processor. And then 2ms later, the power channels start to be turned off at the same time.

**2. Write shutdown Register**

When the PMIC work in the "ON" state or "SLEEP" state, writing register bit 0xF4<0>="1" would turn off the PMIC. The power off sequence is the same with the first one.

**3. SYS over-voltage**

When the PMIC work in the "ON" state or "SLEEP" state, if VCCRTC /VCC9 higher than 6V, the PMIC would be turn off. The power off sequence is the same with the first one.

**4. SYS under-voltage**

When the PMIC work in the "ON" state or "SLEEP" state, if VCCRTC/VCC9 lower than VB\_UV threshold (typical 2.7V) for 2mS, the PMIC would be turn off. For safe attention, the buck converter would be shut down immediately when detect VB\_UV.

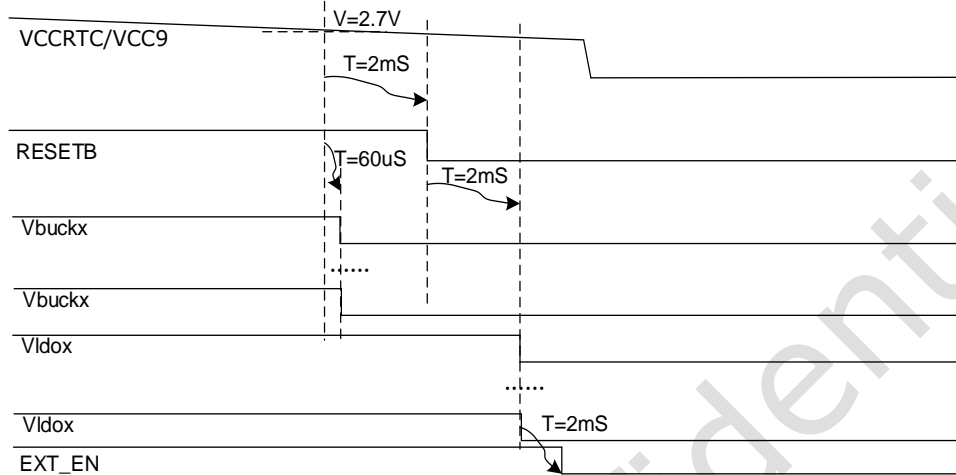

Fig. 4-5 VCC under-voltage to turn off the PMIC

This would lead to processor system halted. So, Writing register bit 0xC6<5>="1" can fix this issue. The detail sequence will be found in "reset Description" chapter.

**5. SYS low-voltage**

When the PMIC work in the "ON" state or "SLEEP" state, if VCCRTC /VCC9 lower than VB\_LO threshold (typical 3.2V) for 2mS and Register bit 0XF1<3>="0", the PMIC would be turn off. The power off sequence is the same with the first one.

**6. SLEEP pin active**

When the PMIC work in the "ON" state or "SLEEP" state, if Register bit 0XF4<4:3>="10", and "SLEEP" pin active (the polarity can be programmed by Register bit 0XF4<5>), the PMIC would be turn off. The power off sequence is the same with the first one.

**7. TSD protection**

When the PMIC work in the "ON" state or "SLEEP" state, if the temperature is higher than TSD threshold (typical 160 degree), the PMIC would be turn off. The power off sequence is the same with the first one.

**4.1.4 Reset Description**

There are 4 kinds of method to reset the PMIC. If register bits 0xF4<7:6>="00", reset function means restart PMIC. If register bits 0xF4<7:6>="01", reset function means reset registers, all channels of power would be reset to default state.

**1. Long press "PWRON" key**

Fig. 4-6 Long press “PWRON” key to restart the PMIC

When the PMIC work in the “ON” state or “SLEEP” state, Writing register bit 0xF7<6>=“1”, and then keeping low level at “PWRON” pin for 6/8/10/12S would restart the PMIC. The “PWRON” pin de-bounce time (6/8/10/12S) can be adjusted by I2C.

Note: If the VCC9 voltage is lower than VB\_OK threshold, the PMIC would be shut down but restart.

**2. SLEEP pin active**

When the PMIC work in the “ON” state or “SLEEP” state, if Register bit 0xF4<4:3>=“11”, and “SLEEP” pin active (the polarity can be programmed by Register bit 0xF4<5>), the PMIC would restart. The restart sequence is the same with the first one.

Note: If the VCC8/VCC9 voltage is lower than VB\_OK threshold, the PMIC would be shut down but restart.

Note: It should delay about 66uS after changing the “SLEEP” pin active each time.

**3. RESETB pin pull low**

When the PMIC work in the “ON” state or “SLEEP” state, if “RESETB” pin is pull down, the PMIC would restart immediately. The restart sequence is the same with the first one.

Note: If the VCC9 voltage is lower than VB\_OK threshold, the PMIC would be shut down but restart.

**4. SYS under-voltage**

When the PMIC work in the “ON” state or “SLEEP” state, if VCC8/VCC9 lower than VB\_UV threshold (typical 2.7V) for 2mS, the PMIC would be turn off. But if register bit 0xC6<5>=“1”, the “RESET” pin would be pull down when VB\_UV happen. So, the PMIC would restart.

Note: If the VCC9 voltage is lower than VB\_OK threshold, the PMIC would be shut down but restart.

**Note: Users must NOT set register bits 0xF4<7:6>=“01” at this case.**

### 4.1.6 Sleep Description

The RK809 could be set to SLEEP mode by two kinds of way.

1. Register bits 0xF4<4:3>="01", and then Register bit 0xF4<1>="1".
2. Register bits 0xF4<4:3>="01", and then "SLEEP" pin active (the polarity can be programmed by Register bit 0XF4<5>)

When sleep mode, the power dissipation of RK809M would be decreased. Writing register bits 0xB9<4:0>="11111", 0xB9<7>="1", 0xF3<3>="1", 0xE3<7>="1" would be decrease quiescent current further.

## 4.2 Power Channels

### 4.2.1 Buck Description

The RK809 provides four high current synchronous buck converters, which deliver up to 3A, 3A, 1.5A and 1.5A, respectively. An enhanced COT architecture is used, which improves the transient response significantly. 2.5MHz switching frequency and good control method decrease the external inductance and capacitance. All output voltages can be adjusted dynamically during operation through DVS (Dynamic Voltage Scaling), which guarantees a linear and gradual voltage ramping up and down. A complete set of protection functions, such as short circuit protection, is implemented in the buck converters too.

For example, the BUCK1:  $V_{out}=1V$ ,  $V_{in}=4V$ ,  $L=0.47\mu H$ ,  $C_{out}=32\mu F$ . Load Current transient from 0.01A to 3A, the current slew rate is 3A/ $\mu S$  (using MOSFET transition). The output voltage drop when load current rising edge is about **38mV**, that is very good

characteristics. The other bucks has the same architecture with BUCK1, so they have the same load transient response characteristics.

Fig. 4-8 BUCK1 load transient rising edge

Fig. 4-9 BUCK1 load transient falling edge

If decreasing inductance to 0.33uH and increasing output capacitance to 44uF, the load transient response characteristics would be better.

Fig. 4-10 BUCK1 load transient rising edge 2

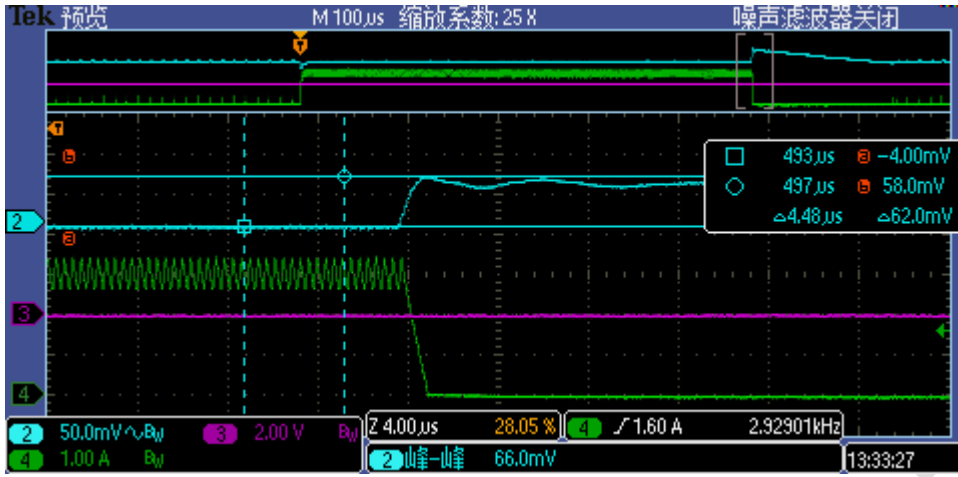

Fig. 4-11 BUCK1 load transient falling edge 2

Meanwhile, bucks converters have good efficiency characteristics. The test data shown as below. All channels of buck output voltage set to default.

Fig. 4-13 BUCK2 efficiency curve when different input voltage

Fig. 4-14 BUCK3 efficiency curve when different input voltage

Fig. 4-15 BUCK4 efficiency curve when different input voltage

The RK809 also integrates a buck5, adopt peak current mode control, which has good performance in load transient response and efficiency.

Fig. 4-16 BUCK5 efficiency curve when different input voltage, Vout=3.3V

### 4.2.2 LDO Description

The RK809 also integrates nine LDOs, with 8 LDOs (LDO1, LDO2, LDO4~LDO9) capable of providing up to 400mA and one LDO3 providing maximum 100mA. The LDO3 is a low noise, high PSRR (75dB) LDO. All channels of LDO output capacitance could be 1.0uF that decreases the system cost. The parameters such as output voltage in the different operating modes can be adjusted through the I<sup>2</sup>C interface.

### 4.3 Battery Gas Gauge

The RK809M provides an accurate battery fuel gauge. A 16-bits battery voltage ADC and a 16-bits battery current ADC are integrated in the RK809M to collect the information on the battery, such as battery voltage, etc. Using the proprietary algorithms and the information collected by the ADC, the battery fuel gauge can accurately calculate the battery capacity based on the charging/discharging characteristics of the battery preloaded in the system. The gauge then sends the battery capacity information to the processor through the I<sup>2</sup>C interface.

## 4.4 Audio System

### 4.4.1 General Description

#### 4.4.5 I2S Description

The RK809 supports I2S for the digital audio data interface. The I2S/PCM audio digital interface is used to input data to a stereo DAC or output data from a stereo ADC. The I2S/PCM audio interface can be configured to Master mode or Slave mode. In Master Mode, BCLK and LRCLK are configured as output, but MCLK is fixed as input. In Slave Mode, BCLK and LRCLK are configured as input, and the MCLK is still as input.

#### 4.4.6 RC Oscillator Description

The RK809 integrates an RC oscillator. If the external crystal oscillator is not connected, the chip will be driven by the internal RC oscillator. Without external crystal oscillator, the system costs can be saved, but the RTC and the fuel gauge will be inaccurate.

### 4.5 Others

#### 4.5.1 Real Time Clock (RTC) Description

The RK809 integrates a crystal oscillator buffer and a real time clock (RTC). The buffer works with an external 32.768 kHz crystal oscillator. With the RTC function, the PMIC provides second/minute/hour/day/month/year information, alarm wake up as well as time calibration. The RK809 provides one channel of 32.768 kHz clocks with open drain outputs, where it is default on and is controlled through I<sup>2</sup>C interface.

## Chapter 6 Thermal Management

### 6.1 Overview

For reliability and operability concerns, the absolute maximum junction temperature of RK809 has to be below 125°C.

Depending on the thermal mechanical design (Smartphone, Tablet, Personal Navigation Device, etc), the system thermal management software and worst case thermal applications, the junction temperature might be exposed to higher values than those specified above.

Therefore, it is recommended to perform thermal simulations at device level (Smartphone, Tablet, Personal Navigation Device, etc) with the measured power of the worst case UC of the device.

### 6.2 Package Thermal Characteristics

Table 6-1 provides the thermal resistance characteristics for the package used on this device.

Table 6-1 Thermal Resistance Characteristics

<b>PACKAGE (QFN7X7-68)</b>	<b>POWER(W)</b>	$\theta_{JA}$ (°C/W)	$\theta_{JB}$ (°C/W)	$\theta_{JC}$ (°C/W)
RK809	2	21.99	12	6.58

Note: The testing PCB is based on 4 layers, 114mm x 76 mm, 1.6mm thickness, Ambient temperature is 85°C.
