Supply Voltage Supervisor with Reset Circuits

1 FEATURES

- **Operating Voltage Range: 1.0V to 5.5V**
- **Low Power Consumption: 40µA (Max)**
- **Precision Supply-Voltage Monitor:**
  2.63V, 2.93V, 3.08V, 4.00V, 4.65V
- **Guaranteed $\overline{\text{RESET}}$ Valid at V_{CC}= 1.0V**
- **200ms Reset Pulse Width**
- **Voltage Monitor for Power-Fail or Low-Battery Warning**
- **Operating Temperature Range:**
  -40°C to +125°C
- **Push-pull, $\overline{\text{RESET}}$ Output**
- **Available in Green Package: SOT23**

2 APPLICATIONS

- **Computers**
- **SOC , DSP or Micro controllers**
- **Embedded Systems**
- **Industrial Equipment**
- **Intelligent Instruments**
- **Critical µP Power Monitoring**
- **Wireless Communications Systems**

3 DESCRIPTIONS

The RS809 microprocessor (µP) supervisory circuits reduce the complexity and number of components required to monitor power-supply and battery function in µP systems. This device significantly improves system reliability and accuracy compared to separate ICs or discrete components.

These circuits perform a single function: they assert a reset signal whenever the V_{CC} supply voltage declines below a preset threshold, keeping it asserted for at least 200ms after V_{CC} has risen above the reset threshold. Reset thresholds suitable for operation with a variety of supply voltages are available.

The RS809 have push-pull outputs. The RS809 have an active-low $\overline{\text{RESET}}$ output. The reset comparator is designed to ignore fast transients on V_{CC}, and the outputs are guaranteed to be in the correct logic state for V_{CC} down to 1.0V.

Low supply current makes the RS809 ideal for use in portable equipment. The RS809 is available in Green SOT23 package. It operates over an ambient temperature range of -40°C to +125°C.

8 SPECIFICATIONS

8.1 Absolute Maximum Ratings [1]

over operating free-air temperature range (unless otherwise noted) [1][2]

			MIN	MAX	UNIT
V_{CC}	Supply voltage range		-0.5	6.0	V
V_I	Input voltage range [2]		-0.5	6.0	V
Vo	Voltage range applied to any output in the high-impedance or power-off state [2]		-0.5	6.0	V
Vo	Voltage range applied to any output in the high or low state [2][3]		-0.5	V_{CC}+0.5	V
I_{IK}	Input clamp current	V_I<0		-20	mA
I_{OK}	Output clamp current	V_O<0		-20	mA
I_O	Continuous output current			±20	mA
	Continuous current through V_{CC} or GND			±20	mA
T_J	Junction temperature [4]		-65	150	°C
T_{stg}	Storage temperature		-65	150	°C
T_A	Operating temperature		-40	125	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.

(3) The value of V_{CC} is provided in the *Recommended Operating Conditions table*.

(4) The maximum power dissipation is a function of $T_{J(MAX)}$, $R_{\theta JA}$, and T_A. The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A) / R_{\theta JA}$. All numbers apply for packages soldered directly onto a PCB.

8.2 ESD Ratings

The following ESD information is provided for handling of ESD-sensitive devices in an ESD protected area only.

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±6000	V
	Machine model (MM)	±300	V

(1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.

ESD SENSITIVITY CAUTION

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.3 Thermal Information:

THERMAL METRIC [1]		RS809	UNIT

10 Detailed Description

A microprocessor's (μP's) reset input starts the μP in a known state. The RS809 assert reset to prevent code-execution errors during power-up, power-down or brownout conditions. They assert a reset signal whenever the V_{CC} supply voltage declines below a preset threshold, keeping it asserted for at least 200ms after V_{CC} has risen above the reset threshold. The RS809 have a push-pull output stage.

11 Application and Implementation

Information in the following applications sections is not part of the RUNIC component specification, and RUNIC does not warrant its accuracy or completeness. RUNIC's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

11.1 Ensuring a Valid RESET Output Down to V_{CC}=0V

When V_{CC} falls down below 1V, the RS809 $\overline{\text{RESET}}$ output no longer sinks current, it becomes an open circuit. High-impedance CMOS logic inputs can drift to undetermined voltages if left un-driven. If a pull-down resistor is added to the $\overline{\text{RESET}}$ pin, as shown in Figure 12, any stray charge or leakage currents will be drained to ground, holding $\overline{\text{RESET}}$ low. Resistor value (R1) is not critical. It should be about 100KΩ, large enough not to load $\overline{\text{RESET}}$ and small enough to pull $\overline{\text{RESET}}$ to ground.

Figure 12. RESET Valid to Ground Circuit

11.2 Reset Timing

The reset signal is asserted low for the RS809 when the power supply voltage falls below the threshold trip voltage and remains asserted for at least 200ms after the power supply voltage has risen above the threshold.
