

## Dual Low-Dropout Regulator with Detector

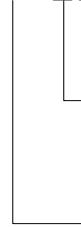

### General Description

The RT9002A/B/C is a dual-channel, low noise, and low dropout regulator. The first regulator is capable of sourcing 240mA, while the second regulator can source up to 500mA and includes a voltage detection function. The RT9002A/B/C performance is optimized for CD/DVD-ROM, CD/RW or wireless communication supply applications.

The RT9002A/B/C regulator is stable with output capacitors as low as 1 $\mu$ F. The other features include high output accuracy, ultra-fast transient response, tight load and line regulation, current limiting/thermal protection and high ripple rejection ratio. The RT9002A/B/C is available in SOP-8 package requiring minimum board space and smallest components.

### Ordering Information

RT9002A/B/C-□□

Package Type  
S : SOP-8

Operating Temperature Range  
P : Pb Free with Commercial Standard  
G : Green (Halogen Free with Commercial Standard)

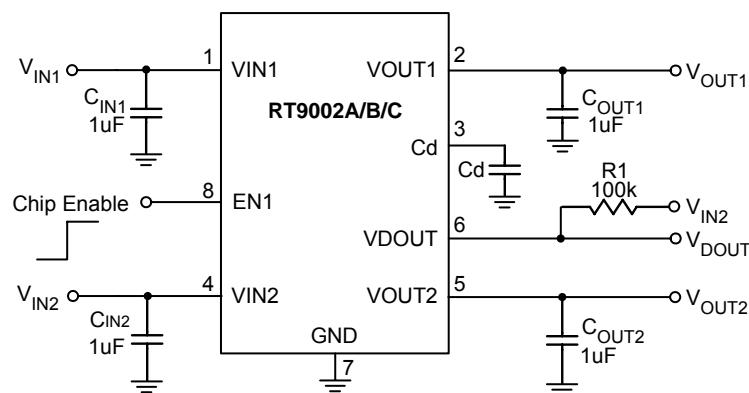

Output Voltage : VOUT1/VOUT2  
A : 2.5V/3.3V  
B : 1.5V/2.8V  
C : 2.5V/3.3V

Note :

RichTek Pb-free and Green products are :

- RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- Suitable for use in SnPb or Pb-free soldering processes.
- 100% matte tin (Sn) plating.

### Typical Application Circuit

### Features

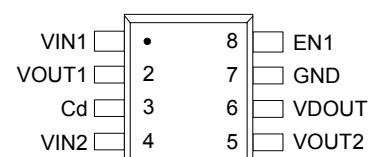

- Low Quiescent Current (Typically 70 $\mu$ A)
- Wide Operating Voltage Ranges : 2.5V to 5.5V
- Ultra-Fast Transient Response
- Tight Load and Line Regulation
- Current Limiting Protection
- Thermal Shutdown Protection
- Only low-ESR Ceramic Capacitors Required for Stability
- Custom LDO VOUT1, VOUT2 Voltage Available from 1.5V to 3.3V
- Custom VIN Detector Available from 3.5V to 4.0V
- RoHS Compliant and 100% Lead (Pb)-Free

### Applications

- CD/DVD-ROM, CD/RW
- Wireless LAN Card/Keyboard/Mouse
- Battery-Powered Equipment
- XDSL Router

### Pin Configurations

(TOP VIEW)

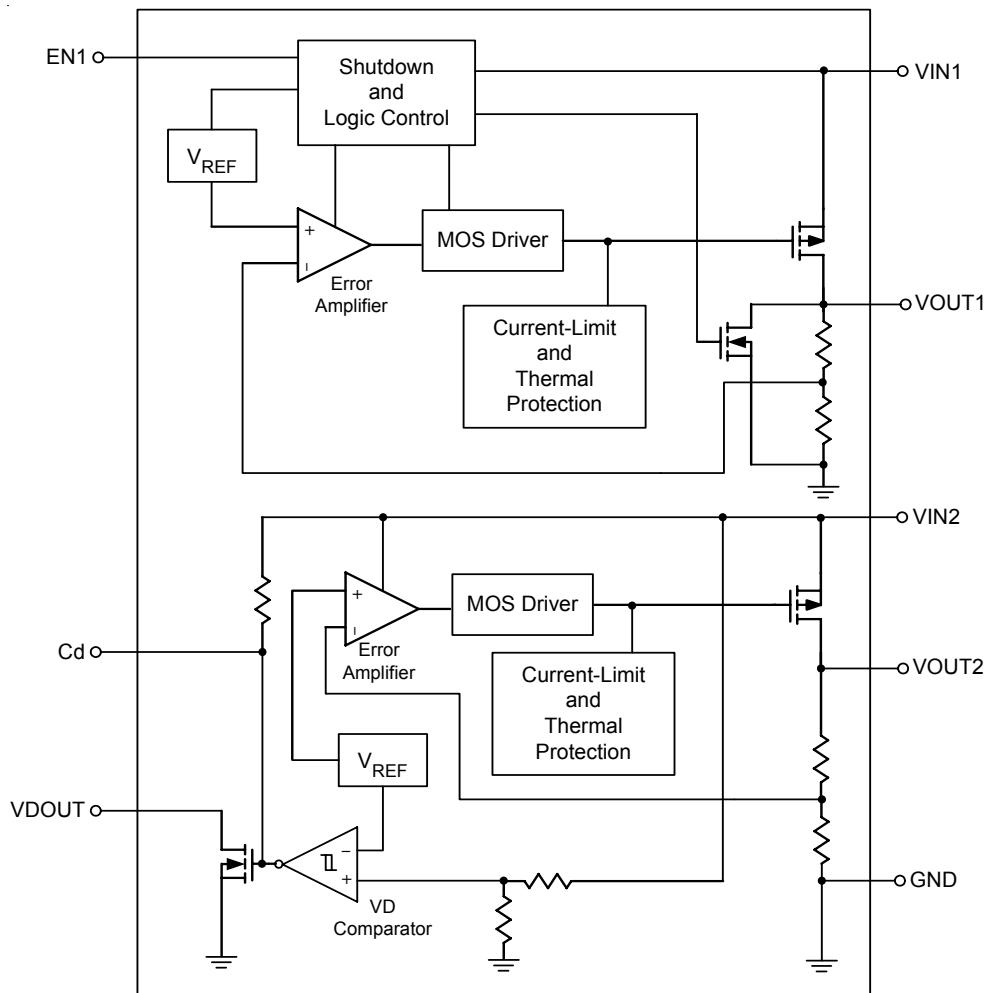

SOP-8

## Functional Pin Description

Pin No.	Pin Name	Pin Function
1	VIN1	Channel 1 Supply Input.
2	VOUT1	Channel 1 Output Voltage.
3	Cd	Delay Capacitor.
4	VIN2	Channel 2 Supply Voltage.
5	VOUT2	Channel 2 Output Input.
6	VDOUT	Detector Output Voltage. (RT9002A = Active High, RT9002B and RT9002C = Active Low)
7	GND	Common Ground.
8	EN1	Chip Enable (Active High) for Channel 1.

## Function Block Diagram

**Absolute Maximum Ratings** (Note 1)

- Supply Input Voltage ----- 6V
- Package Thermal Resistance (Note 4)  
SOP-8,  $\theta_{JA}$  ----- 110°C/W
- Power Dissipation,  $P_D @ T_A = 25^\circ C$   
SOP-8 ----- 0.909W
- Lead Temperature (Soldering, 10 sec.) ----- 260°C
- Junction Temperature ----- 150°C
- Storage Temperature Range ----- -65°C to 150°C
- ESD Susceptibility (Note 2)  
HBM (Human Body Mode) ----- 2kV  
MM (Machine Mode) ----- 200V

**Recommended Operating Conditions** (Note 3)

- Supply Input Voltage ----- 2.5V to 5.5V
- Chip Enable Input Voltage ----- 0V to 5.5V
- Junction Temperature Range ----- -40°C to 125°C
- Ambient Temperature Range ----- -40°C to 125°C

**Electrical Characteristics**(V<sub>IN</sub> = V<sub>OUT</sub> + 1V, whichever is greater, C<sub>IN</sub> = 1μF, C<sub>OUT</sub> = 1μF, T<sub>A</sub> = 25°C, unless otherwise specified)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Units

**Note 1.** Stresses listed as the above "Absolute Maximum Ratings" may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

**Note 2.** Devices are ESD sensitive. Handling precaution recommended.

**Note 3.** The device is not guaranteed to function outside its operating conditions.

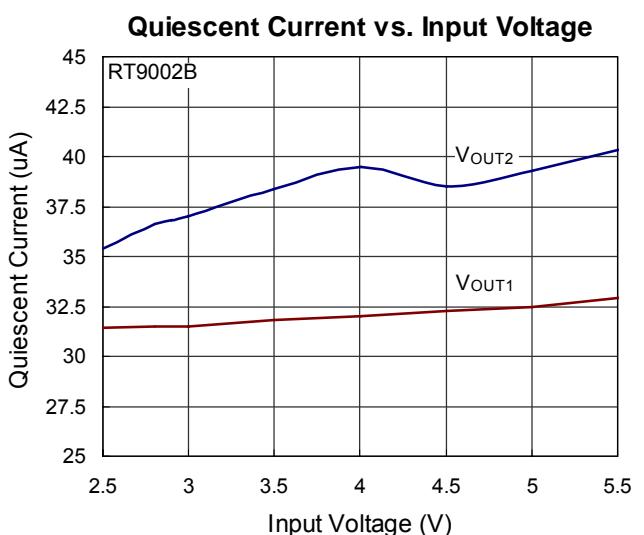

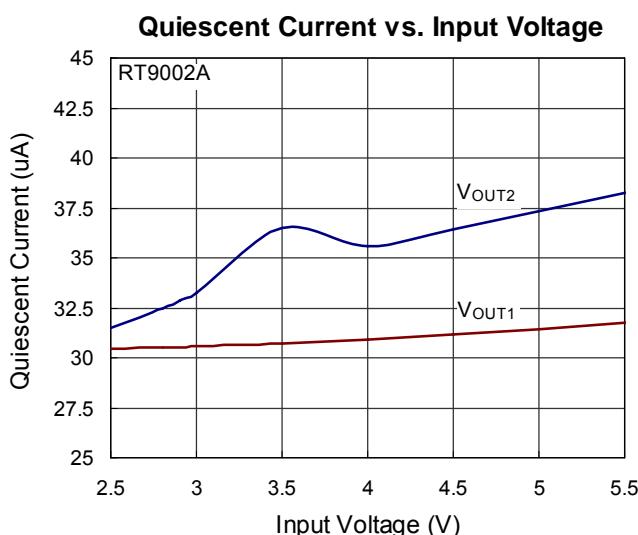

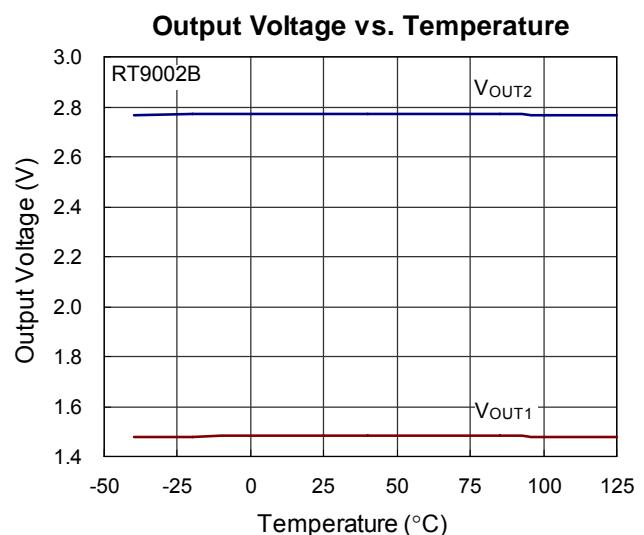

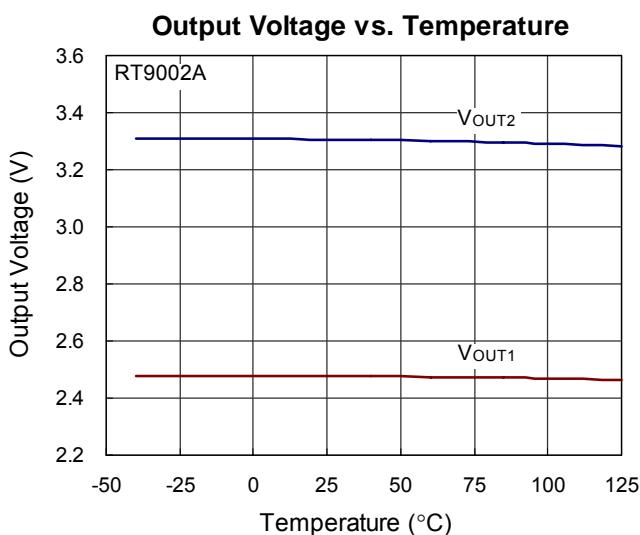

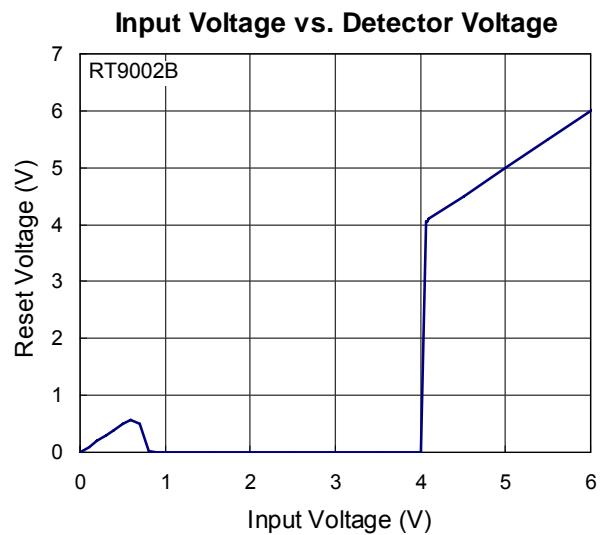

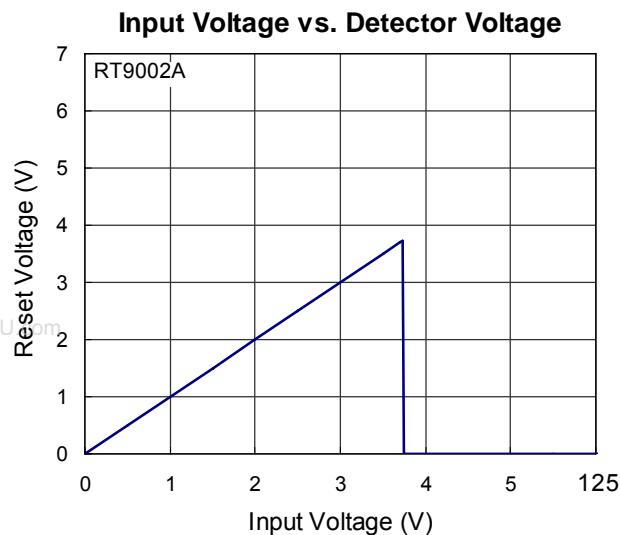

**Note 4.**  $\theta_{JA}$  is measured in the natural convection at  $T_A = 25^\circ\text{C}$  on a high effective thermal conductivity test board of JEDEC 51-7 2S2P 4-layer thermal measurement standard.

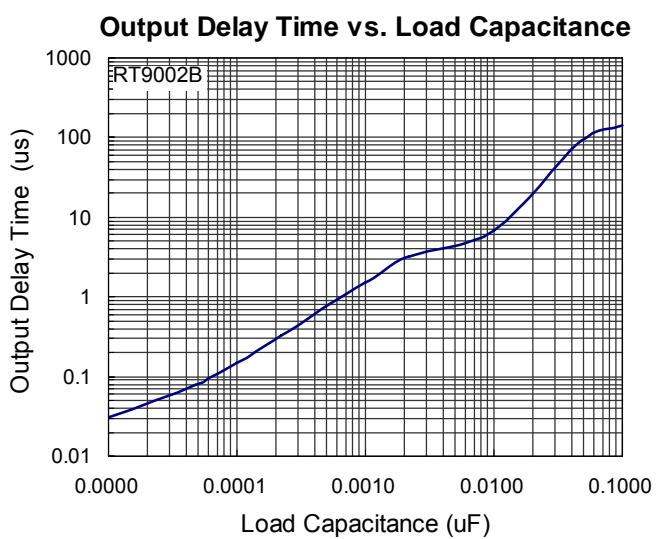

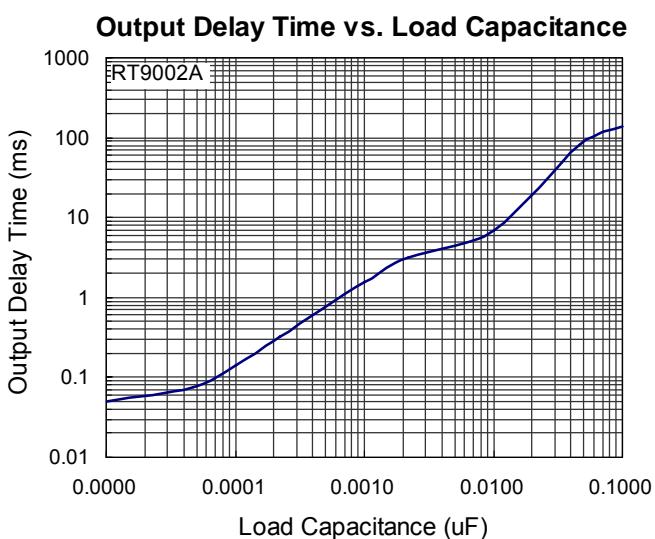

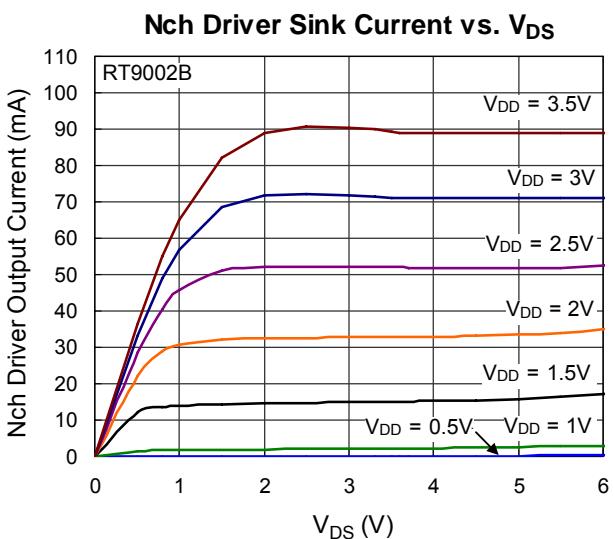

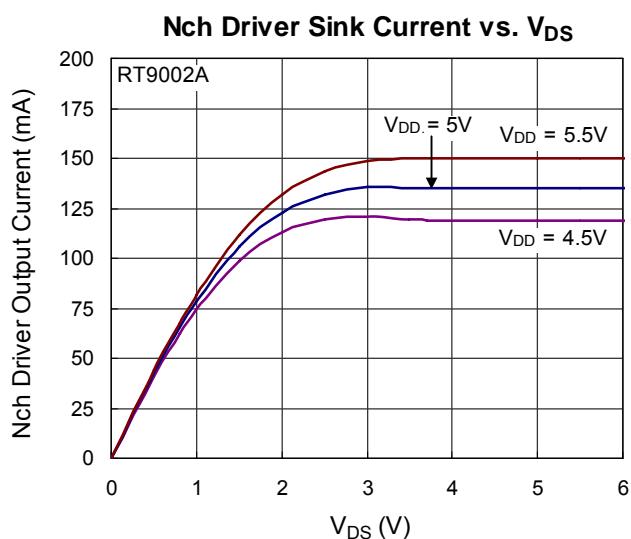

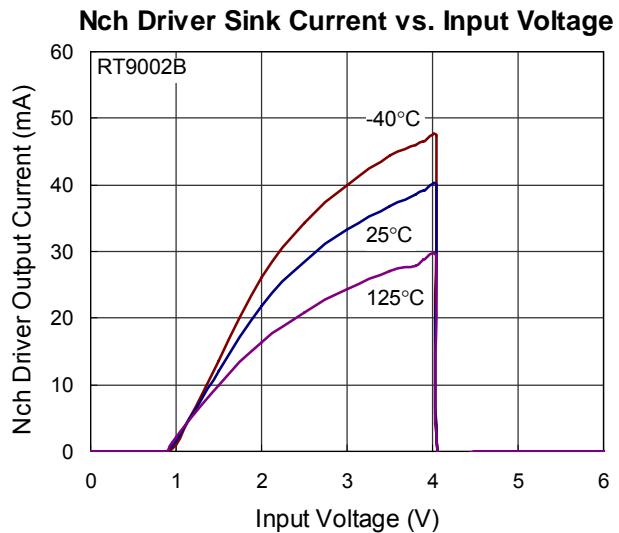

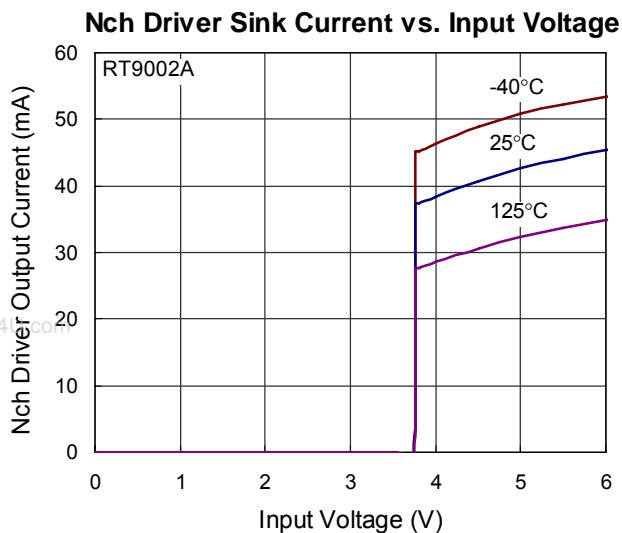

**Note 5.** Regulation is measured at constant junction temperature by using a 20ms current pulse. Devices are tested for load regulation in the load range from 1mA to 100mA.

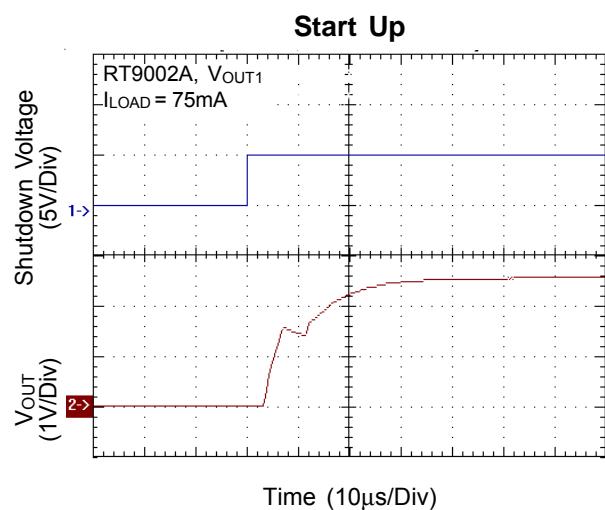

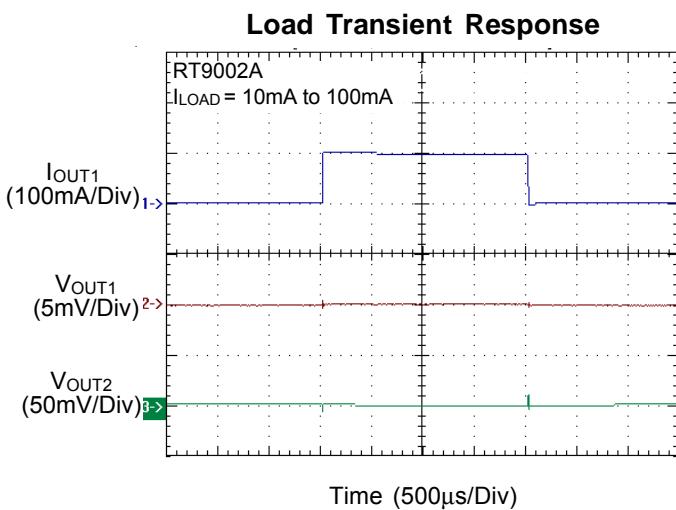

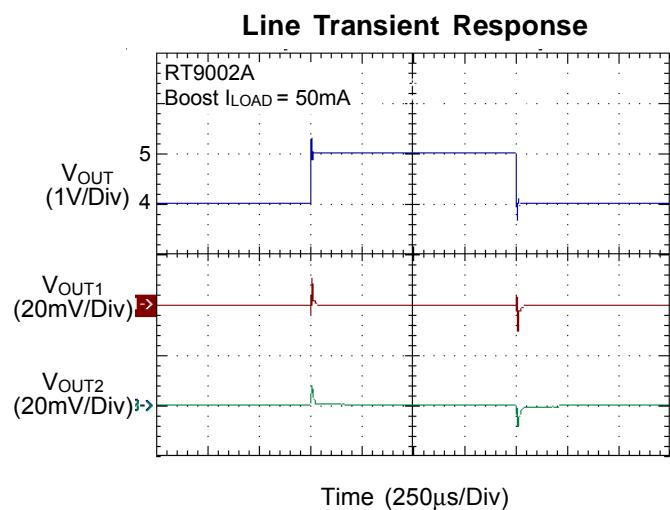

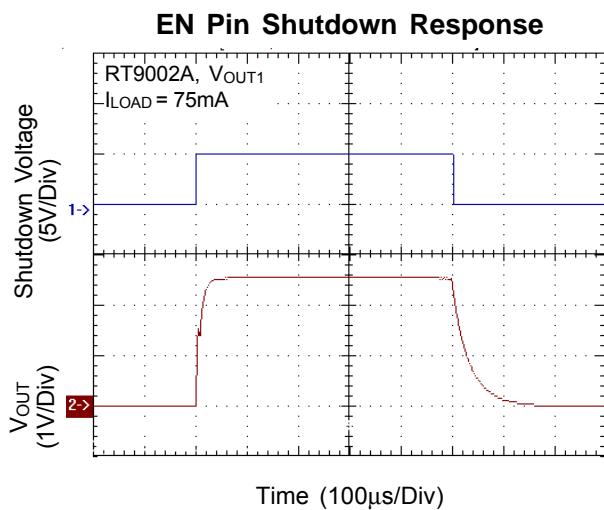

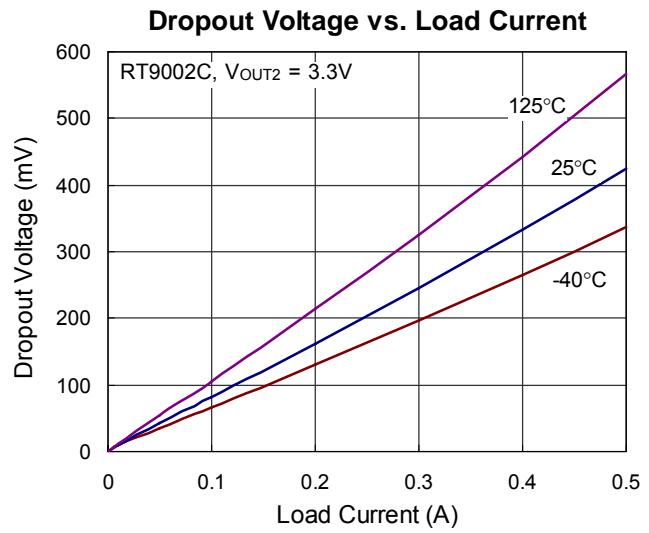

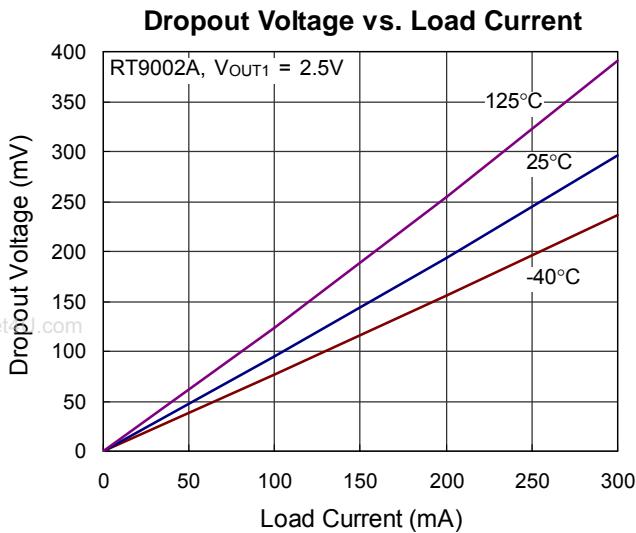

**Note 6.** The dropout voltage is defined as  $V_{IN} - V_{OUT}$ , which is measured when  $V_{OUT}$  is  $V_{OUT(NORMAL)} - 100\text{mV}$ .

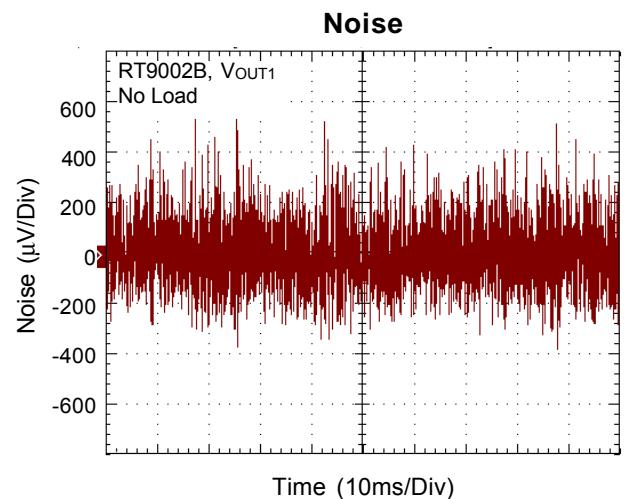

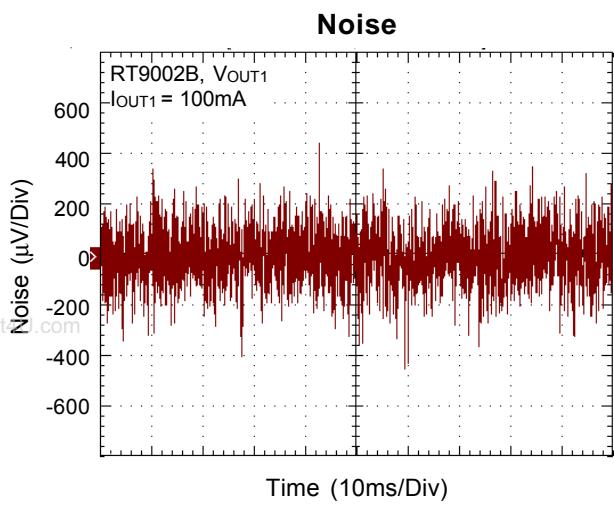

**Note 7.** Quiescent, or ground current, is the difference between input and output currents. It is defined by  $I_Q = I_{IN} - I_{OUT}$  under no load condition ( $I_{OUT} = 0\text{mA}$ ). The total current drawn from the supply is the sum of the load current plus the ground pin current.

## Typical Operating Characteristics

## Applications Information

Like any low-dropout regulator, the external capacitors used with the RT9002A/B/C must be carefully selected for regulator stability and performance. Using a capacitor whose value is  $> 1\mu\text{F}$  on the RT9002A/B/C input and the amount of capacitance can be increased without limit. The input capacitor must be located a distance of not more than 0.5 inch from the input pin of the IC and returned to a clean analog ground. Any good quality ceramic can be used for this capacitor. The capacitor with larger value and lower ESR (equivalent series resistance) provides better PSRR and line-transient response.

The output capacitor must meet both requirements for minimum amount of capacitance and ESR in all LDOs application. The RT9002A/B/C is designed specifically to work with low ESR ceramic output capacitor in space-saving and performance consideration. Using a ceramic capacitor whose value is at least  $1\mu\text{F}$  with ESR is  $> 20\text{m}\Omega$  on the RT9002A/B/C output ensures stability. The RT9002A/B/C still works well with output capacitor of other types due to the wide stable ESR range. Figure 1. shows the curves of allowable ESR range as a function of load current for various output capacitor values. Output capacitor of larger capacitance can reduce noise and improve load transient response, stability, and PSRR. The output capacitor should be located not more than 0.5 inch from the VOUT pin of the RT9002A/B/C and returned to a clean analog ground.

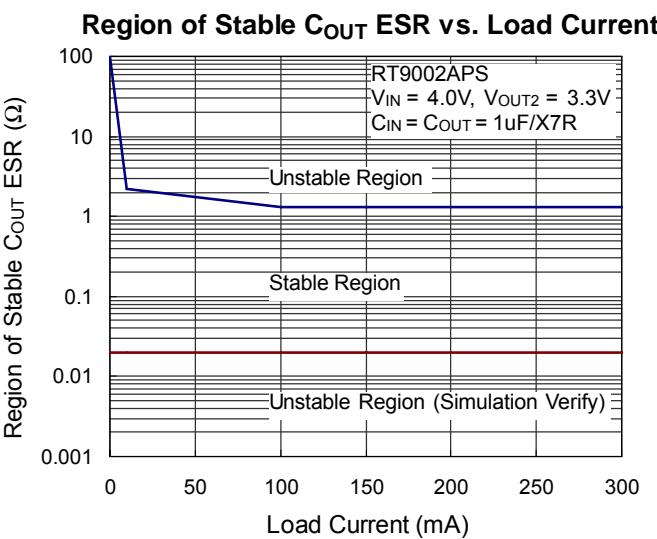

Figure 1

### Enable

The RT9002A/B/C goes into sleep mode when the Enable pin is in a logic low condition. During this condition, the pass transistor, error amplifier, and bandgap are turned off, reducing the supply current to  $0.1\mu\text{A}$  typical. The Enable pin may be directly tied to  $V_{IN}$  to keep the part on. The Enable input is CMOS logic and cannot be left floating.

### PSRR

The power supply rejection ratio (PSRR) is defined as the gain from the input to output divided by the gain from the supply to the output. The PSRR is found to be

$$\text{PSRR} = 20 \times \log \left( \frac{\Delta \text{Gain Error}}{\Delta \text{Supply}} \right)$$

Note that when heavy load measuring,  $\Delta \text{Supply}$  will cause  $\Delta \text{Temperature}$ . And  $\Delta \text{Temperature}$  will cause  $\Delta \text{Output}$  voltage. So the heavy load PSRR measuring is include temperature effect.

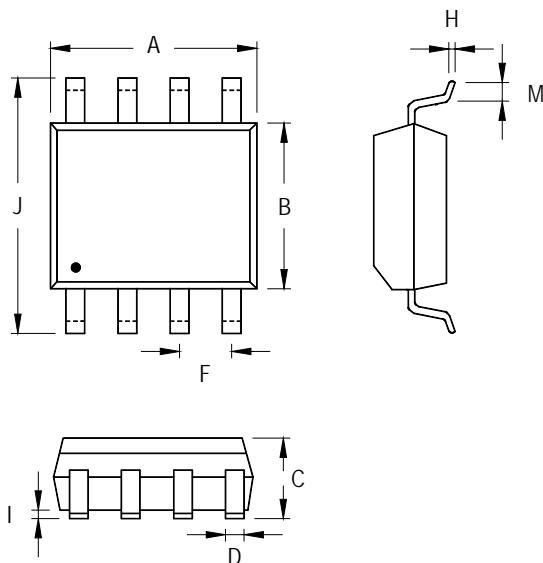

### Current Limit

The RT9002A/B/C contains an independent current limiter, which monitors and controls the pass transistor's gate voltage, limiting the output 1/2 current to  $0.45/0.8\text{A}$  (typ.). The output can be shorted to ground indefinitely without damaging the part.

### Thermal-Shutdown Protection

Thermal-shutdown protection limits total power dissipation in the RT9002A/B/C. When the junction temperature exceeds  $T_J = +170^\circ\text{C}$ , the thermal sensor signals the shutdown logic, turning off the pass transistor and allowing the IC to cool. The thermal sensor turns the pass transistor on again after the IC's junction temperature cools by  $40^\circ\text{C}$ , resulting in a pulsed output during continuous thermal overload conditions. Thermal-shutdown protection is designed to protect the RT9002A/B/C in the event of fault conditions. For continual operation, do not exceed the absolute maximum junction temperature rating of  $T_J = +125^\circ\text{C}$ .
