Design Considerations

Fast switching GaN device can reduce power conversion losses, and thus enable high frequency operations. Certain PCB design rules and instructions, however, need to be followed to take full advantages of fast switching GaN devices.

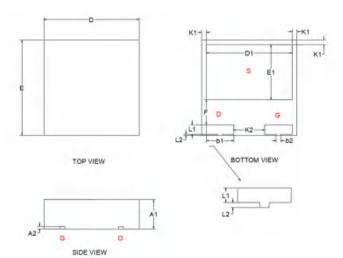

Before evaluating Runxin Micro's GaN devices, please refer to the table below which provides some practical rules that should be followed during the evaluation.

When Evaluating Runxin Micro's GaN Devices:

DO	DO NOT
Make sure the traces are as short as possible for both	Using Runxin Micro's devices in GDS board layouts
drive and power loops to minimize parasitic inductance	
Use the test tool with the shortest inductive loop, and	Use differential mode probe or probe ground clip with
make sure test points should be placed close enough	long wires
Minimize the lead length of TO packages when	Use long traces in drive circuit, or long lead length of
installing them to PCB	the devices
