

### BATTERY PROTECTION IC WITH CELL-BALANCE FUNCTION

The S-8209B Series is a protection IC for lithium-ion / lithium polymer rechargeable batteries and includes a high-accuracy voltage detection circuit and a delay circuit.

The S-8209B Series has a transmission function and two types of cell-balance function so that users are also able to configure a protection circuit with series multi-cell.

#### ■ Features

- High-accuracy voltage detection circuit
 

Overcharge detection voltage <sup>*1</sup>	3.55 V to 4.40 V (5 mV step)	Accuracy ±25 mV
Overcharge release voltage <sup>*1</sup>	3.50 V to 4.40 V <sup>*2</sup>	Accuracy ±50 mV
Cell-balance detection voltage <sup>*1</sup>	3.55 V to 4.40 V (5 mV step) <sup>*3</sup>	Accuracy ±25 mV
Cell-balance release voltage <sup>*1</sup>	3.50 V to 4.40 V <sup>*4</sup>	Accuracy ±50 mV
Overdischarge detection voltage	2.0 V to 3.0 V (10 mV step)	Accuracy ±50 mV
Overdischarge release voltage	2.0 V to 3.4 V <sup>*5</sup>	Accuracy ±100 mV
- Settable delay time by external capacitor for output pin
- Control charging, discharging, cell-balance by CTLC pin, CTLD pin
- Two types of cell-balance function; charge / discharge<sup>\*6</sup>
- Wide range of operation temperature      Ta = -40°C to +85°C
- Low current consumption                      7.0 μA max.
- Lead-free, Sn 100%, halogen-free<sup>\*7</sup>

\*1. Regarding selection of overcharge detection voltage, overcharge release voltage, cell-balance detection voltage and cell-balance release voltage, refer to **Remark 3** in "**3. Product name list**" of "**■ Product Name Structure**".

\*2. Overcharge release voltage = Overcharge detection voltage – Overcharge hysteresis voltage  
(Overcharge hysteresis voltage is selectable in 0 V to 0.4 V in 50 mV step.)

\*3. Select as to overcharge detection voltage > cell-balance detection voltage.

\*4. Cell-balance release voltage = Cell-balance detection voltage – Cell-balance hysteresis voltage  
(Cell-balance hysteresis voltage is selectable in 0 V to 0.4 V in 50 mV step.)

\*5. Overdischarge release voltage = Overdischarge detection voltage + Overdischarge hysteresis voltage  
(Overdischarge hysteresis voltage is selectable in 0 V to 0.7 V in 100 mV step.)

\*6. Also available the product without discharge cell-balance function

\*7. Refer to "**■ Product Name Structure**" for details.

\*1. In the S-8209B Series, users are able to set delay time for the output pins. By using the following formula, delay time is calculated with the value of CDT pin's resistance in the IC (R<sub>CDT</sub>) and the value of capacitor set externally at the CDT pin (C<sub>CDT</sub>).

$$\begin{aligned}
 t_D [s] &= -\ln(1 - V_{CDET} / V_{DS}) \times C_{CDT} [\mu F] \times R_{CDT} [M\Omega] \\
 &= -\ln(1 - 0.7 \text{ (typ.)}) \times C_{CDT} [\mu F] \times 8.31 \text{ M}\Omega \text{ (typ.)} \\
 &= 10.0 \text{ M}\Omega \text{ (typ.)} \times C_{CDT} [\mu F]
 \end{aligned}$$

In case of the capacitance of CDT pin C<sub>CDT</sub> = 0.01 μF, the output pin delay time t<sub>D</sub> is calculated by using the above formula and as follows.

$$t_D [s] = 10.0 \text{ M}\Omega \text{ (typ.)} \times 0.01 \mu F = 0.1 \text{ s (typ.)}$$

Test R<sub>CDT</sub> and the CDT pin detection voltage (V<sub>CDET</sub>) by test circuits shown in this datasheet after applying the power supply while pulling-up the CTLCH pin, CTLDH pin to the level of VDD pin outside the IC.

\*2. In case of using CTLCH pin, CTLDH pin pulled-up to the level of VDD pin externally, the current flows from the VSS pin (I<sub>SS</sub>) is calculated by the following formula.

$$I_{SS} = I_{OPE} + I_{CTLCH} + I_{CTLDH}$$

**■ Operation**

Figure 15 shows the operation transition of the S-8209B Series

**Figure 15 Operation Transition**

### 1. Normal status

In the S-8209B Series, both of CO and DO pin get the  $V_{DD}$  level; the voltage between VDD and VSS ( $V_{DS}$ ) is more than the overdischarge detection voltage ( $V_{DL}$ ), and is less than the overcharge detection voltage ( $V_{CU}$ ) and respectively, the CTLC pin input voltage ( $V_{CTLC}$ ) > the CTLC pin voltage "L" ( $V_{CTLCCL}$ ), the CTLD pin input voltage ( $V_{CTLD}$ ) > the CTLD pin voltage "L" ( $V_{CTLDL}$ ). This is the normal status.

### 2. Overcharge status

In the S-8209B Series, the CO pin is in high impedance; when  $V_{DS}$  gets  $V_{CU}$  or more, or  $V_{CTLC}$  gets  $V_{CTLCCL}$  or less. This is the overcharge status.

If  $V_{DS}$  gets the overcharge release voltage ( $V_{CL}$ ) or less, and  $V_{CTLC}$  gets the CTLC pin voltage "H" ( $V_{CTLCH}$ ) or more, the S-8209B Series releases the overcharge status to return to the normal status.

### 3. Overdischarge status

In the S-8209B Series, the DO pin is in high impedance; when  $V_{DS}$  gets  $V_{DL}$  or less, or  $V_{CTLD}$  gets  $V_{CTLDL}$  or less. This is the overdischarge status.

If  $V_{DS}$  gets the overdischarge release voltage ( $V_{DU}$ ) or more, and  $V_{CTLD}$  gets the CTLD pin voltage "H" ( $V_{CTLDH}$ ) or more, the S-8209B Series releases the overdischarge status to return to the normal status.

### 4. Cell-balance function

In the S-8209B Series, the CB pin gets the level of VDD pin; when  $V_{DS}$  gets the cell-balance detection voltage ( $V_{BU}$ ) or more. This is the charge cell-balance function.

If  $V_{DS}$  gets the cell-balance release voltage ( $V_{BL}$ ) or less again, the S-8209B Series sets the CB pin the level of VSS pin.

In addition, the CB pin gets the level of VDD pin; when  $V_{DS}$  is more than  $V_{DL}$ , and  $V_{CTLD}$  is  $V_{CTLDL}$  or less. This is the discharge cell-balance function.

If  $V_{CTLD}$  gets  $V_{CTLDH}$  or more, or  $V_{DS}$  is  $V_{DL}$  or less again, the S-8209B Series sets the CB pin the level of VSS pin.

### 5. Delay circuit

In the S-8209B Series, users are able to set delay time which is from detection of changes in  $V_{DS}$ ,  $V_{CTLC}$ ,  $V_{CTLD}$  to output to the CO, DO, CB pin.

For example in the detection of overcharge status, when  $V_{DS}$  exceeds  $V_{CU}$ , or  $V_{CTLC}$  gets  $V_{CTLCH}$  or less, charging to  $C_{CDT}$  starts via  $R_{CDT}$ . If the voltage between CDT and VSS ( $V_{CDT}$ ) reaches the CDT pin detection voltage ( $V_{CDET}$ ), the CO pin is in high impedance. The output pin delay time  $t_D$  is calculated by the following formula.

$$t_D [s] = 10.0 \text{ M}\Omega (\text{typ.}) \times C_{CDT} [\mu\text{F}]$$

The electric charge in  $C_{CDT}$  starts to be discharged when the delay time has finished.

The delay time that users have set for the CO pin, as seen above, is settable for each output pin DO, CB.

■ **Precautions**

- The application conditions for the input voltage, output voltage, and load current should not exceed the package power dissipation.
- Do not apply an electrostatic discharge to this IC that exceeds the performance ratings of the built-in electrostatic protection circuit.
- SII claims no responsibility for any and all disputes arising out of or in connection with any infringement by products including this IC of patents owned by a third party.
