

**BATTERY PROTECTION IC  
FOR 3-SERIAL OR 4-SERIAL CELL PACK**

The S-8243A/B Series is a protection IC for lithium-ion rechargeable battery. The S-8243A Series protects 3-series, the S-8243B Series protects 4-series cell pack from the overcharge, overdischarge, overcurrent voltages. This IC has a high-accuracy battery protection circuit and a battery monitor amplifier, and also a voltage regulator which operates the microcomputer or gas gauge IC. Combining this IC and a microcomputer or a gas gauge IC allows to display the amount of charge remained in a battery.

**■ Features**

- (1) High-accuracy voltage detection for each cell
  - Overcharge detection voltage n (n = 1 to 4)  
3.9 V to 4.4 V (50 mV step) Accuracy ±25 mV
  - Overcharge hysteresis voltage n (n = 1 to 4) of overcharge detection  
−0.10 V to −0.40 V (50 mV step) or 0 V Accuracy ±50 mV  
(Overcharge release voltage n (= Overcharge detection voltage n + Overcharge hysteresis voltage n) can be selected within the range 3.8 V to 4.4 V.)
  - Overdischarge detection voltage n (n = 1 to 4)  
2.0 V to 3.0 V (100 mV step) Accuracy ±80 mV
  - Overdischarge hysteresis voltage n (n = 1 to 4) of overdischarge detection  
0.15 V to 0.70 V or 0 V (50 mV step) Accuracy ±100 mV  
(Overdischarge release voltage n (= Overdischarge detection voltage n + Overdischarge hysteresis voltage n) can be selected within the range 2.0 V to 3.4 V.)
- (2) Three-level overcurrent protection including protection for short-circuiting
  - Overcurrent detection voltage 1 0.05 V to 0.3 V (50 mV step) Accuracy ±25 mV
  - Overcurrent detection voltage 2 0.5 V Accuracy ±100 mV
  - Overcurrent detection voltage 3  $V_{DD} / 2$  Accuracy ±15 %
- (3) Delay times for overcharge detection, overdischarge detection and overcurrent detection 1 can be set by external capacitors. (Delay times for overcurrent detection 2 and 3 are fixed internally.)
- (4) Charge/discharge operation can be controlled through the control pins.
- (5) High-accuracy battery monitor amp  $GAMP = V_{BATTERY} \times 0.2 \pm 1.0\%$
- (6) Voltage regulator  $V_{OUT} = 3.3 V \pm 2.4 \% (3 mA \text{ max.})$
- (7) High-withstand voltage Absolute maximum rating: 26 V
- (8) Wide operating voltage range 6 V to 18 V
- (9) Wide operating temperature range: −40°C to +85°C
- (10) Low current consumption
  - Operation mode 120 μA max.
  - Power down mode 0.1 μA max.
- (11) Lead-free, Sn 100%, halogen-free\*1

\*1. Refer to “**■ Product Name Structure**” for details.

**■ Applications**

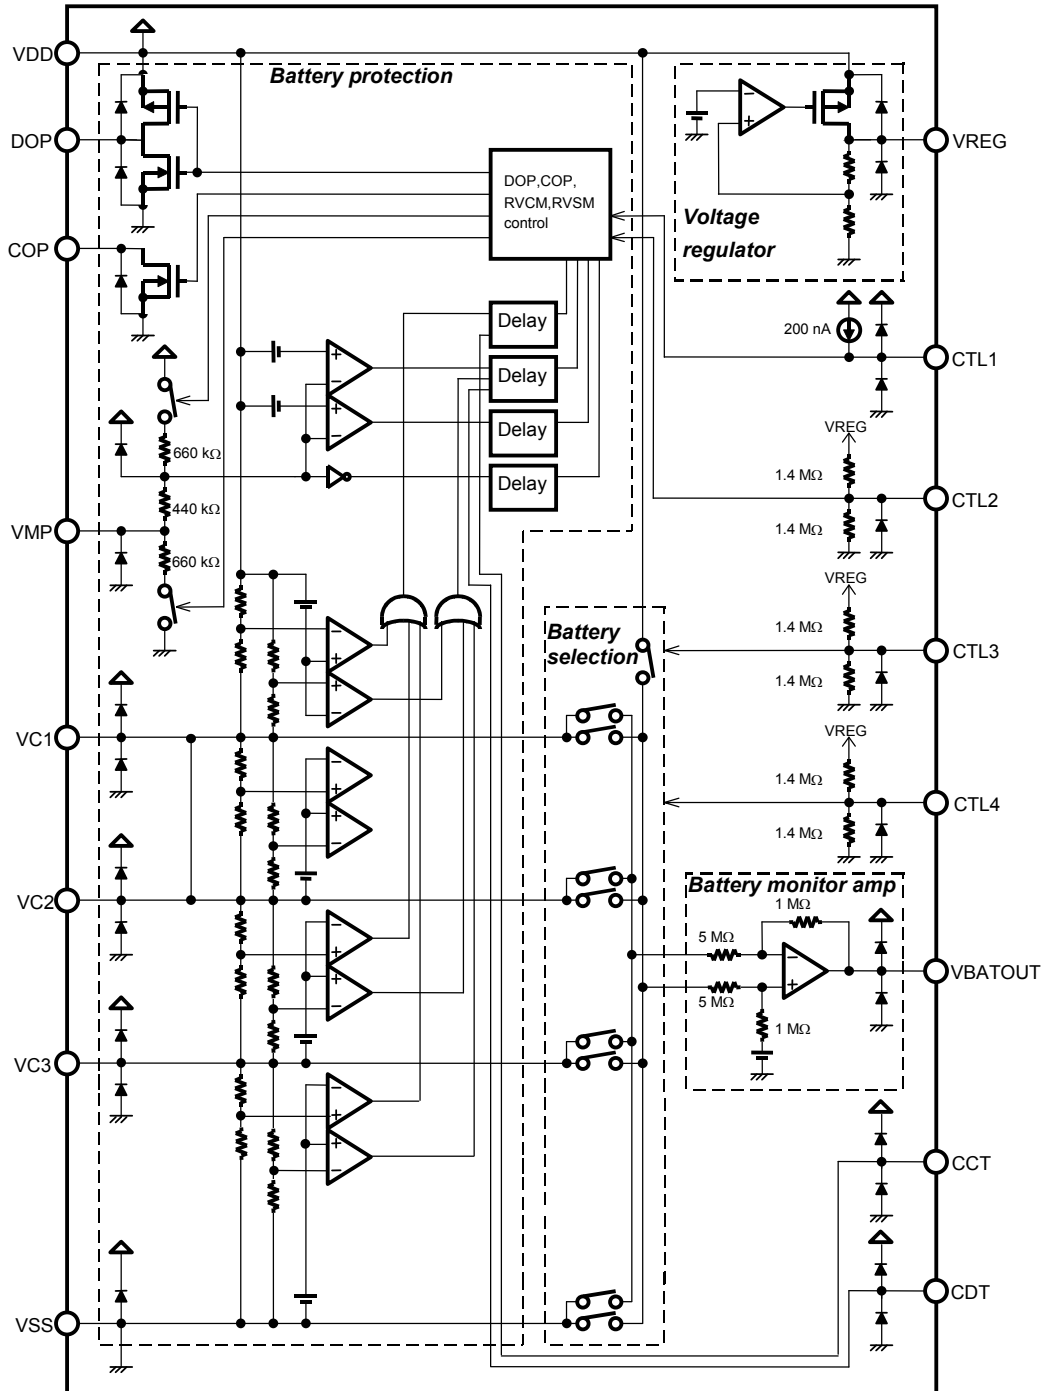

- Lithium-ion rechargeable battery packs
- Lithium polymer rechargeable battery packs

**■ Package**

- 16-Pin TSSOP

■ **Block Diagrams**

1. **S-8243A Series**

**Remark1.** Diodes in the figure are parasitic diodes.  
**2.** Numerical values are typical values.

S-8243BAFFT-TB-x	4.250 ±0.025 V	-0.25 ±0.05 V	2.40 ±0.08 V	0 V	0.20 ±0.025 V	Available
S-8243BAHFT-TB-x	4.315 ±0.025 V	-0.20 ±0.05 V	2.00 ±0.08 V	0.15 ±0.10 V	0.20 ±0.025 V	Available

**Remark 1.** Change in the detection voltage is available in products other than listed above. Contact our sales office.

**2.** x: G or U

**3.** Please select products of environmental code = U for Sn 100%, halogen-free products.

■ **Pin Configuration**

**Figure 3**

**Table 3 Pin description (S-8243A Series)**

Pin No.	Symbol	Description
1	VDD	Input pin for positive power supply, Connection pin for battery 1's positive voltage
2	DOP	Connection pin for discharge control FET gate (CMOS output)
3	COP	Connection pin for charge control FET gate (Nch open drain output)
4	VMP	Pin for voltage detection between VDD-VMP pin (Pin for overcurrent detection)
5	VC1	No connection
6	VC2	Connection pin for battery 1's negative voltage, for battery 2's positive voltage
7	VC3	Connection pin for battery 2's negative voltage, for battery 3's positive voltage
8	VSS	Input pin for negative power supply, Connection pin for battery 3's negative voltage
9	CDT	Connection pin to capacitor for overdischarge detection delay, for overcurrent detection delay 1
10	CCT	Connection pin to capacitor for overcharge detection delay
11	VBATOUT	Output pin for battery voltage and offset voltage
12	CTL4	Pin for selecting output from VBATOUT pin
13	CTL3	Pin for selecting output from VBATOUT pin
14	CTL2	Control pin for charge / discharge FET
15	CTL1	Control pin for charge / discharge FET
16	VREG	Output pin for voltage regulator (3.3 V)

**Table 4 Pin description (S-8243B Series)**

Pin No.	Symbol	Description
1	VDD	Input pin for positive power supply, Connection pin for battery 1's positive voltage
2	DOP	Connection pin for discharge control FET gate (CMOS output)
3	COP	Connection pin for charge control FET gate (Nch open drain output)
4	VMP	Pin for voltage detection between VDD-VMP pin (Pin for overcurrent detection)
5	VC1	Connection pin for battery 1's negative voltage, for battery 2's positive voltage
6	VC2	Connection pin for battery 2's negative voltage, for battery 3's positive voltage
7	VC3	Connection pin for battery 3's negative voltage, for battery 4's positive voltage
8	VSS	Input pin for negative power supply, Connection pin for battery 4's negative voltage
9	CDT	Connection pin to capacitor for overdischarge detection delay, for overcurrent detection delay 1
10	CCT	Connection pin to capacitor for overcharge detection delay
11	VBATOUT	Output pin for battery voltage and offset voltage
12	CTL4	Pin for selecting output from VBATOUT pin
13	CTL3	Pin for selecting output from VBATOUT pin
14	CTL2	Control pin for charge / discharge FET
15	CTL1	Control pin for charge / discharge FET
16	VREG	Output pin for voltage regulator (3.3 V)

■ **Absolute Maximum Ratings**

**Table 5**

(Ta = 25°C unless otherwise specified)

Item	Symbol	Applied Pins	Absolute Maximum Ratings	Unit
Input voltage VDD	V <sub>DS</sub>	–	V <sub>SS</sub> -0.3 to V <sub>SS</sub> +26	V
Input voltage	V <sub>IN</sub>	VC1, VC2, VC3, CCT, CDT	V <sub>SS</sub> -0.3 to V <sub>DD</sub> +0.3	V
VMP pin Input voltage	V <sub>MP</sub>	VMP	V <sub>SS</sub> -0.3 to V <sub>SS</sub> +26	V
DOP pin output voltage	V <sub>DOP</sub>	DOP	V <sub>SS</sub> -0.3 to V <sub>DD</sub> +0.3	V
COP pin output voltage	V <sub>COP</sub>	COP	V <sub>SS</sub> -0.3 to V <sub>SS</sub> +26	V
VREG pin output voltage	V <sub>OUT</sub>	VREG	V <sub>SS</sub> -0.3 to V <sub>DD</sub> +0.3	V
CTL1 pin input voltage	V <sub>CTL1</sub>	CTL1	V <sub>SS</sub> -0.3 to V <sub>DD</sub> +0.3	V
CTL2 to CTL4 pin input voltage	V <sub>CTLn</sub>	CTL2, CTL3, CTL4	V <sub>SS</sub> -0.3 to V <sub>OUT</sub> +0.3	V
Cell voltage output voltage	V <sub>BATOUT</sub>	VBATOUT	V <sub>SS</sub> -0.3 to V <sub>OUT</sub> +0.3	V
Power dissipation	P <sub>D</sub>	–	300 (When not mounted on board)	mW
		–	1100*1	mW
Operation ambient temperature	T <sub>opr</sub>	–	-40 to +85	°C
Storage temperature	T <sub>stg</sub>	–	-40 to +125	°C

\*1. When mounted on board

[Mounted board]

(1) Board size: 114.3 mm × 76.2 mm × t1.6 mm

(2) Board name: JEDEC STANDARD51-7

**Caution** The absolute maximum ratings are rated values exceeding which the product could suffer physical damage. These values must therefore not be exceeded under any conditions.

**Figure 4 Power Dissipation of Package (When Mounted on Board)**

Item	Symbol	Remarks	Min.	Typ.	Max.	Unit	Test circuit
<b>INPUT CURRENT</b>							
Current consumption at not monitoring $V_{BATOUT}$	$I_{OPE}$	$V1 = V2 = V3 = 3.5 V, V_{MP} = V_{DD}$	–	65	120	$\mu A$	1
Current consumption at power down	$I_{PDN}$	$V1 = V2 = V3 = 1.5 V, V_{MP} = V_{SS}$	–	–	0.1	$\mu A$	1
Current for VCn at not monitoring $V_{BATOUT}$ (n = 2, 3)	$I_{VCnN}$	$V1 = V2 = V3 = 3.5 V$	–0.3	0	0.3	$\mu A$	3
Current for VC2 at monitoring of $V_{BATOUT}$	$I_{VC2}$	$V1 = V2 = V3 = 3.5 V$	–	2.0	7.2	$\mu A$	3
Current for VC3 at monitoring of $V_{BATOUT}$	$I_{VC3}$	$V1 = V2 = V3 = 3.5 V$	–	1.0	4.0	$\mu A$	3
Current for CTL1 at Low	$I_{CTL1L}$	$V1 = V2 = V3 = 3.5 V, V_{CTL1} = 0 V$	–0.4	–0.2	–	$\mu A$	5
Current for CTLn at High n = 2,3,4	$I_{CTLnH}$	$V_{CTLn} = V_{OUT}$	–	2.5	5	$\mu A$	9
Current for CTLn at Low n = 2,3,4	$I_{CTLnL}$	$V_{CTLn} = 0 V$	–5	–2.5	–	$\mu A$	9
<b>OUTPUT CURRENT</b>							
Leak current COP	$I_{COH}$	$V_{COP} = 24 V$	–	–	0.1	$\mu A$	9
Sink current COP	$I_{COL}$	$V_{COP} = V_{SS} + 0.5 V$	10	–	–	$\mu A$	9
Source current DOP	$I_{DOH}$	$V_{DOP} = V_{DD} - 0.5 V$	10	–	–	$\mu A$	9
Sink current DOP	$I_{DOL}$	$V_{DOP} = V_{SS} + 0.5 V$	10	–	–	$\mu A$	9
Source current $V_{BATOUT}$	$I_{VBATH}$	$V_{BATOUT} = V_{DD} - 0.5 V$	100	–	–	$\mu A$	9
Sink current $V_{BATOUT}$	$I_{VBATL}$	$V_{BATOUT} = V_{SS} + 0.5 V$	100	–	–	$\mu A$	9

**Applied to S-8243AACFT and S-8243AADFT**

Item	Symbol	Conditions	Min.	Typ.	Max.	Unit	Test circuit
<b>DELAY TIME</b>							
Overcharge detection delay time	$t_{CU}$	$C_{CT} = 0.1 \mu F$	0.5	1.0	1.5	s	5
Overdischarge detection delay time	$t_{DL}$	$C_{DT} = 0.1 \mu F$	50	100	150	ms	5
Overcurrent detection delay time 1	$t_{OV1}$	$C_{DT} = 0.1 \mu F$	5	10	15	ms	5
Overcurrent detection delay time 2	$t_{OV2}$	–	1.5	2.5	4.0	ms	4
Overcurrent detection delay time 3	$t_{OV3}$	–	100	300	600	$\mu s$	4

- \*1. Temperature coefficient for detection and release voltage is applied to overcharge detection voltage n, overcharge release voltage n, overdischarge detection voltage n, and overdischarge release voltage n.
- \*2. Temperature coefficient for overcurrent detection voltage is applied to over current detection voltage 1 and 2.
- \*3. Since products are not screened at high and low temperature, the specification for this temperature range is guaranteed by design, not tested in production.

- \*1. Temperature coefficient for detection and release voltage is applied to overcharge detection voltage n, overcharge release voltage n, overdischarge detection voltage n, and overdischarge release voltage n.
- \*2. Temperature coefficient for overcurrent detection voltage is applied to over current detection voltage 1 and 2.
- \*3. Since products are not screened at high and low temperature, the specification for this temperature range is guaranteed by design, not tested in production.

## ■ Test Circuits

In this chapter test methods are explained for the case of S-8243B Series, which is designed for 4-serial cell pack. For the case of S-8243A Series, which is designed for 3-serial cell, voltage source V2 should be shorted, V3 should be read as V2, and V4 as V3.

### 1. Current consumption (Test circuit 1)

Current consumption at not monitoring  $V_{BATOUT}$ ,  $I_{OPE}$ , is a current measured at the VSS pin when  $V1 = V2 = V3 = V4 = 3.5\text{ V}$  and  $V_{MP} = V_{DD}$ . Current consumption at power down,  $I_{PDN}$ , is a current measured at the VSS pin when  $V1 = V2 = V3 = V4 = 1.5\text{ V}$  and  $V_{MP} = V_{SS}$ .

### 2. Voltage regulator (Test circuit 2)

Output voltage of the regulator  $V_{OUT}$  is a voltage measured at the VREG pin when  $V_{DD} = V_{MP} = 14\text{ V}$  and  $I_{OUT} = 3\text{ mA}$ . Line regulation of the voltage regulator  $\Delta V_{OUT1}$  is defined by the equation  $\Delta V_{OUT1} = V_{OUT2} - V_{OUT1}$  where  $V_{OUT1}$  is the output voltage when  $V_{DD} = V_{MP} = 6\text{ V}$  and  $I_{OUT} = 3\text{ mA}$ , and  $V_{OUT2}$  is the output voltage when  $V_{DD} = V_{MP} = 18\text{ V}$  and  $I_{OUT} = 3\text{ mA}$ .

Load regulation of the regulator is defined by the equation  $\Delta V_{OUT2} = V_{OUT3} - V_{OUT}$  where  $V_{OUT3}$  is the output voltage when  $V_{DD} = V_{MP} = 14\text{ V}$  and  $I_{OUT} = 5\text{ }\mu\text{A}$ .

### 3. Battery monitor amp and pin current for VC1 to VC3 (Test circuit 3)

Voltage gain of the battery monitor amp for each cell is defined by the input offset voltage and the measurement result provided from the VBATOUT pin for the combination of the CTL3 pin and CTL4 pin expressed by the following table at the condition where  $V1 = V2 = V3 = V4 = 3.5\text{ V}$ . Pin current for VC1 to VC3,  $I_{VCn}$  and  $I_{VCnN}$  are at the same time measured.

**Table 8**

CTL3 pin status	CTL4 pin status	VBATOUT pin output	VCn (n = 1, 2, 3) pin current
$V_{CTL3H}\text{ min.}$	$V_{CTL4H}\text{ min.}$	$V_{OFF1}$	$I_{VC1}$ at VC1 pin
$V_{CTL3H}\text{ min.}$	Open	$V_{BAT1}$	-
$V_{CTL3H}\text{ min.}$	$V_{CTL4L}\text{ max.}$	$V_{OFF2}$	$I_{VC2}$ at VC2 pin
Open	$V_{CTL4H}\text{ min.}$	$V_{BAT2}$	-
Open	Open	$V_{OFF3}$	$I_{VC3}$ at VC3 pin
Open	$V_{CTL4L}\text{ max.}$	$V_{BAT3}$	-
$V_{CTL3L}\text{ max.}$	$V_{CTL4H}\text{ min.}$	$V_{OFF4}$	$I_{VCnN}$ at VCn pin (n = 1, 2, 3)
$V_{CTL3L}\text{ max.}$	Open	$V_{BAT4}$	-

Voltage gain of the battery monitor amp for each cell is calculated by the equation  
 $GAMPn = (V_{BATn} - V_{OFFn}) / Vn$  (n = 1 to 4)

#### **4. Overcharge detection voltages, overcharge hysteresis voltages, overdischarge detection voltages, overdischarge hysteresis voltages, and overcurrent detection voltages (Test circuit 4)**

##### **4.1 Overcharge detection voltages, overcharge hysteresis voltages, overdischarge detection voltages and overdischarge hysteresis voltages**

In the following  $V_{MP} = V_{DD}$  and the CDT pin is open.

The COP pin and the DOP pin should provide “Low”, which is a voltage equal to  $V_{DD} \times 0.1$  V or lower, in the condition that  $V1 = V2 = V3 = V4 = 3.5$  V.

The overcharge detection voltage  $V_{CU1}$  is defined by the voltage at which COP pin voltage becomes “High”, which is a voltage equal to  $V_{DD} \times 0.9$  V or higher, when the voltage V1 is gradually increased from the starting condition  $V1 = 3.5$  V. The overcharge release voltage  $V_{CL1}$  is defined by the voltage at which COP pin voltage becomes “Low” when the voltage V1 is gradually decreased. The overcharge hysteresis voltage  $V_{HC1}$  is then defined by the difference between the overcharge detection voltage  $V_{CU1}$  and the overcharge release voltage  $V_{CL1}$ .

The overdischarge detection voltage  $V_{DL1}$  is defined by the voltage at which DOP pin voltage becomes “High” when the voltage V1 is gradually decreased from the starting condition  $V1 = 3.5$  V. The overdischarge release voltage  $V_{DU1}$  is defined by the voltage at which DOP pin voltage becomes “Low” when the voltage V1 is gradually increased. The overdischarge hysteresis voltage  $V_{HD1}$  is then defined by the difference between the overdischarge release voltage  $V_{DU1}$  and the overdischarge detection voltage  $V_{DL1}$ .

Other overcharge detection voltage  $V_{CU_n}$ , overcharge hysteresis voltage  $V_{HC_n}$ , overdischarge detection voltage  $V_{DL_n}$ , and overdischarge hysteresis voltage  $V_{HD_n}$  ( for  $n = 2$  to  $4$ ) are defined in the same manner as in the case for  $n = 1$ .

##### **4.2 Overcurrent detection voltages**

Starting condition is  $V1 = V2 = V3 = V4 = 3.5$  V,  $V_{MP} = V_{DD}$ , and the CDT pin is open. The DOP pin voltage thus provides “Low”

The overcurrent detection voltage 1,  $V_{IOV1}$  is defined by the voltage difference  $V_{DD} - V_{MP}$  at which the DOP pin voltage becomes “High” when the voltage of VMP pin is decreased.

Starting condition for measuring the overcurrent detection voltage 2 and 3 is  $V1 = V2 = V3 = V4 = 3.5$  V,  $V_{MP} = V_{DD}$  and the CDT pin voltage  $V_{CDT} = V_{SS}$ . The DOP pin voltage thus provides “Low”.

The overcurrent detection voltage 2,  $V_{IOV2}$  is defined by the voltage difference  $V_{DD} - V_{MP}$  at which the DOP pin voltage becomes “High” when the voltage of VMP pin is decreased.

The overcurrent detection delay time 2,  $t_{IOV2}$  is a time needed for the DOP pin to become “High” from “Low” when the VMP pin voltage is changed quickly to  $V_{IOV2} \text{ min.} - 0.2$  V from the starting condition  $V_{MP} = V_{DD}$ .

The overcurrent detection voltage 3,  $V_{IOV3}$  is defined by the voltage of the VMP pin at which the DOP pin voltage becomes “High” when the voltage of VMP pin is decreased at the speed 10 V / ms.

The overcurrent detection delay time 3,  $t_{IOV3}$  is a time needed for the DOP pin to become “High” from “Low” when the VMP pin voltage is changed quickly to  $V_{IOV3} \text{ min.} - 0.2$  V from the starting condition  $V_{MP} = V_{DD}$ .

**5. CTL1 pin current, overcharge detection delay time, overdischarge detection delay time, and overcurrent detection delay time 1 (Test circuit 5)**

Starting condition is  $V1 = V2 = V3 = V4 = 3.5\text{ V}$  and  $V_{MP} = V_{DD}$ .

Current that flows between the CTL1 pin and  $V_{SS}$  is the CTL1 pin current  $I_{CTL1L}$ .

The overcharge detection delay time  $t_{CU}$  is a time needed for the COP pin voltage to change from "Low" to "High" just after the V1 voltage is rapidly increased from 3.5 V to 4.5 V.

The overdischarge detection delay time  $t_{DL}$  is a time needed for the DOP pin voltage to change from "Low" to "High" just after the V1 voltage is rapidly decreased from 3.5 V to 1.5 V.

The overcurrent detection delay time 1 is a time needed for the DOP pin voltage to change from "Low" to "High" just after the VMP pin voltage is decreased from  $V_{DD}$  to  $V_{DD}-0.35\text{ V}$  when  $V1 = 3.5\text{ V}$ .

**6. Input voltages for CTL1 and CTL2 (Test circuit 6)**

Starting condition is  $V1 = V2 = V3 = V4 = 3.5\text{ V}$ .

Pin voltages of the COP and the DOP should be "High" when  $V_{CTL1} = V_{CTL1H}\text{ min.}$  and CTL2 is OPEN.

Pin voltages of the COP and the DOP should be "Low" when  $V_{CTL1} = V_{CTL1L}\text{ max.}$  and CTL2 is OPEN.

Pin voltage of the COP is "High" and the pin voltage of the DOP is "Low" when  $V_{CTL1} = V_{CTL1L}\text{ max.}$  and  $V_{CTL2} = V_{CTL2H}\text{ min.}$

Pin voltage of the COP is "Low" and the pin voltage of the DOP is "High" when  $V_{CTL1} = V_{CTL1L}\text{ max.}$  and  $V_{CTL2} = V_{CTL2L}\text{ max.}$

**7. 0 V battery charge starting charger voltage and 0 V battery charge inhibition battery voltage (Test circuit 7)**

One of the 0 V battery charge starting charger voltage and 0 V battery charge inhibition battery voltage is applied to each product according to the 0 V battery charging function.

Starting condition is  $V1 = V2 = V3 = V4 = 0\text{ V}$  for a product in which 0 V battery charging is available.

The COP pin voltage should be lower than  $V_{0CHA}\text{ max.}-1\text{ V}$  when the VMP pin voltage  $V_{MP} = V_{0CHA}\text{ max.}$

Starting condition is  $V1 = V2 = V3 = V4 = V_{0INH}$  for a product in which 0 V battery charging is inhibited.

The COP pin voltage should be higher than  $V_{MP}-1\text{ V}$  when the VMP pin voltage  $V_{MP} = 24\text{ V}$ .

**8. Internal resistance (Test circuit 8)**

The resistance between VDD and VMP is  $R_{VDM}$  and is calculated by the equation  $R_{VDM} = V_{DD} / I_{VDM}$  where  $I_{VDM}$  is a VMP pin current after  $V_{MP}$  is changed to  $V_{SS}$  from the starting condition  $V1 = V2 = V3 = V4 = 3.5\text{ V}$  and  $V_{MP} = V_{DD}$ . The resistance between VSS and VMP is  $R_{VSM}$  and is calculated by the equation  $R_{VSM} = V_{DD} / I_{VSM}$  where  $I_{VSM}$  is a VMP pin current at the condition  $V1 = V2 = V3 = V4 = 1.8\text{ V}$  and  $V_{MP} = V_{DD}$ .

**9. Pin current for CTL2 to CTL4, COP, DOP, VBATOUT (Test circuit 9)**

Starting condition is  $V1 = V2 = V3 = V4 = 3.5\text{ V}$ .

Pin current for CTL2 at "High" is  $I_{CTL2H}$  and is obtained by setting  $V_{CTL2} = V_{OUT}$ .

Pin current for CTL2 at "Low" is  $I_{CTL2L}$  and is obtained by setting  $V_{CTL2} = V_{SS}$ .

Pin current for CTL3 and CTL4 can be obtained in the same manner as in the CTL2.

Pin current for COP at "High" is  $I_{COH}$  and is obtained by setting  $V1 = V2 = V3 = V4 = 6\text{ V}$ ,  $V_{MP} = V_{DD}$ , and  $V_{COP} = V_{DD}$ . And pin current for COP at "Low" is  $I_{COL}$  and is obtained by setting  $V1 = V2 = V3 = V4 = 3.5\text{ V}$ ,  $V_{MP} = V_{DD}$ , and  $V_{COP} = 0.5\text{ V}$ . Pin current for DOP at "Low" is  $I_{DOL}$  and is obtained by setting  $V1 = V2 = V3 = V4 = 3.5\text{ V}$ ,  $V_{MP} = V_{DD}$ , and  $V_{DOP} = 0.5\text{ V}$ . And pin current for COP at "High" is  $I_{COH}$  and is obtained by setting  $V1 = V2 = V3 = V4 = 3.5\text{ V}$ ,  $V_{MP} = V_{DD} - 1\text{ V}$ , and  $V_{DOP} = V_{DD} - 0.5\text{ V}$ .

Pin current for VBATOUT at "High" is  $I_{VBATH}$  and is obtained by setting CTL3 and CTL4 are open and  $V_{BATOUT} = V_{OFF3} - 0.5\text{ V}$ . And pin current for VBATOUT at "Low" is  $I_{VBATL}$  and is obtained by setting  $V_{BATOUT} = V_{OFF3} + 0.5\text{ V}$ .

## ■ Operation

### 1. Battery protection circuit

**Remark** Refer to “■ Battery Protection IC Connection Example”.

Battery protection protects batteries from overcharge and overdischarge, and also protects external FETs from overcurrent.

#### 1.1 Normal status

When the voltage of each of the batteries is in the range from  $V_{DLn}$  to  $V_{CU_n}$  and the discharge current is lower than a specified value (the VMP pin voltage is lower than  $V_{IOV1}$ ), the charging and discharging FETs are turned on.

#### 1.2 Overcharge status

When the voltage of one of the batteries becomes higher than  $V_{CU_n}$  and the state continues for  $t_{CU}$  or longer, the COP pin becomes high impedance and is pulled up to EB+ pin voltage by an external resistor, and the charging FET is turned off to stop charging. The overcharge status is released when one of the following two conditions holds.

- (a) The voltage of each of the batteries becomes lower than  $V_{CU_n} + V_{HCn}$ .
- (b)  $V_{DD} - V_{MP} > V_{IOV1}$  (A load is connected, and discharging starts.)

#### 1.3 Overdischarge status

When the voltage of one of the batteries becomes lower than  $V_{DLn}$  and the state continues for  $t_{DL}$  or longer, the DOP pin voltage becomes  $V_{DD}$  level, and the discharging FET is turned off to stop discharging. This is the overdischarge status.

##### 1.3.1 Power-down function

In the overdischarge status, when the VMP pin voltage is  $V_{IOV3}$  or lower, the power-down function starts to operate and almost every circuit in the S-8243A/B Series stops working. When the power-down function is operating, the VMP pin is pulled down to  $V_{SS}$  level by the internal resistor  $R_{VSM}$ . The conditions of each output pin are as follows.

(a) COP	High-Z	Charging FET is turned off
(b) DOP	$V_{DD}$	Discharging FET is turned off
(c) VREG	$V_{SS}$	Voltage regulator circuit is off
(d) VBATOUT	$V_{SS}$	Battery voltage monitor amp circuit is off

The power down function is released when the following condition holds.

- (a)  $V_{MP} > V_{IOV3}$  (A charger is connected, and charging starts.)

The overdischarge status is released when the following condition holds.

- (a) The voltage of each of the batteries is  $V_{DLn}$  or higher, and the VMP pin voltage is  $V_{DD} / 2$  or higher. (A charger is connected.)

#### 1.4 Overcurrent status

The S-8243A/B Series has three overcurrent detection levels ( $V_{IOV1}$ ,  $V_{IOV2}$  and  $V_{IOV3}$ ) and three overcurrent detection delay times ( $t_{IOV1}$ ,  $t_{IOV2}$  and  $t_{IOV3}$ ) corresponding to each overcurrent detection level. When the discharging current becomes higher than a specified value (the voltage between  $V_{DD}$  and  $V_{MP}$  is greater than  $V_{IOV1}$ ) and the state continues for  $t_{IOV1}$  or longer, the S-8243A/B Series enters the overcurrent status in which the DOP pin voltage becomes  $V_{DD}$  level to turn off the discharging FET to stop discharging, the COP pin becomes high impedance and is pulled up to EB+ pin voltage by an external resistor to turn off the charging FET to stop charging, and the VMP pin is pulled up to  $V_{DD}$  voltage by the internal resistor  $R_{VDM}$ . Operation of two other overcurrent detection levels ( $V_{IOV2}$  and  $V_{IOV3}$ ) and overcurrent detection delay times ( $t_{IOV2}$  and  $t_{IOV3}$ ) is the same as that for  $V_{IOV1}$  and  $t_{IOV1}$ . The overcurrent status is released when the following condition holds.

- (a)  $V_{MP} > \{V_{IOV3} / (1 - V_{IOV3}) \times 3 / 5 - 2 / 5\} \times R_{VDM}$  (A load is released, and the impedance between the EB- and EB+ pin becomes higher.)

**1.5 0 V battery charging function**

Regarding the charging of a self-discharged battery (0 V battery) the S-8243A/B Series has two functions from which one should be selected.

- (a) 0 V battery charging is allowed (0 V battery charging is available)  
When a charger voltage is higher than  $V_{0CHA}$ , 0 V battery can be charged.
- (b) 0 V battery charging is forbidden (0 V battery charging is impossible)  
When the voltage of one of the batteries is lower than  $V_{0INH}$ , 0 V battery can not be charged.

**Caution When the VDD pin voltage is lower than minimum of  $V_{DSOP}$ , the operation of S-8243A/B Series is not guaranteed.**

**1.6 Delay time setting**

Overcharge detection delay times ( $t_{CU1}$  to  $t_{CU4}$ ) are determined by the external capacitor at the CCT pin. Overdischarge detection delay times ( $t_{DL1}$  to  $t_{DL4}$ ) and overcurrent detection delay time 1 ( $t_{IOV1}$ ) are determined by the external capacitor at CDT pin. Overcurrent detection delay time 2, 3 ( $t_{IOV2}$ ,  $t_{IOV3}$ ) are fixed internally.

S-8243AAC, S-8243AAD, S-8243BAE, S-8243BAF, S-8243BAH

		min.	typ.	max.	
$t_{CU}$ [s]	= Delay factor (	5	10	15	) × $C_{CT}$ [μF]
$t_{DL}$ [ms]	= Delay factor (	500	1000	1500	) × $C_{DT}$ [μF]
$t_{IOV1}$ [ms]	= Delay factor (	50	100	150	) × $C_{DT}$ [μF]

S-8243BAD

		min.	typ.	max.	
$t_{CU}$ [s]	= Delay factor (	5	10	15	) × $C_{CT}$ [μF]
$t_{DL}$ [ms]	= Delay factor (	555	1110	2220	) × $C_{DT}$ [μF]
$t_{IOV1}$ [ms]	= Delay factor (	33.1	66.2	132	) × $C_{DT}$ [μF]

**2. Voltage regulator circuit**

Built-in voltage regulator can be used to drive a micro computer, etc. The voltage regulator supplies voltage of 3.3 V (3 mA maximum) and an external capacitor is needed.

**Caution When the power-down function operates, the voltage regulator output is pulled down to the  $V_{SS}$  level by an internal resistor.**

**3. Battery monitor amp circuit**

Battery monitor amp sends information of the batteries to a microcomputer. The battery monitor amp output is controlled and selected by CTL3 and CTL4 pins to give the following two voltages.

- (a)  $V_{BATn} = GAMPn \times V_{BATTERYn} + V_{OFFn}$  where  $GAMPn$  is the n-th voltage gain of the amp,  $V_{BATTERYn}$  is the n-th battery voltage, and  $V_{OFFn}$  is the n-th offset voltage of the amp.
- (b) N-th offset voltage  $V_{OFFn}$

Each battery voltage  $V_{BATTERYn}$  ( $n = 1$  to  $4$ ) is thus calculated by following equation.

$$V_{BATTERYn} = (V_{BATn} - V_{OFFn}) / GAMPn \quad (n = 1, 2, 3, 4)$$

After the state of CTL3 and CTL4 are changed, a time between 25 μs and 250 μs is needed for the battery monitor amp to become stable.

**Caution When the power-down function operates, the battery monitor amp output is pulled down to the  $V_{SS}$  level by an internal resistor.**

**4. CTL pins**

The S-8243A/B Series has four control pins. The CTL1 and CTL2 pins are used to control the COP and DOP pin output voltages. CTL1 takes precedence over CTL2. CTL2 takes precedence over the battery protection circuit. The CTL3 and CTL4 pins are used to control the VBATOUT pin output voltage.

**Table 9 CTL1 and CTL2 Mode**

Input		Output	
CTL1 pin	CTL2 pin	External discharging FET	External charging FET
High	High	OFF	OFF
High	Open	OFF	OFF
High	Low	OFF	OFF
Open	High	OFF	OFF
Open	Open	OFF	OFF
Open	Low	OFF	OFF
Low	High	Normal <sup>*1</sup>	OFF <sup>*2</sup>
Low	Open	Normal <sup>*1</sup>	Normal <sup>*1</sup>
Low	Low	OFF	Normal <sup>*1</sup>

\*1. States are controlled by voltage detection circuit.

\*2. Off state is brought after the overcharge detection delay time  $t_{CU}$ .

**Table 10 CTL3 and CTL4 Mode**

Input		Output	
CTL3 pin	CTL4 pin	V <sub>BATOUT</sub> (A series)	V <sub>BATOUT</sub> (B series)
High	High	V1 Offset	V1 Offset
High	Open	$V1 \times 0.2 + V1$ Offset	$V1 \times 0.2 + V1$ Offset
High	Low	Don't use.	V2 Offset
Open	High	Don't use.	$V2 \times 0.2 + V2$ Offset
Open <sup>*1</sup>	Open <sup>*1</sup>	V2 Offset	V3 Offset
Open	Low	$V2 \times 0.2 + V2$ Offset	$V3 \times 0.2 + V3$ Offset
Low	High	V3 Offset	V4 Offset
Low	Open	$V3 \times 0.2 + V3$ Offset	$V4 \times 0.2 + V4$ Offset
Low	Low	Don't use.	Don't use.

\*1. CTL3 and CTL4 pins should be open when a microcomputer is not used.

**Caution** Please note unexpected behavior might occur when electrical potential difference between the CTL pin ("L" level) aMSS is generated through the external filter (R<sub>VSS</sub> and C<sub>VSS</sub>) as a result of input voltage fluctuations.

■ Timing Charts

1. Overcharge detection, Overdischarge detection

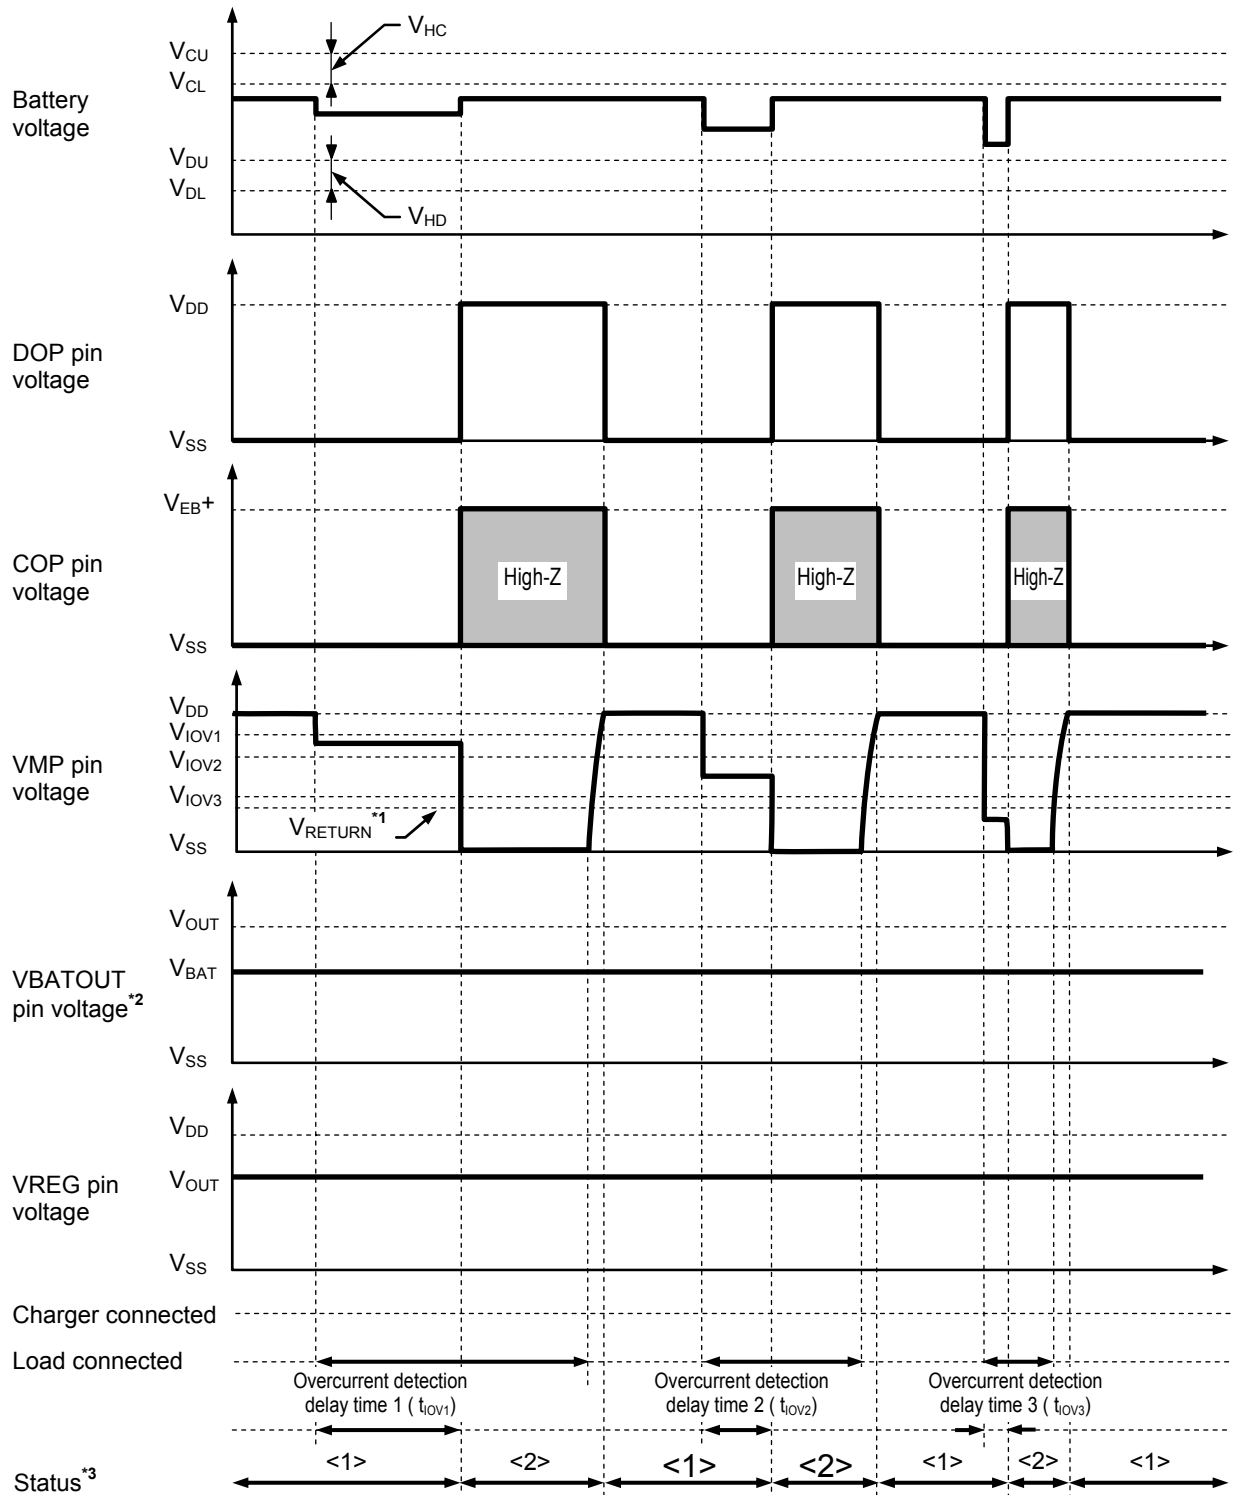

\*1. State depends on CTL3 and CTL4 input levels. Refer to Figure 9.

\*2. <1>: Normal status, <2>: Overcharge status, <3>: Overdischarge status, <4>: Power down status

**Remark** The charger is assumed to charge with a constant current.  $V_{EB+}$  indicates the open voltage of the charger.

16	C <sub>CDT</sub>	0.1	More than 0.02	μF
17	C <sub>VREG</sub>	4.7	0.68 to 10	μF

\*1. Please set up a filter constant to be  $R_{VSS} \times C_{VSS} \geq 22 \mu\text{F} \cdot \Omega$  and to be  $R_{VC2} \times C_{VC2} = R_{VC3} \times C_{VC3} = R_{VSS} \times C_{VSS}$ .

- Caution1.** No resistance should be inserted in the power supply pin VDD.
2. The above constants are subject to change without prior notice.
  3. It has not been confirmed whether the operation is normal or not in circuits other than the above example of connection. In addition, the example of connection shown above and the constant will not guarantee successful operation. Perform thorough evaluation using the actual application to set the constant.

**2. S-8243B Series**

**Figure 11**

**Table 12 Constants for External Components**

No.	Part	Typ.	Range	Unit
1	R <sub>VC1</sub>	1	0.51 to 1 <sup>*1</sup>	kΩ
2	R <sub>VC2</sub>	1	0.51 to 1 <sup>*1</sup>	kΩ
3	R <sub>VC3</sub>	1	0.51 to 1 <sup>*1</sup>	kΩ
4	R <sub>VSS</sub>	10	2.2 to 10 <sup>*1</sup>	Ω
5	R <sub>DOP</sub>	5.1	2 to 10	kΩ
6	R <sub>COP</sub>	1	0.1 to 1	MΩ
7	R <sub>VMP</sub>	5.1	1 to 10	kΩ
8	R <sub>CTL1</sub>	1	1 to 100	kΩ
9	R <sub>CTL2</sub>	1	1 to 10	kΩ
10	R <sub>CTL3</sub>	1	1 to 10	kΩ
11	R <sub>CTL4</sub>	1	1 to 10	kΩ
12	R <sub>VBAT</sub>	0	0 to 100	kΩ
13	C <sub>VC1</sub>	0.047	0.047 to 0.22 <sup>*1</sup>	μF
14	C <sub>VC2</sub>	0.047	0.047 to 0.22 <sup>*1</sup>	μF
15	C <sub>VC3</sub>	0.047	0.047 to 0.22 <sup>*1</sup>	μF
16	C <sub>VSS</sub>	4.7	2.2 to 10 <sup>*1</sup>	μF
17	C <sub>CCT</sub>	0.1	More than 0.01	μF
18	C <sub>CDT</sub>	0.1	More than 0.02	μF
19	C <sub>VREG</sub>	4.7	0.68 to 10	μF

\*1. Please set up a filter constant to be  $R_{VSS} \times C_{VSS} \geq 22 \mu\text{F} \cdot \Omega$  and to be  $R_{VC1} \times C_{VC1} = R_{VC2} \times C_{VC2} = R_{VC3} \times C_{VC3} = R_{VSS} \times C_{VSS}$ .

- Caution1. No resistance should be inserted in the power supply pin VDD.**
- The above constants are subject to change without prior notice.
  - It has not been confirmed whether the operation is normal or not in circuits other than the above example of connection. In addition, the example of connection shown above and the constant will not guarantee successful operation. Perform thorough evaluation using the actual application to set the constant.

■ **Precautions**

- Pay attention to the operating conditions for input/output voltage and load current so that the power loss in the IC does not exceed the package power dissipation.
- Do not apply an electrostatic discharge to this IC that exceeds the performance ratings of the built-in electrostatic protection circuit.
- ABLIC Inc. shall not be responsible for any patent infringement by products including the S-8243A/B Series, the method of using the S-8243A/B Series in such products, the product specifications or the country of destination thereof.

## Disclaimers (Handling Precautions)

1. All the information described herein (product data, specifications, figures, tables, programs, algorithms and application circuit examples, etc.) is current as of publishing date of this document and is subject to change without notice.
2. The circuit examples and the usages described herein are for reference only, and do not guarantee the success of any specific mass-production design.  
ABLIC Inc. is not responsible for damages caused by the reasons other than the products described herein (hereinafter "the products") or infringement of third-party intellectual property right and any other right due to the use of the information described herein.
3. ABLIC Inc. is not responsible for damages caused by the incorrect information described herein.
4. Be careful to use the products within their specified ranges. Pay special attention to the absolute maximum ratings, operation voltage range and electrical characteristics, etc.  
ABLIC Inc. is not responsible for damages caused by failures and / or accidents, etc. that occur due to the use of the products outside their specified ranges.
5. When using the products, confirm their applications, and the laws and regulations of the region or country where they are used and verify suitability, safety and other factors for the intended use.
6. When exporting the products, comply with the Foreign Exchange and Foreign Trade Act and all other export-related laws, and follow the required procedures.
7. The products must not be used or provided (exported) for the purposes of the development of weapons of mass destruction or military use. ABLIC Inc. is not responsible for any provision (export) to those whose purpose is to develop, manufacture, use or store nuclear, biological or chemical weapons, missiles, or other military use.
8. The products are not designed to be used as part of any device or equipment that may affect the human body, human life, or assets (such as medical equipment, disaster prevention systems, security systems, combustion control systems, infrastructure control systems, vehicle equipment, traffic systems, in-vehicle equipment, aviation equipment, aerospace equipment, and nuclear-related equipment), excluding when specified for in-vehicle use or other uses. Do not apply the products to the above listed devices and equipments without prior written permission by ABLIC Inc. Especially, the products cannot be used for life support devices, devices implanted in the human body and devices that directly affect human life, etc.  
Prior consultation with our sales office is required when considering the above uses.  
ABLIC Inc. is not responsible for damages caused by unauthorized or unspecified use of our products.
9. Semiconductor products may fail or malfunction with some probability.  
The user of the products should therefore take responsibility to give thorough consideration to safety design including redundancy, fire spread prevention measures, and malfunction prevention to prevent accidents causing injury or death, fires and social damage, etc. that may ensue from the products' failure or malfunction.  
The entire system must be sufficiently evaluated and applied on customer's own responsibility.
10. The products are not designed to be radiation-proof. The necessary radiation measures should be taken in the product design by the customer depending on the intended use.
11. The products do not affect human health under normal use. However, they contain chemical substances and heavy metals and should therefore not be put in the mouth. The fracture surfaces of wafers and chips may be sharp. Be careful when handling these with the bare hands to prevent injuries, etc.
12. When disposing of the products, comply with the laws and ordinances of the country or region where they are used.
13. The information described herein contains copyright information and know-how of ABLIC Inc.  
The information described herein does not convey any license under any intellectual property rights or any other rights belonging to ABLIC Inc. or a third party. Reproduction or copying of the information from this document or any part of this document described herein for the purpose of disclosing it to a third-party without the express permission of ABLIC Inc. is strictly prohibited.
14. For more details on the information described herein, contact our sales office.
