The S-8270A is a CMOS IC developed for infrared remote control System. A photodetecting PIN diode can be directly connected. An input amplifier, limiter amplifier,band-pass filter, detector and an output waveform shaper are contained in a one-chip.

■ Features

Characteristics

- Power supply voltage : 2. 4 to 6. 0 V ($I_{IN} = 30 \mu A$)
- Current consumption: 0.13 mA typ. 0. 25 mA max. at 3. 0 V

Hardware functions

- Incorporates band-pass filter
(possible to adjust resonance frequency by external resistance: $f_0 = 30$ to 46KHz)
- Incorporates trap filter
- Possible to connect input terminal directly to photodetecting PIN diode
- Output logic is active "LOW"
- Output is generated N-channel open drain with pull-up resistor (Possible to connect output terminal directly to TTL or CMOS)

Package

- 8-pin SOP: S-8270AFE
- 8-pin DIP : S-8270ADP

■ Applications

- Infrared remote control encoder for TVs, VCRs, audio devices
- Infrared remote control TOYS

■ Functions

The S-8270A amplifies the voltage converted from the current signal of the PIN diode , which is coupled directly to S-8270A, at the reception of the infrared.

The signal, then, goes through the band-pass filter for noise reduction before being input to the discriminator. The discriminator recovers the transmitted data out of a burst signal. Finally the data are shaped by the signal shaping circuit.

3. Terminal Description

Table 1

Terminal No.	Symbol	External parts	Description
1	NC		• No connection
2	IN	Photodetecting PIN diode	• Input terminal which connects photodetecting PIN diode. • Internal impedance is $50\text{ k}\Omega$ typ. Therefore a photodetecting PIN diode can be directly connected. • ABLC (Automatic Bias Level Control) prevent from saturation of input level
3	CG	1500pF to $0.01\mu\text{F}$	• Input terminal which connects condenser to AMP gain control.
4	VSS		• GND potential terminal.
5	F0	$24\text{K }\Omega$	• Input terminal which connects resistance to adjust resonance frequency of band-pass filter ($f_0 = 30$ to 46KHZ) • TRAP AMP. prevent from illegal action which is caused by high frequency noise of fluorescent lamp.
6	CD	200pF	• Input terminal which connects condenser to adjust detector circuit.
7	DOUT		• Output terminal which output logic is active "LOW". • Output is generated at N-channel open drain with pull-up resistor, which is easily interfaced to next stage circuit.
8	VDD		• Positive power supply

■ Absolute Maximum Ratings ($T_a = 25^\circ\text{C}$)

Table 2

Item	Symbol	Rating	Unit
Storage temperature	T _{stg}	-40 to +125	°C
Operating ambient temperature	T _{opr}	-30 to +85	°C
Power supply voltage	V _{DD}	-0.3 to +7.0	V
Input voltage	V _{IN}	0 to V _{DD}	V
Output voltage	V _{OUT}	0 to V _{DD}	V
Power dissipation	P _d	200	mW

■ Recommended Operating Conditions

Table 3

Item	Symbol	Conditions	Min.	Typ.	Max.	Unit
Power supply voltage	V _{DD}	I _{IN} = $30\text{ }\mu\text{A}$	2.4		6.0	V
		I _{IN} = $300\text{ }\mu\text{A}$	2.7		6.0	V
Input frequency	f _{IN}		30		46	KHz
Condenser for AMP gain control	CG			2000		pF
Resistor to adjust resonance frequency of band-pass filter	F0	f _{IN} = 38 KHz		24		KΩ
Condenser to adjust detector circuit	CD			200		pF

■ **Electrical Characteristics ($T_a = 25^\circ\text{C}$, $V_{DD} = 3.0 \text{ V}$)**

Table 4

Item	Symbol	Conditions	Min.	Typ.	Max.	Unit
Operating current consumption	I_{DD}	$V_{IN} = V_{SS}$	—	0.13	0.25	mA
AMP gain	AV	$f_{IN} = 38 \text{ KHz}$ $V_{IN} = 30 \mu\text{Vp-p}$ (*1)	77	80	83	dB
Resonance frequency of band-pass filter	f_0	$V_{IN} = 300 \mu\text{Vp-p}$ (*1)	—	38	—	KHz
Band width of band-pass filter	f_{BW}	-3dB band width $f_0 = 38 \text{ KHz}$	2.0	2.5	3.0	KHz
Output pulse width	tpw	$f_{IN} = 38 \text{ KHz BW}$ $V_{IN} = 50 \text{ mVp-p}$ (*2)	440	—	770	μs
Low level output voltage	V_{OL}	$I_{OL} = 0.1 \text{ mA}$	—	—	0.4	V
High level output current	I_{OH}	$V_{OH} = V_{DD}$	-1	—	1	μA
Input resistance	R_{IN}	$I_{IN} = 300 \mu\text{A}$ (*3)	30	50	70	$\text{K}\Omega$
Input voltage 1	V_{IN1}	$I_{IN} = 0 \mu\text{A}$	—	0	—	V
Input voltage 2	V_{IN2}	$I_{IN} = 300 \mu\text{A}$	0.5	1.2	1.8	V
Output pull-up resistance	R_{OUT}	$V_{DD} = 3.0 \text{ V}$	50	100	200	$\text{K}\Omega$

(*1) V_{IN} is input voltage

(*2) Input (burst wave)

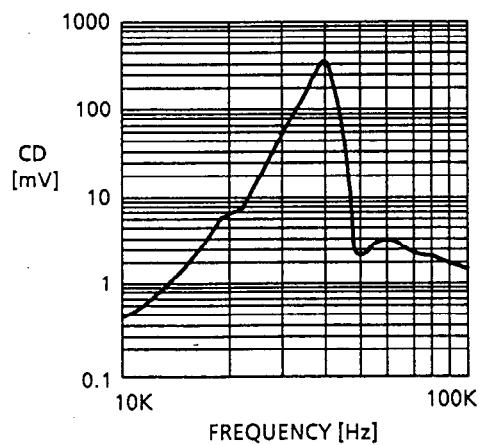

(*3) V_{IN} : Input voltage, V_r : Measurement voltage

$$R_{IN} = \frac{50}{V_{IN}/V_r - 1} [\text{K}\Omega]$$

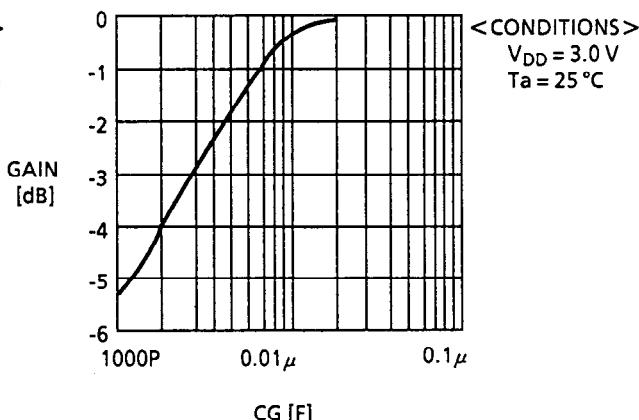

■ **Electrical Characteristic Curves**

(1) **Voltage Gain - Frequency**

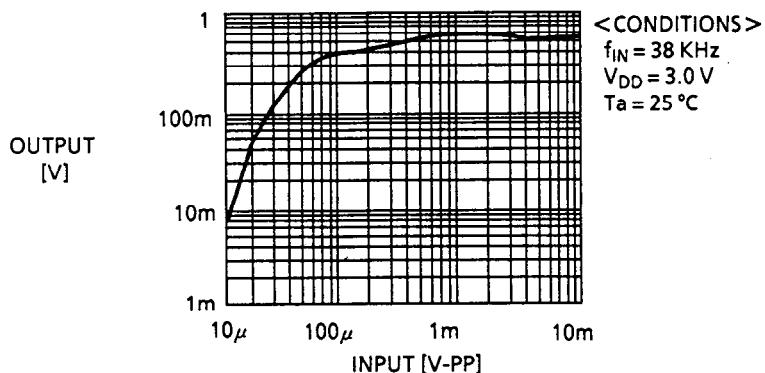

<CONDITIONS>
 $f_{IN} = 38 \text{ KHz}$
 $V_{IN} = 100 \mu\text{Vp-p}$
 $V_{DD} = 3.0 \text{ V}$
 $T_a = 25^\circ\text{C}$

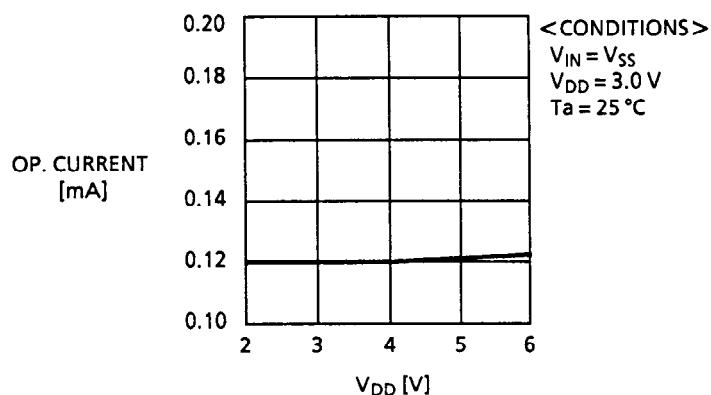

(2) **AMP Gain - External Condenser**

(3) Input - Output

(4) V_{DD} - Operating current

(5) B.P.F frequency - External Resistor
