

S10111 to S10114 series

Current-output type sensors with variable integration time function

The S10111 to S10114 series are self-scanning photodiode arrays designed specifically as detectors for spectroscopy. The scanning circuit operates at low power consumption and is easy to handle. Each photodiode has a large active area with high UV sensitivity.

Features

- Variable integration time for each pixel
- Wide active area
Pixel pitch: 50 μm , 25 μm
Pixel height: 2.5 mm, 0.5 mm
- High UV sensitivity
- Large saturation output charge

Applications

- Spectrophotometry

Absolute maximum ratings

Parameter	Symbol	Condition	Value	Unit

*2: f(CLK)=250 kHz (S10111/S10114 series), 500 kHz (S10112/S10113 series)

Electrical and optical characteristics [Ta=25 °C, Vdd=5 V, Vb=Vofd=2 V, Vofg=0.2 V, f(CLK)=200 kHz]

Parameter	Symbol	Min.	Typ.	Max.	Unit
Spectral response range	λ	200	-	1000	nm
Peak sensitivity wavelength	λ_p	-	750	-	nm
Dark current	S10111 series	-	0.2	0.6	pA
	S10112 series	-	0.04	0.12	
	S10113 series	-	0.04	0.12	
	S10114 series	-	0.2	0.6	
Saturation output charge	S10111 series	110	140	-	pC
	S10112 series	22	28	-	
	S10113 series	11	14	-	
	S10114 series	55	70	-	
Saturation exposure ^{*3}	Esat	-	580	-	m/x · s
Photo response non-uniformity ^{*3 *4 *5}	PRNU	-	-	±3	%

*3: Measured with a tungsten lamp of 2856 K

*4: Photo response non-uniformity is defined under the condition that the device is uniformly illuminated by light which is 50 % of the saturation exposure level as follows:

$$PRNU = \frac{\Delta X}{X} \times 100 (\%)$$

X: the average output of all pixels, ΔX : difference between X and maximum or minimum output.

*5: Except for the first and last pixels

Timing chart

Allow CLK pulse transition from "high" to "low" only one time while ST pulse is "high".
Integration time is determined by the interval between start pulses.

Only the switching noise component is output from the Dummy Video line.
Do not use the Dummy Video output during integration readout.
The INT signal is not needed between EOS and the rising edge of the next ST signal.

KMPDC0249ED

Parameter	Symbol	Min.	Typ.	Max.	Unit
Start pulse (ST) interval	S1011*-128	$130/f(CLK)$	-	-	s
	S1011*-256	$258/f(CLK)$	-	-	
	S1011*-512	$514/f(CLK)$	-	-	
	S1011*-1024	$1026/f(CLK)$	-	-	
INT pulse rise and fall times	$t_r(INT)$, $t_f(INT)$	0	20	30	ns
INT pulse - clock pulse timing	$t(INT-CLK)$	30	-	$1 / [2 \times f(CLK)]$	ns
Clock pulse - INT pulse timing	$t(CLK-INT)$	30	-	$1 / [2 \times f(CLK)]$	ns
Start pulse rise and fall times	$t_f(ST)$, $t_r(ST)$	0	20	30	ns
Clock pulse duty ratio	-	40	50	60	%
Clock pulse rise and fall times	$t_f(CLK)$, $t_r(CLK)$	0	20	30	ns
Clock pulse - start pulse timing	$t(CLK-ST)$	20	-	-	ns
Start pulse - clock pulse timing	$T(ST-CLK)$	20	-	-	ns

Variable integration time function

By controlling the clock pulse to the INT terminal, the integration time for each pixel can be changed to any length that is an integer multiple of one readout period. When the clock pulse at the INT terminal is set to "high" at the pixel signal readout timing, then no signal is output from that pixel (see below). This allows the signal charge to continuously accumulate in that pixel as long as no signal is output. For example, when the integration time of one readout period is 100 ms and this function is used to output a signal from a pixel once every 3 readout periods, then the integration time of that pixel will be 300 ms. Using this function to lengthen the integration time of certain pixels makes it possible to effectively detect spectral signals of weak wavelength components.

■ Timing chart

(Concept view showing the settings to double, triple and quadruple the integration times at channels 2, 3 and 4, respectively, by using the variable integration time function on the basis of the integration time at channel 1.)

Precautions during use

(1) Electrostatic countermeasures

This device has a built-in protection circuit against static electrical charges. However, to prevent destroying the device with electrostatic charges, take countermeasures such as grounding yourself, the workbench and tools to prevent static discharges. Also protect this device from surge voltages which might be caused by peripheral equipment.

(2) Incident window

If dust or dirt gets on the light incident window, it will show up as black blemishes on the image. When cleaning, avoid rubbing the window surface with dry cloth or dry cotton swab, since doing so may generate static electricity. Use soft cloth, paper or a cotton swab moistened with alcohol to wipe dust and dirt off the window surface. Then blow compressed air onto the window surface so that no spot or stain remains.

(3) Soldering

To prevent damaging the device during soldering, take precautions to prevent excessive soldering temperatures and times. Soldering should be performed within 5 seconds at a soldering temperature below 260 °C.
