

**Ordering Code :**

<b>S</b>	<b>34</b>	<b>AR</b>	<b>550</b>
<b>A</b>	<b>B</b>	<b>C</b>	<b>D</b>

SELECT	Code
A) Type of Diode	Rectifier S Fast Recovery SF
B) Voltage Class	V <sub>RRM</sub> required divided by 100 e.g. 15 will indicate 1500 volts V <sub>RRM</sub>
C) Outline Package	
1) Tophat normal polarity	AN, BN, DN DBN, HN, HBN, HFN & HNS
2) Tophat reverse polarity	AR, BR, DR, DBR, HR, HBR, HFR & HRS
3) Capsule	C
D) Current	Average forward current in Amperes

**DEVICE & HEAT SINK SELECTION :**

Consider a single phase full wave bridge having a D.C. output of 500 Amps.

$$\text{The current per device} = \frac{500}{2} = 250 \text{ Amps}$$

You may therefore choose a device with a suitable I<sub>F</sub> (AV), with some safety margin. Say type HN 400 Ensure that the I<sup>2</sup>t of the device meets the circuit fusing requirements.

The power loss P<sub>w</sub> of the device:

$$P_w = V_o \times I_F(\text{av}) + I(\text{RMS})^2 \times r$$

Where:

V <sub>o</sub>	= Threshold voltage (taken from catalogue)
I <sub>F</sub> (av)	= Average forward current.
I (RMS)	= I <sub>F</sub> (AV) × Form factor (Form factor single for phase system & Resistive Load = 1.57)
r	= Forward Conduction Slope Resistance in ohms.
P <sub>w</sub>	= 0.75 × 250 + (250 × 1.57) <sup>2</sup> × .00035 = 187.5 + 53.9 = Say 242 watts

To evaluate maximum permissible thermal resistance of the Heat Sink; use following formula

$$T_j = T_{\text{amb}} + P_w \{ (R_{\text{th}}(j-c) + R_{\text{th}}(c-hs) + R_{\text{th}}(hs-amb)) \}$$

Where

T <sub>j</sub>	= Maximum allowable junction temperature.
P <sub>w</sub>	= Calculated power loss
T amb.	= Ambient Temperature (To be taken worst = 55°C)
R <sub>th</sub> (j-c)	= Thermal Resistance Junction to case (taken from catalogue)
R <sub>th</sub> (c-hs)	= Thermal resistance case to heat sink (taken from catalogue)

R<sub>th</sub> (hs-amb) = Thermal Resistance Heat Sink to ambient.

Taking a safety of 3°C, for device type HN 400, maximum allowable T<sub>j</sub> = 167°C.

$$\therefore 167 = 55 + 242 (0.11 + 0.05 + R_{\text{th}}(hs-amb))$$

$$\therefore R_{\text{th}}(hs-amb) = 0.302^\circ\text{C/W}$$

Therefore, the heat sink should have R<sub>th</sub> less than 0.302 C/Watt.

**Note:** VRSM =non repetitive voltage is 100 volts more than rated VRRM grade of device .

**RECTIFIER DIODES (TOP HAT TYPES) :**
