Preliminary

I²C BUS CONTROLLED R/G/B VIDEO AMPLIFIER

The S1D2503X01-D0B0 is a very high frequency video amplifier system with I²C bus control used in monitors with high resolution up to 1600 × 1200.

It contains 3 matched R/G/B video amplifiers with OSD interface and provides flexible interfacing to I²C bus controlled adjustment systems.

FUNCTIONS

- I²C bus controlled 200MHz RGB video pre-amplifier for monitors
- The S1D2503X01-D0B0 is a very high frequency video amplifier system with OSD interface controlled by I²C bus.
- All controls and adjustments are digitally performed thanks to I²C bus.
: Contrast, brightness and DC output level of R/G/B signals common to the 3-channel and drive adjustment (sub contrast), cut-off control (AC or DC coupling by CT bit) is separated for each channel.
- The S1D2503X01-D0B0 is included video & OSD half tone function.
- The white balance adjustment is effective on brightness, video & OSD signals.
- The S1D2503X01-D0B0 works for application using AC or DC coupled CRT driver.
- In addition to beam current limitation (ABL), OSD intensity interface and brightness uniformity (BU) interface are possible with external pins.

ORDERING INFORMATION

Device	Package	Operating Temperature
S1D2503X01-D0B0	32-DIP-600A	-25 °C — +80°C

FEATURES

- 3-channel matched R/G/B Video Amplifier
- I²C BUS control items
 - Contrast control
 - Brightness control
 - SUB contrast control for each channel
 - OSD contrast control
 - Cut-off control for each channel
 - Brightness control for cut-off
 - Switch registers for SBLK, half tone, cut-off INT/EXT, BPS (Blank Pulse Input Polarity Selection) and CPS (Clamp Pulse Input Polarity Selection).
- Built in clamp gate with anti OSD sagging
- Built in OSD Interface, OSD BLK
- Built in OSD Intensity Interface
- Built in ABL (Automatic Beam Limitation)
- Built in video input clamp, BRT clamp
- Built in video & OSD half tone function on OSD picture (OSD raster 8 colors and 3 raster selection by HR/G/B)
- Built in smooth video contrast control with external capacitor.
- 3-channel R/G/B video amplifier 200MHz @f-3dB
- TTL OSD inputs, 80MHz bandwidth
- Contrast control range: 38dB
- SUB contrast control range: 11dB
- OSD contrast control range: 38dB
- Capable of 7Vp-p output swing
- High speed OSD BLK

I²C BUS TIMING REQUIREMENTFigure 3. I²C BUS Timing Requirement

NOTES:

1. Absolute maximum rating indicates the limit beyond which damage to the device may occur.
2. Operating ratings indicate conditions for which the device is functional but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the electrical characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.
3. VCC supply pins 6, and 27 must be externally wired together to prevent internal damage during VCC power on/off cycles.
4. The supply current specified is the quiescent current for VCC1/VCC2 and VDD with $R_L = \infty$, The supply current for VCC2 (pin 27) also depends on the output load.
5. Output voltage is dependent on load resistor. Test circuit uses $R_L = 390\Omega$
6. Measure gain difference between any two amplifiers $V_{in} = 560mV_{pp}$.
7. When measuring video amplifier bandwidth or pulse rise and fall times, a double sided full ground plane printed circuit board without socket is recommended. Video amplifier 10MHz isolation test also requires this printed circuit board. The reason for a double sided full ground plane PCB is that large measurement variations occur in single sided PCBs.
8. Adjust input frequency from 10MHz (AV max reference level) to the -3dB frequency (f_{-3dB}).
9. Measure output levels of the other two undriven amplifiers relative to the driven amplifier to determine channel separation. Terminate the undriven amplifier inputs to simulate generator loading. Repeat test at $f_{in} = 10MHz$ for Iso_10MHz.
10. A minimum pulse width of 200 ns is guaranteed for a horizontal line of 15kHz. This limit is guaranteed by design. if a lower line rate is used a longer clamp pulse may be required.
11. During the AC test the 4V DC level is the center voltage of the AC output signal. For example. If the output is 4V_{pp} the signal will swing between 2V DC and 6V DC.
12. These parameters are not tested on each product which is controlled by an internal qualification procedure.

- S1, S6, S7, S9 signals low level must be synchronized with the S8 signals sync. term.
- The input signal level uses the IC pin as reference

FUNCTIONAL DESCRIPTION

OSD INTENSITY INPUT (ACTIVE: HIGH)

This input pin is used to indicate the OSD color intensity.

Thus, 16 color selection is achievable by combining this intensity pin with R/G/B OSD input.

OSD INPUTS

The S1D2503X01-D0B0 includes all the circuitry necessary to mix OSD signals into the R/G/B video signal.

You need 4 pins for function. (R/G/B OSD, OSD blanking)

DATA TRANSFER

All bytes are sent MSB (Most Significant Bit) bit first and the write data transfer is closed by a stop.

The MCU can write data into the S1D2503X01-D0B0 registers. To do that, after a start, the MCU must send:

- The I²C address slave byte with a low level for R/W bit (bit1)
- The byte of the internal register address where the MCU wants to write data (sub address)
- The data
- Stop

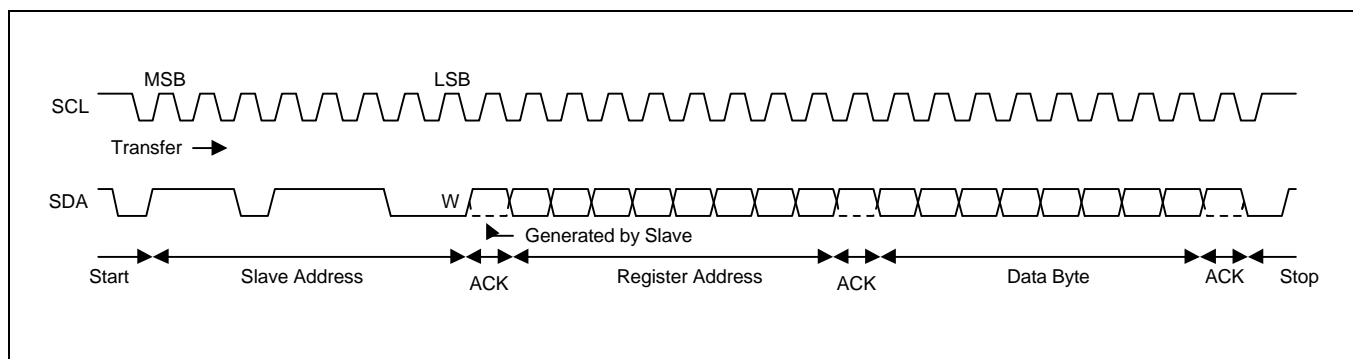

Serial Interface

The 2-wires serial interface is an I²C bus interface.

The slave address of the S1D2503X01-D0B0 is DC (hexadecimal)

Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1
1	1	0	1	1	1	0	0 (W)

I²C Bus Write Operation: A complete data transfer

Data Transfer Format

- 1Byte Data Transfer

- Multi Data Transfer

- Automatic Increment

The automatic increment feature of the sub address enables a quick slave receiver initialization within one transmission, by the I²C bus controller

REGISTER DESCRIPTION

Contrast (OSD contrast adjustment) (8-bits)

The contrast adjustment is made by controlling simultaneously the gain of three internal variable gain amplifiers through the I²C bus interface.

The contrast adjustment allows you to cover a typical range of 38dB.

Brightness Adjustment (8-bits)

The brightness adjustment controls to add the same black level (pedestal) to the 3-channel/R/G/B signals after contrast amplifier by I²C bus.

Cut-Off Brightness Adjustments (8-bits)

The cut-off brightness adjustment is made by simultaneously controlling the external cut-off current.

SUB Contrast Adjustment (8-bits × 3)

The SUB contrast adjustment allows to cover a typical range of 12dB.

Cut-Off Adjustments (8-bits × 3)

These adjustments are used to adjust the white balance, and the gain of each channel is controlled by I²C bus.

RECOMMENDATION

12V Power Routing

Because S1D2503X01-D0B0 is a wideband AMP of above 200MHz, 12V power significantly affects the video characteristics. The effects from the inductance and capacitance are different for each board, and , therefore, some tuning is required to obtain the optimum performance. The output power, VCC2, must be separated from VCC1 using a bead or a coil, which is parallel-connected to the damping resistor. In the case of using a coil , the appropriate coil value is between 20uH - 200uH. Parallel-connected a variable resistor to the coil and control its resistance to obtain the optimum video waveform.

(Bead use: Refer to Application Circuit)

(Moreover, bead can be replaced using a coil and variable resistor to obtain the optimum video waveform.)

VCC1 12V Power

Use a 104 capacitor and large capacitor for the power filter capacitor.

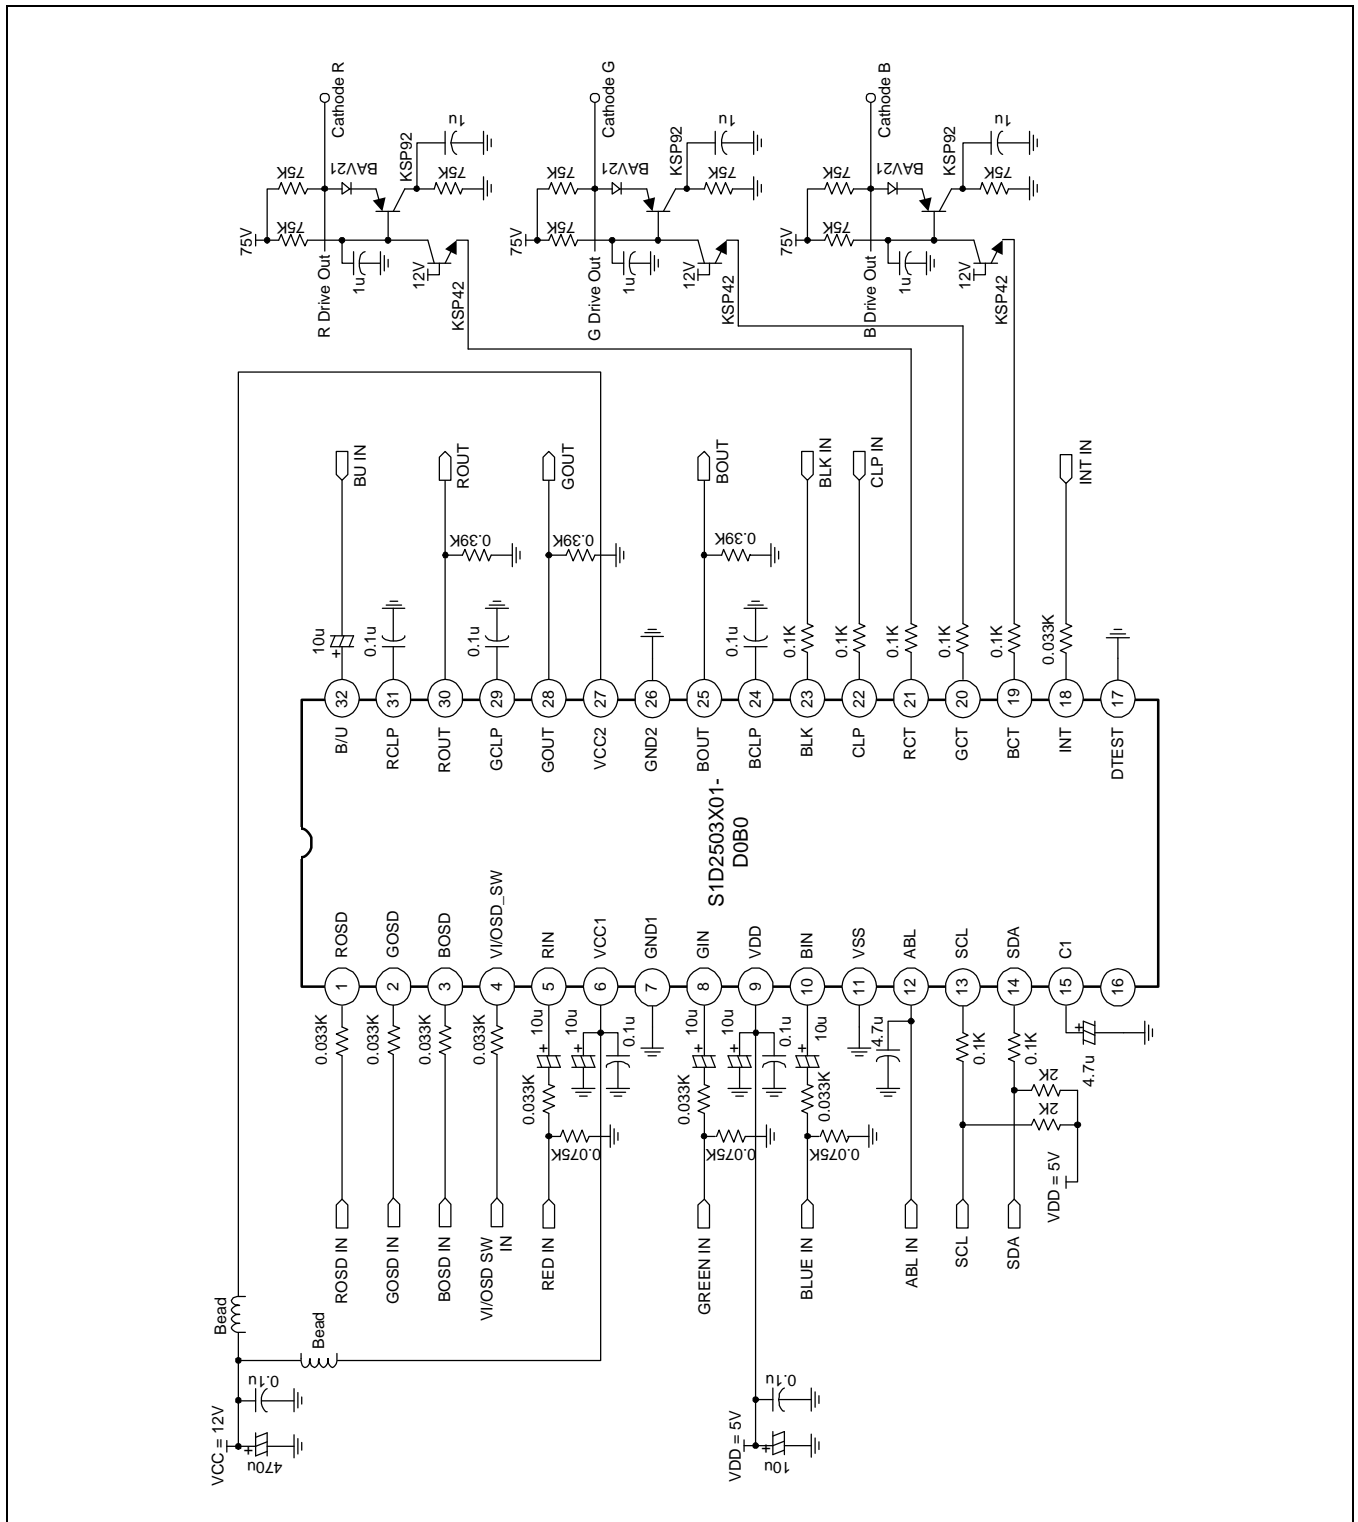

12V Output Stage Power VCC2

Do not use the power filter capacitor or use a capacitor smaller than 22pF, because it is an important factor of video oscillation.

Output Stage GND2

Care must be taken during routing because it ,as an AMP output stage GND, is an important factor of video oscillation. R/G/B clamp cap and R/G/B load resistor must be placed as close as possible to the GND2 pin. GND2 must be arranged so that it has the minimum GND loop.
