

32 Bit, High Voltage **Driver**

S4535

F	ea	tu	res

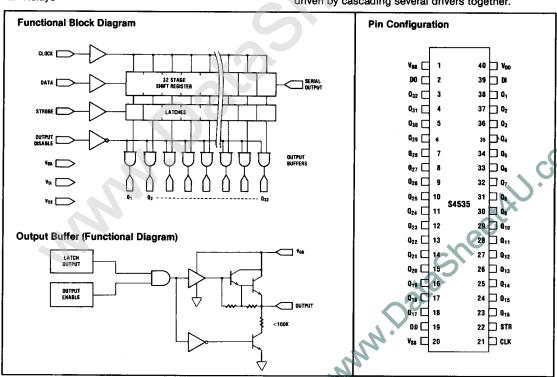

- ☐ High Voltage Outputs Capable of 60 Volt Swing
- ☐ Drives Up to 32 Devices
- □ Cascadable
- Requires Only 4 Control Lines

Applications:

- ☐ Vacuum Fluorescent Displays
- ☐ LED and Incandescent Displays
- □ Solenoids
- Print Head Drives
- □ DC and Stepping Motors
- □ Relays

General Description

The S4535 is a high voltage MOS/LSI circuit that drives a variety of output devices, usually under microprocessor control, by converting low level signals such as TTL, and CMOS to high voltage, high current drive signals. This device requires only four control lines due to its serial input construction. It latches the data to be output, or it may be used to bring data directly to the driver. The part acts as a versatile peripheral to drive displays, motors, relays and solenoids within its output limitations of a 60 volt swing and up to 25mA per drive. It is especially well suited to drive vacuum fluorescent displays due to its high voltage output capability. One circuit will drive up to 32 devices and more can be driven by cascading several drivers together.

tw	Input Pulse Width	500		ns	
t _{SU}	Data Set-Up Time	150		ns	
t _H	Data Hold Time	50		ns	

Functional Description

Serial data present at the input is transferred to the shift register on the Logic "0" to Logic "1" transition of the clock input signal. On succeeding clock pulses, the registers shift data information towards the serial data output. The input serial data must be presented prior to the rising edge of the clock input waveform.

Information present at any register is transferred to its respective latch when the strobe signal is high (serial-

to-parallel conversion). The latches will continue to accept new data as long as the strobe signal is held high.

When the output disable input is high, all of the high voltage buffers are disabled without affecting the information stored in the latches or shift register. With the output disable signal low, the high voltage outputs are controlled by the state of the latches.

S4535

Pin Description

Pin #	Name	Description	
20	V _{SS}	Ground Connection	
2	DO DO	Output of Shift Register — primarily used for cascading	
19	OD	Output Disable	
1	V _{BB}	Q Output Drive Voltage	
21	CLK	System Clock Input	
40	V _{DD}	Logic Supply Voltage	
22	STR	Strobe to Latch Data from Registers	
39	DI	Data Input to Shift Register	
3-18 and 23-38	Q ₁ -Q ₃₂	Direct Drive Outputs
