INTRODUCTION

The S6D0128 is 1-chip solution for TFT-LCD panel: source driver with built-in memory, gate driver, power IC are integrated on one chip. This IC can display to a maximum of 176-RGB x 240-dot graphics on 260k-color TFT panel.

The S6D0128 also supports 18-/16-/9-/8-bit high-speed bus interface and high-speed RAM-write functions enable efficient data transfer and high-speed rewriting of data to the internal GRAM.

The motion picture area can be specified in internal GRAM by window function. The specified window area can be updated selectively, so that motion picture is able to be displayed simultaneously independent of still picture area.

The S6D0128 has various functions for reducing the power consumption of a LCD system: operating at low voltage (1.8V), register-controlled power-save mode, low-current mode, partial display mode and so on. The IC has internal GRAM to store 176-RGB x 240-dot 260k-color image and internal step-up circuit that generates the LCD driving voltage, breeder resistance and the voltage follower circuit for LCD driver.

This LSI is suitable for any medium-sized or small portable mobile solution requiring long-term driving capabilities, such as digital cellular phones supporting a web browser, bi-directional pagers, and small PDAs.

FEATURES

176-RGB x 240-dot TFT-LCD display controller/driver IC for 262,144 colors (528 channel-source driver/240 channel-gate driver)

18-/16-/9-/8-bit high-speed parallel bus interface (80- and 68- system) and serial peripheral interface (SPI)

18-/16-/6-bit RGB interface

VSYNC interface

Writing to a window-RAM address area by using a window-address function

Various color-display control functions

- 262,144 colors can be displayed at the same time (including gamma adjust)
- Vertical scroll display function in raster-row units

Internal RAM capacity: 176 x 18 x 240 = 760,320 bits

Low-power operation supports:

- Power-save mode: standby mode, sleep mode
- Partial display of two screens in any position
- Maximum 6-times step-up circuit for generating driving voltage
- Voltage followers to decrease direct current flow in the LCD drive breeder-resistors
- Charge sharing function for the switching performance of step-up circuits and operational amplifiers

1-raster row inversion drive (Reverse the polarity of driving voltage in every selected raster row)

Internal oscillation circuit and external hardware reset

Structure for TFT-display retention volume (only for Cst)

Alternating functions for TFT-LCD counter-electrode power

- Line alternating drive of VCOM.

Internal power supply circuit

- Step-up circuit: four to six times positive-polarity, two to five times negative-polarity
- Adjustment of VCOM amplitude: internal 64-level digital potentiometer

Operating voltage

• Apply voltage

- VDD = 1.65 to 1.95 [V] (Typical 1.8 [V])
- VDD3 = 1.65 to 3.3 [V]
When VDD3 = 1.65 to 1.95 [V], VDD = VDD3 (No using Internal Regulator, PREGB = "VDD3")
When VDD3 > 1.95 [V] (Using Internal Regulator, PREGB = "VSS")

- VCI to VSS = 2.5 to 3.3 V (internal reference power-supply voltage)

• Generate voltage

- For the source driver: AVDD to VSS = 4.0 to 5.5V (power supply for driving circuits)
GVDD to VSS = 3.5 to 5.0V (reference power supply for grayscale voltages)
- For the gate driver: VGH to VGL = 10.5 to 30V, VGH to VSS = +7.0 to +16.5V,
VGL to VSS = -13.75 to -3.5 V
- For the step up circuit: VCI1 to VSS = 1.75 to 2.75 V (refer to Instruction Description)
- For the TFT-LCD counter electrode: VCOM amplitude (max) = 6.0V,
VCOMH to VSS = 3.0 to 5.0V,
VCOML to VSS = (VCL+0.5) V to 1.0V
(The value of C31 ITO resistance must be 50Ω and below.)

S6D0128 is released COG type package format only.

PIN DESCRIPTION

POWER SUPPLY PIN

Table 9. Power supply pin description

Symbol	I/O	Description
VDD	I / Power	System power supply. As S6D0128 has internal regulator, VDD range varies with each mode. - Non-regulated mode (PREGB = 1) : 1.65 to 1.95 V (Connected to VDD3) - Regulated mode (PREGB = 0) (Connected to VDDM)
VDDM	I / Power	Power supply for internal RAM. - Non-regulated mode (PREGB = 1) : 1.65 to 1.95 V (Connected to VDD3) - When use voltage regulator (PREGB=0), VDDM is regulator output (1.8V). connect a capacitor for stabilization.
VDDIO	I / Power	I/O power supply for internal interface.
VDDO	I / Power	Power supply for oscillator circuit.
PREGB	I	Internal power regulator control input pin. When the internal regulated power is used as VDD, PREGB is fixed to “low” level. When the external logic power (VDD3) is used as VDD, PREGB is fixed to “high” level.
VDD3	I / Power	I/O power supply for external interface. VDD3 is more than VDD. VDD3 = 1.65 to 3.3 [V] When VDD3 = 1.65 to 1.95 [V], VDD = VDD3 (No using Internal Regulator, PREGB = “VDD3”) When VDD3 > 1.95 [V] (Using Internal Regulator, PREGB = “VSS”)
AVDD	O / Power	A power output pin for source driver block that is generated from power block. Connect a capacitor for stabilization. (AVDD: 4.0 ~ 5.5V)
GVDD	O / Power	A Standard level for grayscale voltage generator. Connect a capacitor for stabilization. When internal GVDD generator is not used, connect an external power supply, AVDD – 0.5V
VCI	I / Power	Analog power supply (VCI : 2.5 ~ 3.3V)
VCI_REF	I / Power	A Reference voltage for VCI. Must connect to VCI at FPC
VSS	I / Power	System ground (0V)
VSS3	I / Power	System ground level for I/O
VSSC	I / Power	System ground level for step up circuit block.

Table 10. Power supply pin description (continued)

Symbol	I/O	Description
VSSA	I / Power	System ground level for analog circuit block.
VSSM	I / Power	System ground level for internal RAM.
VSSO	I / Power	System ground level for oscillator circuit.
AVSS	I / Power	System ground level for source driver block.
VGS	I / Power	Gamma reference level.
VCI1	O / Power	A reference voltage in step-up circuit 1. Connect a capacitor for stabilization. VCI1 can't exceed 2.75V
VCL	O / Power	A power supply pin for generating VCOML. Connect a capacitor for stabilization.
VREFO	O	A reference voltage for GVDD, VCOMH, VCOML
VREFI	I	A reference voltage for GVDD, VCOMH, VCOML
VCOM	O	A power supply for the TFT-display counter electrode. The alternating cycle can be set by the M pin. Connect this pin to the TFT-display counter electrode. This pin is also used as charge sharing function: When ECS = "High" period, all source driver's outputs (S1 to S528) are short to VCOM level (Hi-z). In case of VCOML < 0V, charge sharing function must not be used. (Set ECS bit (R0Bh) to be "000" for preventing the abnormal function.)
VCOMR	I/O	A reference voltage of VCOMH. When VCOMH is externally adjusted, halt the internal adjuster of VCOMH by setting the register and insert a variable resistor between GVDD and VSS. When this pin is not externally adjusted, leave it open and adjust VCOMH by setting the internal register. And VCOMR pin is used for monitoring the input voltage of the AMP which makes the VCOMH voltage.
VCOMH	O	This pin indicates a high level of VCOM generated in driving the VCOM alternation. Connect this pin to the capacitor for stabilization.
VCOML	O	When the VCOM alternation is driven, this pin indicates a low level of VCOM. An internal register can be used to adjust the voltage. Connect this pin to a capacitor for stabilization.
VGH	O / Power	A positive power output pin for gate driver, internal step-up circuits, bias circuits, and operational amplifiers. Connect a capacitor for stabilization.

Table 11. Power supply pin description (continued)

Symbol	I/O	Description
VGL	O/ Power	A Negative power output pin for gate driver, bias circuits, and operational amplifiers. Connect a capacitor for stabilization. When internal VGL generator is not used, connect an external-voltage power supply higher than -13.75 V. To protect IC against Latch up, connect the cathode of the schottky diode to the VSS pad, the anode of the schottky diode to the VGL pad. Refer to the application circuit.
OSC1, OSC2	I/O	Connect an external resistor for R-C oscillation. When input the clock from outside, input to OSC1, and open OSC2. When use DOTCLK, connect OSC1 pin to VSS3, and open OSC2.
C11M, C11P	-	Connect the step-up capacitor for generating the AVDD level.
C21M, C21P C22M, C22P	-	Connect a step-up capacitor for generating the VGH, VGL level.
C31M, C31P	-	Connect a step-up capacitor for generating the VCL level.

SYSTEM/RGB INTERFACE PIN

Table 12. System interface pin description

Symbol	I/O	Description					
IM3-1, IM0/ID	I	Selects the MPU interface mode:					
		IM3	IM2	IM1	IM0/ID	MPU interface mode	DB PIN assign
		VSS	VSS	VSS	VSS	68-system 16-bit bus interface	DB17-10, DB8-1
		VSS	VSS	VSS	VDD3	68-system 8bit bus interface	DB17-10
		VSS	VSS	VDD3	VSS	80-system 16bit bus interface	DB17-10, DB8-1
		VSS	VSS	VDD3	VDD3	80-system 8bit bus interface	DB17-10
		VSS	VDD3	VSS	ID	Serial peripheral interface (SPI)	SDI / SDO
		VSS	VDD3	VDD3	*	Non-selecting	-
		VDD3	VSS	VSS	VSS	68-system 18-bit bus interface	DB17-0
		VDD3	VSS	VSS	VDD3	68-system 9bit bus interface	DB17-9
		VDD3	VSS	VDD3	VSS	80-system 18bit bus interface	DB17-0
		VDD3	VSS	VDD3	VDD3	80-system 9bit bus interface	DB17-9
		VDD3	VDD3	*	*	Non-selecting	-
1) When a SPI mode is selected, the IM0 pin is used as ID setting bit for a device code. 2) In RGB interface mode, the IM3-0 pins must select SPI mode.							
CSB	I	Chip select signal input pin. Low: S6D0128 is selected and can be accessed High: S6D0128 is not selected and cannot be accessed					
RS	I	Register select pin. Low: Index/status, High: Control Must be fixed at VSS level when not used.					
RW_WRB/ SCL	I	IM3	IM2	IM1	Pin function	MPU type	Pin description
		*	VSS	VSS	RW	68-system	Read/Write operation selection pin. Low: Write , High: Read
		*	VSS	VDD3	WRB	80-system	Write strobe signal input pin. Data is fetched at the rising edge.
		VSS	VDD3	VSS	SCL	serial peripheral interface (SPI)	the synchronous clock signal input pin
E_RDB	I	IM3	IM2	IM1	Pin function	MPU type	Pin description
		*	VSS	VSS	E	68-system	Read/Write operation enable pin.
		*	VSS	VDD3	RDB	80-system	Read strobe signal input pin. Read out data at the low level.
		When SPI mode is selected, fix this pin at VSS level.					
SDI	I	For a serial peripheral interface (SPI), input data is fetched at the rising edge of the SCL signal. Fix SDI to the VDD3 or VSS level if the pin is not in use.					
SDO	O	For a serial peripheral interface (SPI), serves as the serial data output pin (SDO). Successive bits are output at the falling edge of the SCL signal SDO must be opened when not used					

Table 13. System interface pin description (Continued)

Symbol	I/O	Description																				
RESETB	I	Reset pin Initializes the IC when low. Must be reset after power-on. If one pin is in use, leave the other pins open.																				
DB17-DB0	I/O	Bi-directional data bus. When CPU I/F, 18-bit interface : DB 17-0 16-bit interface : DB 17-10, DB 8-1 9-bit interface : DB 17-9 8-bit interface : DB 17-10 When RGB I/F, 18-bit interface : DB 17-0 16-bit interface : DB 17-13, DB 11-1 6-bit interface : DB 17-12 Fix unused pin to the VDD3 or VSS level.																				
ENABLE	I	Data enable signal pin for RGB interface. EPL="0": Only in case of ENABLE="Low", the IC can be access via RGB interface. EPL="1": Only in case of ENABLE="High", the IC can be access via RGB interface																				
		<table border="1"> <thead> <tr> <th>EPL</th> <th>ENABLE</th> <th>GRAM write</th> <th>GRAM address</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>Valid</td> <td>Updated</td> </tr> <tr> <td>0</td> <td>1</td> <td>Invalid</td> <td>Held</td> </tr> <tr> <td>1</td> <td>0</td> <td>Invalid</td> <td>Held</td> </tr> <tr> <td>1</td> <td>1</td> <td>Valid</td> <td>Updated</td> </tr> </tbody> </table>	EPL	ENABLE	GRAM write	GRAM address	0	0	Valid	Updated	0	1	Invalid	Held	1	0	Invalid	Held	1	1	Valid	Updated
		EPL	ENABLE	GRAM write	GRAM address																	
		0	0	Valid	Updated																	
		0	1	Invalid	Held																	
1	0	Invalid	Held																			
1	1	Valid	Updated																			
Fix ENABLE pin at VDD3 or VSS level if the pin is not used.																						
VSYNC	I	Synchronous signal of frame. VSPL="0": Low active, VSPL="1": High active Fix this pin at VDD3 or VSS level if the pin is not used.																				
HSYNC	I	Synchronous signal of line. HSPL="0": Low active, HSPL="1": High active Fix this pin at VDD3 or VSS level if the pin is not used.																				
DOTCLK	I	Input pin for clock signal of external interface: dot clock. DPL="0": Display data is fetched at DOTCLK's rising edge DPL="1": Display data is fetched at DOTCLK's falling edge Fix this pin at VDD3 or VSS level if the pin is not used.																				

DISPLAY PIN

Table 14. Display pin description

Symbol	I/O	Description
S1 – S528	O	Source driver output pins. The SS bit can change the shift direction of the source signal. For example, if SS = 0, gray data of <S1/S2/S3> is read from RAM address 0000h. If SS = 1, contents of is RAM address 0000h is out from <S526/S527/S528>. S1, S4, S7, ... S(3n-1) : display Red (R) (BGR = 0) S2, S5, S8, ... S(3n-2) : display Green (G) (BGR = 0) S3, S6, S9, ... S(3n) : display Blue (B) (BGR = 0)
G1 – G240	O	Gate driver output pins. The output of driving circuit is whether VGH or VGL. VGH : gate-ON level VGL : gate-OFF level

MISCELLANEOUS PIN

Table 15. Oscillator and internal power regulator pin description

Symbol	I/O	Description
TAD9-TAD0/ TSI0/TSI1 TEST/ TEST_MUX/ TEST_GRAY	I	Input pin for test. In normal operation, connect this pin to VSS3.
FUSE_EN	I	Input pin for test. In normal operation, connect this pin to VDD3.
VCIR	I	Input pin for test. In normal operation, connect this pin to VCI.
ATEST	I	Input pin for test. In normal operation, open this pin .
DISPTMG/ PREC/ M/ CL1/ ECS/ FLM/ / TSO	O	Output pin for test. In normal operation, leave this pin open.
DUMMY	-	Dummy pin. Open or connect VSS3.
GMON	O	Monitoring grayscale voltage level - V0P/N, V63P/N - monitoring pin. Must be opened when not used
VDD30, VSS30	-	Output dummy pin for mode setting. Connect these pin to adjacent logic input pin. Must be opened when not used.
CONTACT1, CONTACT2	-	Pass-through pin. Identical pins at input and output part that is connected without any circuitry.

FUNCTIONAL DESCRIPTION

SYSTEM INTERFACE

The S6D0128 has nine high-speed system interfaces: an 80-system 18-/16-/9-/8-bit bus, a 68-system 18-/16-/9-/8-bit bus, and a serial interface (SPI: Serial Peripheral Interface). The IM3-0 pins select the interface mode.

The S6D0128 has three 18-bit registers: an index register (IR), a write data register (WDR), and a read data register (RDR). The IR stores index information for control register and GRAM. The WDR temporarily stores data to be written into control register and GRAM. The RDR temporarily stores data read from GRAM. Data written into the GRAM from MPU is initially written to the WDR and then written to the GRAM automatically. Data is read through the RDR when reading from the GRAM, and the first read data is invalid and the second and the following data are valid. Execution time for instruction, except oscillation start, is 0-clock cycle so that instructions can be written in succession.

Table 16. Register Selection (18-/16-/9-/8- Parallel Interface)

SYSTEM	RW_WRB	E_RDB	RS	Operations
68	0	1	0	Write index to IR
	1	1	0	Read internal status
	0	1	1	Write to control register and GRAM through WDR
	1	1	1	Read from GRAM through RDR
80	0	1	0	Write index to IR
	1	0	0	Read internal status
	0	1	1	Write to control register and GRAM through WDR
	1	0	1	Read from GRAM through RDR

Table 17. CSB signal (GRAM update control)

CSB	Operation
0	Data is written to GRAM, GRAM address is updated
1	Data is not written to GRAM, GRAM address is not updated

Table 18. Register Selection (Serial Peripheral Interface)

R/W bit	RS bit	Operation
0	0	Write index to IR
1	0	Read internal status
0	1	Write data to control register and GRAM through WDR
1	1	Read data from GRAM through RDR

EXTERNAL INTERFACE (RGB-I/F, VSYNC-I/F)

The S6D0128 incorporates RGB and VSYNC interface as external interface for motion picture display. When the RGB interface is selected, the synchronization signals (VSYNC, HSYNC, and DOTCLK) are available for display. The RGB data for display (DB17-0) are written according to enable signal (ENABLE) and data valid signal (VLD) in synchronization with VSYNC, HSYNC, and DOTCLK signal. This allows flicker-free updating of the screen. When the VSYNC interface is selected, internal operation is normally synchronized with internal clock except operation related to frame synchronization: It is synchronized with the VSYNC signal. The data for display are written to GRAM via conventional system interface. There are some limitations on the timing and methods for writing to GRAM in VSYNC interface. See the section on the EXTERNAL DISPLAY INTERFACE.

ADDRESS COUNTER (AC)

The address counter (AC) assigns address to GRAM. When an address-set-instruction is written to the IR, the address information is sent from IR to AC. After writing to the GRAM, the address value of AC is automatically increased/ decreased by 1 according to ID1-0 bit of control register. After reading data from GRAM, the AC is not updated. A window address function allows data to be written only to a window area specified by GRAM.

GRAPHICS RAM (GRAM)

The graphics RAM (GRAM) has 18-bits/pixel and stores the bit-pattern data for 176-RGB x 240-dot display.

GRAYSCALE VOLTAGE GENERATOR

The grayscale voltage circuit generates a certain voltage level that is specified by the grayscale γ -adjusting register for LCD driver circuit. By use of the generator, 262,144 colors can be displayed at the same time. For details, see the GAMMA-ADJUSTING REGISTER section.

TIMING GENERATOR

The timing generator generates timing signals for the operation of internal circuits such as GRAM. The GRAM read timing for display and the internal operation timing for MPU access is generated separately to avoid interference with one another. Several important timing signals can be monitored via signal monitoring pin (M, FLM, CL1, ECS, DISPTMG, PREC).

OSCILLATION CIRCUIT (OSC)

The S6D0128 can provide R-C oscillation simply through the addition of an external oscillation-resistor between the OSC1 and OSC2 pin. The appropriate oscillation frequency for operating voltage, display size, and frame frequency can be obtained by adjusting the external-resistor value. Clock pulse can also be supplied externally. Since R-C oscillation stops during the standby mode, current consumption can be reduced. For details, see the OSCILLATION CIRCUIT section.

SOURCE DRIVER CIRCUIT

The liquid crystal display source driver circuit consists of 528 drivers (S1 to S528). Display pattern data is latched when 528-channel data has arrived. The latched data then enables the source drivers to generate drive waveform outputs. The SS bit can change the shift direction of 528-channel data by selecting an appropriate direction for the device-mounted configuration.

GATE DRIVER CIRCUIT

The liquid crystal display gate driver circuit consists of 240 gate drivers (G1 to G240). The VGH or VGL level is output by the signal from the gate control circuit.

SYSTEM/RGB INTERFACE AND GRAM ADDRESS SETTING

GRAM ADDRESS SETTING (SS="0")

When SS bit is 0 (source output shift direction: right) and BGR bit is 0 (RGB sequence: right) that can be set in R01h, R03h register, GRAM address is set as follows:

Table 19. GRAM address (SS="0")

S/G Output		S1	S2	S3	S4	S5	S6	S7	S8	S9	S10	S11	S12	S517	S518	S519	S520	S521	S522	S523	S524	S525	S526	S527	S528

6-bit RGB interface

GRAM ADDRESS SETTING (SS="1")

When SS bit is 1 (source output shift direction: reversed) and BGR bit is 1 (RGB sequence: reversed) that can be set in R01h, R03h register, GRAM address is set as follows:

Table 20. GRAM address (SS="1")

S/G Output		S1	S2	S3	S4	S5	S6	S7	S8	S9	S10	S11	S12	S17	S18	S19	S20	S21	S22	S23	S24	S25	S26	S27	S28

Note: n= lower 8 bits of address (0 to 175)

INSTRUCTIONS

The S6D0128 uses the 18-bit bus architecture. Before the internal operation of the S6D0128 starts, control information is temporarily stored in the registers described below to allow high-speed interfacing with a high-performance microcomputer. The internal operation of the S6D0128 is determined by signals sent from the microcomputer. These signals, which include the register selection signal (RS), the read/write signal (R/W), and the data bus signals (DB17 to DB0), make up the S6D0128 instructions.

There are nine categories of instructions that:

- Specify the index
- Read the status
- Control the display
- Control power management
- Set internal GRAM addresses
- Transfer data to and from the internal GRAM
- Set grayscale level for the internal grayscale palette table
- Interface with the gate driver and power supply IC

Normally, instructions that write data are used the most. However, an auto-update of internal GRAM addresses after each data write can lighten the microcomputer program load. As instructions are executed in 0 cycles, they can be written in succession.

The 16-bit instruction assignment differs from interface-setup (18-/16-/9-/8-/SPI), so instructions should be fetched according to the data format shown below:

68/80 system 18-bit Interface

68/80 system 16-bit Interface

68/80 system 9-bit Interface

68/80 system 8-bit Interface

INSTRUCTION DESCRIPTIONS

Index

The index instruction specifies the RAM control indexes (R00h to R7Fh). It sets the register number in the range of 0000000 to 11111111 in binary form. However, R71h to R72h are disabled as they are test registers.

R/W	RS	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	0	*	*	*	*	*	*	*	*	*	ID6	ID5	ID4	ID3	ID2	ID1	ID0

Status Read

The status read instruction read out the internal status of the IC.

R/W	RS	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
R	0	L7	L6	L5	L4	L3	L2	L1	L0	0	0	0	0	0	0	0	0

L7–0: Indicate the driving raster-row position where the liquid crystal display is being driven.

Start Oscillation (R00h)

R/W	RS	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	1
R	1	0	0	0	0	0	0	0	1	0	0	1	0	1	0	0	0

The start oscillation instruction restarts the oscillator from the Halt State in the standby mode. After this instruction, wait at least 10 ms for oscillation to stabilize before giving the next instruction. (See the Power Control 1 Register (R10h))

If this register is read forcibly, *0128h is read.

Driver Output Control (R01h)

R/W	RS	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	0	VSPL	HSPL	DPL	EPL	SM	GS	SS	0	0	0	NL4	NL3	NL2	NL1	NL0

VSPL: reverses the polarity of the VSYNC signal.

VSPL= "0": VSYNC is low active.

VSPL= "1": VSYNC is high active.

HSPL: reverses the polarity of the HSYNC signal.

HSPL= "0": HSYNC is low active.

HSPL= "1": HSYNC is high active.

DPL: reverses the polarity of the DOTCLK signal.

DPL= "0": Display data is fetched at DOTCLK's rising edge.

DPL= "1": Display data is fetched at DOTCLK's falling edge.

EPL: Set the polarity of ENABLE pin while using RGB interface.

EPL = "0": ENABLE = "Low" / write data of DB17-0

ENABLE = "High" / don't write data of DB17-0

EPL = "1": ENABLE = "High" / write data of DB17-0

ENABLE = "Low" / don't write data of DB17-0

Table 23. Relationship between EPL, ENABLE and RAM access

EPL	ENABLE	RAM write	RAM address
0	0	Valid	Updated
0	1	Invalid	Held
1	1	Valid	Updated
1	0	Invalid	Held

GS: Selects the output shift direction of the gate driver. When GS = 0, G1 shifts to G240. When GS = 1, G240 shifts to G1.

SM: Select the division drive method of the gate driver. When SM = 0, even/odd division is selected; SM = 1, upper/lower division drive is selected. Various connections between TFT panel and the IC can be supported with the combination of SM and GS bit.

SS: Selects the output shift direction of the source driver. When SS = 0, S1 shifts to S528. When SS = 1, S528 shifts to S1. In addition, SS and BGR bits should be specified in case of the RGB order is changed. When SS = 0 and BGR = 0, <R><G> are assigned in order from S1 pin. When SS = 1 and BGR = 1, <R><G> are assigned in order from S528. Re-write data to GRAM whenever SS and BGR bit are changed.

NL4-0: Specify the number of raster-rows to be driven. The number of raster-row can be adjusted in units of eight. GRAM address mapping is independent of this setting. The set value should be higher than the panel size.

Table 24. NL bit and Drive Duty (SCN4-0=0000)

NL4	NL3	NL2	NL1	NL0	Display size	Number of LCD driver lines	Gate driver used
0	0	0	0	0	Setting disabled	Setting disabled	Setting disabled
0	0	0	0	1	528 X 16 dots	16	G1 to G16
0	0	0	1	0	528 X 24 dots	24	G1 to G24
0	0	0	1	1	528 X 32 dots	32	G1 to G32
0	0	1	0	0	528 X 40 dots	40	G1 to G40
0	0	1	0	1	528 X 48 dots	48	G1 to G48
0	0	1	1	0	528 X 56 dots	56	G1 to G56
0	0	1	1	1	528 X 64 dots	64	G1 to G64
0	1	0	0	0	528 X 72 dots	72	G1 to G72
0	1	0	0	1	528 X 80 dots	80	G1 to G80
0	1	0	1	0	528 X 88 dots	88	G1 to G88
0	1	0	1	1	528 X 96 dots	96	G1 to G96
0	1	1	0	0	528 X 104 dots	104	G1 to G104

1	0	1	0	0	528 X 168 dots	168	G1 to G168
1	0	1	0	1	528 X 176 dots	176	G1 to G176
1	0	1	1	0	528 X 184 dots	184	G1 to G184
1	0	1	1	1	528 X 192 dots	192	G1 to G192
1	1	0	0	0	528 X 200 dots	200	G1 to G200
1	1	0	0	1	528 X 208 dots	208	G1 to G208
1	1	0	1	0	528 X 216 dots	216	G1 to G216
1	1	0	1	1	528 X 224 dots	224	G1 to G224
1	1	1	0	0	528 X 232 dots	232	G1 to G232
1	1	1	0	1	528 X 240 dots	240	G1 to G240

NOTE: A FP (front porch) and BP (back porch) period will be inserted as blanking period (All gates output VGL level) before / after the driver scan through all of the scans.

LCD-Driving-Waveform Control (R02h)

R/W	RS	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	0	0	0	0	0	1	B/C	EOR	0	0	0	0	0	0	0	0

B/C: When B/C = 0, a frame inversion waveform is generated and alternates at every frame. When B/C = 1, an 1 raster-row AC waveform is generated and alternates in each raster-row specified by bits EOR in the LCD-driving-waveform control register (R02h). For details, see the 1-RASTER-ROW REVERSED AC DRIVE section.

EOR: When the line inversion waveform is set (B/C = 1) and EOR = 1, the odd/even frame-select signals and the n-raster-row reversed signals are EORed (Exclusive-OR) for alternating drive. EOR is used when the LCD is not alternated by combining the set values of the number of the LCD drive raster-row and the n raster-row. For details, see the ONE-RASTER-ROW REVERSED AC DRIVE section.

Entry Mode (R03h)

R/W	RS	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	TRI	DFM1	DFM0	BGR	0	0	0	0	0	0	I/D1	I/D0	0	0	0	0

TRI: This bit is active on the 80-system of 8-bit bus interface, and the data for 1-pixel is transported to the memory for 3 write cycles. This bit is on the 80-system of 16-bit interface, and the data for 1-pixel is transported to the memory for 2 write cycles. When the 80-system interface mode is not set in the 8-bit or 16 bit mode, set TRI bit to be "0"

DFM: When 8-bit or 16-bit 80 interface mode and TRI bit=1, DFM defines color depth for the IC.

8-bit (80-system), DFM=0: 260k-color mode (3 times of 6-bit data transfer to GRAM)

8-bit (80-system), DFM=1: 65k-color mode (5-bit, 6-bit, 5-bit data transfer to GRAM)

16-bit (80-system), DFM=0: 260k-color mode (16-bit, 2-bit data transfer to GRAM)

16-bit (80-system), DFM=1: 260k-color mode (2-bit, 16-bit data transfer to GRAM)

Table 26. TRI and DFM1-0 setting

TRI	DFM1	DFM0	Write data to GRAM
0	0	0	<p>80-system 8bit interface</p> <p>The diagram shows two transmissions. The 1st transmission contains data bits DB 17-10, which are mapped to RGB channels R5-R0, G5-G0, and B5-B0. The 2nd transmission contains data bits DB 17-10, which are mapped to RGB channels B5-B0, G5-G0, and R5-R0. The output is divided into three sections: S(3n+1), S(3n+2), and S(3n+3).</p> <p>Note: n= lower 8 byte of address (0 to 175)</p>
0	*	*	Setting disabled
1	0	*	Setting disabled
1	1	0	<p>80-system 8bit interface</p> <p>The diagram shows three transmissions. The 1st transmission contains data bits DB 17-12, mapped to R5-R0, G5-G0, and B5-B0. The 2nd transmission contains data bits DB 17-12, mapped to B5-B0, G5-G0, and R5-R0. The 3rd transmission contains data bits DB 17-12, mapped to R5-R0, G5-G0, and B5-B0. The output is divided into three sections: S(3n+1), S(3n+2), and S(3n+3).</p> <p>Note: n= lower 8 byte of address (0 to 175)</p>
1	1	1	<p>80-system 8bit interface</p> <p>The diagram shows three transmissions. The 1st transmission contains data bits DB 17-12, mapped to R5-R0, G5-G0, and B5-B0. The 2nd transmission contains data bits DB 17-12, mapped to B5-B0, G5-G0, and R5-R0. The 3rd transmission contains data bits DB 17-12, mapped to R5-R0, G5-G0, and B5-B0. The output is divided into three sections: S(3n+1), S(3n+2), and S(3n+3).</p> <p>Note: n= lower 8 byte of address (0 to 175)</p>

TRI	DFM1	DFM0	Write data to GRAM
0	0	0	<p>80-system 16bit interface</p> <p>Note: n= lower 8 bits of address (0 to 175)</p>
0	*	*	Setting disabled
1	0	*	Setting disabled
1	1	0	<p>80-system 16bit interface</p> <p>Note: n= lower 8 bits of address (0 to 175)</p>
1	1	1	<p>80-system 16bit interface</p> <p>Note: n= lower 8 bits of address (0 to 175)</p>

I/D1-0: When I/D1-0 = 1, the address counter (AC) is automatically increased by 1 after the data is written to the GRAM. When I/D1-0 = 0, the AC is automatically decreased by 1 after the data is written to the GRAM. Automatic address counter updating is not performed when reading data from GRAM. The increment/decrement setting of the address counter by I/D1-0 bits is performed independently for the upper (AD15-8) and lower (AD7-0) addresses.

Table 27. Address Direction Setting

I/D1-0="00" H: decrement V: decrement	I/D1-0="01" H: increment V: decrement	I/D1-0="10" H: decrement V: increment	I/D1-0="11" H: increment V: increment

BGR: About writing 18-bit data to GRAM, it is changed <R><G> into <G><R>.

- BGR = 0 ; {DB[17:12], DB[11:6], DB[5:0]} is assigned to {R, G, B}.
- BGR = 1 ; {DB[17:12], DB[11:6], DB[5:0]} is assigned to {B, G, R}.

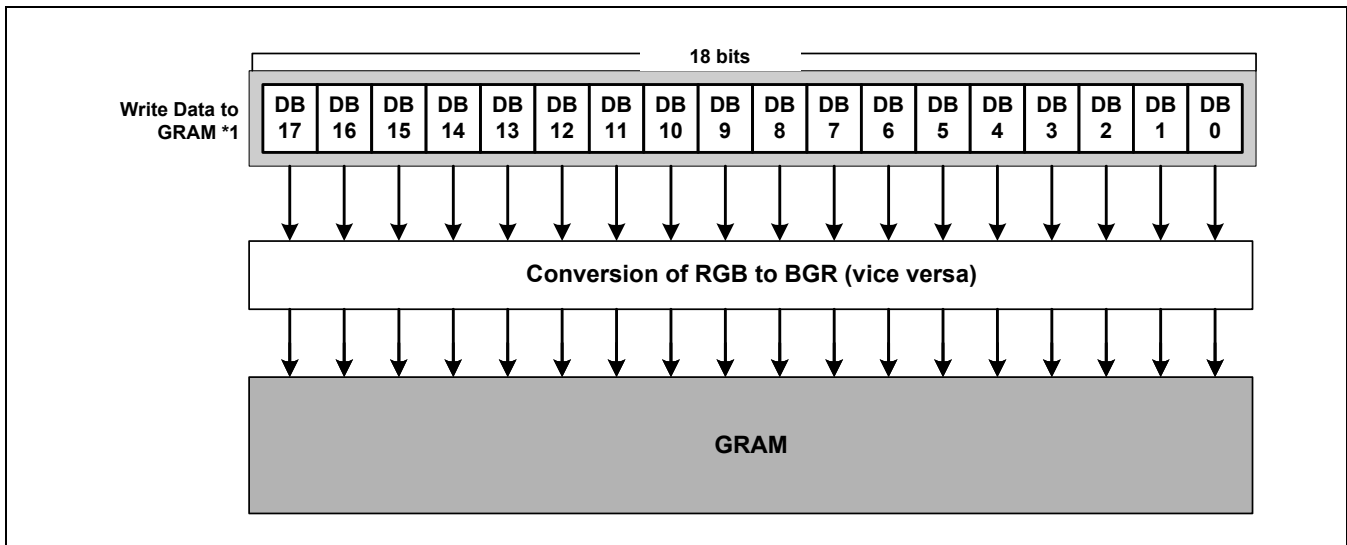

Figure 5. Write data to GRAM via RGB swapping block

Display Control (R07h)

R/W	RS	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	0	0	0	PT1	PT0	VLE2	VLE1	SPT	0	0	0	GON	CL	REV	D1	D0

PT1-0: Normalize the source outputs when non-displayed area of the partial display is driven. For details, see the SCREEN-DIVISION DRIVING FUNCTION section.

PT1	PT0	Source Output on Non-display Area		VCOM Output on Non-display Area		Gate Output for Non-display Area
		Positive	Negative	Positive	Negative	
0	0	AVSS	AVSS	AVSS	AVSS	Normal Scan
0	1	AVSS	GVDD	VCOML	VCOMH	Normal Scan
1	0	GVDD	AVSS	VCOML	VCOMH	Normal Scan
1	1	Hi-z	Hi-z	AVSS	AVSS	Normal Scan

VLE2-1: When VLE1 = 1, a vertical scroll is performed in the 1st screen. When VLE2 = 1, a vertical scroll is performed in the 2nd screen. Vertical scrolling on the two screens cannot be controlled at the same time.

VLE2	VLE1	2 nd Screen	1 st Screen
0	0	Fixed display	Fixed display
0	1	Fixed display	Scroll
1	0	Scroll	Fixed display
1	1	Setting disabled	Setting disabled

SPT: When SPT = 1, the 2-division LCD drive is performed. For details, see the SCREEN-DIVISION DRIVING FUNCTION section.

Note: this function is not available when the external display interface (i.e. RGB interface or VSYNC interface) is in use.

GON: Gate on/off control signal. All gate output is set to be gate off level when GON = 0.

When GON = 1, gate driver is working: G1 to G240 output is either VGH or VGL level. See the Instruction Set up flow for further description on the display on/off flow.

GON	Gate Output
0	All gate off (All gates output are set to VGL)
1	Gate on(VGH / VGL)

CL: CL = 1 selects 8-color display mode. For details, see the section on 8-COLOR DISPLAY MODE.

CL	Number of display colors
0	262,144 colors
1	8 colors

REV: Displays all character and graphics display sections with reversal when REV = 1. For details, see the Reversed Display Function section. Since the grayscale level can be reversed, display of the same data is enabled on normally white and normally black panels.

REV	GRAM Data	Display Area	
		Positive	Negative
0	6'b000000	V63	V0
	:	:	:
	6'b111111	V0	V63
1	6'b000000	V0	V63
	:	:	:
	6'b111111	V63	V0

D1-0: Display is on when D1 = 1 and off when D1 = 0. When off, the display data remains in the GRAM, and can be re-displayed instantly by setting D1 = 1. When D1 is 0, the display is off with the entire source outputs set to the VSS level. Because of this, the S6D0128 can control the charging current for the LCD with AC driving. Control the display on/off while control GON. For details, see the Instruction set up flow.

When D1-0 = 01, the internal display of the S6D0128 is performed although the display is off. When D1-0 = 00, the internal display operation halts and the display is off.

D1	D0	GON	Source output	Gate Output	VCOM Output	Internal display operation
0	0	0	AVSS	VGL	AVSS	Halt
0	1	1	AVSS	Operate	AVSS	Operate
1	0	1	Blank display	Operate	Operate	Operate
1	1	1	Normal Display	Operate	Operate	Operate

Notes:

1. Writing from MCU to GRAM is independent of D1-0.
2. In sleep and standby mode, D1-0 = 00. However, the register contents of D1-0 are not modified.
3. Case of Blank display, source output is the same phase with VCOM and white screen is displayed at normally white LCD panel

Display control 2 (R08h)

R/W	RS	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	0	0	0	0	FP3	FP2	FP1	FP0	0	0	0	0	BP3	BP2	BP1	BP0

The blanking period in the front and end of the display area can be defined using this register.

When N-raster-row is driving, a blank period is inserted after all screens are drawn. Front and Back porch can be adjusted using FP3-0 and BP3-0 bits (R08h).

FP3-0/BP3-0: Set the periods of blanking (the front and back porch), which are placed at the beginning and end of the display. FP3-0 is for a front porch and BP3-0 is for a back porch. When front and back porches are set, the settings should meet the following conditions.

$$1 \leq BP + FP \leq 16 \text{ raster-rows}$$

$$FP \geq 0$$

$$BP \geq 0$$

When the external display interface is in use, the front porch (FP) will start on the falling edge of the VSYNC signal and display operation commences at the end of the front-porch period. The back porch (BP) will start when data for the number of raster-rows specified by the NL bits has been displayed. During the period between the completion of the back-porch period and the next VSYNC signal, the display will remain blank.

Table 28. Front/Back Porch

FP3 BP3	FP2 BP2	FP1 BP1	FP0 BP0	# of Raster Periods In the Front Porch # of Raster Periods In the Back Porch
0	0	0	0	0
0	0	0	1	1
0	0	1	0	2
0	0	1	1	3
0	1	0	0	4
.
.
.
1	1	0	0	12
1	1	0	1	13
1	1	1	0	14
1	1	1	1	Setting Disabled

Frame Cycle Control (R0Bh)

R/W	RS	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	NO1	NO0	SDT1	SDT0	ECS	ECS	ECS	DIV	DIV	0	DCR	DCR	DCR	DCR	RTN1	RTN0
						2	1	0	1	0		_EX	2	1	0		

NO1-0: Set amount of non-overlap for the gate output.

NO1	NO0	Amount of non-overlap	
		Internal Operation (synchronized with internal clock)	RGB I/F Operation (synchronized with DOTCLK)
0	0	2 clock cycle	16 clock cycle
0	1	4 clock cycle	32 clock cycle
1	0	6 clock cycle	48 clock cycle
1	1	8 clock cycle	64 clock cycle

Note: The amount of non-overlap time is defined from the falling edge of the CL1

SDT1-0: Set delay amount from gate edge (end) to source output.

SDT1	SDT0	Delay amount of the source output	
		Internal Operation (synchronized with internal clock)	RGB I/F Operation (synchronized with DOTCLK)
0	0	1 clock cycle	8 clock cycle
0	1	2 clock cycle	16 clock cycle
1	0	3 clock cycle	24 clock cycle
1	1	4 clock cycle	32 clock cycle

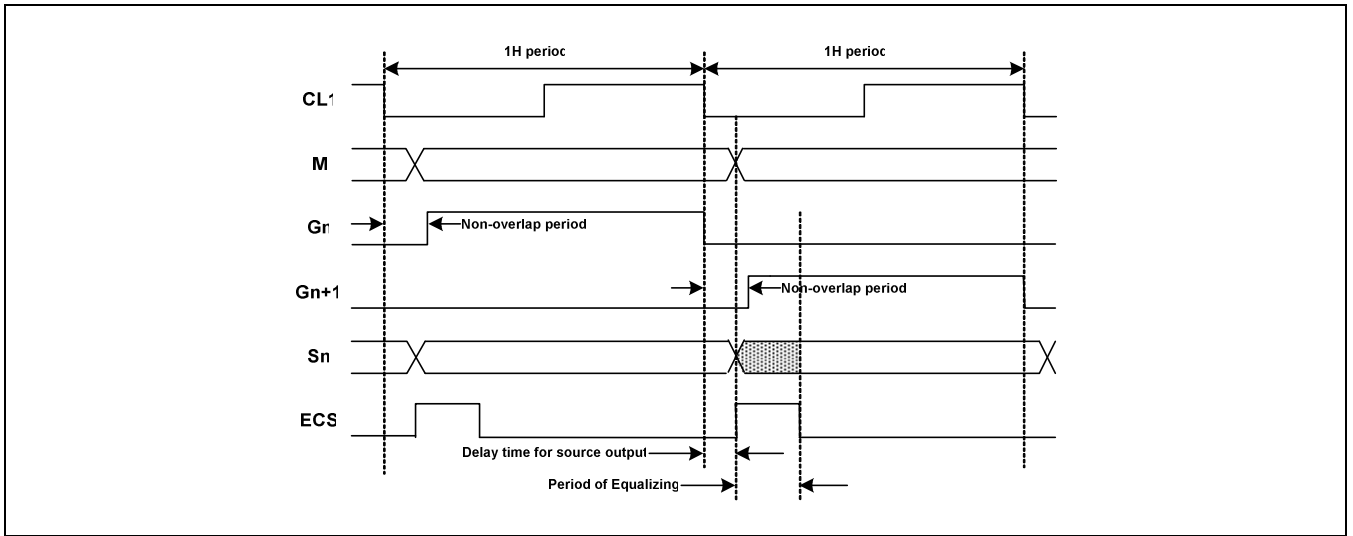

Figure 6. Set Delay from Gate Output to Source Output and ECS signal

Note: The values specified by the bits of ECS, SDT1-0 and NO1-0 vary in a reference clock for each interface mode.

Internal operation mode: Internal R-C oscillation clock
 RGB-I/F mode : DOTCLK
 VSYNC-I/F : Internal R-C oscillation clock

ECS2-0: ECS period is sustained for the number of clock cycle which is set on ECS2-0. When VCOML<0, set these bits as “000” for preventing the abnormal function.

ECS2	ECS1	ECS0	ECS period	
			Internal Operation (synchronized with internal clock)	RGB I/F Operation (synchronized with DOTCLK)
0	0	0	No ECS	No ECS
0	0	1	2 clock cycle	8 clock cycle
0	1	0	4 clock cycle	16 clock cycle
0	1	1	6 clock cycle	24 clock cycle
1	0	0	8 clock cycle	32 clock cycle
1	0	1	12 clock cycle	48 clock cycle
1	1	0	14 clock cycle	56 clock cycle
1	1	1	Setting disabled	Setting disabled

DIV1-0: Set the division ratio of clocks for internal operation (DIV1-0). Internal operations are driven by clocks, which are frequency divided according to the DIV1-0 setting. Frame frequency can be adjusted along with the 1H period (RTN3-0). When changing number of the drive cycle, adjust the frame frequency. For details, see the Frame Frequency Adjustment Function section.

DIV1	DIV0	Division Ratio	Internal operation clock frequency(INCLK)
0	0	1	fosc/1
0	1	2	fosc/2
1	0	4	fosc/4
1	1	8	fosc/8

*fosc = R-C oscillation frequency

$$\text{Frame Frequency} = \frac{f_{\text{osc}}}{\text{Clock cycles per raster-row} \times \text{division ratio} \times (\text{Line} + \text{B})} \text{ [Hz]}$$

fosc: R-C oscillation frequency
 Line: Number of raster-rows (NL bit)
 Clock cycles per raster-row: RTN bit
 Division ratio: DIV bit
 B: Blank period(Back porch + Front Porch)

Figure 7. Formula for the frame frequency

DCR_EX: Input signal selection signal for external interface mode. (0: internal operation clock, 1: DOTCLK)
 Set DCR_EX bit to 1 for DOTCLK to be DCCLK (clock cycle for step-up circuit) source when external interface mode is in use (DM[1:0]="01").

DCR 2-0: Set clock cycle for step-up circuit in external interface mode. Please set DCR_EX bit to "1" and DCR1-0 value when external interface is in use. In this case, DOTCLK must be input periodically and continuously.

DCR2	DCR1	DCR0	Clock cycle for step-up circuits (DCCLK) in external interface mode
0	0	0	DOTCLK/32
0	0	1	DOTCLK/64
0	1	0	DOTCLK/128
0	1	1	DOTCLK/256
1	*	*	DOTCLK/512

Note: If DOTCLK input cycle is variable or discontinuous, clock cycle for step-up circuit must be generated internally (DCR_EX=0).

RTN1-0: Set the 1H period (1 raster-row).

RTN1	RTN0	Horizontal clock frequency(CL1)	Clock frequency for step-up circuits(DCCLK)
0	0	INCLK/16	fosc/8
0	1	INCLK/20	fosc/10
1	0	INCLK/24	fosc/12
1	1	INCLK/28	fosc/14

External Display Interface Control (R0Ch)

R/W	RS	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	0	0	0	0	0	0	0	RM	0	0	DM1	DM0	0	0	RIM1	RIM0

RM: Specifies the interface for RAM accesses. RAM accesses can be performed through the interface specified by the bits of RIM1-0. When the display data is written via the RGB interface, 1 should be set. This bit and the DM bits can be set independently. The display data can be written via the system interface by clearing this bit while the RGB interface is used.

RM	Interface for RAM Access
0	System interface / VSYNC interface
1	RGB interface

DM1-0: Specify the display operation mode. The interface can be set based on the bits of DM1-0. This setting enables switching interface between internal operation and the external display interface. Switching between two external display interfaces (RGB interface and VSYNC interface) should not be done.

DM1	DM0	Display Operation Mode
0	0	Internal clock operation
0	1	RGB interface
1	0	VSYNC interface
1	1	Setting disabled

RIM1-0: Specify the RGB interface mode when the RGB interface is used. Specifically, this setting specifies the mode when the bits of DM and RM are set to RGB interface. These bits should be set before display operation through the RGB interface and should not be set during operation.

RIM1	RIM0	RGB Interface Mode
0	0	18-bit RGB interface (one transfer/pixel)
0	1	16-bit RGB interface (one transfer /pixel)
1	0	6-bit RGB interface (three transfers /pixel)
1	1	Setting disabled

Depending on the external display interface setting, various interfaces can be specified to match the display state. While displaying motion pictures (RGB interface/VSYNC interface), the data for display can be written in high-speed write mode, which achieves both low power consumption and high-speed access.

Table 29. Display State and Interface

Display State	Operation Mode	RAM Access (RM)	Display Operation Mode (DM1-0)
Still Pictures	Internal Clock	System interface (RM=0)	Internal clock (DM1-0=00)
Motion Pictures	RGB interface (1)	RGB interface (RM=1)	RGB interface (DM1-0=01)
Rewrite still picture area while displaying motion pictures	RGB interface (2)	System interface (RM=0)	RGB interface (DM1-0=01)
Motion Picture Display	VSYNC interface	System interface (RM=0)	VSYNC interface (DM1-0=10)

- NOTE:**
- 1) The instruction register can only be set through the system interface.
 - 2) Switching between RGB interface and VSYNC interface cannot be done.
 - 3) The RGB interface mode should not be set during operation.
 - 4) For the transition flow for each operation mode, see the External Display Interface section.

Internal Clock Mode

All display operation is controlled by signals generated by the internal clock in internal clock mode. All inputs through the external display interface are invalid. The internal RAM can be accessed only via the system interface.

RGB Interface Mode (1)

The display operations are controlled by the frame synchronization clock (VSYNC), raster-row synchronization signal (HSYNC), and dot clock (DOTCLK) in RGB interface mode. These signals should be supplied during display operation in this mode.

The display data is transferred to the internal RAM via DB17-0 for each pixel. Combining the function of the high-speed write mode and the window address enables display of both the motion picture area and the internal RAM area simultaneously. In this method, data is only transferred when the screen is updated, which reduces the amount of data transferred.

The periods of the front (FP), back (BP) porch, and the display are automatically generated in the S6D0128 by counting the raster-row synchronization signal (HSYNC) based on the frame synchronization signal (VSYNC).

RGB Interface Mode (2)

When RGB interface is in use, data can be written to RAM via the system interface. This write operation should be performed while data for display is not being transferred via RGB interface (ENABLE = active). Before the next data transfer for display via RGB interface, the setting above should be changed, and then the address and index (R22h) should be set.

VSYNC Interface Mode

The internal display operation is synchronized with the frame synchronization signal (VSYNC) in VSYNC interface mode. When data is written to the internal RAM with the required speed after the falling edge of VSYNC, motion pictures can be displayed via the conventional interface. There are some limitations on the timing and methods of writing to RAM. See the section on the external display interface.

In VSYNC interface mode. Only the VSYNC input is valid. The other input signals for the external display interface are invalid.

The periods of the front and back porch and display period are automatically generated by the frame synchronization signal (VSYNC) according to the setting of the S6D0128 registers.

Power Control 1 (R10h)**Power Control 2 (R11h)**

R/W	RS	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	0	0	SAP2	SAP1	SAP0	BT2	BT1	BT0	DC2	DC1	DC0	BT3	0	0	SLP	STB
W	1	0	0	GVD	GVD	GVD	GVD	GVD	GVD	0	0	0	0	0	VC2	VC1	VC0
				5	4	3	2	1	0								

SAP2-0: Adjust the slew-rate of the operational amplifier for the source driver. If higher SAP2-0 is set, LCD panel having higher resolution or higher frame frequency can be driven because the slew-rate of the operational amplifier is increased. But, these bits must be set as adequate value because the amount of fixed current of the operational amplifier is also adjusted. During non-display, when SAP2-0="000", operational amplifiers are turned off, so current consumption can be reduced.

SAP2	SAP1	SAP0	Slew-rate of operational Amplifier	Amount of Current in operational Amplifier
0	0	0	Operational-Amplifier halted	
0	0	1	Slow	Small
0	1	0		Medium Low
0	1	1	Normal	Medium
1	0	0	Fast	Medium High
1	0	1		Large
1	1	0	Setting disabled	
1	1	1	Setting disabled	

BT3–0: The output factor of step-up is switched. Adjust scale factor of the step-up circuit by the voltage used. When the step-up operating frequency is high, the driving ability of the step-up circuit and the display quality become high, but the current consumption is increased. Adjust the frequency considering the display quality and the current consumption.

BT3	BT2	BT1	BT0	VGH	VGL	VGH (Notes*)	VGL(Notes*)

0	1	1	1	6 X Vci1	-5X Vci1	16.5V	-13.75V
1	0	0	0	4 X Vci1	-2X Vci1	11V	- 5.5V
1	0	0	1	4 X Vci1	-2X Vci1	11V	- 5.5V
1	0	1	0	5 X Vci1	-2X Vci1	13.75V	- 5.5V
1	0	1	1	5 X Vci1	-2X Vci1	13.75V	- 5.5V
1	1	0	0	5 X Vci1	-2X Vci1	13.75V	- 5.5V
1	1	0	1	6 X Vci1	-2X Vci1	16.5V	- 5.5V
1	1	1	0	6 X Vci1	-2X Vci1	16.5V	- 5.5V
1	1	1	1	6 X Vci1	-2X Vci1	16.5V	- 5.5V

Note: The value is maximum by register setting (VC = "100", when VCI = 2.75V)

DC2-0: The operating frequency in the step-up circuit is selected. When the step-up operating frequency is high, the driving ability of the step-up circuit and the display quality become high, but the current consumption is increased. Adjust the frequency considering the display quality and the current consumption.

DC2	DC1	DC0	Step-up Cycle in Step-up Circuit 1, 3	Step-up Cycle in Step-up Circuit 2
0	0	0	DCCLK / 1	DCCLK / 1
0	0	1	DCCLK / 1	DCCLK / 2
0	1	0	DCCLK / 1	DCCLK / 4
0	1	1	DCCLK / 2	DCCLK / 2
1	0	0	DCCLK / 2	DCCLK / 4
1	0	1	DCCLK / 4	DCCLK / 4
1	1	0	DCCLK / 4	DCCLK / 8
1	1	1	DCCLK / 4	DCCLK / 16

Note: DCCLK is Clock frequency for step-up circuits

SLP: When SLP = 1, the S6D0128 enters the sleep mode, where the internal display operations are halted except for the R-C oscillator, thus reducing current consumption. Only the following instructions can be executed during the sleep mode.

During the sleep mode, the other GRAM data cannot be updated. Register set-up is maintained.

STB: When STB = 1, the S6D0128 enters the standby mode, where display operation completely stops, halting all the internal operations including the internal R-C oscillator. Further, no external clock pulses are supplied. For details, see the standby mode section.

Level	Condition

PON: This is an operation-starting bit for the step-up circuit 1. In case of PON = 0, the circuit is stopped and vice versa. For further information about timing for adjusting to the PON = 1, please refer to the SET UP FLOW OF POWER SUPPLY. (AVDD is generated.)

PON1: This is an operation-starting bit for the step-up circuit 2,3. In case of PON1 = 0, the circuit is stopped and vice versa. For further information about timing for adjusting to the PON1= 1, please refer to the SET UP FLOW OF POWER SUPPLY. (VGL, VGH, VCL is generated.)

AON: This is an operation-starting bit for the Amplifier. In case of AON = 0, the circuit is stopped and vice versa. For further information about timing for adjusting to the AON= 1, please refer to the SET UP FLOW OF POWER SUPPLY.

VCMR: In case of VCMR = 0, VCOMH is adjusted by VCM5-0 Register.
In case of VCMR =1, VCM5-0 register is ignored and VCOMH voltage is adjusted by VCOMR voltage. VCOMR voltage is externally supplied. The relationship between VCOMH and VCOMR is given as $VCOMH=2.5 \times VCOMR$.

VCM5-0: Set level for upper side of the VCOM (VCOMH).

AD15–0: Initially set GRAM addresses to the address counter (AC). Once the GRAM data is written, the AC is automatically updated according to the I/D bit settings. This allows consecutive accesses without resetting address. Once the GRAM data is read, the AC is not automatically updated. GRAM address setting is not allowed in the standby mode. Ensure that the address is set within the specified window address

When RGB interface is in use (RM=1), AD15-0 will be set at the falling edge of the VSYNC signal.

When the internal clock operation and VSYNC interface (RM=1) are in use, AD15-0 will be set upon execution of an instruction.

AD15 to AD0	GRAM setting
"0000H" to "00AF"H	Bitmap data for G1
"0100H" to "01AF"H	Bitmap data for G2

W	1	WD15	WD14	WD13	WD12	WD11	WD10	WD9	WD8	WD7	WD6	WD5	WD4	WD3	WD2	WD1	WD0
When RGB-interface																	

WD17-0: Input data for GRAM can be expanded to 18 bits. The expansion format varies according to the interface method. The input data selects the grayscale level. After a write, the address is automatically updated according to I/D bit settings. The GRAM cannot be accessed in standby mode. When 16- or 8-bit interface is in use, the write data is expanded to 18 bits by writing the MSB of the <R> data to its LSB.

When data is written to RAM used by RGB interface via the system interface, please make sure that write data conflicts do not occur.

When the 18-bit RGB interface is in use, 18-bit data is written to RAM via DB17-0 and 262,144-colors are available. When the 16-bit RGB interface is in use, the MSB is written to its LSB and 65,536-colors are available

Figure 19. Memory data write sequence

RAM ACCESS via RGB INTERFACE & SYSTEM INTERFACE

All the data for display is written to the internal RAM in the S6D0128 when RGB interface is in use. In this method, data, including that in both the motion picture area and the screen update frame, can only be transferred via RGB interface. Data for display that is not in the motion picture area or the screen update frame can be written via the system interface.

RAM can be accessed via the system interface when RGB interface is in use. When data is written to RAM during RGB interface mode, the ENABLE bit should be low to stop data writing via RGB interface, because RAM writing is always performed in synchronization with the DOTCLK input when ENABLE is high. After this RAM access via the system interface, a waiting time is needed for a write/read bus cycle before the next RAM access starts via RGB interface. When a RAM write conflict occurs, data writing is not guaranteed.

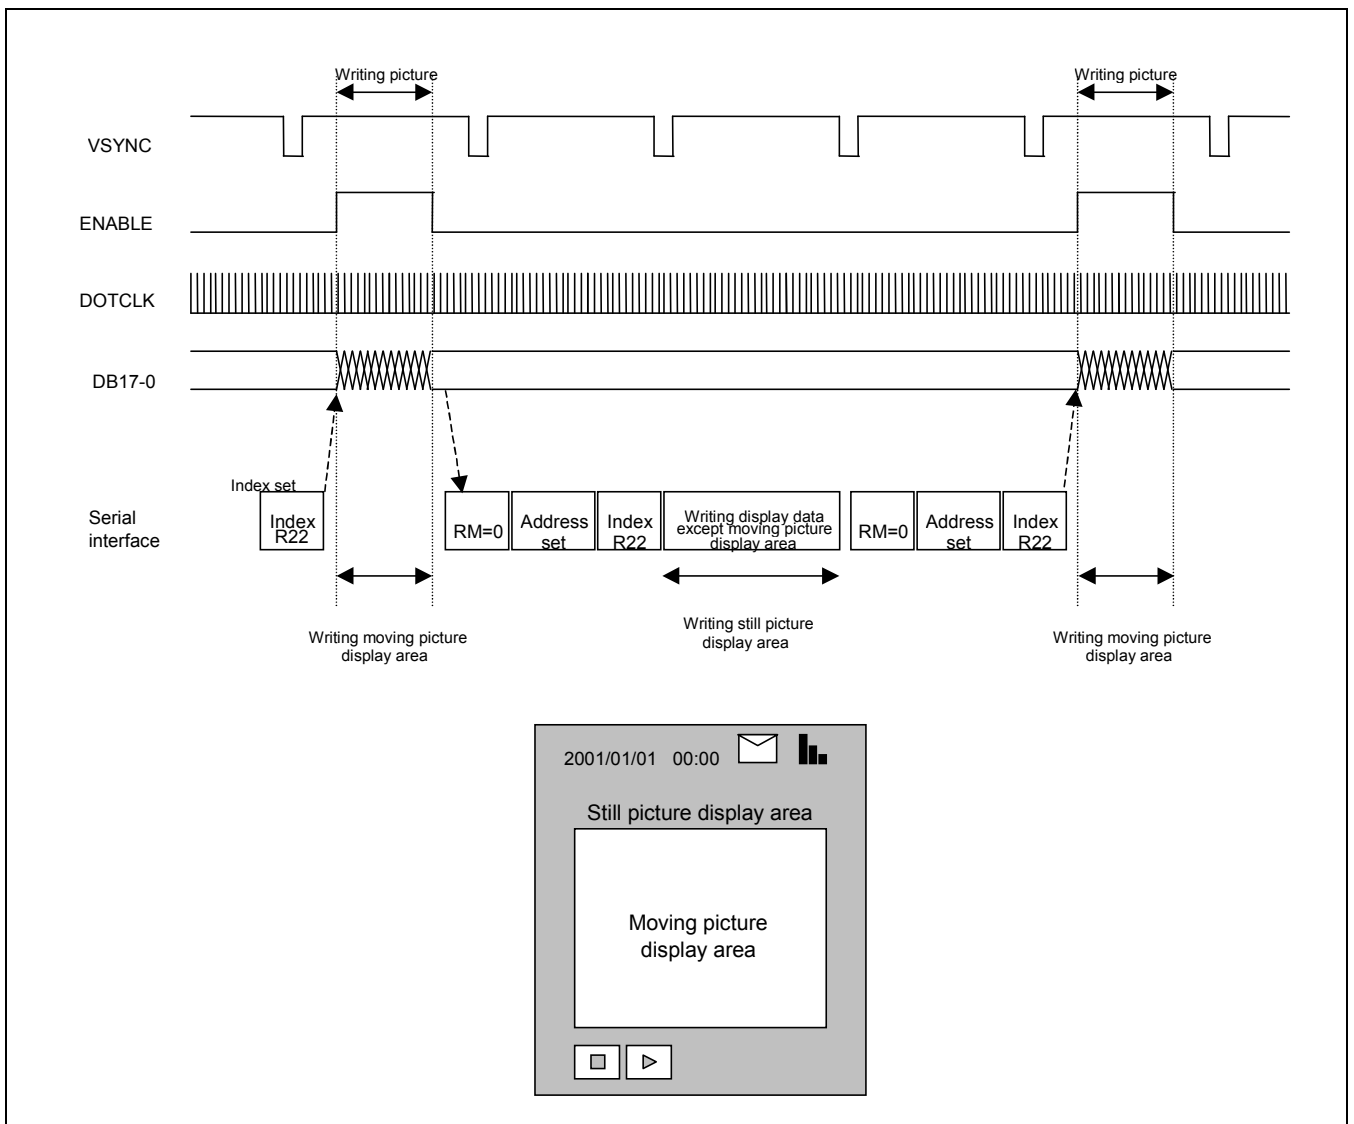

Figure 20. RAM access via RGB Interface & System Interface (EPL=1)

Read Data from GRAM (R22h)

R/W	R/S	DB17	DB16	DB15	DB14	DB13	DB12	DB11	DB10	DB9	DB8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
R	1	RAM Read data (RD17-0): Pin assignment varies according to the interface method. (see the following figure for more information)																	

RD17-0: Read 18-bit data from the GRAM. When the data is read to the MCU, the first-word read immediately after the GRAM address setting is latched from the GRAM to the internal read-data latch. The data on the data bus (DB15-0) becomes invalid and the second-word read is normal.

In case of 16-/8-bit interface, the LSB of <R> color data will not be read.

This function is not available in RGB interface mode.

SE17-10: Specify the driving end position for the first screen in a line unit. The LCD driving is performed to the 'set value + 1' gate driver. For instance, when SS17-10 = 07h and SE17-10 = 10h are set, the LCD driving is performed from G8 to G17, and non-display driving is performed for G1 to G7, G18, and others. Ensure that SS17-10 ≤ SE17-10 ≤ AFh. For details, see the SCREEN-DIVISION DRIVING FUNCTION section.

SS17-10: Specify the drive starting position for the first screen in a line unit. The LCD driving starts from the 'set value +1' gate driver.

SE27-20: Specify the driving end position for the second screen in a line unit. The LCD driving is performed to the 'set value + 1' gate driver. For instance, when SPT = 1, SS27-20 = 20h, and SE27-20 = AFh are set, the LCD driving is performed from G33 to G80. Ensure that SS17-10 ≤ SE17-10 ≤ SS27-20 ≤ SE27-20 ≤ AFh. For details, see the SCREEN-DIVISION DRIVING FUNCTION section.

SS27-20: Specify the driving start position for the second screen in a line unit. The LCD driving starts from the 'set value + 1' gate driver. The second screen is driven when SPT = 1.

Horizontal RAM Address Position (R44h)
Vertical RAM Address Position (R45h)

R/W	RS	IB15	IB14	IB13	IB12	IB11	IB10	IB9	IB8	IB7	IB6	IB5	IB4	IB3	IB2	IB1	IB0
W	1	HEA 7	HEA 6	HEA 5	HEA 4	HEA 3	HEA 2	HEA 1	HEA 0	HSA 7	HSA 6	HSA 5	HSA 4	HSA 3	HSA 2	HSA 1	HSA 0

HSA7-0/HEA7-0: Specify the horizontal start/end positions of a window for access in memory. Data can be written to the GRAM from the address specified by HSA7-0 to the address specified by HEA7-0. Note that an address must be set before RAM is written. Ensure $00h \leq HSA7-0 \leq HEA7-0 \leq AFh$.

VSA7-0/VEA7-0: Specify the vertical start/end positions of a window for access in memory. Data can be written to the GRAM from the address specified by VSA7-0 to the address specified by VEA7-0. Note that an address must be set before RAM is written. Ensure $00h \leq VSA7-0 \leq VEA7-0 \leq EFh$.

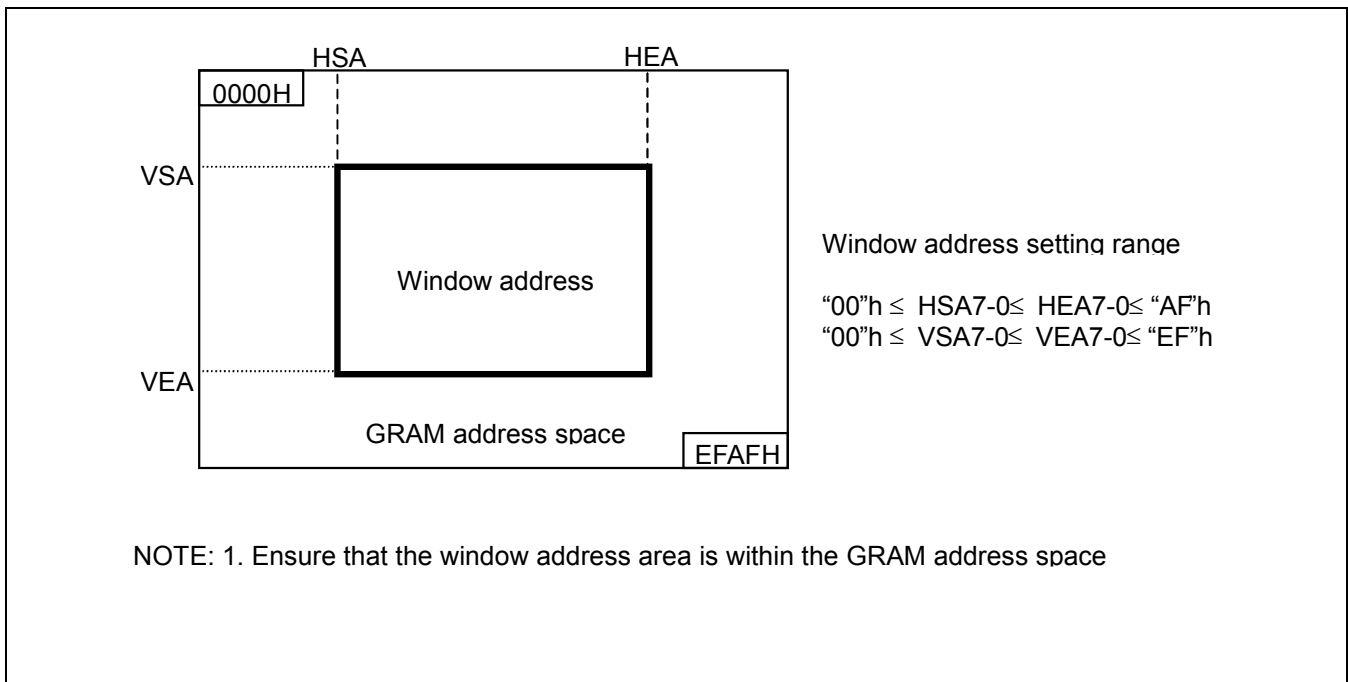

Figure 27. Window address setting range

RESET FUNCTION

The S6D0128 is internally initialized by RESET input. The reset input must be held for at least 1 ms. Do not access the GRAM nor initially set the instructions until the R-C oscillation frequency is stable after power has been supplied (10 ms).

Instruction Set Initialization

1. Start oscillation executed
2. Driver output control (NL4-0 = 11101, SS = 0, GS = 0, SM = 0, EPL=0, VSPL=0, HSPL=0, DPL=0)

20. Vertical RAM address position (VEA7-0 = 11101111, VSA7-0 = 00000000)

GRAM Data Initialization

GRAM is not automatically initialized by reset input but must be initialized by software while display is off (D1-0 = 00).

Output Pin Initialization

1. LCD driver output pins (Source output) : Output VSS level
(Gate output) : Output VGL level
2. Oscillator output pin (OSC2): Outputs oscillation sign

POWER SUPPLY CIRCUIT

The following figure shows a configuration of the voltage generation circuit for S6D0128. The step-up circuits consist of step-up circuits 1 to 3. Step-up circuit1 doubles the voltage supplied to VCI1 for AVDD level. Step-up circuit2 make 2, 2.5 or 3times AVDD level for VGH level, and make -1, -1.5, -2 or -2.5 times AVDD level for VGL level. Step-up circuit3 reverses the VCI1 level with reference to VSS and generates the VCL level. These step-up circuits generate power supplies AVDD, GVDD, VGH, VGL, VCL, and VCOM. Reference voltages GVDD, VCOM, and VGL for the grayscale voltage are amplified from the voltage adjustment circuit. Connect VCOM to the TFT panel.

Figure 28. Configuration of the Internal Power-Supply Circuit

Notes:

Use the 1uF capacitor.

PATTERN DIAGRAMS FOR VOLTAGE SETTING

The following figure shows a pattern diagram for the voltage setting and an example of waveforms.

MIN	Voltage	Calculation	MAX
3.5V	GVDD	Vref x GVD setting	5V
3V	VCOMH	Vref x VCM setting	5V
VCL + 0.5V	VCOML	VCOMH-VML setting	1V
1.75V	VCI1	VCI x VC setting	2.75V

MIN	Voltage	Calculation	MAX
4.0V	AVDD	VCI1 x 2	5.5V
7.0V	VGH	VCI1 x BT setting	16.5V
-13.75V	VGL	VCI1 x BT setting	-3.5V
-2.75	VCL	VCI1 x -1	-1.75V

Note:

- 1) Set the conditions of AVDD-GVDD>0.3V, VCOML-VCL>0.5V with loads because they differ depending on the display load to be driven.
- 2) VCI can be directly applied to VCI1.
- 3) VGLON/VCLON are internally generated instruction

cf> Pattern diagram above shows not only a relationship of each generated levels but practical power-up sequence

Figure 29. Pattern diagram and an example of waveforms

SET UP FLOW OF POWER

Apply the power in a sequence as shown in the following figure. The stable time of the oscillation circuit, step-up circuit, and operational amplifier depend on the external resistor or capacitance.

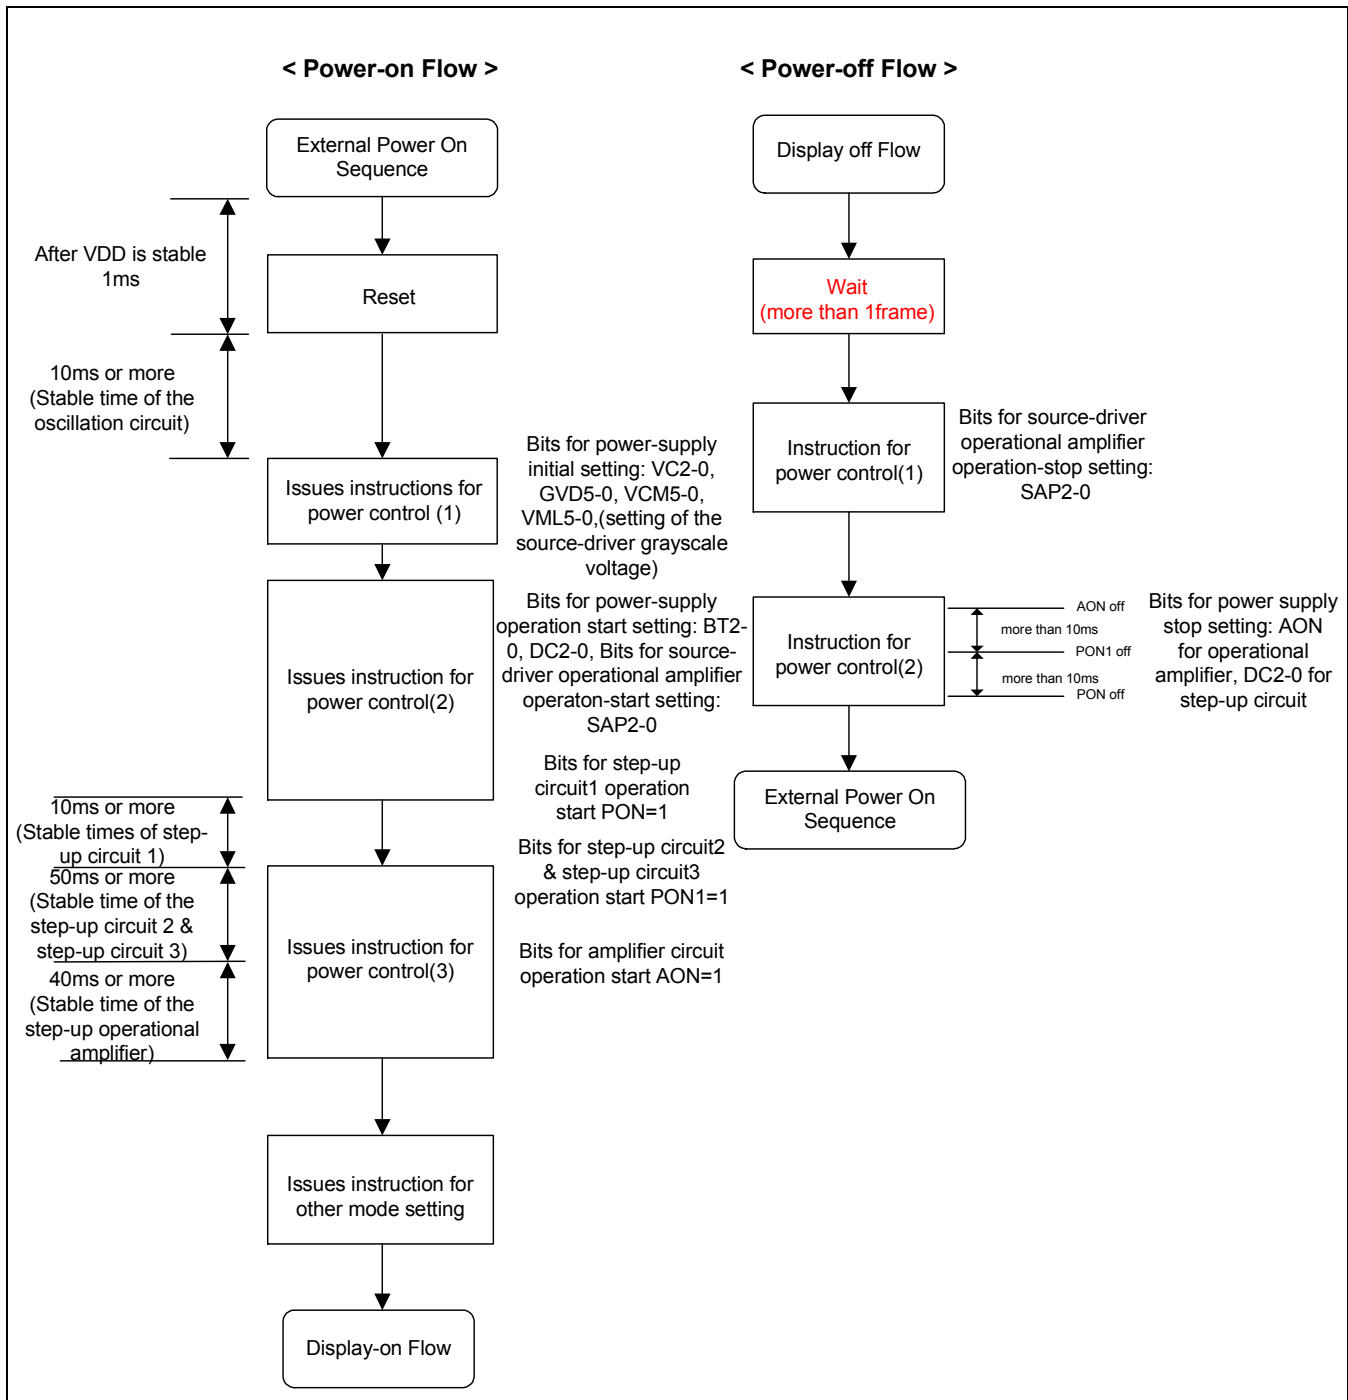

Figure 30. Set up Flow of Power

EXTERNAL POWER ON / OFF SEQUENCE

a) EXTERNAL POWER ON SEQUENCE

VDD3 should reach 90% before VCI does so. When regulator cap is $1\mu\text{F}$, RESETB must be applied after VCI have been applied. The applied time gap between VCI and RESETB is minimum 1ms. As regulator cap becomes larger, this time gap must be increased. Otherwise function is not guaranteed.

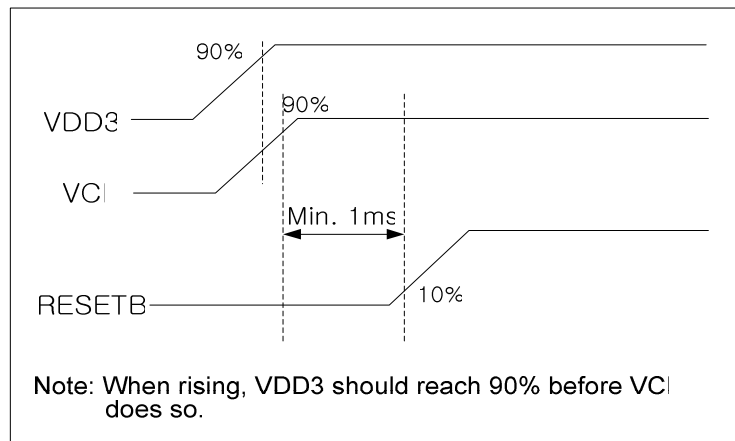

Figure 31. External power on sequence

b) EXTERNAL POWER OFF SEQUENCE

VCI should reach 90% before VDD3 does so. VCI must be powered down after RESETB have been powered down. The time gap of powered down between RESETB and VCI is minimum 1ms. Otherwise function is not guaranteed.

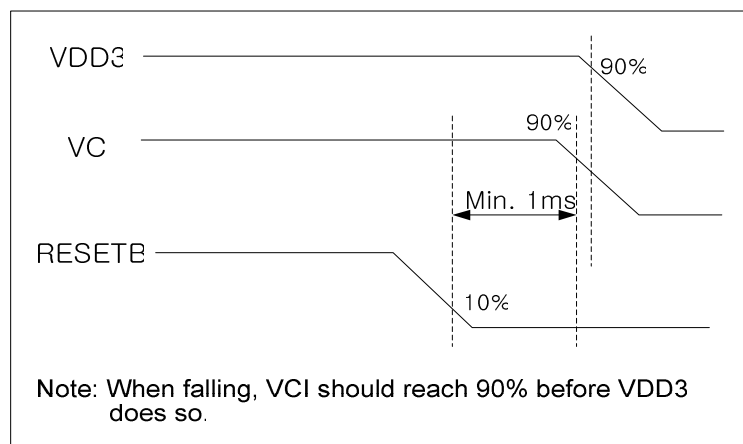

Figure 32. External power off sequence

SET UP FLOW OF DISPLAY

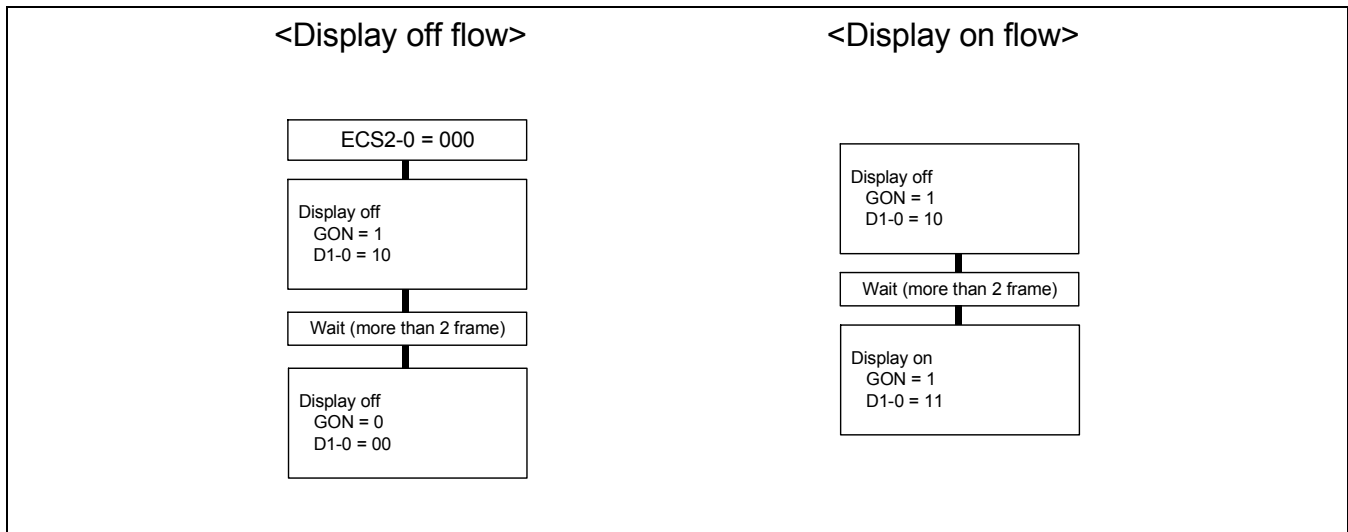

Figure 33. Set up flow of display

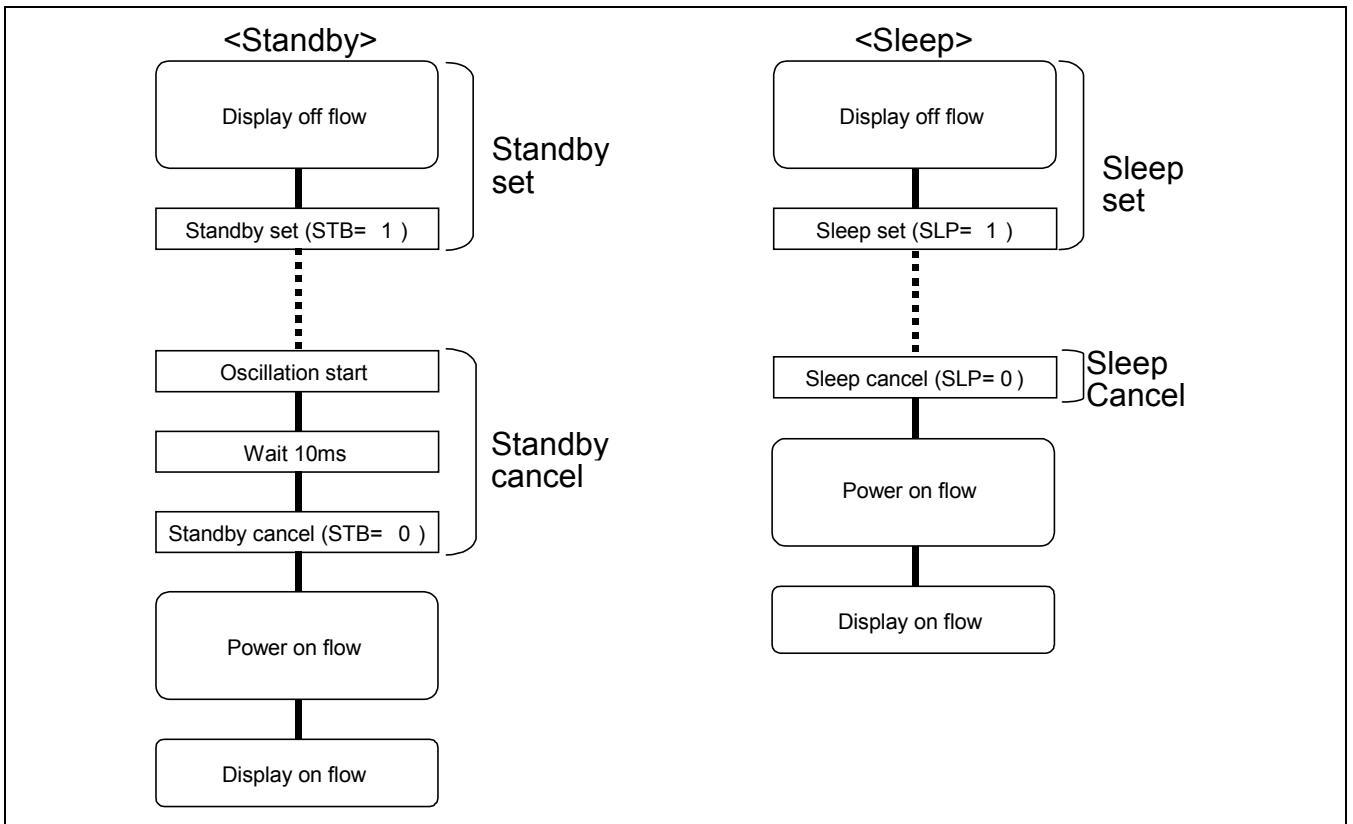

Figure 34. Setup flow of Standby / Sleep

VOLTAGE REGULATION FUNCTION

The S6D0128 have internal voltage regulator. Voltage regulation function is controlled by PREGB pin. If PREGB= "H", voltage regulation is stopped. PREGB= "L" enables internal voltage regulation function. By use of this function, internal logic circuit damage can be prohibited. Furthermore, power consumption also be obtained. Detailed function description and application setup is described in the following diagram.

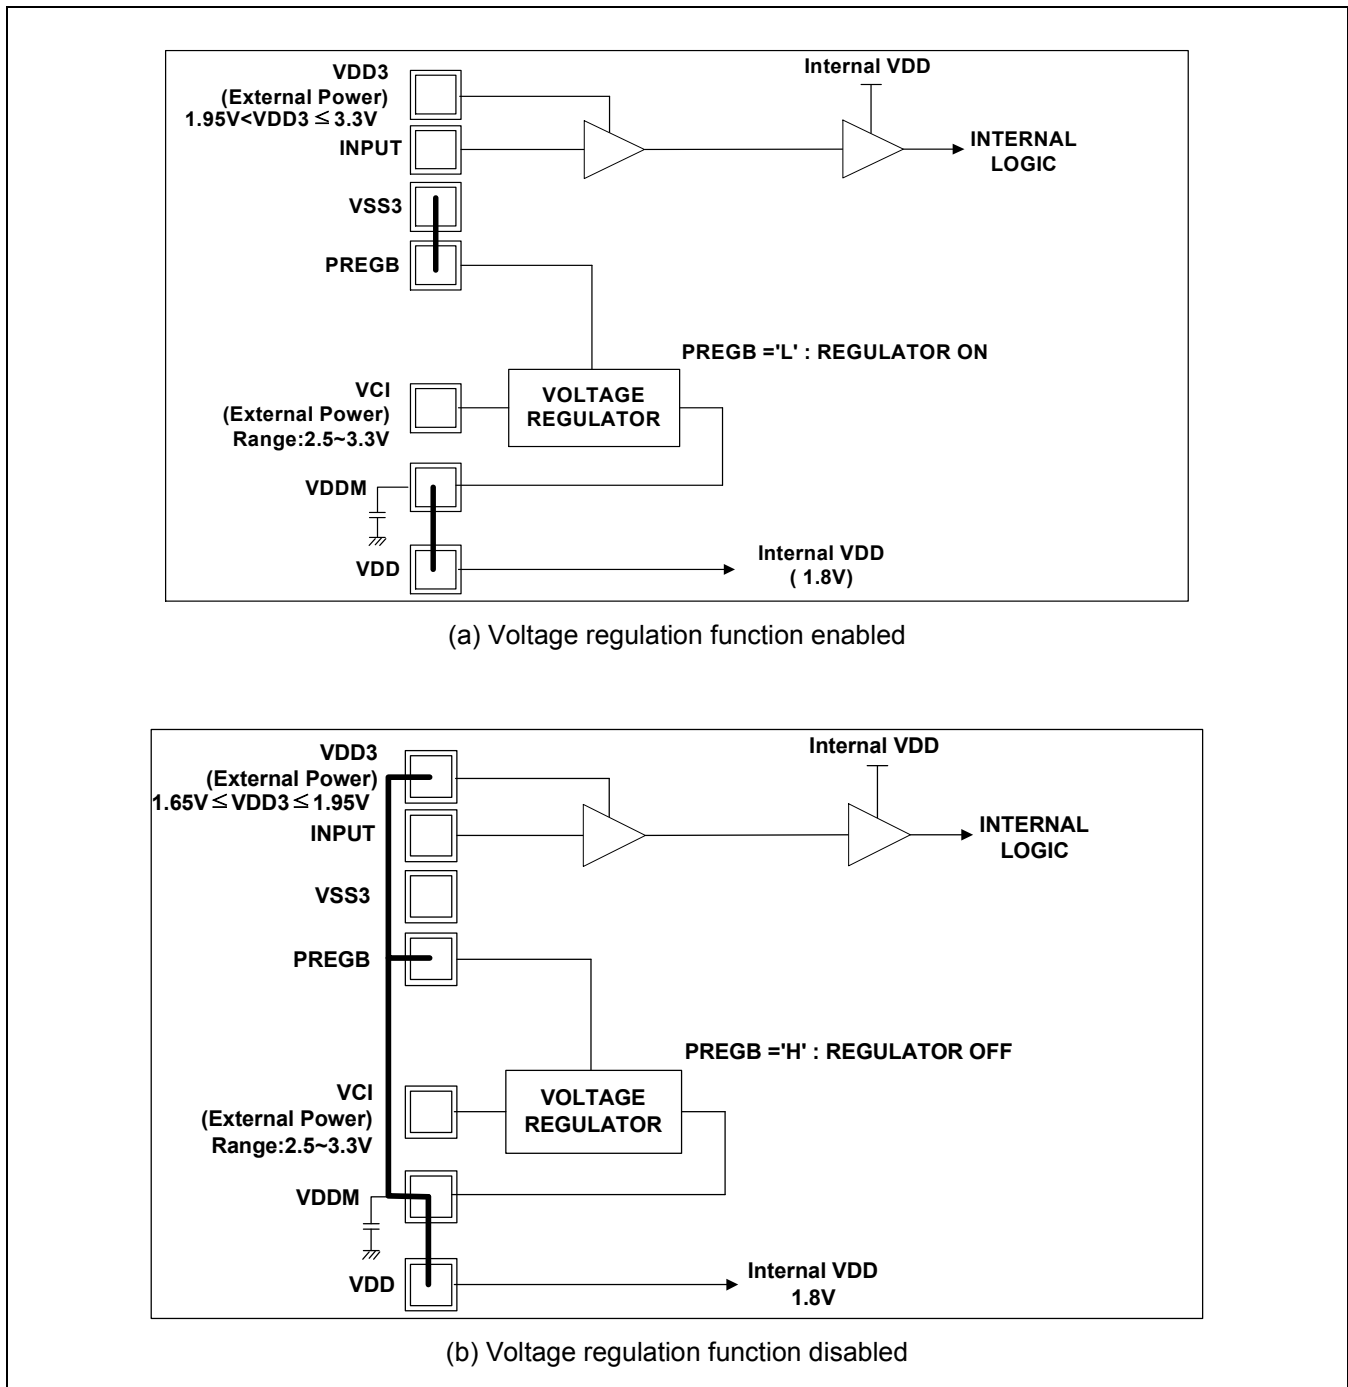

Figure 35. Voltage regulation function

INTERFACE SPECIFICATION

The S6D0128 incorporates a system interface, which is used to set instructions, and an external display interface, which is used to display motion pictures. Selecting these interfaces to match the screen data (motion picture or still picture) enables efficient transfer of data for display.

The external display interface includes RGB interface and VSYNC interface. This allows flicker-free screen update. When RGB interface is selected, the synchronization signals (VSYNC, HSYNC, and DOTCLK) are available for use in operating the display. The data for display (DB17-0) is written according to the values of the data enable signal (ENABLE) in synchronization with the VSYNC, HSYNC, and DOTCLK signals. In addition, using the window address function enables rewriting only to the internal RAM area to display motion pictures. Using this function also enables simultaneously display of the motion picture area and the RAM data that was written.

The internal display operation is synchronized with the frame synchronization signal (VSYNC) in VSYNC interface mode. When writing to the internal RAM is done within the required time after the falling edge of VSYNC, motion pictures can be displayed via the conventional interface. There are some limitations on the timing and methods of writing to RAM. See the section on the external display interface.

The S6D0128 has four operation modes for each display state. These settings are specified by control instructions for external display interface. Transitions between modes should follow the transition flow.

Table 30. Display Operation Mode and RAM Access Selection

Operation Mode	RAM Access Selection (RM)	Display Operation Mode (DM1-0)
Internal Clock Operation (Displaying still picture)	System interface (RM=0)	Internal clock operation (DM1-0=00)
RGB interface (1) (Displaying motion picture)	RGB interface (RM=1)	RGB interface (DM1-0=01)
RGB interface (2) (Rewriting still picture while displaying motion pictures)	System interface (RM=0)	RGB interface (DM1-0=01)
VSYNC interface (Displaying motion Pictures)	System interface (RM=0)	VSYNC interface (DM1-0=10)

- NOTES:**
- 1) Instruction registers can only be set via system interface.
 - 2) RGB interface and VSYNC interface cannot be used at the same time.
 - 3) RGB interface mode cannot be set during operations.
 - 4) For mode transitions, see the section on the external display interface.

SYSTEM INTERFACE

S6D0128 is enabling to set instruction and access to RAM by selecting IM3/2/1/0 pin in the system interface mode.

Table 31. IM Bits and System Interface

IM3	IM2	IM1	IM0	System Interface	DB Pin
0	0	0	0	68-system 16-bit interface	DB17 to10, 8 to1
0	0	0	1	68-system 8-bit interface	DB17 to10

68/80-SYSTEM 9-BIT BUS INTERFACE

Setting the IM3/2/1/0 (interface mode) to the VDD3/VSS/VSS/VDD3 level allows 68-system 9-bit parallel data transfer using pins DB17–DB9. Setting the IM3/2/1/0 to be VDD3/VSS/VDD3/VDD3 level allows 80-system 9-bit parallel data transfer. The 16-bit instructions and RAM data are divided into nine upper/lower bits and the transfer starts from the upper nine bits. Fix unused pins DB8–DB0 to the VDD 3 or VSS level. Note that the upper bytes must also be written when the index register is written.

Figure 44. Interface to 9-bit Microcomputer

68/80-SYSTEM 9-bit interface data FORMAT

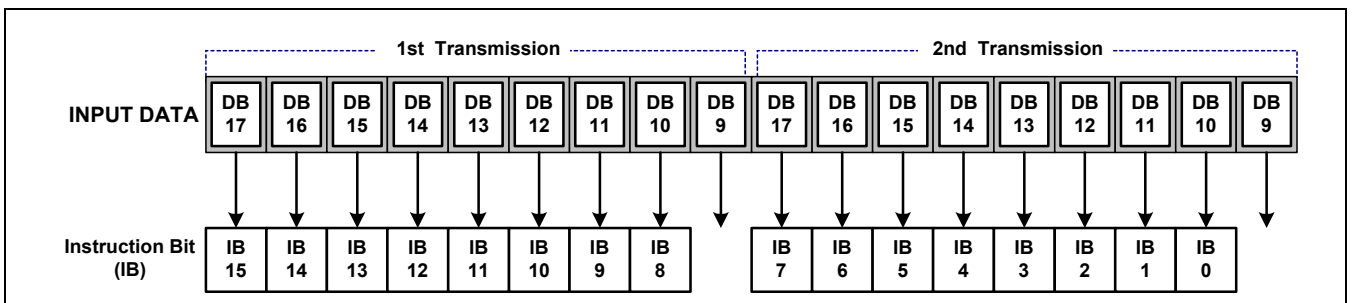

Figure 45. Instruction format for 9-bit Interface

Figure 46. RAM Data Write format for 9-bit Interface

NOTE: Transfer synchronization function for a 9-bit bus interface

The S6D0128 supports the transfer synchronization function, which resets the upper/lower counter to count upper/lower 9-bit data transfer in the 9-bit bus interface. Noise causing transfer mismatch between the nine upper and lower bits can be corrected by a reset triggered by consecutively writing a "00"H instruction four times. The next transfer starts from the upper nine bits. Executing synchronization function periodically can recover any runaway in the display system.

Figure 47. 9-bit Transfer Synchronization

68/80-SYSTEM 8-BIT BUS INTERFACE

Setting the IM3/2/1/0 (interface mode) to the VSS/VSS/VSS/VDD3 level allows 68-system 8-bit parallel data transfer. Setting the IM3/2/1/0 to the VSS/VSS/VDD3/VDD3 level allows 80-system 8-bit parallel data transfer. The 16-bit instructions and RAM data are divided into eight upper/lower bits and the transfer starts from the upper eight bits. Fix unused pins DB9–DB0 to the VDD3 or VSS level. Note that the upper bytes must also be written when the index register is written.

NOTE: Transfer synchronization function for an 8-bit bus interface

The S6D0128 supports the transfer synchronization function, which resets the upper/lower counter to count upper/lower 8-bit data transfer in the 8-bit bus interface. Noise causing transfer mismatch between the eight upper and lower bits can be corrected by a reset triggered by consecutively writing a "00"H instruction four times. The next transfer starts from the upper eight bits. Executing synchronization function periodically can recover any runaway in the display system

Figure 53. 8-bit Transfer Synchronization

SERIAL DATA TRANSFER

Setting the IM3 pin to the VSS level allows serial peripheral interface (SPI) transfer, using the chip select line (CS⁺), serial transfer clock line (SCL), serial input data (SDI), and serial output data (SDO). For a serial interface, the IM0/ID pin function uses an ID pin. If the chip is set up for serial interface, the DB17-0 pins that are not used must be fixed at VDD3 or VSS.

The S6D0128 initiates serial data transfer by transferring the start byte at the falling edge of CSB input. It ends serial data transfer at the rising edge of CSB input.

The S6D0128 is selected when the 6-bit chip address in the start byte matches the 6-bit device identification code that is assigned to the S6D0128. When selected, the S6D0128 receives the subsequent data string. The LSB of the identification code can be determined by the ID pin. The five upper bits must be 01110. Two different chip addresses must be assigned to a single S6D0128 because the seventh bit of the start byte is used as a register select bit (RS): that is, when RS = 0, data can be written to the index register or status can be read, and when RS = 1, an instruction can be issued or data can be written to or read from RAM. Read or write is selected according to the eighth bit of the start byte (R/W bit). The data is received when the R/W bit is 0, and is transmitted when the R/W bit is 1.

After receiving the start byte, the S6D0128 receives or transmits the subsequent data byte-by-byte. The data is transferred with the MSB first. All S6D0128 instructions are 16 bits. Two bytes are received with the MSB first (DB17 to 0), then the instructions are internally executed. After the start byte has been received, the first byte is fetched as the upper eight bits of the instruction and the second byte is fetched as the lower eight bits of the instruction.

Four bytes of RAM read data after the start byte are invalid. The S6D0128 starts to read correct RAM data from the fifth byte.

Table 32. Start Byte Format

Transfer bit	S	1	2	3	4	5	6	7	8
Start byte format	Transfer start	Device ID code						RS	R/W
		0	1	1	1	0	ID		

NOTE: ID bit is selected by the IM0/ID pin.

Table 33. RS and R/W Bit Function

RS	RW	Function
0	0	Set index register
0	1	Read status
1	0	Writes instruction or RAM data
1	1	Reads instruction or RAM data

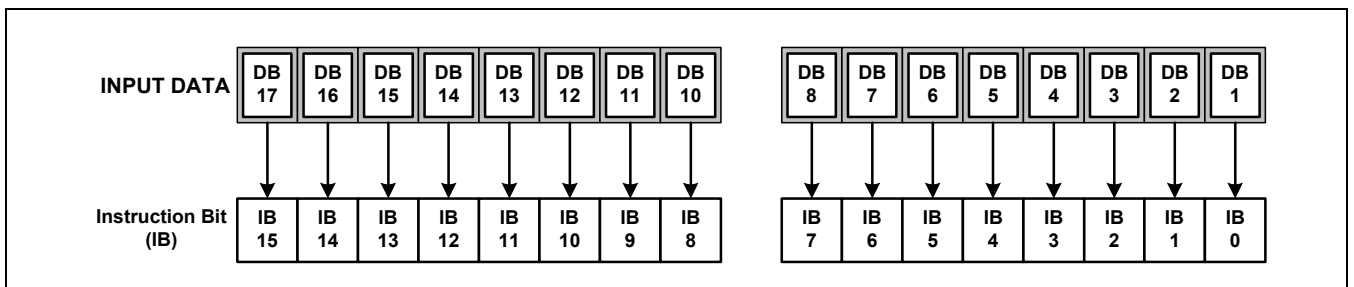

Figure 54. Instruction format for Serial Data Transfer

Figure 55. RAM Data Write format for Serial Data Transfer

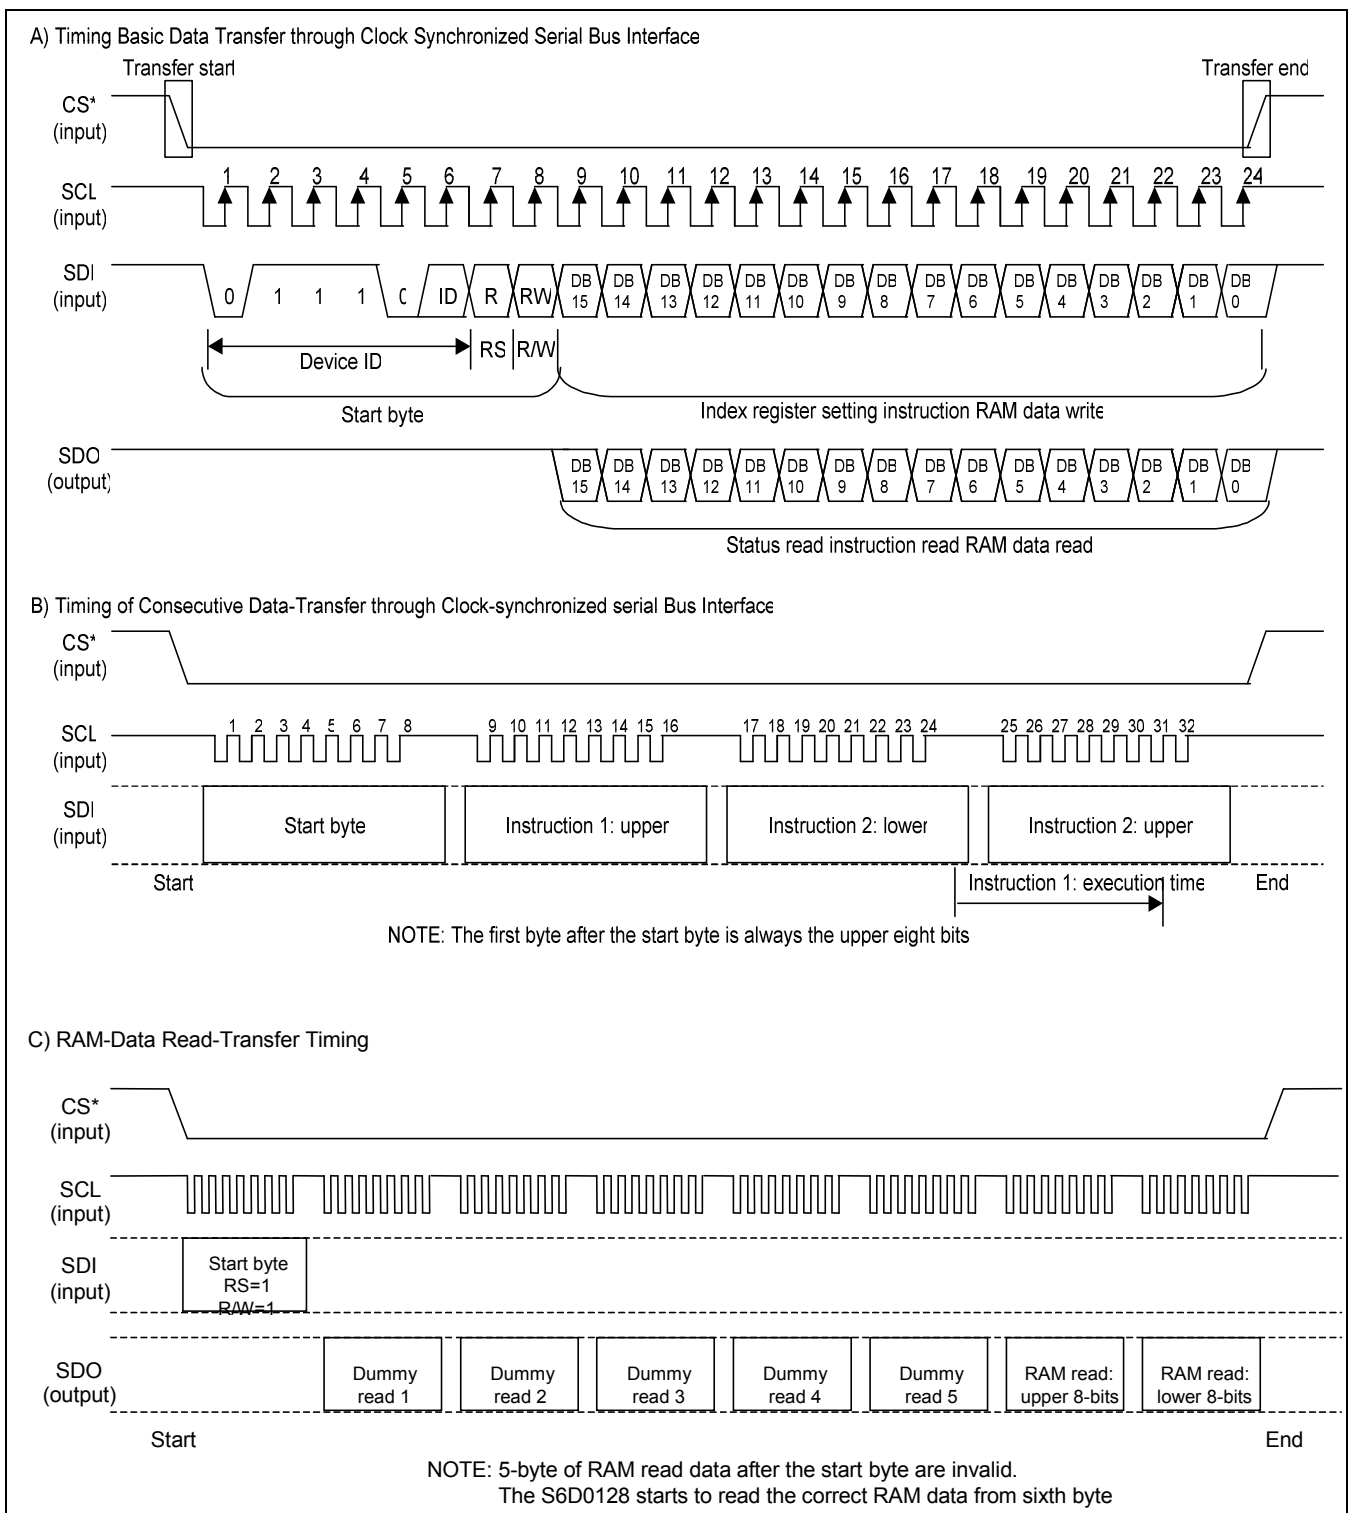

Figure 56. Procedure for transfer on clock synchronized serial bus interface

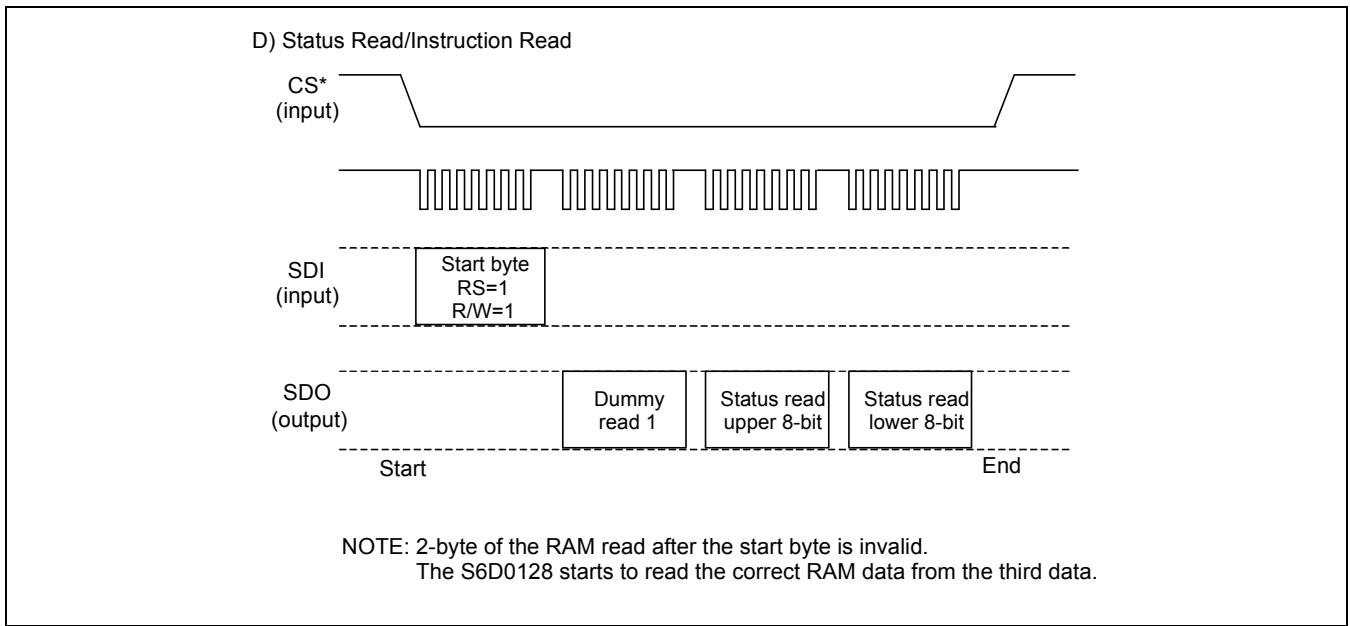

Figure 57. Procedure for transfer on clock synchronized serial bus interface (continued)

VSYNC INTERFACE

The S6D0128 incorporates VSYNC interface, which enables motion pictures to be displayed with only the conventional system interface and the frame synchronization signal (VSYNC). This interface requires minimal changes from the conventional system to display motion pictures.

Figure 58. VSYNC Interface (example: 16bit interface)

When DM1-0="10" and RM="0", VSYNC interface is available. In this interface the internal display operation is synchronized with VSYNC. Data for display is written to RAM via the system interface with higher speed than for internal display operation. This method enables flicker-free display of motion pictures with the conventional interface.

Display operation can be achieved by using the internal clock generated by the internal oscillator and the VSYNC input. Because all the data for display is written to RAM, only the data to be rewritten is transferred. This method reduces the amount of data transferred during motion picture display operation.

Figure 59. Motion Picture Data Transfer via VSYNC Interface

VSYNC interface requires taking the minimum speed for RAM writing via the system interface and the frequency of the internal clock into consideration. RAM writing should be performed with higher speed than the result obtained from the calculation shown below. The internal memory write address counter is reset by VSYNC. So, ensure interval time between VSYNC falling and GRAM data writing. The minimum interval time is 2 raster rows, and hence the data writing should start only after that duration.

Internal clock frequency (f_{osc}) [Hz] = $\frac{\text{Frame freq.} \times (\text{Display raster-row (NL)} + \text{Front porch (FP)} + \text{Back porch (BP)})}{16\text{-Clock} \times \text{Fluctuation}}$

Minimum speed for RAM writing [Hz] > $\frac{176 \times \text{Display raster-row (NL)}}{\{(\text{Back porch (BP)} + \text{Display raster-row (NL)} - \text{Margin}) \times 16 \text{ Clock}\} / f_{osc}}$

NOTE: When RAM writing does not start immediately after the falling edge of VSYNC, the time between the falling edge of VSYNC and the RAM writing start timing must also be considered.

An example is shown below.

Example

Display size	176RGB × 240 raster-rows
Display line number	240 raster-row (NL=11101)
Back/Front porch	14 lines/2 lines (BP=1110/FP=0010)
Frame Frequency	60Hz

Internal clock frequency (f_{osc}) [Hz] = $60 \text{ Hz} \times (240 + 2 + 14) \text{ lines} \times 16 \text{ clock} \times 1.1 / 0.9 = 300 \text{ kHz}$

- NOTES:**
1. Calculating the internal clock frequency requires considering the fluctuation. In the above case a 10% Fluctuation within the VSYNC period is assumed.
 2. The fluctuation includes LSI production variation and air temperature fluctuation. Other fluctuations, including those for the external resistors and the supplied power, are not included in this example. Please keep in mind that a margin for these factors is also needed.

Minimum speed for RAM writing [Hz] > $\frac{176 \times 240}{\{(14 + 240 - 2) \text{ lines} \times 16 \text{ clock}\} / 300 \text{ kHz}} = 3.14 \text{ MHz}$

- NOTES:**
3. In this case RAM writing starts immediately after the falling edge of VSYNC.
 4. The margin for display raster-row should be two raster-rows or more at the completion of RAM writing for one frame.

Therefore, when RAM writing starting immediately after the falling edge of VSYNC is performed at 3.14 MHz or more, the data for display can be rewritten before display operation starts. This means that flicker-free display operation is achieved.

Figure 60. Operation for VSYNC Interface

Usage on VSYNC interface

1. The Example above is a calculated value. Please keep in mind that a margin for these factors is also needed. Because production variation of the internal oscillator requires consideration.
2. The Example above is a calculated value of rewriting the whole screen. A limitation of the motion picture area generates a margin for the RAM write speed.

Figure 61. Limitation of Motion picture Area

3. During the period between the completion of displaying one frame data and the next VSYNC signal, the display will remain front porch period.
4. Transition between the internal operating clock mode (DM1-0="00") and VSYNC interface mode will be valid after the completion of the screen, which is displayed when the instruction is set.

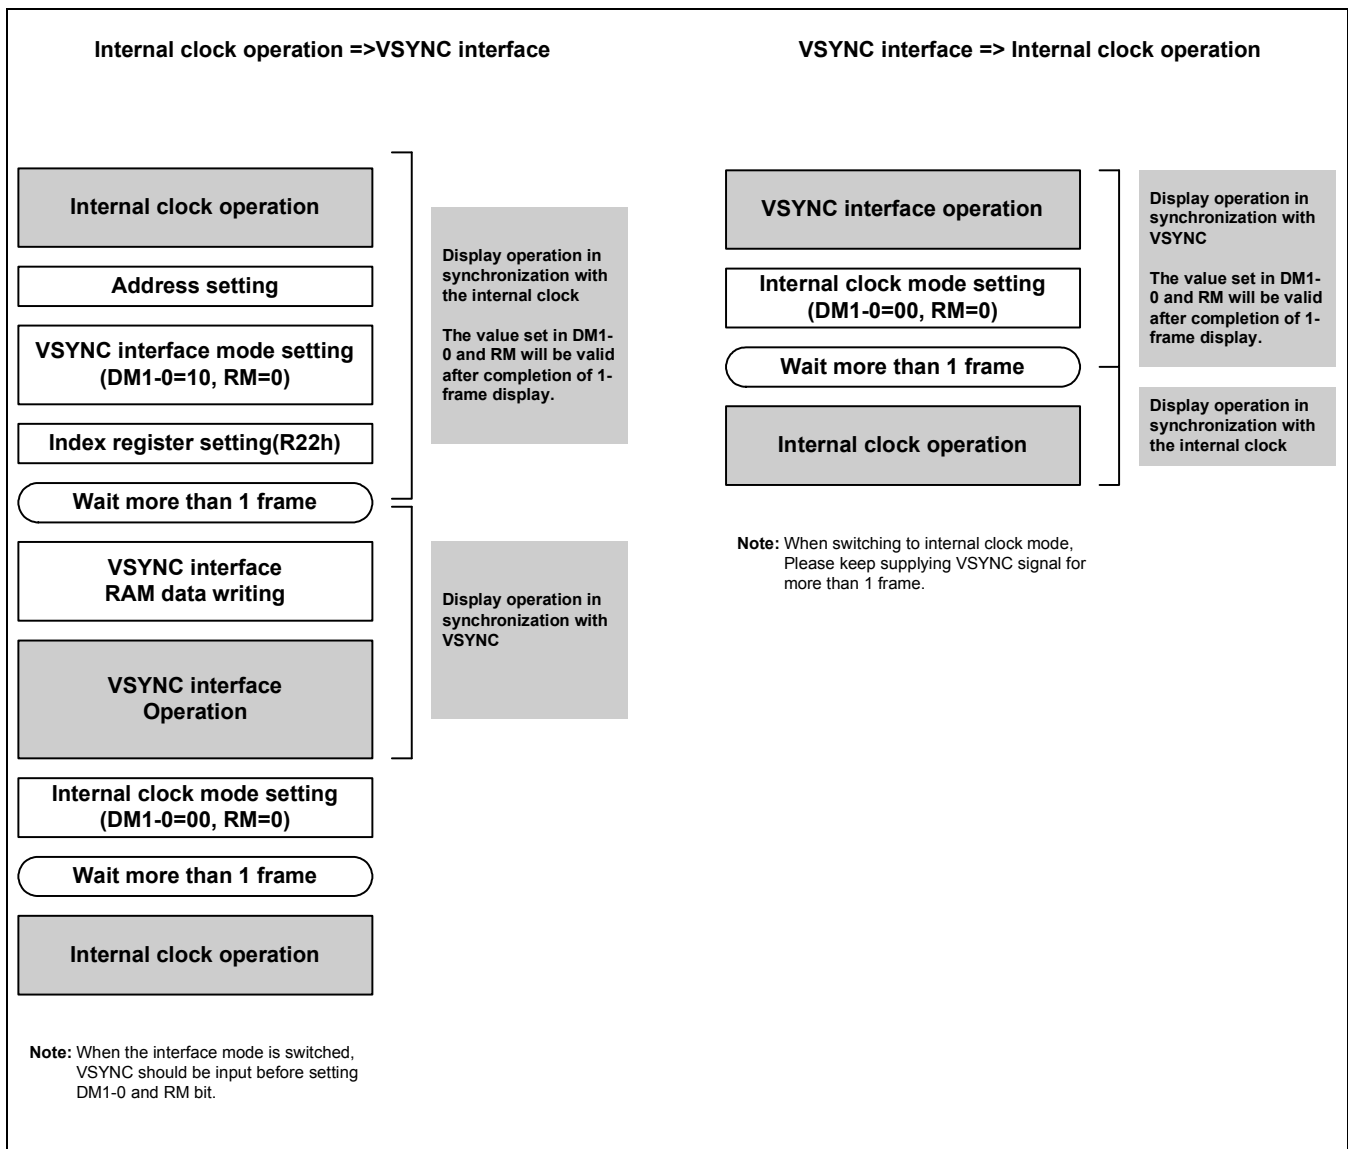

Figure 62. Transition between the Internal Operating Clock Mode and VSYNC Interface Mode

- 5. Partial display and vertical scroll functions are not available on VSYNC interface mode.
- 6. The VSYNC interface is performed by the method above.

EXTERNAL DISPLAY INTERFACE

The following interfaces are available as external display interface. It is determined by bit setting of RIM1-0. RAM accesses can be performed via the RGB interface.

Table 34. RIM Bits

RIM1	RIM0	RGB Interface	DB Pin
0	0	18-bit RGB interface	DB17 to 0
0	1	16-bit RGB interface	DB17 to13, 11 to 1
1	0	6-bit RGB interface	DB17 to12
1	1	Setting disabled	

RGB INTERFACE

The RGB interface is performed in synchronization with VSYNC, HSYNC, and DOTCLK. Combining the function of the high-speed write mode and the window address enables transfer only the screen to be updated and reduce the power consumption.

Figure 63. RGB Interface

ENABLE SIGNALS

The relationship between EPL and ENABLE signals is shown below. When ENABLE is not active, the address is not updated. When ENABLE is active, the address is updated.

Table 35. Relationship between EPL and ENABLE

EPL	ENABLE	RAM WRITE	RAM ADDRESS
0	0	Valid	Updated
0	1	Invalid	Hold
1	0	Invalid	Hold
1	1	Valid	Update

RGB INTERFACE TIMING

Time chart for RGB interface is shown below. (In case of EPL = 0)

Figure 64. 16-/18-bit RGB Interface Timing (In case of EPL = 0, DPL = 0, VSPL = 0, HSPL = 0)

- VLW: The period in which VSYNC is “Low” level
- HLW: The period in which HSYNC is “Low” level
- DTST: Set up time of data transfer

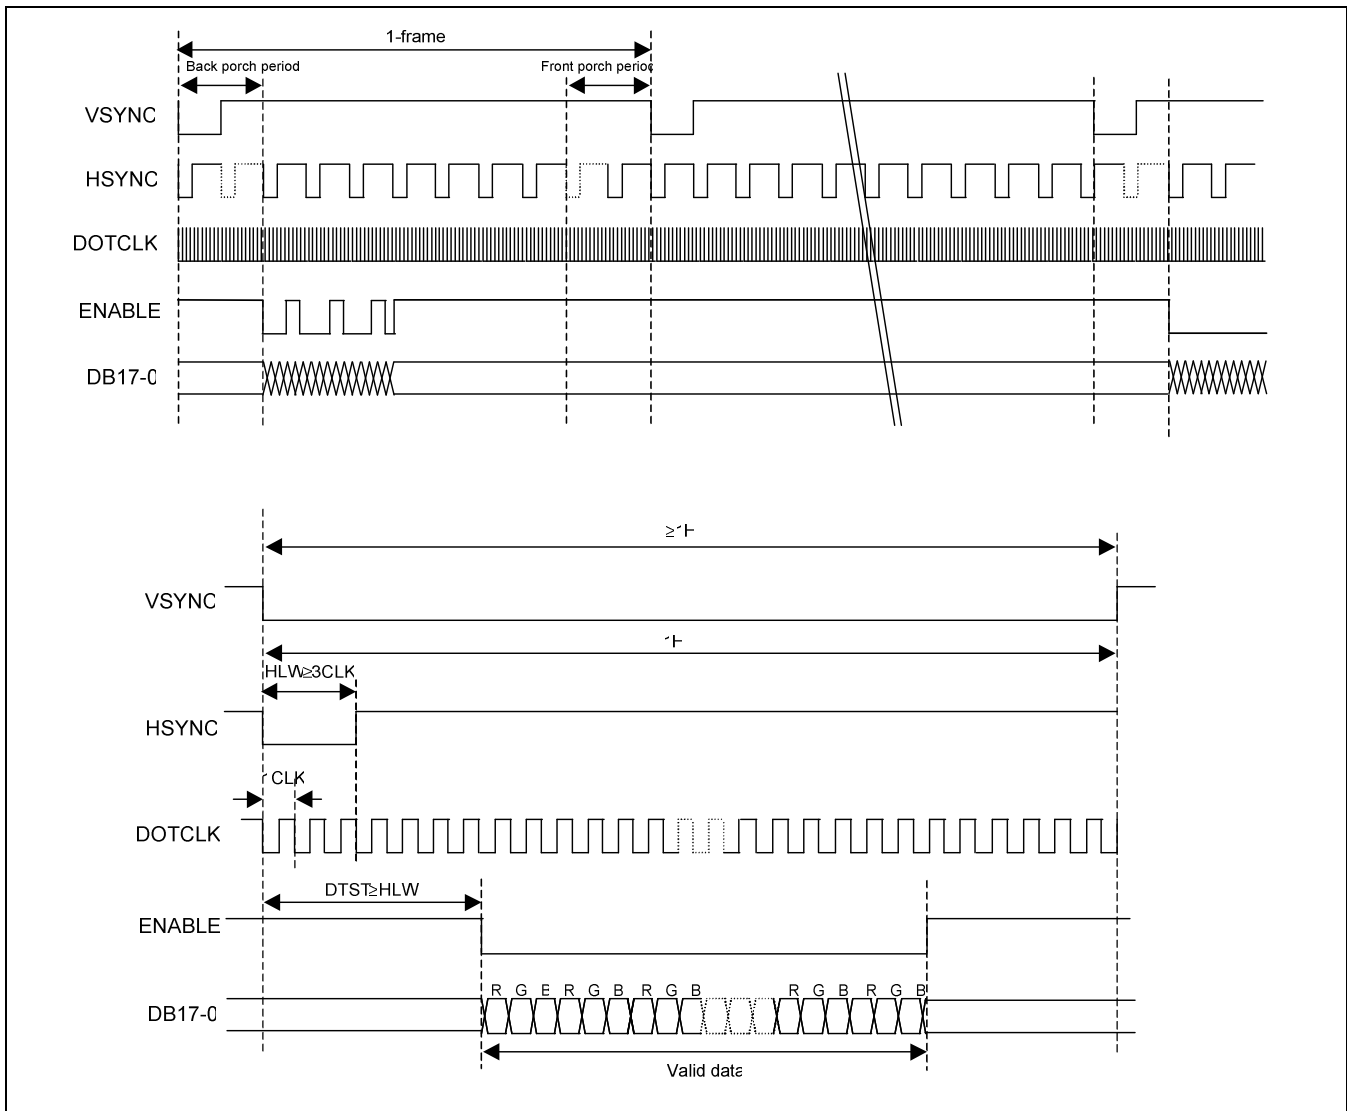

Figure 65. 6-bit RGB Interface Timing (In case of EPL = 0, DPL = 0, VSPL = 0, HSPL = 0)

VLW: The period in which VSYNC is “Low” level

HLW: The period in which HSYNC is “Low” level

DTST: Set up time of data transfer

- NOTES:**
1. Three clocks are regarded as one clock for transfer when data is transferred in 6-bit interface.
 2. VSYNC, HSYNC, ENABLE, DOTCLK and DB17-2 should be transferred in units of three clocks.

MOTION PICTURE DISPLAY

The S6D0128 incorporates RGB interface to display motion pictures and RAM to store data for display. For displaying motion pictures, the S6D0128 has the following features.

- Motion picture area can only be transferred by the window address function.
- Motion picture area to be rewritten can only be transferred.
- Reducing the amount of data transferred enables reduce the power consumption to the whole system.
- Still picture area, such as an icon, can be updated while displaying motion pictures combining with the system interface.

RAM ACCESS VIA RGB INTERFACE AND SYSTEM INTERFACE

RAM can be accessed via the system interface when RGB interface is in use. When data is written to RAM during RGB interface mode, the ENABLE bit should be low to stop data writing via RGB interface, because RAM writing is always performed in synchronization with the DOTCLK input when ENABLE is high. After this RAM access via the system interface, a waiting time is needed for a write/read bus cycle before the next RAM access starts via RGB interface. When a RAM write conflict occurs, data writing is not guaranteed.

Example of display motion picture via RGB-I/F and updating still picture via the system interface are shown below.

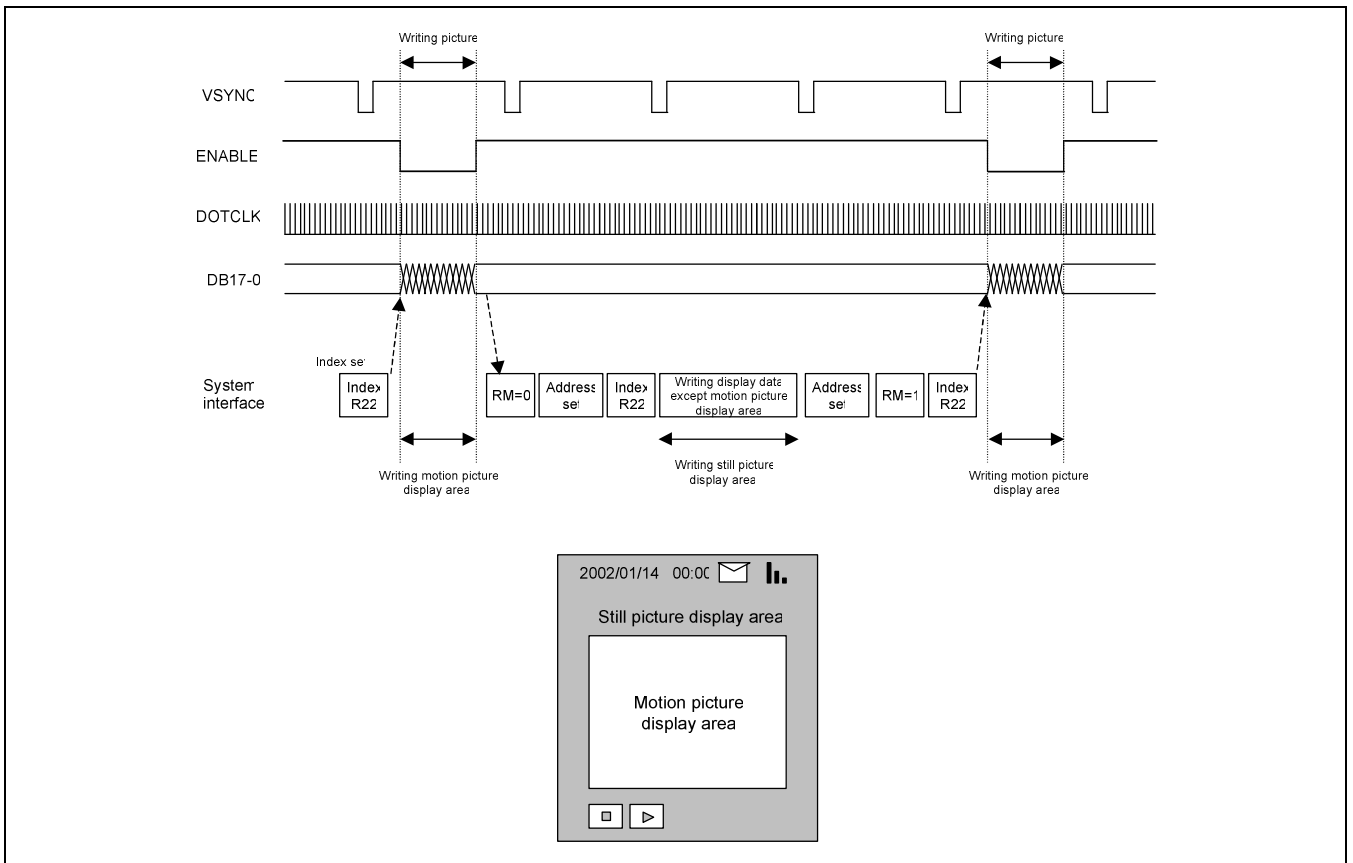

Figure 66. Example of Updating Still Picture Area during Displaying Motion Picture (In case of EPL = 0, VSPL = 0)

6-BIT RGB INTERFACE

6-bit RGB interface can be used by setting RIM1-0 pins to “10”. Display operation is synchronized with VSYNC, HSYNC, and DOTCLK signals. Data for display is transferred to the internal RAM via 6-bit RGB data bus (DB17 to 12), the data valid signal (VLD), and the data enable signal (ENABLE). Unused pins must be fixed to the VDD3 or GND level.

Figure 67. 6-bit RGB Interface

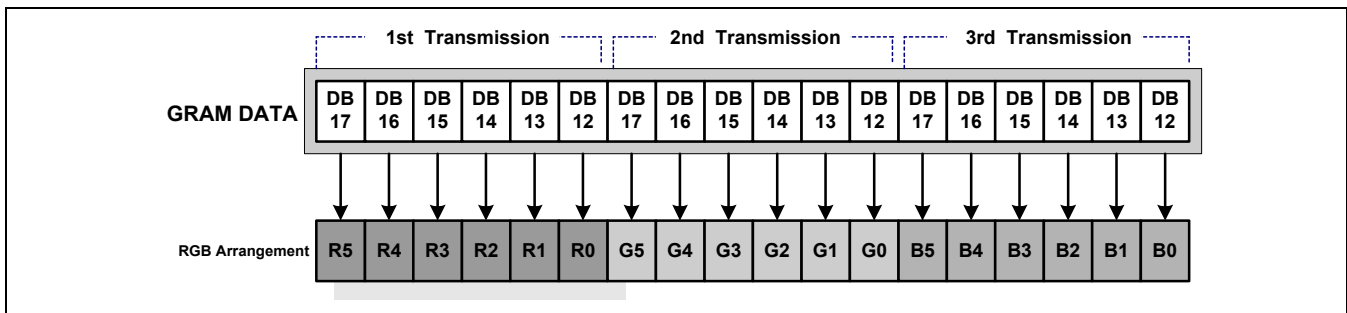

Figure 68. GRAM Write Data format for 6-bit RGB Interface Mode

NOTE: Transfer synchronization function for a 6-bit bus interface. The S6D0128 has the transfer counter to count 1st, 2nd and 3rd data transfer in the 6-bit bus interface. The transfer counter is reset on the falling edge of VSYNC and enters the 1st data transmission state. Transfer mismatch can be corrected transfer restarts correctly. In this method, when data is consecutively transferred such as displaying motion pictures, the effect of transfer mismatch will be reduced and recover normal operation.

NOTE: The internal display is operated in units of three DOTCLK. When the DOTCLK is not input in units of pixels, click mismatch occurs and the frame, which is operated, and the next frame are not display correctly.

Figure 69. Transfer Synchronization Function when 6-bit RGB Interface

16-BIT RGB INTERFACE

16-bit RGB interface can be used by setting RIM1-0 pins to 01. Display operation is synchronized with VSYNC, HSYNC, and DOTCLK signals. Data for display is transferred to the internal RAM via 6-bit RGB data bus (DB17-13 and 11-1). Instruction should be set via the system interface.

Figure 70. 16-bit RGB Interface to System

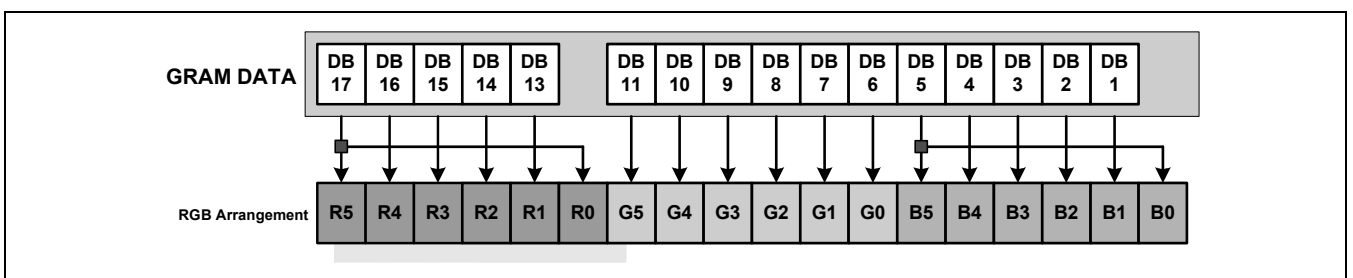

Figure 71. GRAM Write Data in the 16-bit RGB Interface Mode

18-BIT RGB INTERFACE

18-bit RGB interface can be used by setting RIM1-0 pins to 00. Display operation is synchronized with VSYNC, HSYNC, and DOTCLK signals. Data for display is transferred to the internal RAM via 6-bit RGB data bus (DB17-0).

Figure 72. 18-bit RGB Interface to System

Figure 73. GRAM Write Data format for 18-bit RGB Interface Mode

USAGE ON EXTERNAL DISPLAY INTERFACE

1. When external display interface is in use, the following functions are not available.

Table 36. External Display Interface and Internal Display Operation

Function	External Display Interface	Internal Display Operation
Partial Display	Cannot be used	Can be used
Scroll Function	Cannot be used	Can be used

2. VSYNC, HSYNC, and DOTCLK signals should be supplied during display operation via RGB interface.

3. Please make sure that when setting bits of NO1-0, SDT1-0, and ECS2-0 in RGB interface, the clock on which operations are based changes from the internal operating clock to DOTCLK.

4. RGB data are transferred for three clock cycles in 6-bit RGB interface. Data transferred, therefore, should be transferred in units of RGB.

5. Interface signals, VSYNC, HSYNC, DOTCLK, ENABLE and DB17-0 should be set in units of RGB (pixels) to match RGB transfer.

6. Transitions between internal operation mode and external display interface should follow the mode transition sequence shown below.
7. During the period between the completion of displaying one frame data and the next VSYNC signal, the display will remain front porch period.
8. An address set is done on the falling edge of VSYNC every frame in RGB interface.

Figure 74. Transition between the Internal Operating Clock Mode and RGB Interface Mode

WINDOW ADDRESS FUNCTION

When data is written to the on-chip GRAM, a window address-range that is specified by the horizontal address register (start: HSA7-0, end: HEA7-0) and vertical address register (start: VSA7-0, end: VEA7-0) can be updated consecutively.

Data is written to addresses in the direction specified by the I/D1-0bit. When image data, etc. is being written, data can be written consecutively without thinking a data wrap by doing this.

The window must be specified to be within the GRAM address area described as following example. Addresses must be set within the window address.

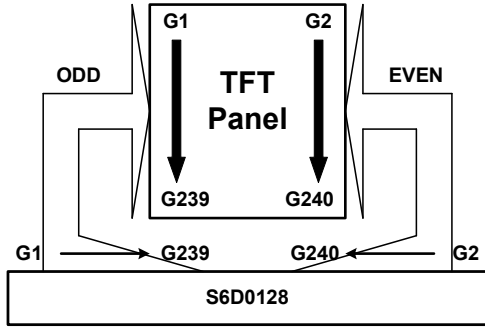

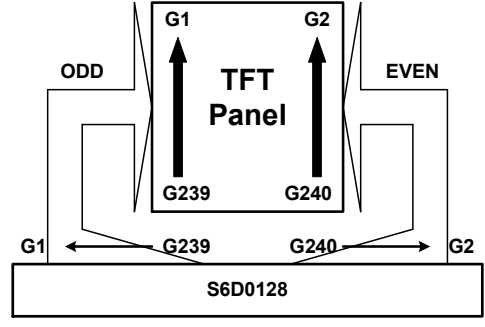

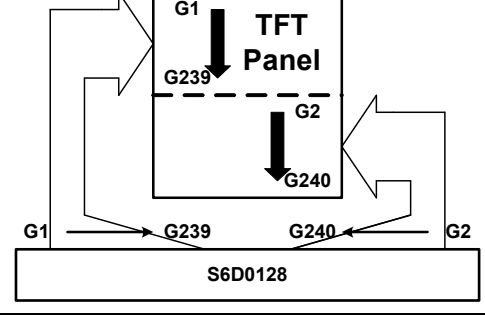

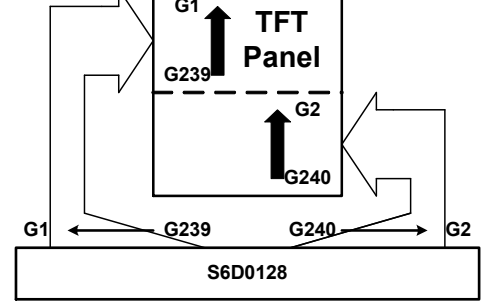

Figure 75. Example of address operation in the window address specification

GATE DRIVER SCAN MODE SETTING

SM and GS bit set the gate scan mode of S6D0128. GS bit determines the scan direction whether the gate driver scans forward or reverse direction. SM bit determines the method of display division (Even/Odd or Upper/Lower division drive). Using this function, various connections between S6D0128 and the liquid crystal panels can be accomplished.

Figure 76. Scan mode setting

SM	GS	Scan Mode
0	0	 <p>G1 → G2 → G3 → G4 → ... → G237 → G238 → G239 → G240</p>
0	1	 <p>G240 → G239 → G238 G237 → ... → G4 → G3 → G2 → G1</p>
1	0	 <p>G1 → G3 → G5 → ... → G237 → G239 G2 → G4 → G6 → ... → G238 → G240</p>
1	1	 <p>G240 → G238 → G172 → ... → G4 → G2 G239 → G237 → G171 → ... → G3 → G1</p>

GAMMA ADJUSTMENT FUNCTION

The S6D0128 provides the gamma adjustment function to display 262,144 colors simultaneously. The gamma adjustment executed by the gradient adjustment register and the micro-adjustment register that determines 8 grayscale levels. Furthermore, since the gradient adjustment register and the micro-adjustment register have the positive polarities and negative polarities, adjust them to match LCD panel respectively.

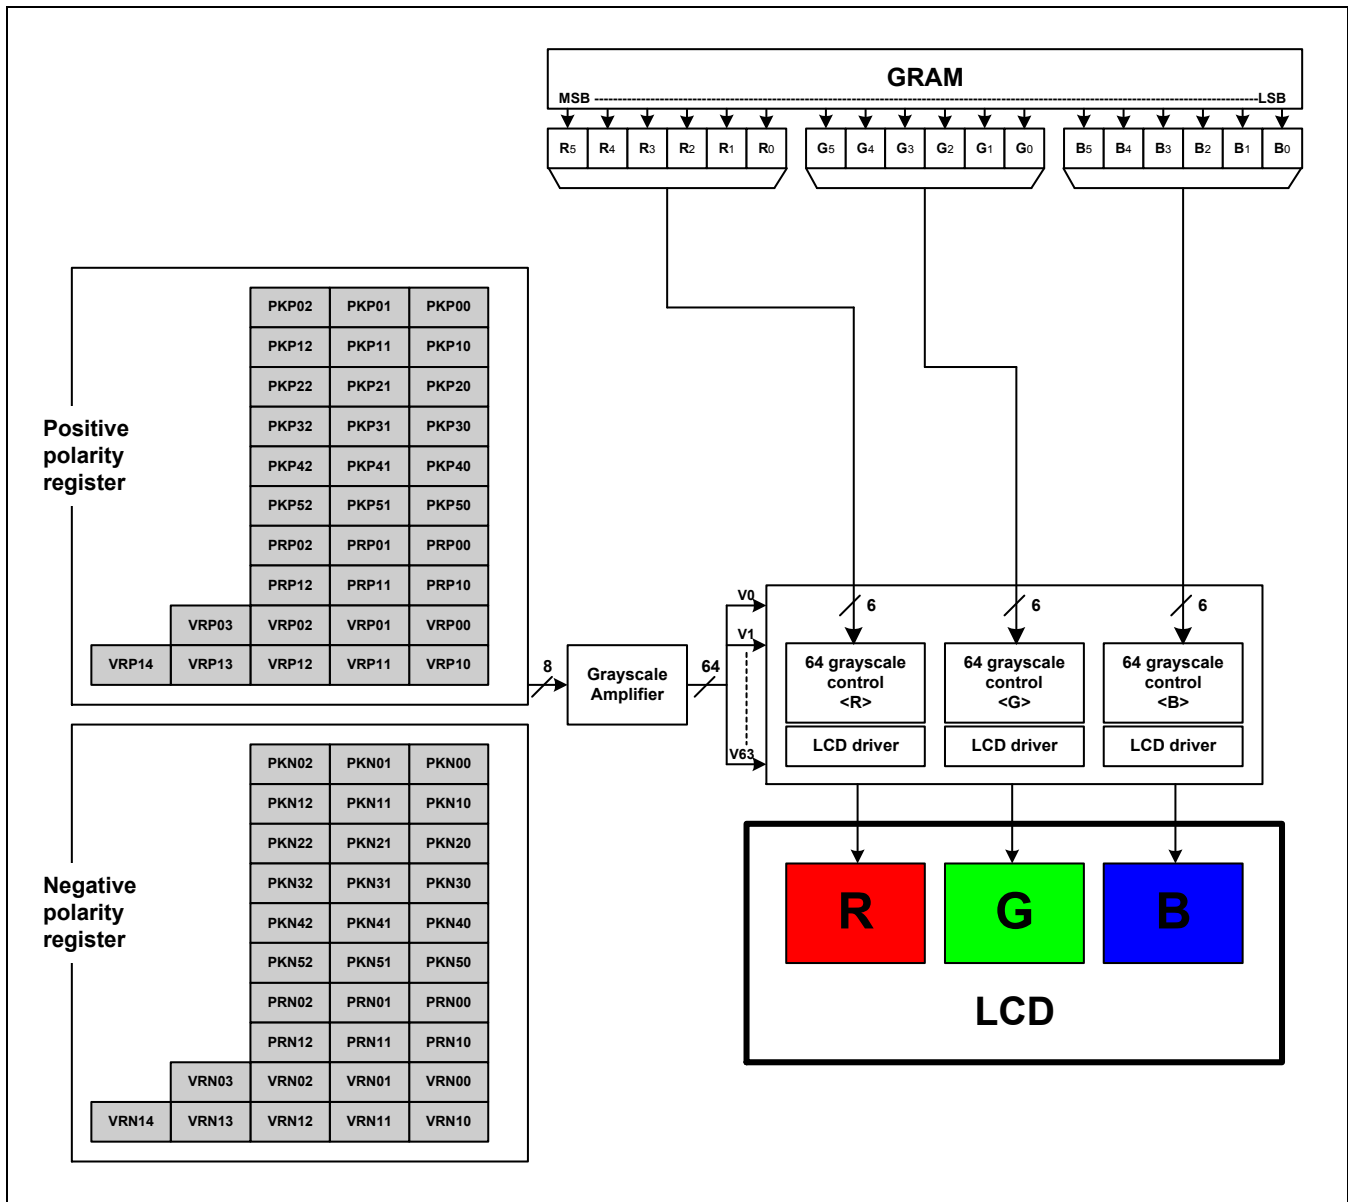

Figure 77. Grayscale control

STRUCTURE OF GRAYSCALE AMPLIFIER

The structure of the grayscale amplifier is shown as below. Determine 8-level (VIN0-VIN7) by the gradient adjuster and the micro adjustment register. The internal ladder resistor splits each level and level between V0 to V63 is generated.

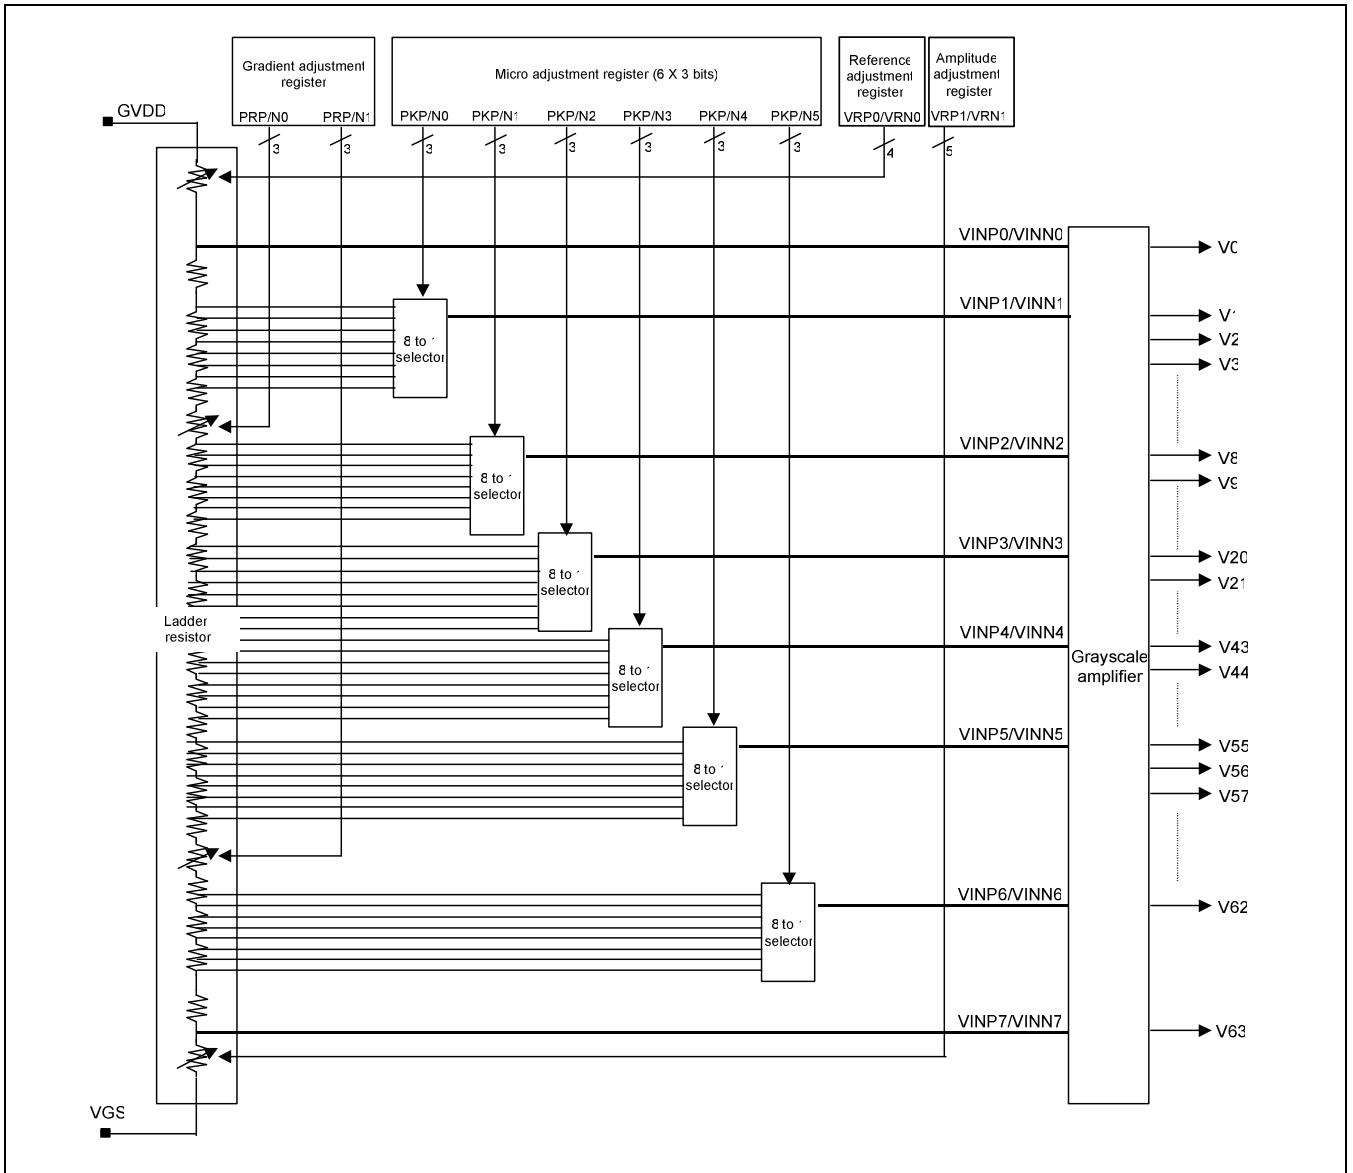

Figure 78. Structure of grayscale amplifier

Figure 79. Structure of Ladder / 8 to 1 selector

GAMMA ADJUSTMENT REGISTER

This block has the register to set up the grayscale voltage adjusting to the gamma specification of the LCD panel. These registers can independently set up to positive/negative polarities and there are 4 types of register groups to adjust gradient and amplitude on number of the grayscale, characteristics of the grayscale voltage. (average <R><G> are common.) The following figure indicates the operation of each adjusting register.

Figure 80. The operation of adjusting register

a) Gradient adjustment resistor

The gradient adjustment resistors are used to adjust the gradient in the middle of the grayscale characteristics for the voltage without changing the dynamic range. To accomplish the adjustment, it controls the variable resistor (VRHP(N) / VRLP(N)) of the ladder resistor for the grayscale voltage generator. Also, there is an independent resistor on the positive/negative polarities in order for corresponding to asymmetry drive.

b) Amplitude adjustment resistor

The amplitude-adjusting resistor is to adjust amplitude of the grayscale voltage. To accomplish the adjustment, it controls the variable resistor (VRP(N)1) of the ladder resistor for the grayscale voltage generator located at lower side of the ladder resistor. (Adjust upper side by input GVDD level.) Also, there is an independent resistor on the positive/negative polarities as well as the gradient-adjusting resistor.

c) Reference adjustment resistor

The Reference-adjusting resistor is to adjust reference of the grayscale voltage. To accomplish the adjustment, it controls the variable resistor (VRP(N)0) of the ladder resistor for the grayscale voltage generator located at upper side of the ladder resistor.

d) Micro adjustment resistor

The micro adjustment resistor is to make subtle adjustment of the grayscale voltage level. To accomplish the adjustment, it controls the each reference voltage level by the 8 to 1 selector towards the 8-leveled reference voltage generated from the ladder resistor. Also, there is an independent resistor on the positive/negative polarities as well as other adjusting resistors.

Table 37. Gamma correction registers

Register	Positive polarity	Negative polarity	Set-up contents
Gradient adjustment	PRP0[2:0]	PRN0[2:0]	Variable resistor VRHP(N)
	PRP1[2:0]	PRN1[2:0]	Variable resistor VRLP(N)
Amplitude adjustment	VRP1[4:0]	VRN1[4:0]	Variable resistor VRP(N)1
Reference adjustment	VRP0[3:0]	VRN0[3:0]	Variable resistor VRP(N)0
Micro-adjustment	PKP0[2:0]	PKN0[2:0]	The voltage of grayscale number 1 is selected by the 8 to 1 selector
	PKP1[2:0]	PKN1[2:0]	The voltage of grayscale number 8 is selected by the 8 to 1 selector
	PKP2[2:0]	PKN2[2:0]	The voltage of grayscale number 20 is selected by the 8 to 1 selector
	PKP3[2:0]	PKN3[2:0]	The voltage of grayscale number 43 is selected by the 8 to 1 selector
	PKP4[2:0]	PKN4[2:0]	The voltage of grayscale number 55 is selected by the 8 to 1 selector
	PKP5[2:0]	PKN5[2:0]	The voltage of grayscale number 62 is selected by the 8 to 1 selector

LADDER RESISTOR/8 TO 1 SELECTOR

This block outputs the reference voltage of the grayscale voltage. There are two ladder resistors including the variable resistor and the 8 to 1 selector selecting voltage generated by the ladder resistance voltage. The variable and 8 to 1 resistors are controlled by the gamma resistor. Also, there are pins that connect to the external volume resistor. In addition, it allows compensating the dispersion of length between one panel to another.

VARIABLE RESISTOR

There are 3 types of the variable resistors that is for the gradient adjustment (VRHP(N) / VRLP(N)), for the reference adjustment (VRP(N)0) and for the amplitude adjustment (VRP(N)1). The resistance value is set by the gradient adjusting resistor and the amplitude adjustment resistor as below.

Table 38. Gradient Adjustment (1)

THE 8 TO 1 SELECTOR

In the 8 to 1 selector, the voltage level must be selected given by the ladder resistance and the micro-adjusting register. And output the voltage the six types of the reference voltage, the VIN1- to VIN6.

Following table explains the relationship between the micro-adjusting register and the selecting voltage.

Table 42. Relationship between Micro-adjustment Register and Selected Voltage

Register value PKP(N) [2:0]	Selected voltage					
	VINP(N)1	VINP(N)2	VINP(N)3	VINP(N)4	VINP(N)5	VINP(N)6

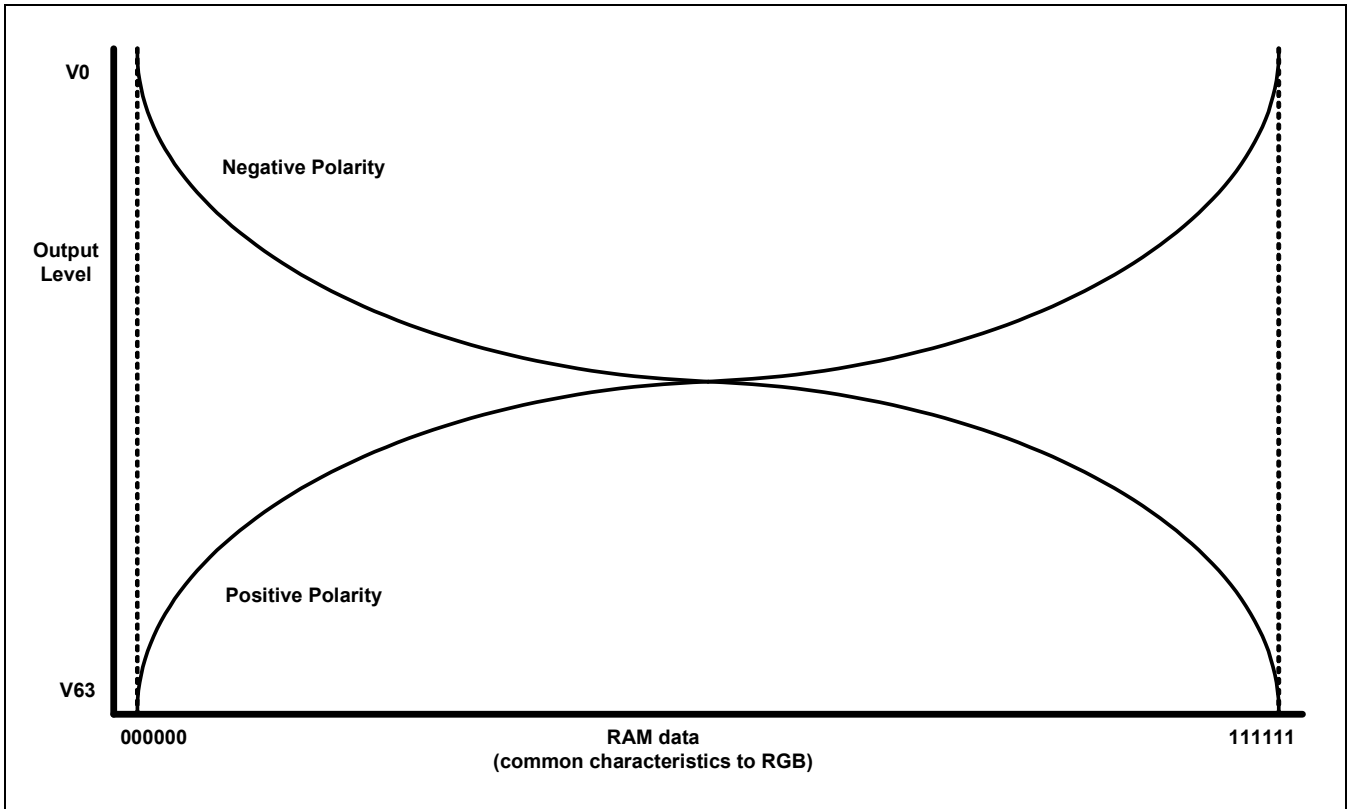

Figure 81. Relationship between RAM data and output voltage

Figure 82. Relationship between source output and VCOM

THE 8-COLOR DISPLAY MODE

The S6D0128 incorporates 8-color display mode. The grayscale levels (V0~V63) are all halt. So that it attempts to lower power consumption.

During the 8-color mode, the Gamma micro adjustment register, Gradient adjustment register, Amplitude adjustment register and Reference adjustment register are invalid.

The level power supply (V0-V63) is in OFF condition during the 8-color mode in order to select AVSS/GVDD.

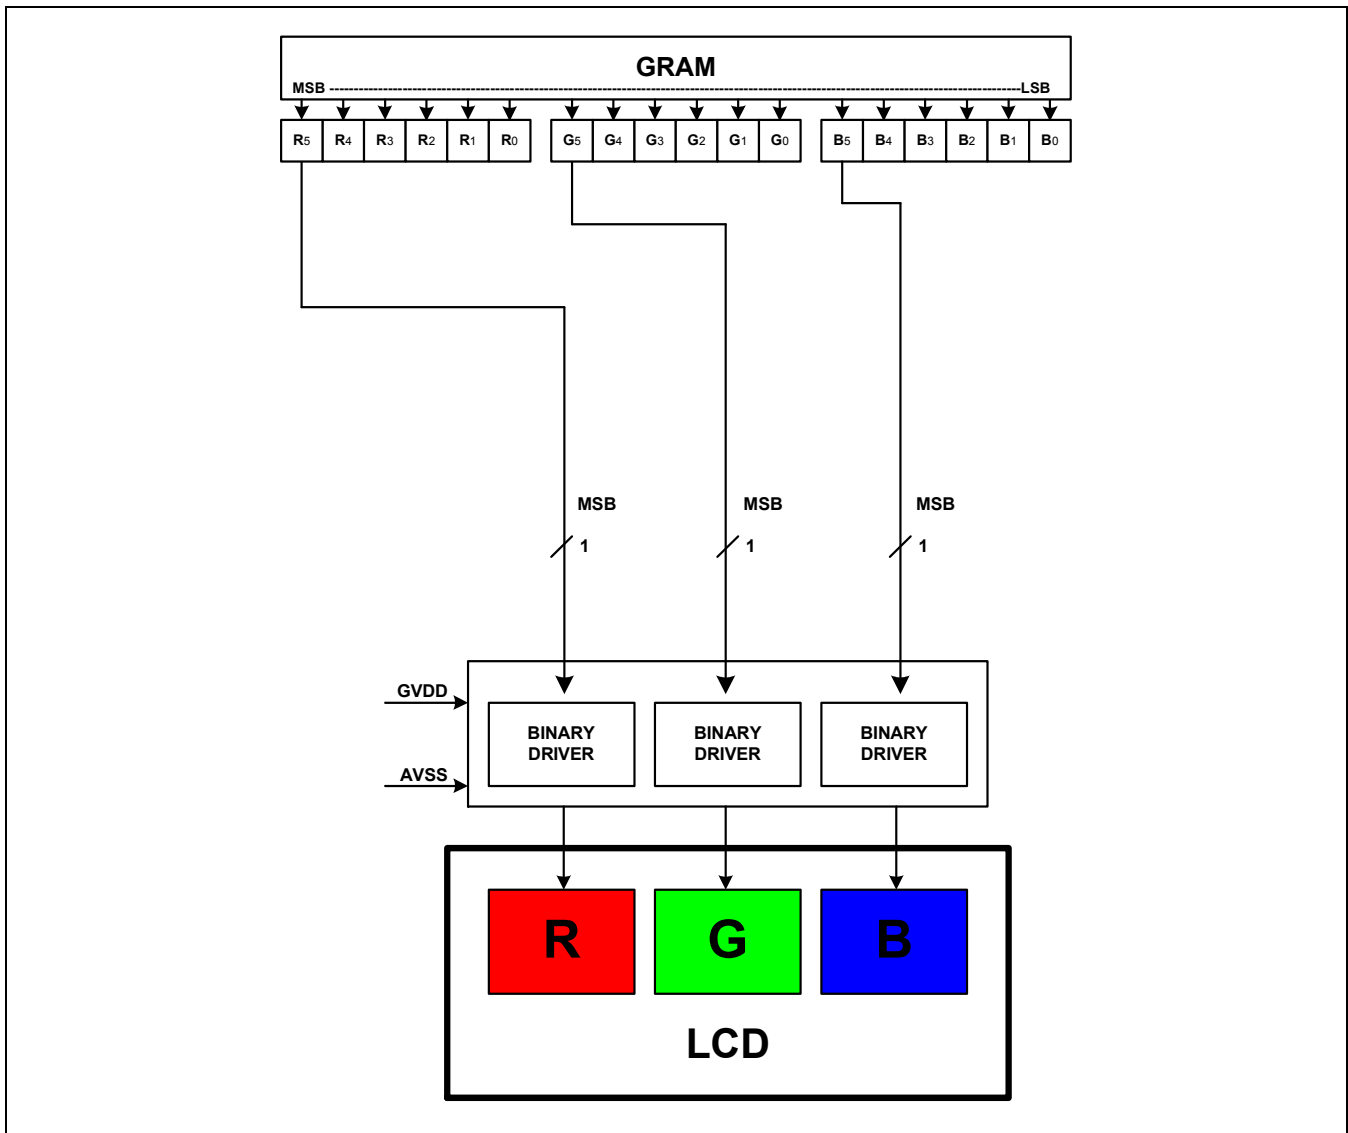

Figure 83. 8-color display control

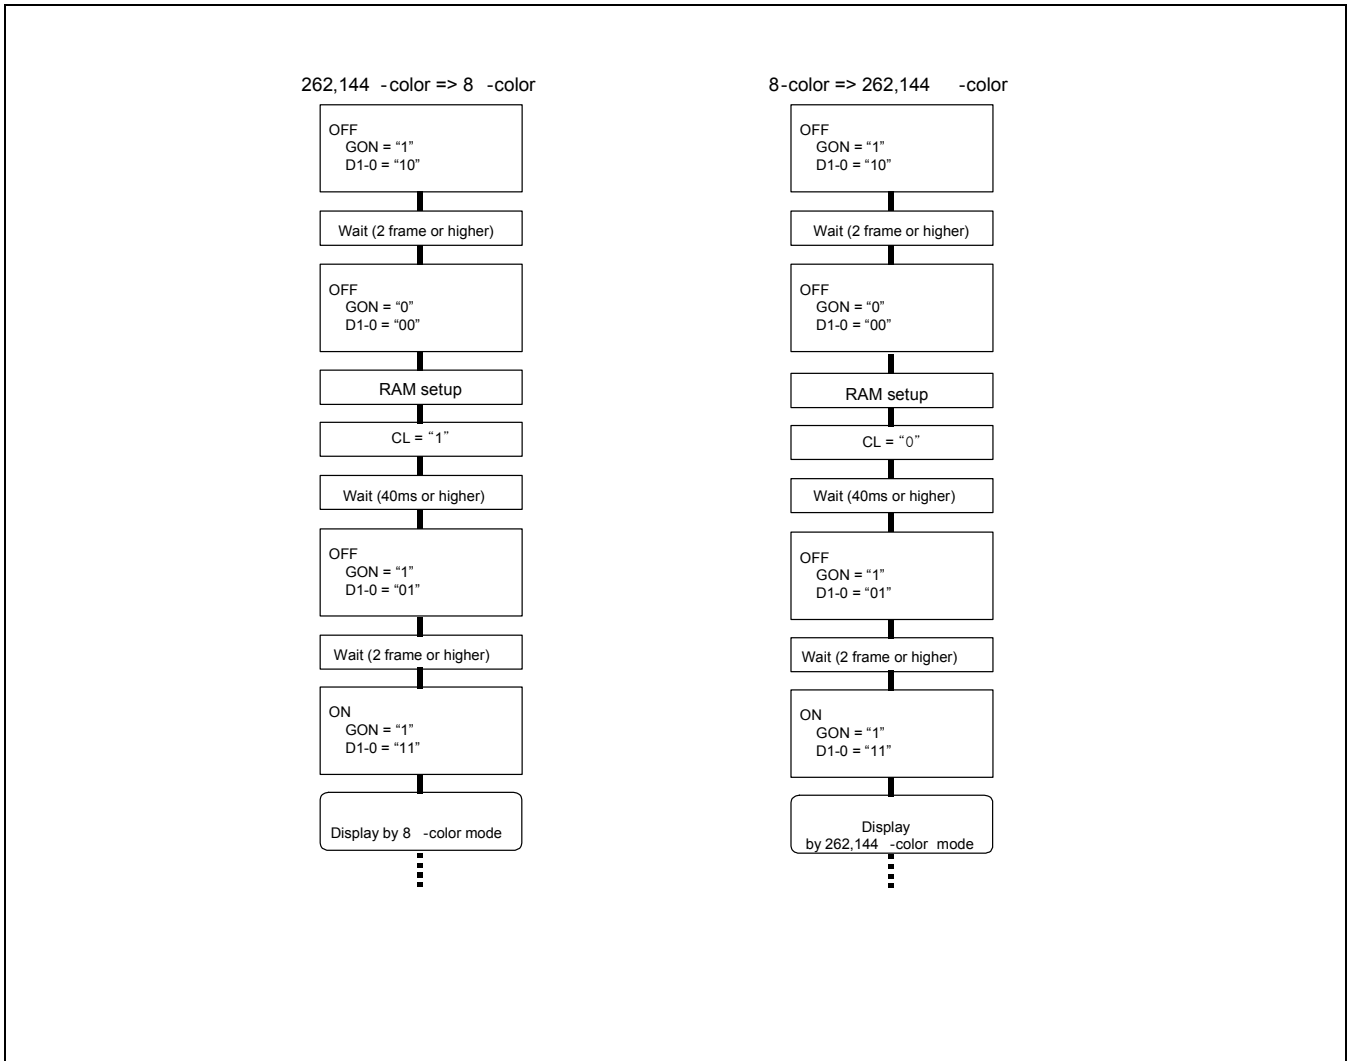

Figure 84. Set up procedure for the 8-color mode

SYSTEM STRUCTURE EXAMPLE

The following figure indicates the system structure, which composes the 176 (width) x 240 (length) dots TFT-LCD panel.

Figure 85. System structure

OSCILLATOR CIRCUIT

The S6D0128 can oscillate between the OSC1 and OSC2 pins using an internal R-C oscillator with an external oscillator resistor. Note that in R-C oscillation, the oscillator frequency is changed according to the external resistor value, wiring length, or operating power-supply voltage. If R_f is increased or power supply voltage is decrease, the oscillation frequency decreases. For the relationship between R_f resistor value and oscillation frequency, see the Electric Characteristics Notes section.

Figure 86. Oscillation Circuit

1-RASTER-ROW REVERSED AC DRIVE

The S6D0128 supports not only the LCD reversed AC drive in a one-frame unit but also the one-raster-row reversed AC drive which alternates in a one-raster-row unit. When a problem affecting display quality occurs, the one-raster-row reversed AC drive can improve the quality.

Figure 87. Example of an AC signal under one-raster-row reversed AC drive (FP=2, BP=14)

FRAME FREQUENCY ADJUSTING FUNCTION

The S6D0128 has an on-chip frame-frequency adjustment function. The frame frequency can be adjusted by the instruction setting (DIV, RTN) during the LCD driver as the oscillation frequency is always same.

If the oscillation frequency is set to high, animation or a static image can be displayed in suitable ways by changing the frame frequency. When a static image is displayed, the frame frequency can be set low and the low-power consumption mode can be entered. When high-speed screen switching for an animated display, etc. is required, the frame frequency can be set high.

RELATIONSHIP BETWEEN LCD DRIVE DUTY AND FRAME FREQUENCY

The relationships between the LCD drive duty and the frame frequency is calculated by the following expression. The frame frequency can be adjusted in the 1H period adjusting bit (RTN) and in the operation clock division bit (DIV) by the instruction.

$$\text{Frame Frequency} = \frac{f_{\text{osc}}}{\text{Clock cycles per raster-row} \times \text{division ratio} \times (\text{Line} + \text{B})} \text{ [Hz]}$$

f_{osc} : R-C oscillation frequency

Line: Number of raster-rows (NL bit)

Clock cycles per raster-row: RTN bit

Division ratio: DIV bit

B: Blank period (Back porch + Front Porch)

Figure 89. Formula for the frame frequency

Example calculation

Driver raster-row: 240

1H period: 16 clock (RTN1 to 0 = 00)

Operation clock division ratio: 1 division

B: Blank period (BP + FP): 16

$$f_{\text{osc}} = 60\text{Hz} \times (0+16) \text{ clock} \times 1 \text{ division} \times (240+16) \text{ lines} = 246 \text{ [kHz]}$$

In this case, the RC oscillation frequency becomes 246 kHz. The external resistance value of the RC oscillator must be adjusted to be 246 kHz.

SCREEN-DIVISION DRIVING FUNCTION

The S6D0128 can select and drive two screens at any position with the screen-driving position registers (R14 and R15). Any two screens required for display are selectively driven and reducing LCD-driving voltage and power consumption.

For the 1st division screen, start line (SS17 to 10) and end line (SE17 to 10) are specified by the 1st screen-driving position register (R14). For the 2nd division screen, start line (SS27 to 20) and end line (SE27 to 20) are specified by the 2nd screen-driving position register (R15). The 2nd screen control is effective when the SPT bit is 1. The total count of selection-driving lines for the 1st and 2nd screens must correspond to the LCD-driving duty set value.

Figure 90. Driving on 2 screen

RESTRICTION ON THE 1ST/2ND SCREEN DRIVING POSITION REGISTER SETTINGS

The following restrictions must be satisfied when setting the start line (SS17 to 10) and end line (SE17 to 10) of the 1st screen driving position register (R42H) and the start line (SS27 to 20) and end line (SE27 to 20) of the 2nd screen driving position register (R43H) for the S6D0128. Note that incorrect display may occur if the restrictions are not satisfied.

Table 47. Restrictions on the 1st/2nd Screen Driving Position Register Setting

1st Screen Driving (SPT=0)

Register setting	Display operation
$(SE17\ to\ 10) - (SS17\ to\ 10) = NL$	Full screen display Normally displays (SE17 to 10) to (SS17 to 10)
$(SE17\ to\ 10) - (SS17\ to\ 10) < NL$	Partial display Normally displays (SE17 to 10) to (SS17 to 10) White display for all other times (RAM data is not related at all)
$(SE17\ to\ 10) - (SS17\ to\ 10) > NL$	Setting disabled

NOTE 1: $SS17\ to\ 10 \leq SE17\ to\ 10 \leq EFh$

NOTE 2: Setting SE27 to 20 and SS27 to 20 are invalid

NOTE 3: $SS17 + VL \leq F0h$

2nd Screen Driving (SPT=1)

Register setting	Display operation
$((SE17\ to\ 10) - (SS17\ to\ 10)) + ((SE27\ to\ 20) - (SS27-20)) = NL$	Full screen display Normally displays (SE27 to 20) to (SS17 to 10)
$((SE17\ to\ 10) - (SS17\ to\ 10)) + ((SE27\ to\ 20) - (SS27-20)) < NL$	Partial display Normally displays (SE27 to 20) to (SS17 to 10) White display for all other times (RAM data is not related at all)
$((SE17\ to\ 10) - (SS17\ to\ 10)) + ((SE27\ to\ 20) - (SS27-20)) > NL$	Setting disabled

NOTE 1: $SS17\ to\ 10 \leq SE17\ to\ 10 < SS27\ to\ 20 \leq SE27\ to\ 20 \leq EFh$

NOTE 2: $(SE27\ to\ 20) - (SS17\ to\ 10) \leq NL$

NOTE 3: $SS17(SS27) + VL \leq F0h$

The driver output can't be set for non-display area during the partial display. Determine based on specification of the panels.

PT1	PT0	Source output in non-display area		Gate output in Non-display area
		Positive polarity	Negative polarity	
0	0	AVSS	AVSS	Normal Scan
0	1	AVSS	GVDD	Normal Scan
1	0	GVDD	AVSS	Normal Scan
1	1	Hi-Z	Hi-Z	Normal Scan

Refer to the following flow to set up the partial display.

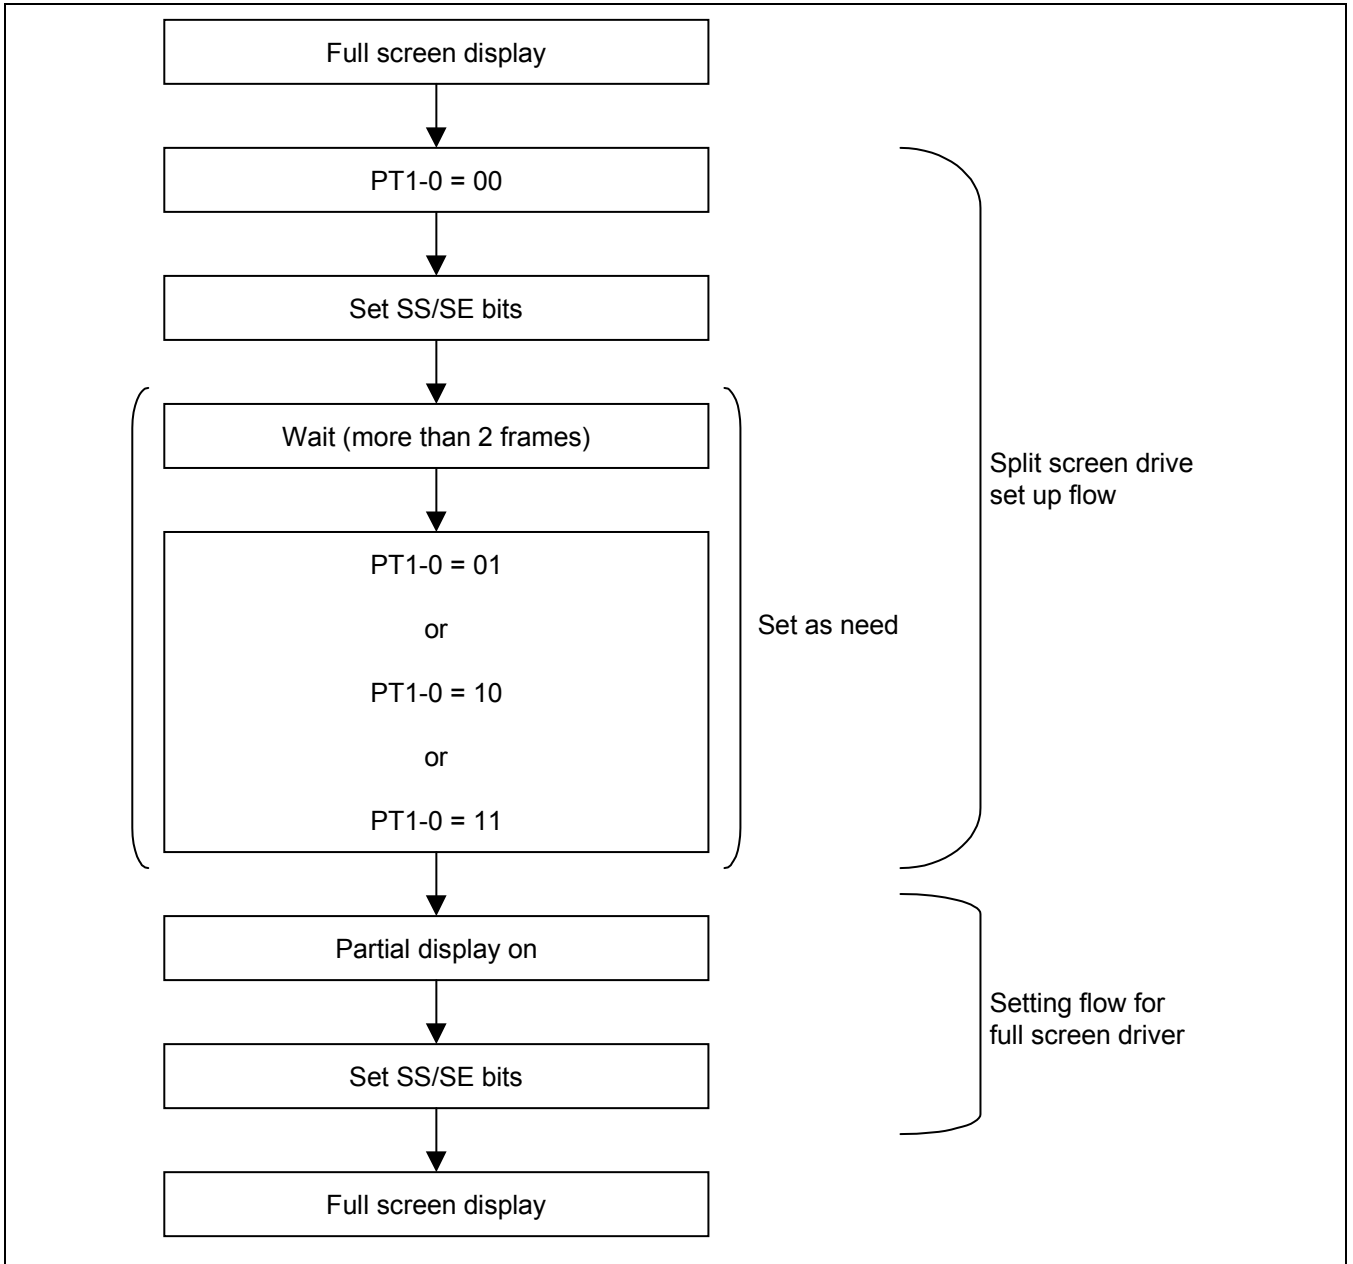

Figure 91. Partial display set up flow

APPLICATION CIRCUIT

The following figure indicates a schematic diagram of application circuit for S6D0128.

Figure 92. Application Circuit (18bit CPU interface mode)

SPECIFICATIONS

ABSOLUTE MAXIMUM RATINGS

Table 48. Absolute Maximum Rating

(VSS = 0V)

Item	Symbol	Rating	Unit
Supply voltage for Logic Block	VDD – VSS	-0.3 ~ 3.5	V
Supply voltage for I/O Block	VDD3 – VSS	-0.3 ~ 5.0	V
Supply voltage for step-up circuit	VCI – VSS	-0.3 ~ 5.0	V
LCD Supply Voltage range	AVDD - VSS	-0.3 ~ 6.5	V
	VSS - VCL	-0.3 ~ 5.0	V
	VGH – VGL	-0.3 ~ 35	V
Input Voltage range	V _{in}	-0.3 to VDD3 + 0.3	V
Operating temperature	T _{opr}	-40 ~ 85	°C
Storage temperature	T _{stg}	-55 ~ 110	°C

Notes:

1. Absolute maximum rating is the limit value beyond which the IC may be broken. They do not assure operations.
2. Operating temperature is the range of device-operating temperature. They do not guarantee chip performance.
3. Absolute maximum rating is guaranteed when our company's package used.

DC CHARACTERISTICS

Table 49. DC Characteristics

(VSS = 0V)

Characteristic	Symbol	CONDITION	MIN	TYP	MAX	Unit	Note
Operating voltage	VDD		1.65	1.8	1.95	V	*1
	VDD3		1.65	-	3.3	V	*0, *1
LCD driving voltage	VGH		7.0	-	16.5	V	
	VGL		-13.75	-	-3.5	V	
	VCL		-2.75	-	-1.75	V	
	AVDD		4.0	-	5.5	V	
	GVDD		3.5	-	5.0	V	
Input high voltage	V _{IH}		0.8*VDD3		VDD3		*2
Input low voltage	V _{IL}		0.0		0.2*VDD3		*2
Output high voltage	V _{OH}	I _{OH} = -0.5mA	0.7*VDD3		VDD3		*3
Output low voltage	V _{OL}	I _{OL} = 0.5mA	0.0	-	0.3*VDD3		*3
Input leakage current	I _{IL}	VIN = VSS or VDD3	-1.0		1.0		*2
Output leakage current	I _{OL}	VIN = VSS or VDD3	-3.0		3.0		*3
Operating frequency	fosc	Frame freq. = 60 Hz Display line = 240 Temp. = 25°C VDD = 1.8V	221.4	246	270.6	kHz	*4
Internal reference power supply voltage	VCI		2.5		3.3	V	
Internal generated logic supply voltage	RVDD		1.65	1.8	1.95	V	
1 st step-up output efficiency	AVDD	I _{LOAD} = 2.5 mA	90	95	100	%	
2 nd step-up output efficiency	VGH	I _{LOAD} = 0.2 mA	90	95	100	%	
3 rd step-up output efficiency	VGL	I _{LOAD} = 0.2 mA	90	95	100	%	
4 th step-up output efficiency	VCL	I _{LOAD} = 0.3 mA	90	95	100	%	

Notes:

0. When VDD3 = 1.65 to 1.95 [V], VDD = VDD3 (No using Internal Regulator, PREGB = "VDD3")
When VDD3 > 1.95 [V] (Using Internal Regulator, PREGB = "VSS")

- VSS = 0V.
- Applied pins; IM3-0, CSB, E_RDB, RW_WRB, RS, DB0 to DB17, RESETB.
- Applied pins; DB0 to DB17
- Target frame frequency = 60 Hz, Display line = 240, Back porch = 8, Front porch = 8
RTN1-0 = "00", DIV1-0 = "00"

(You can measure OSC2 (fosc) or CL1 (fosc / 16))

fosc range can be changed by module condition. The oscillation frequency is changed according to the external resistance value, wiring length, or operating power-supply voltage.

Table 50. DC Characteristics for LCD driver outputs

(VDD = 1.8V, VDD3 = 3.0V, VSS = 0V)

Characteristic	Symbol	CONDITION	MIN	TYP	MAX	Unit	Note
LCD gate driver output On resistance	Ron	VGH-VGL=30V, VGH=16.5V, VGL=-13.5V	-	-	2	kΩ

Write data hold time		t _{WDH68}	15	-	
Read data delay time		t _{RDD68}	-	200	
Read data hold time		t _{RDH68}	5	-	

Figure 94. AC characteristics (68 Mode)

Table 52. Parallel Write Interface Characteristics (80 Mode)(VDD = 1.8V, VDD3 = 1.65 to 3.3V, T_A = -40 to +85°C)

Characteristic		Symbol	Specification		Unit
			Min.	Max.	
Cycle time	Write	tCYCW80	100	-	ns
	Read	tCYCR80	500	-	
Pulse rise / fall time		tR, tF	-	25	
Pulse width low	Write	tWLW80	40	-	
	Read	tWLR80	250	-	
Pulse width high	Write	tWHW80	40	-	
	Read	tWHR80	200	-	
RW, RS and CSB setup time		tAS80	10	-	
RW, RS and CSB hold time		tAH80	2	-	
Write data setup time		tWDS80	60	-	
Write data hold time		tWDH80	15	-	
Read data delay time		tRDD80	-	200	
Read data hold time		tRDH80	5	-	

Figure 95. AC characteristics (80 Mode)

Table 53. Clock Synchronized Serial Write Mode Characteristics(VDD = 1.8V, VDD3 = 1.65 to 3.3V, T_A = -40 to +85°C)

Characteristic	Symbol	specification		Unit
		Min.	Max.	
Serial clock cycle time	tscyc	250	-	ns
Serial clock rise / fall time	t _R , t _F	-	25	ns
Pulse width high for write	tSCHW	40	-	ns
Pulse width high for read	tSCHR	230	-	ns
Pulse width low for write	tSCLW	60	-	ns
Pulse width low for read	tSCLR	230	-	ns
Chip Select setup time	tCSS	20	-	ns
Chip Select hold time	tCSH	60	-	ns
Serial input data setup time	tSIDS	30	-	ns
Serial input data hold time	tSIDH	30	-	ns
Serial output data delay time	tSODD	-	130	ns
Serial output data hold time	tSODH	5	-	ns

Table 54. Reset Timing Characteristics(VDD = 1.8V, VDD3 = 1.65 to 3.3V, T_A = -40 to +85°C)

Characteristic	Symbol	Min.	Max.	Unit
Reset low pulse width	tRES	1	-	us

Figure 96. AC characteristics (SPI Mode)

Figure 97. AC characteristics (RESET timing)

Table 55. RGB Data Interface Characteristics

(VDD = 1.8V, VDD3 = 1.65 to 3.3V, T_A = -40 to +85°C)

Characteristic	Symbol	18/16bit RGB interface		6bit RGB interface		Unit
		Min.	Max.	Min.	Max.	
DOTCLK cycle time	tDCYC	100	-	100	-	ns
DOTCLK rise / fall time	tR, tF	-	25	-	25	
DOTCLK Pulse width high	tDCHW	40	-	40	-	
DOTCLK Pulse width low	tDCLW	40	-	40	-	
ENABLE setup time	tENS	30	-	30	-	
ENABLE hold time	tENH	20	-	20	-	
DB data setup time	tPDS	30	-	30	-	
DB data hold time	tPDH	20	-	20	-	

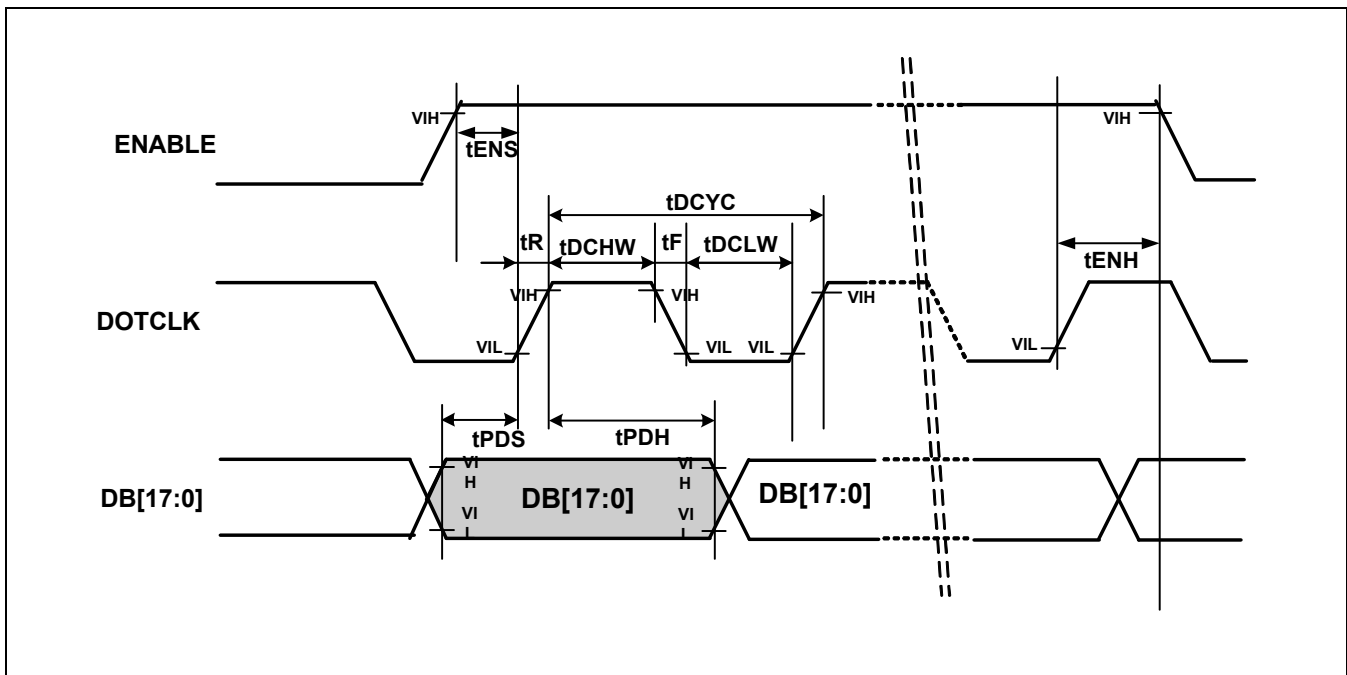

Figure 98. AC characteristics (RGB Mode)

REVISION HISTORY

Version	Content	Author	Date
0.0	Original	S.H.LIM	March 31. 2005
0.1	Page 8 - Added PAD Configuration (figure 2) Page 9 - Added S6D0128 PAD Dimension Page 10 - Added Align Key Page 11 ~ 17 - Added PAD Center Coordinates	S.H.LIM	May 17. 2005
	Page 8, 11 - Changed PAD name from "TSO0" to "TSO" Page 23 - Added Description "VCIR" Pin for test. Page 23 - Added Description "ATEST" Pin for test. Page 80 - Deleted diode between VGL and VCL in figure 28	S.H.LIM	May 27. 2005
0.2	Page 6 - Changed operating Voltage range (VDD, VDD3) in Features Page 18 - Inserted VDD comment "connected to VDDM" in regulated mode - Inserted VDDM comment "VDDM connected to VDD3" in Non-regulated mode - Inserted VDDM comment "VDDM is regulator output " in regulated mode - Inserted VDD3 comment "VDD3 is more than VDD" in VDD3 pin description - Changed VDD3 comment in VDD3 pin description Page 50 - Added comment "3. Case of Blank display " Page 84 - Changed VDD3 range in figure 33 Page 139 - Changed VDD3 range from "1.8~3.3V" to "1.65~3.3V" in table50 - Inserted Note 0 (VDD3 comment) Page 141 ~ 147 - Changed VDD3 range from "1.8~3.3V" to "1.65~3.3V" in AC Characteristics Page 6,60,61,80,81,139 - Changed GVDD range from "3.0 to 5.0V" to "3.5 to 5.0V" - Changed AVDD range from "3.5 to 5.5V" to "4.0 to 5.5V" Page 138 - Added Application Circuit	S.H.LIM	July 19. 2005

Version	Content	Author	Date
1.0	<p>Page 29~32,34~37</p> <ul style="list-style-type: none"> - Changed from "GRAM_DATA" to INPUT_DATA" <p>Page 40,41 Changed column R/W of the Instruction Table</p> <ul style="list-style-type: none"> - Changed from 0 to W - Changed from 1 to R <p>Page 40, 45, 80, 110, 131</p> <ul style="list-style-type: none"> - Deleted 3 Field-interlace function. <p>Page 40, 45, 48, 100 ..</p> <ul style="list-style-type: none"> - Deleted AM register in R03H instruction <p>Page 48</p> <ul style="list-style-type: none"> - Added BGR Description <p>Page 50 Changed REV Description</p> <ul style="list-style-type: none"> - Changed from 18'h00000 to 6'b000000 - Changed from 18'h3FFFF to 6'b111111 <p>Page 70</p> <ul style="list-style-type: none"> - Deleted the table of "GRAM Data and Grayscale level " - Added Memory data write sequence <p>Page 74</p> <ul style="list-style-type: none"> - Modified GRAM read sequence <p>Page 76</p> <ul style="list-style-type: none"> - Added Note "Number of LCD driver lines + Scanning start position < 241 " <p>Page 82</p> <ul style="list-style-type: none"> - Move Instruction setup flow from 128 page to 82 page - Modified setup flow of power (Added "wait more than 1frame" and "wait time about PON off , PON1 off") <p>Page 84</p> <ul style="list-style-type: none"> - Modified title from "Instruction setup flow " to "Setup flow of display" <p>Page136</p> <ul style="list-style-type: none"> -Added Schottky diode between VGH and VCI in Application Circuit <p>Page 137</p> <ul style="list-style-type: none"> - Changed Absolute Maximum Ratings <p>Page 138</p> <ul style="list-style-type: none"> - Added MIN & MAX value of operating frequency - Added Temp. & VDD condition of operating frequency <p>Page 138</p> <ul style="list-style-type: none"> - Changed 1st step-up output efficiency condition <p>Page 138</p> <ul style="list-style-type: none"> - Changed 2nd step-up output efficiency condition <p>Page 138</p> <ul style="list-style-type: none"> - Changed 3rd step-up output efficiency condition <p>Page 139</p> <ul style="list-style-type: none"> - Changed LCD source driver delay - Added tsd Description - Changed Current consumption value from TYP to MAX 	S.H.YUO S.H.LIM	November 2 . 2005

NOTICE

Precautions for Light

Light has characteristics to move electrons in the integrated circuitry of semiconductors, therefore may change the characteristics of semiconductor devices when irradiated with light. Consequently, the users of the packages which may expose chips to external light such as COB, COG, TCP and COF must consider effective methods to block out light from reaching the IC on all parts of the surface area, the top, bottom and the sides of the chip. Follow the precautions below when using the products.

1. Consider and verify the protection of penetrating light to the IC at substrate (board or glass) or product design stage.
2. Always test and inspect products under the environment with no penetration of light.
