

PRELIMINARY

S6E1B3 Series

32-bit ARM[®] Cortex[®]-M0+ FM0+ Microcontroller

The S6E1B3 Series is a series of highly integrated 32-bit microcontrollers designed for embedded controllers aiming at low power consumption and low cost. This series has the ARM Cortex-M0+ Processor with on-chip Flash memory and SRAM, and consists of peripheral functions such as various timers, ADC and communication interfaces (UART, CSIO (SPI), I²C, I²S, Smart Card, and USB). The products which are described in this data sheet are placed into TYPE2-M0+ product categories in "FM0+ Family Peripheral Manual".

Features

32-bit ARM Cortex-M0+ Core

- Processor version: r0p1
- Maximum operating frequency: 40.8 MHz
- Nested Vectored Interrupt Controller (NVIC): 1 NMI (non-maskable interrupt) and 24 peripheral interrupt with 4 selectable interrupt priority levels
- 24-bit System timer (Sys Tick): System timer for OS task management

Bit Band Operation

Compatible with Cortex-M3 bit band operation.

On-Chip Memory

- Flash memory
 - Up to 512 K+48 Kbytes
 - Dual bank
 - upper bank : 512 Kbytes(64 Kbytes x 8)
 - lower bank : 48 Kbytes(8K bytes x 6)
 - Read cycle: 0 wait-cycle
 - Security function for code protection
- SRAM

The on-chip SRAM of this series has one independent SRAM .

 - Up to SRAM: 60 K+4 Kbytes
 - 4Kbytes: can retain value in Deep standby Mode

USB Interface

USB interface is composed of Device and Host PLL for USB is built-in, USB clock can be generated by multiplication of Main clock.

- USB Device
 - USB 2.0 Full-Speed supported
 - Max 6 EndPoint supported
 - EndPoint 0 is control transfer
 - EndPoint 1, 2 can be selected Bulk-transfer, Interrupt-transfer or Isochronous-transfer
 - EndPoint 3 to 5 can select Bulk-transfer or Interrupt-transfer
 - EndPoint 1 to 5 comprise Double Buffer
 - The size of each EndPoint is according to the follows
 - EndPoint 0, 2 to 5 : 64 bytes
 - EndPoint 1 : 256 bytes

- USB host
 - USB 2.0 Full/Low-Speed supported
 - Bulk-transfer, Interrupt-transfer and Isochronous-transfer support
 - USB Device connected/disconnected automatically detect
 - IN/OUT token handshake packet automatically
 - Max 256-byte packet-length supported
 - Wake-up function supported

Multi-Function Serial Interface (Max 8channels)

- 128 bytes with Tx/Rx FIFO in all channels (The number of FIFO steps varies depending on the settings of the communication mode or bit length.)
- The operation mode of each channel can be selected from one of the following.
 - UART
 - CSIO (CSIO is known to many customers as SPI)
 - I²C
- UART
 - Full duplex double buffer
 - Parity can be enabled or disabled.
 - Built-in dedicated baud rate generator
 - External clock available as a serial clock
 - Various error detection functions (parity errors, framing errors, and overrun errors)
- CSIO (also known as SPI)
 - Full duplex double buffer
 - Built-in dedicated baud rate generator
 - Overrun error detection function
 - Serial chip select function (ch1 and ch3 only)
 - Data length: 5 to 16 bits
- I²C
 - Standard-mode (Max: 100 kbps) supported / Fast-mode (Max 400 kbps) supported.
- I²S
 - Using CSIO (ch.5, ch.6) and I²S clock generator
 - Supports two transfer protocol
 - I²S
 - MSB-justified
 - Master mode only

Descriptor System Data Transfer Controller (DSTC) (64 Channels)

- The DSTC can transfer data at high-speed without going via the CPU. The DSTC adopts the Descriptor
- system and, following the specified contents of the Descriptor that has already been constructed on the
- memory, can access directly the memory / peripheral device and performs the data transfer operation.
- It supports the software activation, the hardware activation, and the chain activation functions

A/D Converter (Max: 24 Channels)

- 12-bit A/D Converter
 - Successive approximation type
 - Conversion time: 2.0 μ s @ 2.7 V to 3.6 V
 - Priority conversion available (2 levels of priority)
 - Scan conversion mode
 - Built-in FIFO for conversion data storage (for scan conversion: 16 steps, for priority conversion: 4 steps)

Base Timer (Max: 8 Channels)

The operation mode of each channel can be selected from one of the following.

- 16-bit PWM timer
- 16-bit PPG timer
- 16/32-bit reload timer
- 16/32-bit PWC timer

General-Purpose I/O Port

This series can use its pin as a general-purpose I/O port when it is not used for an external bus or a peripheral function. All ports can be set to fast general-purpose I/O ports or slow general-purpose I/O ports. In addition, this series has a port relocate function that can set to which I/O port a peripheral function can be allocated.

- All ports are Fast GPIO which can be accessed by 1 cycle
- Capable of controlling the pull-up of each pin
- Capable of reading pin level directly
- Port relocate function
- Up to 102 fast general-purpose I/O ports @120-pin package
- Certain ports are 5 V tolerant.
See 4. List of Pin Functions and 5. I/O Circuit Type for the corresponding pins.

Dual Timer (32-/16-bit Down Counter)

The Dual Timer consists of two programmable 32-/16-bit down counters. The operation mode of each timer channel can be selected from one of the following.

- Free-running mode
- Periodic mode (= Reload mode)
- One-shot mode

Multi-Function Timer

The Multi-function Timer consists of the following blocks.

- 16-bit free-run timer \times 3 channels
- Input capture \times 4 channels
- Output compare \times 6 channels
- ADC start compare \times 6 channel
- Waveform generator \times 3 channels
- 16-bit PPG timer \times 3 channels

IGBT mode is contained.

The following function can be used to achieve the motor control.

- PWM signal output function
- DC chopper waveform output function
- Dead time function
- Input capture function
- ADC start function
- DTIF (motor emergency stop) interrupt function

Real-Time Clock (RTC with Vbat)

The Real-time Clock counts year/month/day/hour/minute/second/day of the week from year 01 to year 99.

- The RTC can generate an interrupt at a specific time (year/month/day/hour/minute/second/day of the week) and can also generate an interrupt in a specific year, in a specific month, on a specific day, at a specific hour or at a specific minute.
- It has a timer interrupt function generating an interrupt upon a specific time or at specific intervals.
- It can keep counting while rewriting the time.
- It can count leap years automatically.

Watch Counter

The Watch Counter wakes up the microcontroller from the low power consumption mode. The clock source can be selected from the main clock, the sub clock, the built-in high-speed CR clock or the built-in low-speed CR clock.

Interval timer: up to 64 s (sub clock: 32.768 kHz)

External Interrupt Controller Unit

- Up to 24 external interrupt input pins
- Non-maskable interrupt (NMI) input pin: 1

Watchdog Timer (2 Channels)

The watchdog timer generates an interrupt or a reset when the counter reaches a time-out value.

This series consists of two different watchdogs, hardware watchdog and software watchdog.

The hardware watchdog timer is clocked by the built-in low-speed CR oscillator. Therefore, the hardware watchdog is

active in any low-power consumption modes except RTC, Stop, Deep standby RTC and Deep standby Stop mode.

CRC (Cyclic Redundancy Check) Accelerator

The CRC accelerator calculates the CRC which has a heavy software processing load, and achieves a reduction of the integrity check processing load for reception data and storage.

- CCITT CRC16 and IEEE-802.3 CRC32 are supported.
 - CCITT CRC16 Generator Polynomial: 0x1021
 - IEEE-802.3 CRC32 Generator Polynomial: 0x04C11DB7

HDMI-CEC/Remote Control Receiver (Up to 2 Channels)

- HDMI-CEC transmitter
 - Header block automatic transmission by judging Signal free
 - Generating status interrupt by detecting Arbitration lost
 - Generating START, EOM, ACK automatically to output CEC transmission by setting 1 byte data
 - Generating transmission status interrupt when transmitting 1 block (1 byte data and EOM/ACK)
- HDMI-CEC receiver
 - Automatic ACK reply function available
 - Line error detection function available
- Remote control receiver
 - 4 bytes reception buffer
 - Repeat code detection function available

Smart Card Interface

- Compliant with ISO7816-3 specification
- Card Reader only/B class card only
- Available protocols
 - Transmitter: 8E2, 8O2, 8N2
 - Receiver: 8E1, 8O1, 8N2, 8N1, 9N1
 - Inverse mode
- TX/RX FIFO integrated (RX: 16-bytes, TX:16-bytes)

Clock and Reset

- Clocks

A clock can be selected from five clock sources (two external oscillators, two built-in CR oscillator, and main PLL).

 - Main clock: 4 MHz to 40 MHz
 - Sub clock: 32.768 kHz
 - Built-in high-speed CR clock: 4 MHz
 - Built-in low-speed CR clock: 100 kHz
 - Main PLL clock
- Resets
 - Reset request from the INITX pin
 - Power on reset
 - Software reset
 - Watchdog timer reset
 - Low-voltage detection reset
 - Clock supervisor reset

Clock Supervisor (CSV)

The Clock Supervisor monitors the failure of external clocks with a clock generated by a built-in CR oscillator.

- If an external clock failure (clock stop) is detected, a reset is asserted.
- If an external frequency anomaly is detected, an interrupt or a reset is asserted.

Low-Voltage Detector (LVD)

This series monitors the voltage on the VCC pin with a 2-stage mechanism. When the voltage falls below a designated voltage, the Low-voltage Detector generates an interrupt or a reset.

- LVDR: monitor V_{CC} and auto-reset operation
- LVD1: monitor V_{CC} and error reporting via an interrupt
- LVD2: selectable to monitor V_{CC} or LVDI and error reporting via an interrupt

Low Power Consumption Mode

This series has six low power consumption modes.

- Sleep
- Timer
- RTC
- Stop
- Deep standby RTC (selectable between keeping the value of RAM and not)
- Deep standby Stop (selectable between keeping the value of RAM and not)

Peripheral Clock Gating

The system can reduce the current consumption of the total system with gating the operation clocks of peripheral functions not used.

VBAT

The consumption power during the RTC operation can be reduced by supplying the power supply independent VBAT pin. RTC (calendar circuit) / 32 kHz oscillation circuit. The following circuit can also be used.

- RTC
- 32 kHz oscillation circuit
- Power-on circuit
- Back up register: 32 bytes
- Port circuit

Debug

- Serial Wire Debug Port (SW-DP)
- Micro Trace Buffer (MTB)

Unique ID

A 41-bit unique value of the device has been set.

Power Supply

- Wide voltage range:
 - VCC = 1.65V to 3.6 V
 - VCC = 3.0V to 3.6V (when USB is used)
- Power supply for VBAT: VBAT = 1.65 V to 3.6 V

List of Pin Functions

The number after the underscore ("_") in a pin name such as XXX_1 and XXX_2 indicates the relocated port number. The channel on such pin has multiple functions, each of which has its own pin name. Use the Extended Port Function Register (EPFR) to select the pin to be used.

6. Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Spansion semiconductor devices.

6.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

(1) Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

(2) Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device.

Therefore, avoid this type of connection.

(3) Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

Latch-Up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNP junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

CAUTION: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

- (1) Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
- (2) Be sure that abnormal current flows do not occur during the power-on sequence.

Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

Precautions Related to Usage of Devices

Spanion semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

6.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Spanion's recommended conditions. For detailed information about mount conditions, contact your sales representative.

Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Spanion recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Spansion recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Spansion ranking of recommended conditions.

Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

- (1) Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product.
Store products in locations where temperature changes are slight.
- (2) Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5 °C and 30 °C.
When you open Dry Package that recommends humidity 40% to 70% relative humidity.
- (3) When necessary, Spansion packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
- (4) Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Spansion recommended conditions for baking.

Condition: 125°C/24 h

Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

- (1) Maintain relative humidity in the working environment between 40% and 70%.
Use of an apparatus for ion generation may be needed to remove electricity.
- (2) Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
- (3) Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
- (4) Ground all fixtures and instruments, or protect with anti-static measures.
- (5) Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

6.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

(1) Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

(2) Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

(3) Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

(4) Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

(5) Smoke, Flame

CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Spansion products in other special environmental conditions should consult with sales representatives.

7. Handling Devices

Power Supply Pins

In products with multiple VCC and VSS pins, respective pins at the same potential are interconnected within the device in order to prevent malfunctions such as latch-up. However, all of these pins should be connected externally to the power supply or ground lines in order to reduce electromagnetic emission levels, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating.

Moreover, connect the current supply source with each Power supply pin and GND pin of this device at low impedance. It is also advisable that a ceramic capacitor of approximately 0.1 μF be connected as a bypass capacitor between each Power supply pin and GND pin, between AVCC pin and AVSS pin near this device.

Stabilizing Supply Voltage

A malfunction may occur when the power supply voltage fluctuates rapidly even though the fluctuation is within the recommended operating conditions of the VCC power supply voltage. As a rule, with voltage stabilization, suppress the voltage fluctuation so that the fluctuation in VCC ripple (peak-to-peak value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the VCC value in the recommended operating conditions, and the transient fluctuation rate does not exceed 0.1 V/ μs when there is a momentary fluctuation on switching the power supply.

Crystal Oscillator Circuit

Noise near the X0/X1 and X0A/X1A pins may cause the device to malfunction. Design the printed circuit board so that X0/X1, X0A/X1A pins, the crystal oscillator, and the bypass capacitor to ground are located as close to the device as possible.

It is strongly recommended that the PC board artwork be designed such that the X0/X1 and X0A/X1A pins are surrounded by ground plane as this is expected to produce stable operation.

Evaluate oscillation of your using crystal oscillator by your mount board.

Sub Crystal Oscillator

This series sub oscillator circuit is low gain to keep the low current consumption. The crystal oscillator to fill the following conditions is recommended for sub crystal oscillator to stabilize the oscillation.

■ Surface mount type

Size: More than 3.2 mm \times 1.5 mm

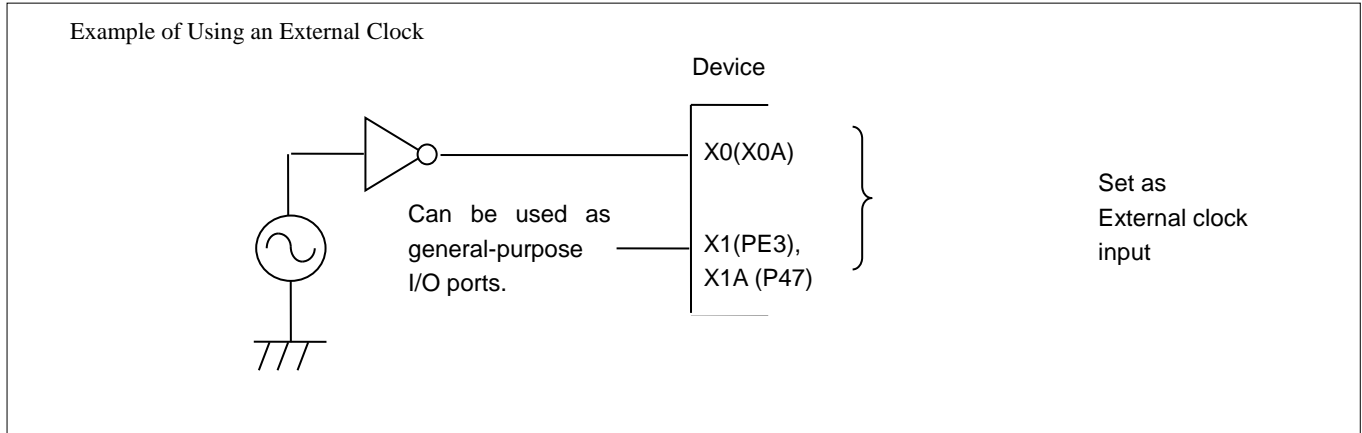

Load capacitance: Approximately 6 pF to 7 pF

■ Lead type

Load capacitance: Approximately 6 pF to 7 pF

Using an External Clock

When using an external clock as an input of the main clock, set X0/X1 to the external clock input, and input the clock to X0. X1(PE3) can be used as a general-purpose I/O port. Similarly, when using an external clock as an input of the sub clock, set X0A/X1A to the external clock input, and input the clock to X0A. X1A (P47) can be used as a general-purpose I/O port.

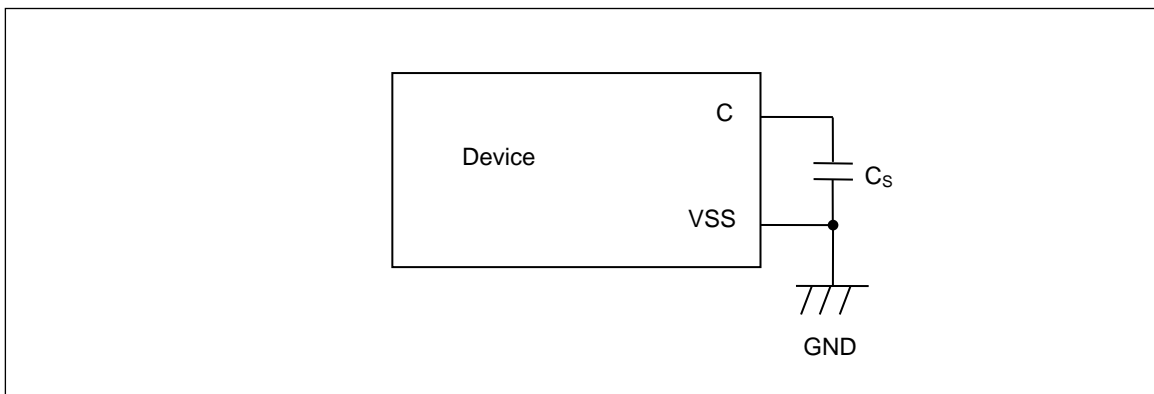

Handling when Using Multi-Function Serial Pin as I²C Pin

If it is using the multi-function serial pin as I²C pins, P-ch transistor of digital output is always disabled. However, I²C pins need to keep the electrical characteristic like other pins and not to connect to the external I²C bus system with power OFF.

C Pin

This series contains the regulator. Be sure to connect a smoothing capacitor (C_s) for the regulator between the C pin and the GND pin. Please use a ceramic capacitor or a capacitor of equivalent frequency characteristics as a smoothing capacitor. However, some laminated ceramic capacitors have the characteristics of capacitance variation due to thermal fluctuation (F characteristics and Y5V characteristics). Please select the capacitor that meets the specifications in the operating conditions to use by evaluating the temperature characteristics of a capacitor. A smoothing capacitor of about 4.7 μF would be recommended for this series.

Mode Pins (MD0)

Connect the MD pin (MD0) directly to VCC or VSS pins. Design the printed circuit board such that the pull-up/down resistance stays low, as well as the distance between the mode pins and VCC pins or VSS pins is as short as possible and the connection impedance is low, when the pins are pulled-up/down such as for switching the pin level and rewriting the Flash memory data. It is because of preventing the device erroneously switching to test mode due to noise.

Notes on Power-on

Turn power on/off in the following order or at the same time.

Turning on : VBAT → VCC
 VCC → AVCC → AVRH
Turning off : VCC → VBAT
 AVRH → AVCC → VCC

Serial Communication

There is a possibility to receive wrong data due to the noise or other causes on the serial communication.

Therefore, design a printed circuit board so as to avoid noise.

Consider the case of receiving wrong data due to noise; perform error detection such as by applying a checksum of data at the end.

If an error is detected, retransmit the data.

Differences in Features Among the Products with Different Memory Sizes and Between Flash Memory Products and MASK Products

The electric characteristics including power consumption, ESD, latch-up, noise characteristics, and oscillation characteristics among the products with different memory sizes and between Flash memory products and MASK products are different because chip layout and memory structures are different.

If you are switching to use a different product of the same series, please make sure to evaluate the electric characteristics.

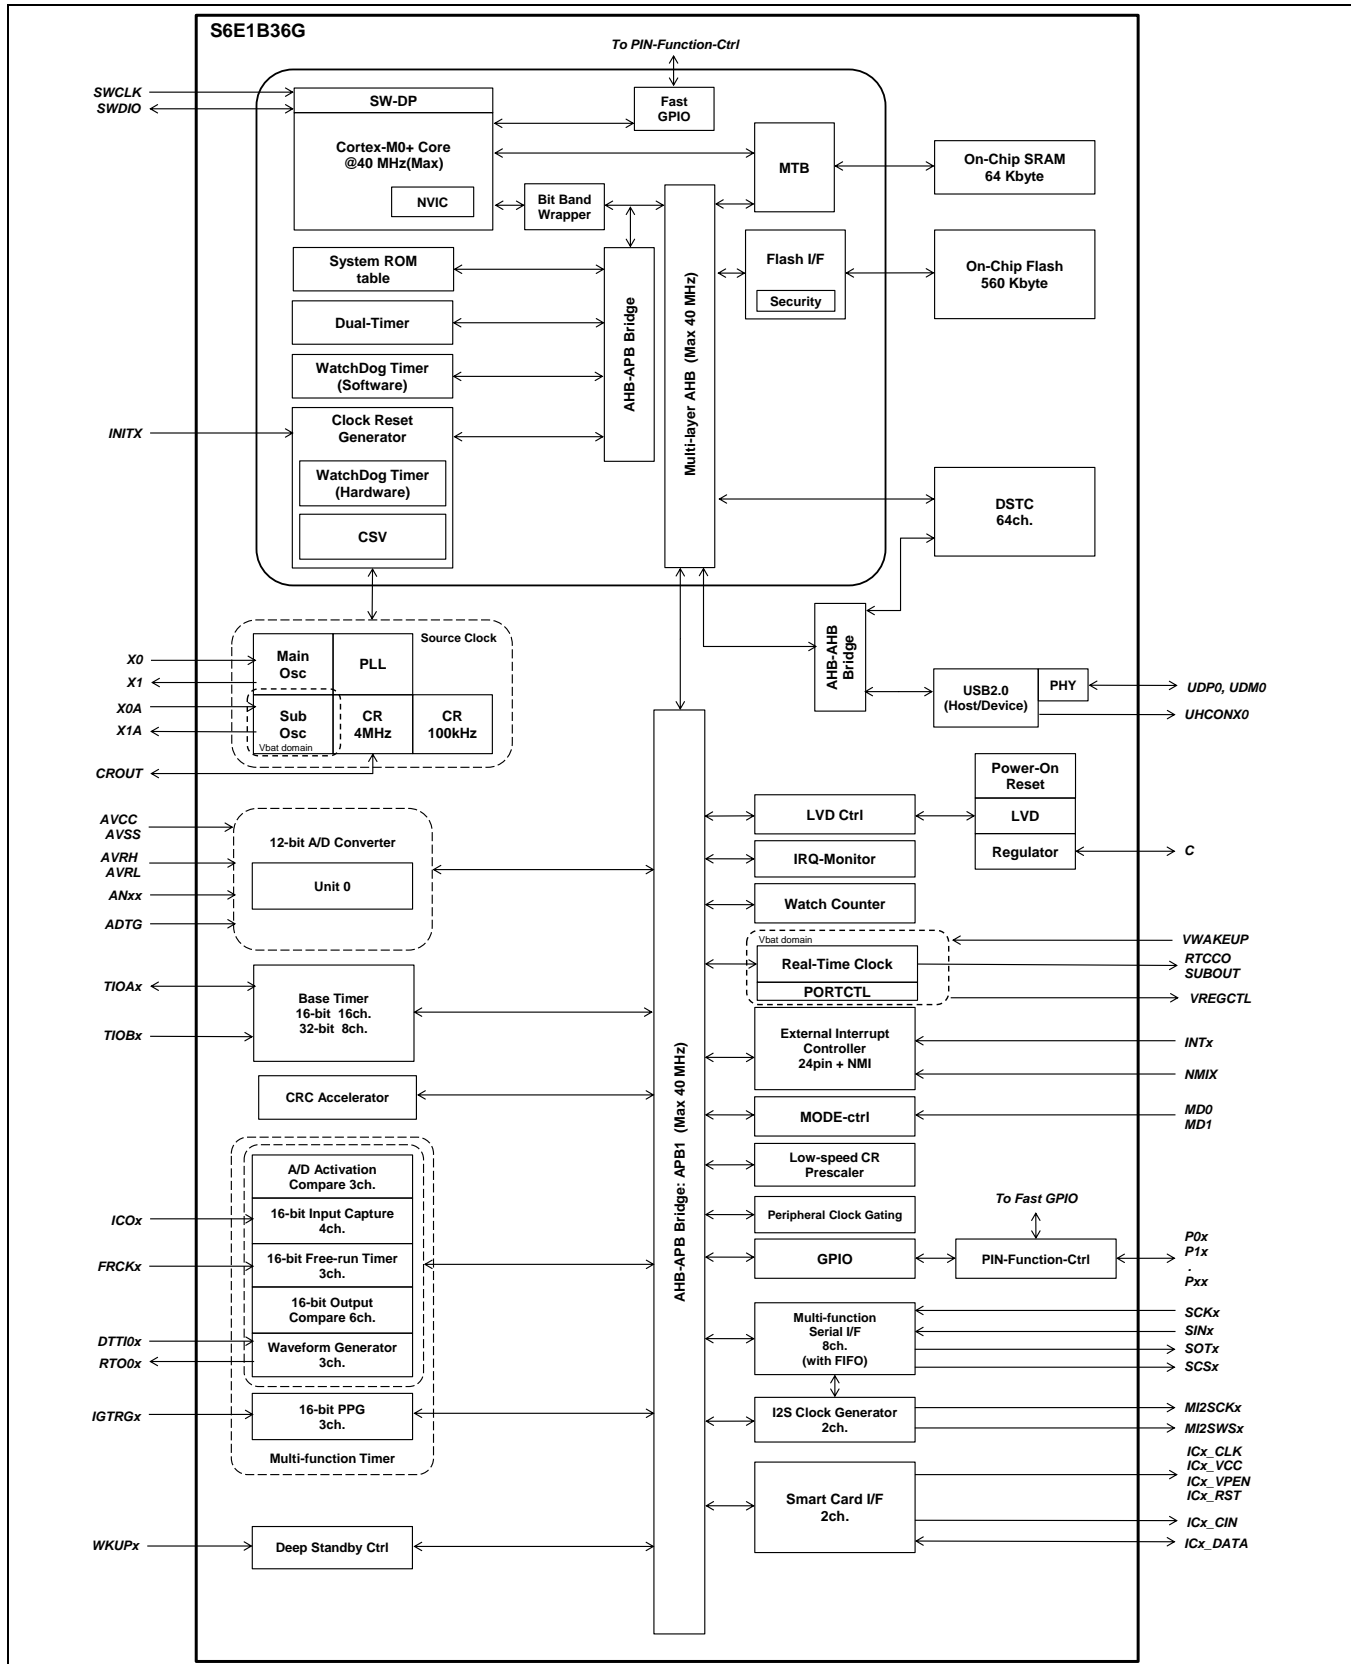

Pull-Up Function of 5 V Tolerant I/O

Please do not input the signal more than VCC voltage at the time of Pull-Up function use of 5 V tolerant I/O.

Handling when Using Debug Pins

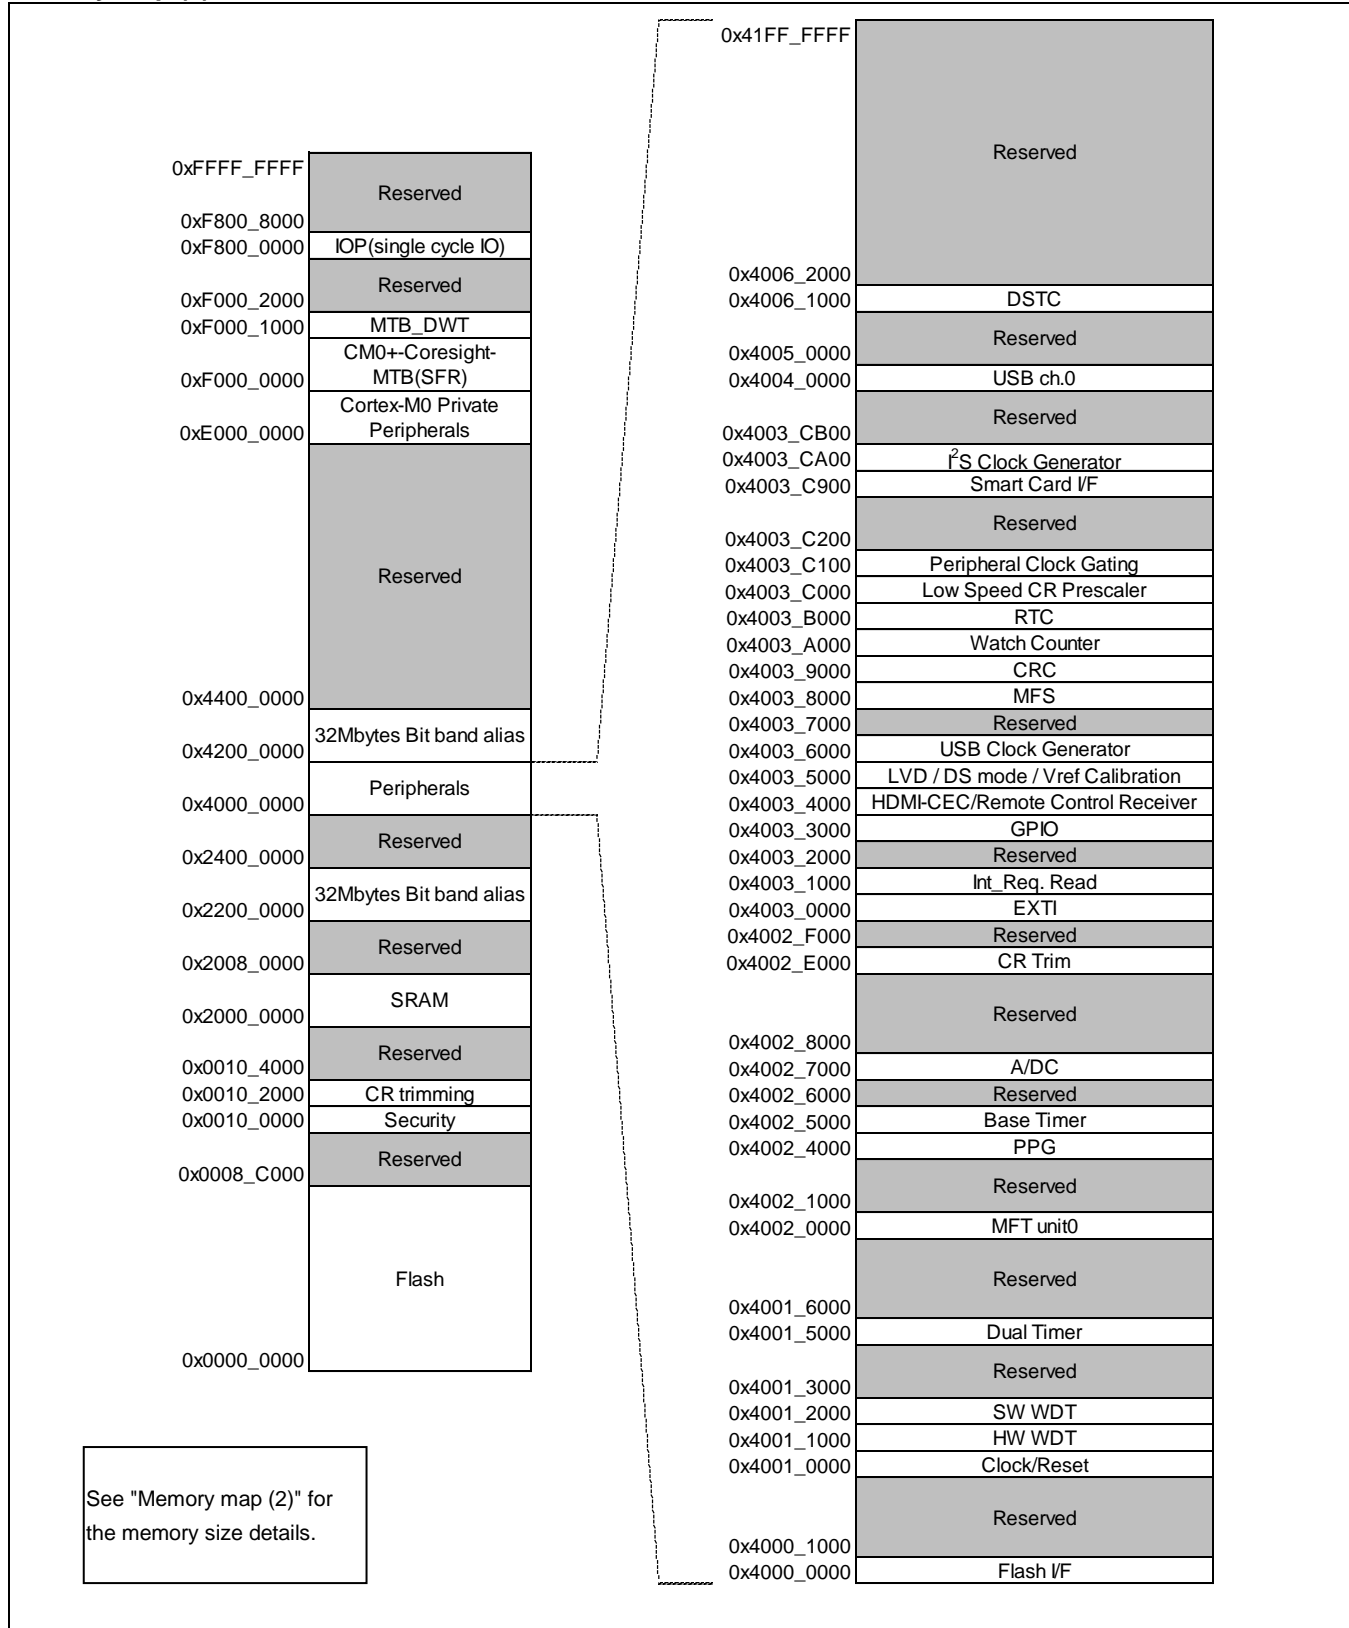

When debug pins (SWDIO/SWCLK) are set to GPIO or other peripheral functions, set them as output only; do not set them as input.

10. Pin Status in Each CPU State

The terms used for pin status have the following meanings.

- **INITX=0**
This is the period when the INITX pin is the "L" level.
- **INITX=1**
This is the period when the INITX pin is the "H" level.
- **SPL=0**
This is the status that the standby pin level setting bit (SPL) in the Standby Mode Control Register (STB_CTL) is set to "0".
- **SPL=1**
This is the status that the standby pin level setting bit (SPL) in the Standby Mode Control Register (STB_CTL) is set to "1".
- **Input enabled**
Indicates that the input function can be used.
- **Internal input fixed at "0"**
This is the status that the input function cannot be used. Internal input is fixed at "L".
- **Hi-Z**
Indicates that the pin drive transistor is disabled and the pin is put in the Hi-Z state.
- **Setting disabled**
Indicates that the setting is disabled.
- **Maintain previous state**
Maintains the state in which a pin was immediately prior to entering the current mode.
If a built-in peripheral function is operating, the output follows the peripheral function.
If the pin is being used as a port, that output is maintained.
- **Analog input is enabled**
Indicates that the analog input is enabled.
- **Trace output**
Indicates that the trace function can be used.
- **GPIO selected**
In Deep standby mode, pins switch to the general-purpose I/O port.

*1: These parameters are based on the condition that V_{SS}=AV_{SS}=0 V.

*2: V_{CC} must not drop below V_{SS} - 0.5 V.

*3: Ensure that the voltage does not to exceed V_{CC} + 0.5 V at power-on.

*4: The maximum output current is the peak value for a single pin.

*5: The average output is the average current for a single pin over a period of 100 ms.

*6: The total average output current is the average current for all pins over a period of 100 ms.

*7: When P0C/UDP0 and P0B/UDM0 pins are used as GPIO (P0C, P0B).

*8: When P0C/UDP0 and P0B/UDM0 pins are used as USB (UDP0, UDM0).

<WARNING>

- Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

11.2 Recommended Operating Conditions

 (V_{SS}=AV_{SS}=0.0 V)

Parameter	Symbol	Conditions	Value		Unit	Remarks
			Min	Max		
Power supply voltage	V _{CC}	-	1.65 ^{*3}	3.6	V	
			3.0	3.6	V	*1

Analog reference voltage	AVRH	-	2.7	AV _{CC}	V	AV _{CC} ≥ 2.7 V
			AV _{CC}	AV _{CC}	V	AV _{CC} < 2.7 V
	AVRL	-	AV _{SS}	AV _{SS}	V	
Smoothing capacitor	C _S	-	1	10	μF	For regulator ^{*2}
Operating temperature	T _A	-	- 40	+ 105	°C	

*1: When P0C/UDP0 and P0B/UDM0 pins are used as USB (UDP0, UDM0).

*2: See "C Pin" in "7. Handling Devices" for the connection of the smoothing capacitor.

*3: In between less than the minimum power supply voltage reset / interrupt detection voltage or more, instruction execution and low voltage detection function by built-in High-speed CR (including Main PLL is used) or built-in Low-speed CR is possible to operate only.

<WARNING>

1. The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.
2. Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.
3. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet.
4. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

SCK falling time	t_F	SCKx		-	5	-	5	ns
SCK rising time	t_R	SCKx		-	5	-	5	ns

Notes:

- The above AC characteristics are for clock synchronous mode.
- t_{CYCP} represents the APB bus clock cycle time.
For the number of the APB bus to which Multi-function Serial has been connected, see "8. Block Diagram".
- The characteristics are only applicable when the relocate port numbers are the same.
For instance, they are not applicable for the combination of SCKx_0 and SOTx_1.
- External load capacitance $C_L=30\text{ pF}$

- *1: The conversion time is the value of sampling time (t_s) + compare time (t_c).
The minimum conversion time is computed according to the following conditions:
 $AV_{CC} \geq 2.7\text{ V}$ sampling time=0.6 μs , compare time=1.4 μs
 $1.8 \leq AV_{CC} < 2.7\text{ V}$ sampling time=1.2 μs , compare time=2.8 μs
 $1.65 \leq AV_{CC} < 1.8\text{ V}$ sampling time=3.0 μs , compare time=7.0 μs
Ensure that the conversion time satisfies the specifications of the sampling time (t_s) and compare clock cycle (t_{CCK}).
For details of the settings of the sampling time and compare clock cycle, refer to "Chapter: A/D Converter" in "FM0+ Family Peripheral Manual Analog Macro Part".
The register settings of the A/D Converter are reflected in the operation according to the APB bus clock timing.
For the number of the APB bus to which the A/D Converter is connected, see "8. Block Diagram".
The base clock (HCLK) is used to generate the sampling time and the compare clock cycle.
- *2: The required sampling time varies according to the external impedance.
Set a sampling time that satisfies (Equation 1).
- *3: The compare time (t_c) is the result of (Equation 2).

Definitions of 12-bit A/D Converter Terms

- Resolution: Analog variation that is recognized by an A/D converter.
- Integral Nonlinearity: Deviation of the line between the zero-transition point (0b000000000000 ↔ 0b000000000001) and the full-scale transition point (0b111111111110 ↔ 0b111111111111) from the actual conversion characteristics.
- Differential Nonlinearity: Deviation from the ideal value of the input voltage that is required to change the output code by 1 LSB.

11.6 USB Characteristics

($V_{CC}=3.0\text{ V to }3.6\text{ V}$, $V_{SS}=0\text{ V}$, $T_A=-40^\circ\text{C to }+105^\circ\text{C}$)

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks

	Rising/Falling time matching	t_{LRFM}	Low-speed	80	125	%	*7

*1 : The switching threshold voltage of single-end-receiver of USB I/O buffer is set as within $V_{IL}(\text{Max})=0.8\text{ V}$, $V_{IH}(\text{Min})=2.0\text{ V}$ (TTL input standard).

There are some hysteresis to lower noise sensitivity.

*2 : Use differential-receiver to receive USB differential data signal.

Differential-receiver has 200 mV of differential input sensitivity when the differential data input is within 0.8 V to 2.5 V to the local ground reference level.

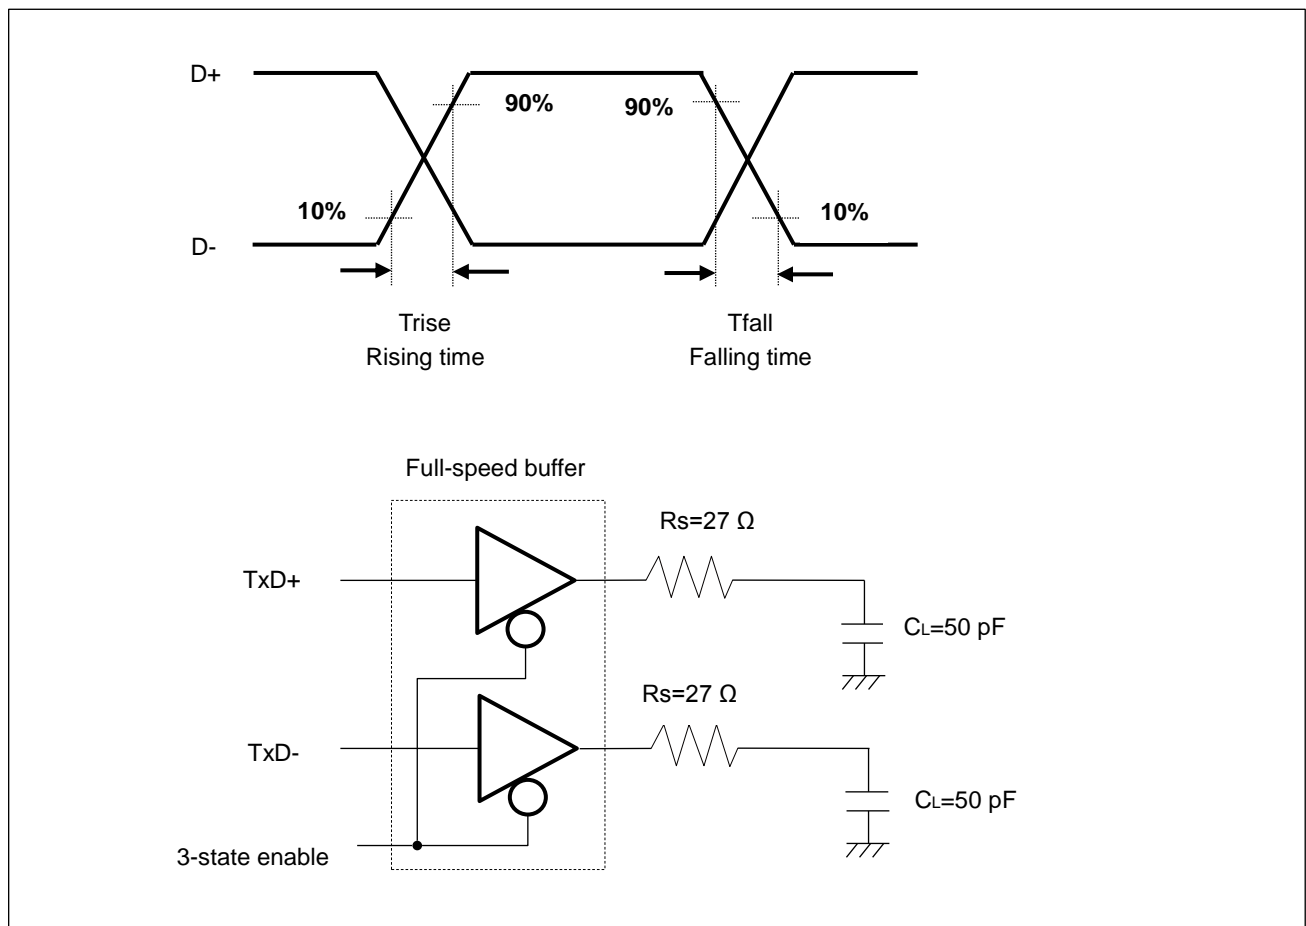

Above voltage range is the common mode input voltage range.

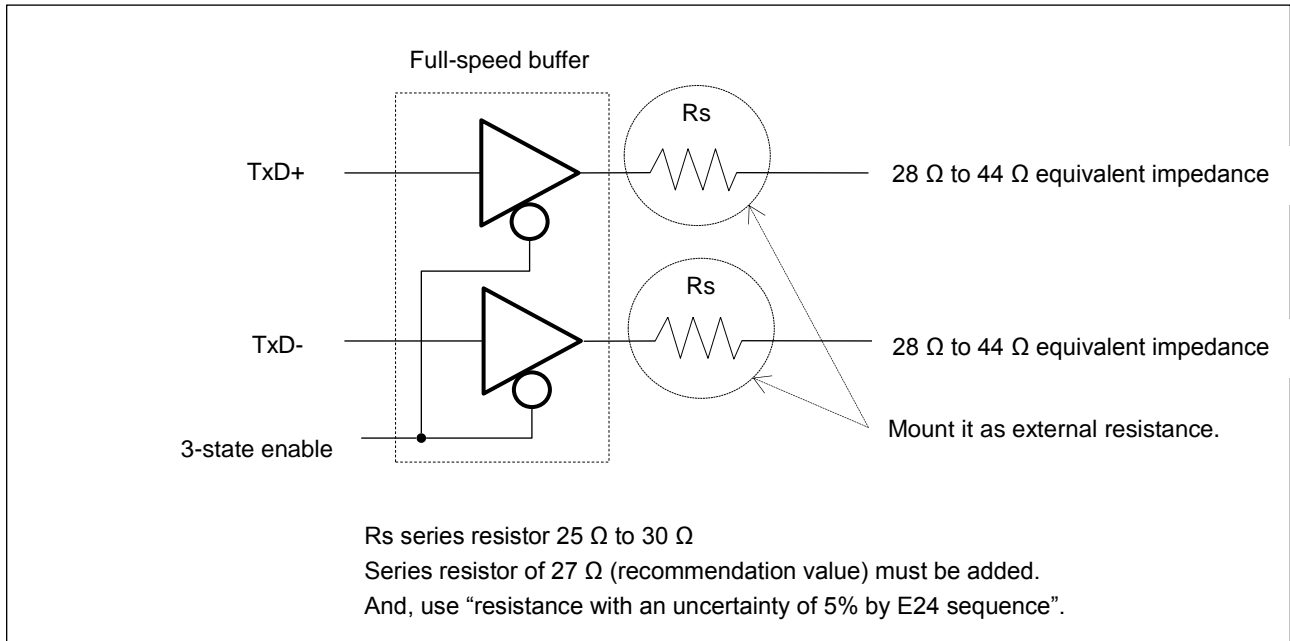

- *3 : The output drive capability of the driver is below 0.3 V at Low-state (V_{OL}) (to 3.6 V and 1.5 k Ω load), and 2.8 V or above (to the VSS and 1.5 k Ω load) at high-state (V_{OH})
- *4 : The cross voltage of the external differential output signal (D+ / D-) of USB I/O buffer is within 1.3 V to 2.0 V.

- *5 : The indicate rising time (T_{rise}) and falling time (T_{fall}) of the full-speed differential data signal. They are defined by the time between 10% and 90% of the output signal voltage. For full-speed buffer, T_r/T_f ratio is regulated as within $\pm 10\%$ to minimize RFI emission.

- *6 : USB Full-speed connection is performed via twist pair cable shield with $90 \Omega \pm 15\%$ characteristic impedance (Differential Mode).
 USB standard defines that output impedance of USB driver must be in range from 28Ω to 44Ω . So, discrete series resistor (R_s) addition is defined in order to satisfy the above definition and keep balance.
 When using this USB I/O, use it with 25Ω to 33Ω (recommendation value : 27Ω) series resistor R_s .

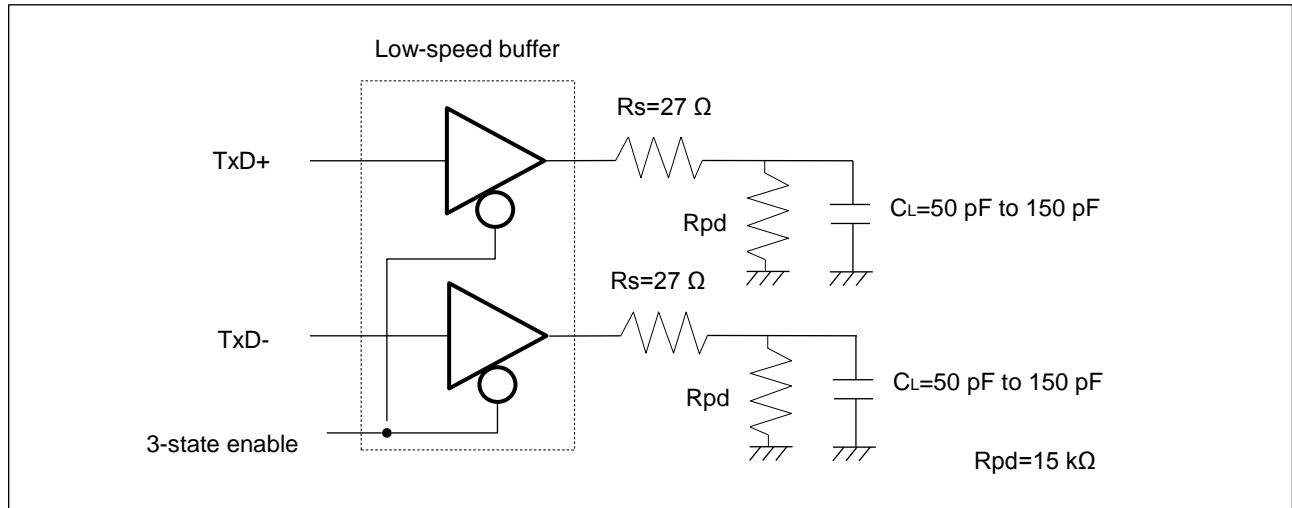

*7 : They indicate rising time (T_{rise}) and falling time (T_{fall}) of the low-speed differential data signal. They are defined by the time between 10% and 90% of the output signal voltage.

11.8 Flash Memory Write/Erase Characteristics

 (V_{CC}=1.65 V to 3.6 V, T_A=- 40°C to +105°C)

Parameter		Value			Unit	Remarks
		Min	Typ*	Max*		
Sector erase time	Large sector	-	1.1	2.7	s	The sector erase time includes the time of writing prior to internal erase.
	Small sector	-	0.3	0.9		
Halfword (16-bit) write time		-	30	528	µs	The halfword (16-bit) write time excludes the system-level overhead.
Chip erase time		-	11.2	28.8	s	The chip erase time includes the time of writing prior to internal erase.

*: The typical value is immediately after shipment, the maximum value is guarantee value under 10,000 cycle of erase/write.

Write/Erase Cycle and Data Hold Time (Target Value)

Write/Erase Cycle	Data Hold Time (Year)	Remarks
1,000	20*	
10,000	10*	

*: At average + 85°C

11.9 Return Time from Low-Power Consumption Mode

11.9.1 Return Factor: Interrupt/WKUP

The return time from Low-Power consumption mode is indicated as follows. It is from receiving the return factor to starting the program operation.

Return Count Time

($V_{CC}=1.65\text{ V to }3.6\text{ V}$, $T_A=-40^\circ\text{C to }+105^\circ\text{C}$)

Parameter	Symbol	Value		Unit	Remarks
		Typ	Max ¹		
Sleep mode	t _{CNT}	6*HCLK	7*HCLK	μs	
High-speed CR Timer mode, Main Timer mode, PLL Timer mode		12*HCLK	13*HCLK	μs	
Low-speed CR Timer mode		20+12*HCLK	42+13*HCLK	μs	
Sub Timer mode		20+12*HCLK	42+13*HCLK	μs	
RTC mode, Stop mode		38 ^(*3) 38+t _{OSCWT} ^(*2,4)	71 71+t _{OSCWT} ^(*2,4)	μs	The count time is different in different clock mode
Deep RTC mode, Deep Stop mode		45	80	μs	

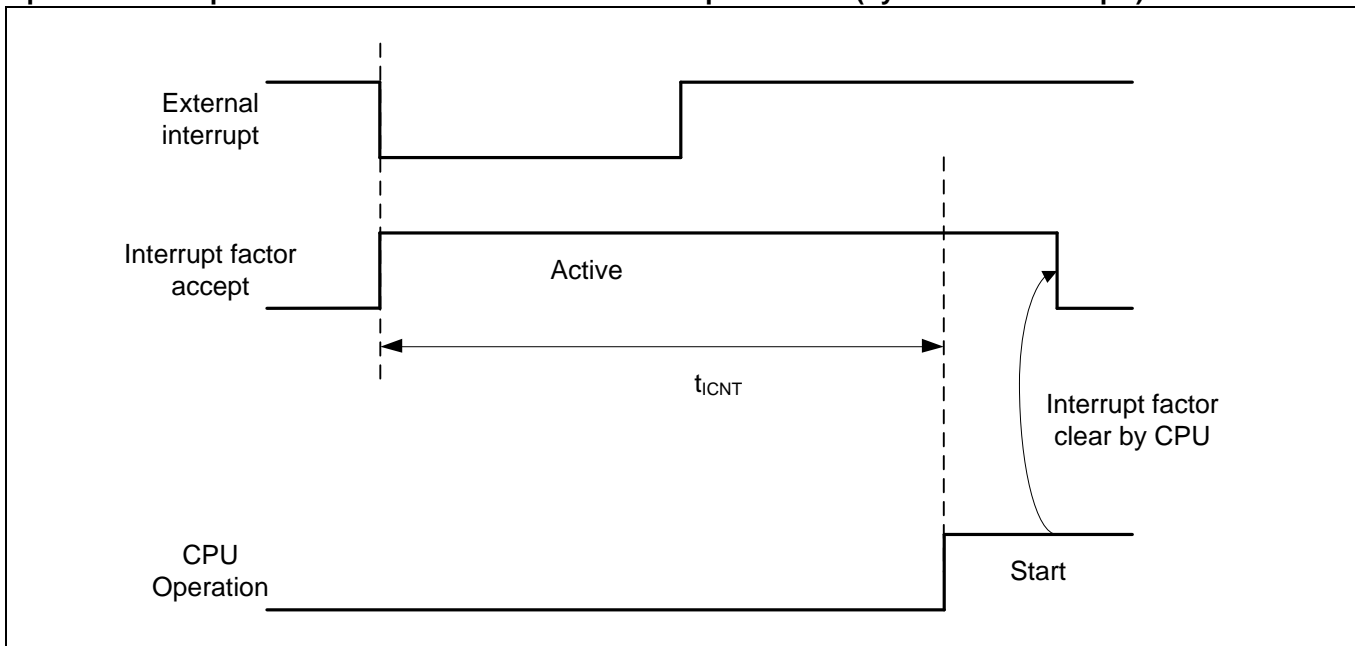

*1: The maximum value depends on the condition of environment.

*2: t_{OSCWT}: Oscillator stabilization time.

*3: It is for HCR mode.

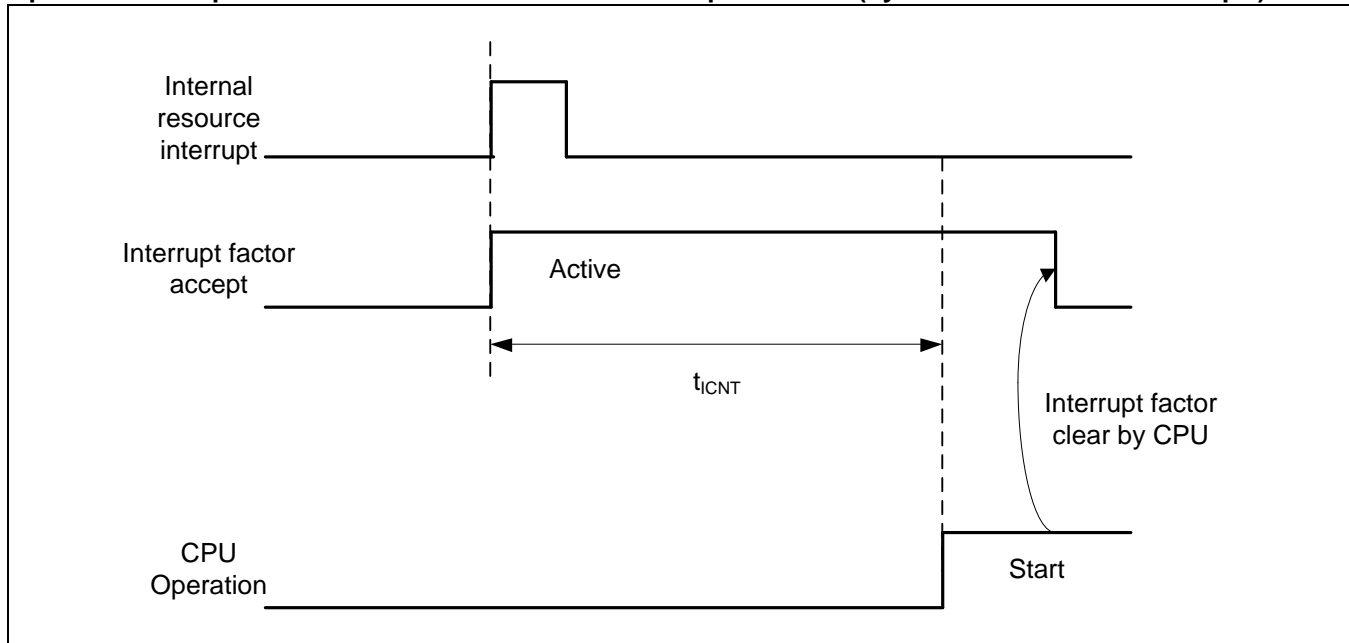

*4: For clock mode except HCR mode.

Operation Example of Return from Low-Power Consumption Mode (by External Interrupt*)

*: External interrupt is set to detecting fall edge.

Operation Example of Return from Low-Power Consumption Mode (by Internal Resource Interrupt*)

*: Internal resource interrupt is not included in return factor by the kind of Low-Power consumption mode.

Notes:

- The return factor is different in each Low-Power consumption modes. See "Chapter: Low Power Consumption Mode" and "Operations of Standby Modes" in FM0+ Family Peripheral Manual.
- When interrupt recovers, the operation mode that CPU recovers depends on the state before the Low-Power consumption mode transition. See "Chapter: Low Power Consumption Mode" in "FM0+ Family Peripheral Manual".

11.9.2 Return Factor: Reset

The return time from Low-Power consumption mode is indicated as follows. It is from releasing reset to starting the program operation.

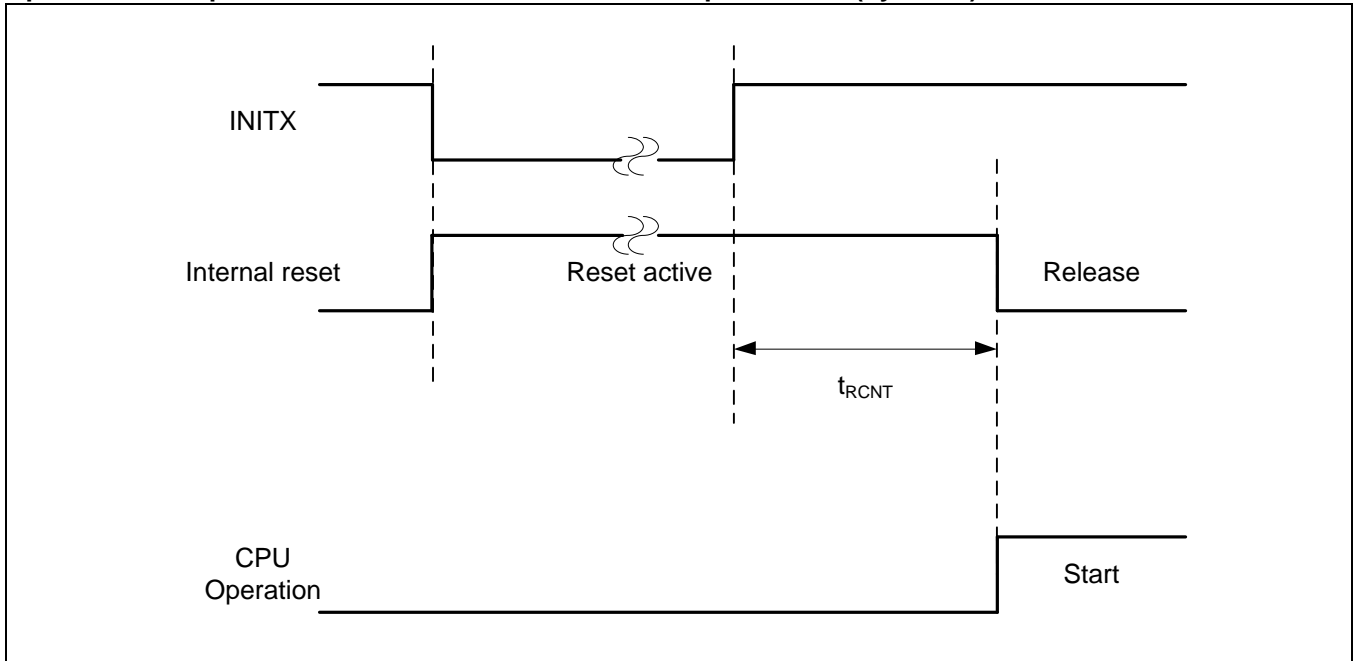

Return Count Time

($V_{CC}=1.65\text{ V to }3.6\text{ V}$, $T_A=-40^{\circ}\text{C to }+105^{\circ}\text{C}$)

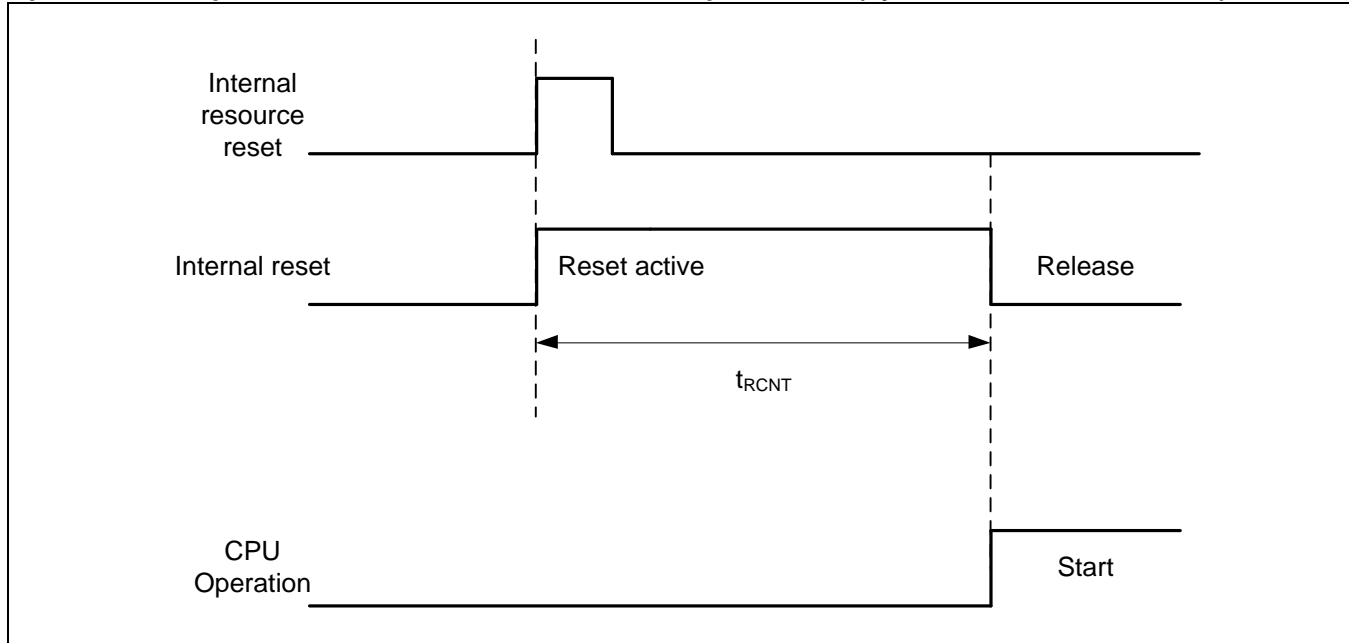

Parameter	Symbol	Value		Unit	Remarks
		Typ	Max*		
Sleep mode	t _{RCNT}	10 ^{*1} 40 ^{*2}	70	μs	*1 : HCR ON.(HCR/MOSC/PLL mode) *2 : HCR OFF.(LCR/SOS mode)
High-speed CR Timer mode, Main Timer mode, PLL Timer mode		20	30	μs	
Low-speed CR Timer mode		61	114	μs	
Sub Timer mode		61	114	μs	
RTC/Stop mode		38	85	μs	
Deep RTC mode, Deep Stop mode		46	95	μs	

*: The maximum value depends on the accuracy of built-in CR.

Operation Example of Return from Low-Power Consumption Mode (by INITX)

Operation Example of Return from Low Power Consumption Mode (by Internal Resource Reset*)

*: Internal resource reset is not included in return factor by the kind of Low-Power consumption mode.

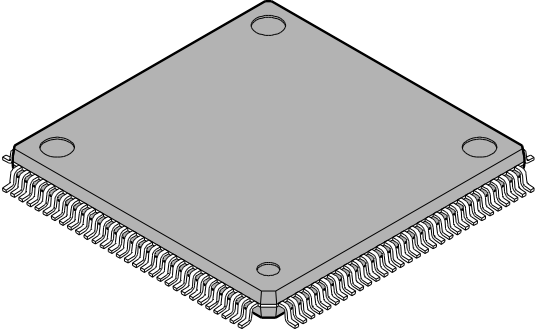

Notes:

- The return factor is different in each Low-Power consumption modes. See "Chapter: Low Power Consumption Mode" and "Operations of Standby Modes" in FM0+ Family Peripheral Manual.
- When interrupt recovers, the operation mode that CPU recovers depends on the state before the Low-Power consumption mode transition. See "Chapter: Low Power Consumption Mode" in "FM0+ Family Peripheral Manual".
- The time during the power-on reset/low-voltage detection reset is excluded. See "11.4.7 Power-on Reset Timing in 11.4 AC Characteristics in 11. Electrical Characteristics" for the detail on the time during the power-on reset/low -voltage detection reset.
- When in recovery from reset, CPU changes to the high-speed CR run mode. When using the main clock or the PLL clock, it is necessary to add the main clock oscillation stabilization wait time or the main PLL clock stabilization wait time.
- The internal resource reset means the watchdog reset and the CSV reset.
