

TWO CELL LI⁺ BATTERY PROTECTION CIRCUIT

DESCRIPTIONS

SA1412 protects for Lithium-Ion Batteries. When the Lithium-Ion Batteries is in state of overcharge, overdischarge and overcurrent. The IC turns off the external mosfet to protect the batteries.

FEATURES

- * Overcharge consumption current($V_{CELL}=4.5V$ $ROC=270K\Omega$): $150\mu A$
- * Normal consumption current($V_{CELL}=3.5V$): $18\mu A$
- * Overcharge consumption current($V_{CELL}=1.9V$): $0.5\mu A$
- Overcharge consumption current($V_{CELL}=1.0V$): $0.1\mu A$

APPLICATIONS

- * Digital camer
- * Digital vidicon
- * Special illumination
- * Portable DVD
- * PDA
- * Interphone
- * 7.2V large capacity battery.

PIN DESCRIPTION

Pin no.	Pin name	I/O	Description
1	OC	O	Overcharge detection output pin
2	GD	O	Discharge control FET (N-ch) control output pin
3	CS	I	Overcurrent detection input pin
4	GND	--	Ground pin, or lower cell load negative pole input pin.
5	TD	--	Overcharge detection dead time setting pin
6	VL	--	Connection pin for lower cell positive electrode side and upper cell negative electrode side.
7	VCC	--	Power supply input pin
8	VH	--	Upper cell positive electrode input pin

FUNCTION DESCRIPTION

This IC is a lithium ion battery (2-cell in-series type) protection IC. It has functions below: Overcharge detection, Overdischarge detection, Overcurrent detection. It controls the batteries charging or discharging by control the

external mosfet off and on. There are four operation modes as follows:

1. Overcharge mode:

The battery voltage of either the H or L cell goes above overcharge detection voltage. The IC shuts down the charging loop. Detection operation delay for overcharge detection can be set with the dead time setting pin.

2. Normal mode

The battery voltage of both H and L cells is above overdischarge detection voltage and below overcharge detection voltage.

3. Overdischarge mode

The battery voltage of either the H or L cell drops below overdischarge detection voltage. The IC shuts down the discharging loop. Dead time for overdischarge detection is set internally.

4. Overcurrent mode

The voltage between CS-GND goes above overcurrent detection voltage during discharge. The IC shuts down the discharging loop.

TEST CIRCUIT

TYPICAL APPLICATION CIRCUIT

Note: The circuit and parameters are reference only, please set the parameters of the real application circuit based on the real test .
