

Absolute Maximum Ratings

Ambient temperature under bias (T_A)	- 40 to + 85 °C
Storage temperature (T_{ST}).....	- 65 to + 150 °C
Voltage on V_{CC} pins with respect to ground (V_{SS})	- 0.5 V to 6.5 V
Voltage on any pin with respect to ground (V_{SS})	- 0.5 V to $V_{CC} + 0.5$ V
Input current on any pin during overload condition	- 10 mA to + 10 mA
Absolute sum of all input currents during overload condition	100 mA
Power dissipation.....	TBD

Note: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage of the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for longer periods may affect device reliability. During overload conditions ($V_{IN} > V_{CC}$ or $V_{IN} < V_{SS}$) the Voltage on V_{CC} pins with respect to ground (V_{SS}) must not exceed the values defined by the absolute maximum ratings.

- 1) Capacitive loading on ports 0 and 2 may cause spurious noise pulses to be superimposed on the V_{OL} of ALE and port 3. The noise is due to external bus capacitance discharging into the port 0 and port 2 pins when these pins make 1-to-0 transitions during bus operation. In the worst case (capacitive loading > 100 pF), the noise pulse on ALE line may exceed 0.8 V. In such cases it may be desirable to qualify ALE with a schmitt-trigger, or use an address latch with a schmitt-trigger strobe input.
- 2) Capacitive loading on ports 0 and 2 may cause the V_{OH} on ALE and \overline{PSEN} to momentarily fall below the 0.9 V_{CC} specification when the address lines are stabilizing.
- 3) I_{PD} (Power Down Mode) is measured under following conditions:
 $\overline{EA} = \text{Port0} = V_{CC}$; $\text{RESET} = V_{SS}$; XTAL2 = N.C.; XTAL1 = V_{SS} ; all other pins are disconnected.
- 4) I_{CC} (active mode) is measured with:
 XTAL1 driven with t_{CLCH} , $t_{CHCL} = 5 \text{ ns}$, $V_{IL} = V_{SS} + 0.5 \text{ V}$, $V_{IH} = V_{CC} - 0.5 \text{ V}$; XTAL2 = N.C.;
 $\overline{EA} = \text{Port0} = \text{RESET} = V_{CC}$; all other pins are disconnected. I_{CC} would be slightly higher if a crystal oscillator is used (appr. 1 mA).
- 5) I_{CC} (Idle mode) is measured with all output pins disconnected and with all peripherals disabled;
 XTAL1 driven with t_{CLCH} , $t_{CHCL} = 5 \text{ ns}$, $V_{IL} = V_{SS} + 0.5 \text{ V}$, $V_{IH} = V_{CC} - 0.5 \text{ V}$; XTAL2 = N.C.;
 $\text{RESET} = \overline{EA} = V_{SS}$; $\text{Port0} = V_{CC}$; all other pins are disconnected;
- 7) $I_{CC \text{ max}}$ at other frequencies is given by:
 active mode: $I_{CC} = 1.27 \times f_{OSC} + 5.73$
 idle mode: $I_{CC} = 0.28 \times f_{OSC} + 1.45$
 where f_{OSC} is the oscillator frequency in MHz. I_{CC} values are given in mA and measured at $V_{CC} = 5 \text{ V}$.
