

# Atmel | SMART ARM-based Embedded MPU

**DATASHEET** 

# **Description**

The SAM9X35 is a member of the Atmel<sup>®</sup> | SMART series of 400 MHz ARM926EJ-S<sup>™</sup> embedded microprocessor units. This MPU features an extensive peripheral set and high bandwidth architecture for industrial applications that require refined user interfaces and high-speed communication.

The SAM9X35 features a graphics LCD controller with 4-layer overlay and 2D acceleration (picture-in-picture, alpha-blending, scaling, rotation, color conversion), and a 10-bit ADC that supports 4-wire or 5-wire resistive touchscreen panels. Networking/connectivity peripherals include two 2.0A/B compatible Controller Area Network (CAN) interfaces and an IEEE Std 802.3-compatible 10/100 Mbps Ethernet MAC. Multiple communication interfaces include a soft modem supporting exclusively the Conexant SmartDAA line driver, HS USB Device and Host, FS USB Host, two HS SDCard/SDIO/MMC interfaces, USARTs, SPIs, I2S, TWIs and 10-bit ADC.

The 10-layer bus matrix associated with 2 x 8 central DMA channels as well as dedicated DMAs to support the high-speed connectivity peripherals ensure uninterrupted data transfer with minimum processor overhead.

The External Bus Interface incorporates controllers for 4-bank and 8-bank DDR2/LPDDR, SDRAM/LPSDRAM, static memories, as well as specific circuitry for MLC/SLC NAND Flash with integrated ECC up to 24 bits.

The SAM9X35 is available in a 217-ball BGA package with 0.8 mm ball pitch.

### **Features**

#### Core

- ARM926EJ-S™ ARM® Thumb® Processor running at up to 400 MHz @ 1.0V +/- 10%
- 16 Kbytes Data Cache, 16 Kbytes Instruction Cache, Memory Management Unit

#### Memories

- One 64-Kbyte internal ROM embedding bootstrap routine: Boot on NAND Flash, SDCard, DataFlash or serial DataFlash. Programmable order.
- One 32-Kbyte internal SRAM, single-cycle access at system speed
- High Bandwidth Multi-port DDR SDR SDRAM Controller (DDRSDRC)
- 32-bit External Bus Interface supporting 4-bank and 8-bank DDR2/LPDDR, SDR/LPSDR, Static Memories
- MLC/SLC 8-bit NAND Controller, with up to 24-bit Programmable Multi-bit Error Correcting Code (PMECC)

### System running at up to 133 MHz

- Power-on Reset Cells, Reset Controller, Shutdown Controller, Periodic Interval Timer, Watchdog Timer and Real Time Clock
- Boot Mode Select Option, Remap Command
- Internal Low Power 32 kHz RC and Fast 12 MHz RC Oscillators
- Selectable 32768 Hz Low-power Oscillator and 12 MHz Oscillator
- One PLL for the system and one PLL at 480 MHz optimized for USB High Speed
- Twelve 32-bit-layer AHB Bus Matrix for large Bandwidth transfers
- Dual Peripheral Bridge with dedicated programmable clock for best performances
- Two dual port 8-channel DMA Controllers (DMAC)
- Advanced Interrupt Controller (AIC) and Debug Unit (DBGU)
- Two Programmable External Clock Signals

#### Low Power Mode

- Shutdown Controller with four 32-bit Battery Backup Registers
- Clock Generator and Power Management Controller
- Very Slow Clock Operating Mode, Software Programmable Power Optimization Capabilities

#### Peripherals

- LCD Controller (LCDC) with overlay, alpha-blending, rotation, scaling and color conversion
- USB Device High Speed, USB Host High Speed and USB Host Full Speed with dedicated On-Chip Transceiver
- One 10/100 Mbps Ethernet MAC Controller (EMAC)
- Two High Speed Memory Card Hosts
- Two CAN Controllers
- Two Master/Slave Serial Peripheral Interfaces (SPI)
- Two 3-channel 32-bit Timer/Counters (TC)
- One Synchronous Serial Controller (SSC)
- One 4-channel 16-bit PWM Controller
- 3 Two-wire Interfaces (TWI)
- Three USARTs, two UARTs, one DBGU
- One 12-channel 10-bit Touchscreen Analog-to-Digital Converter
- Software Modem Device (SMD)
- Write Protected Registers

#### I/O

- Four 32-bit Parallel Input/Output Controllers
- 105 Programmable I/O Lines Multiplexed with up to Three Peripheral I/Os
- Input Change Interrupt Capability on Each I/O Line, optional Schmitt trigger input
- Individually Programmable Open-drain, Pull-up and pull-down resistor, Synchronous Output

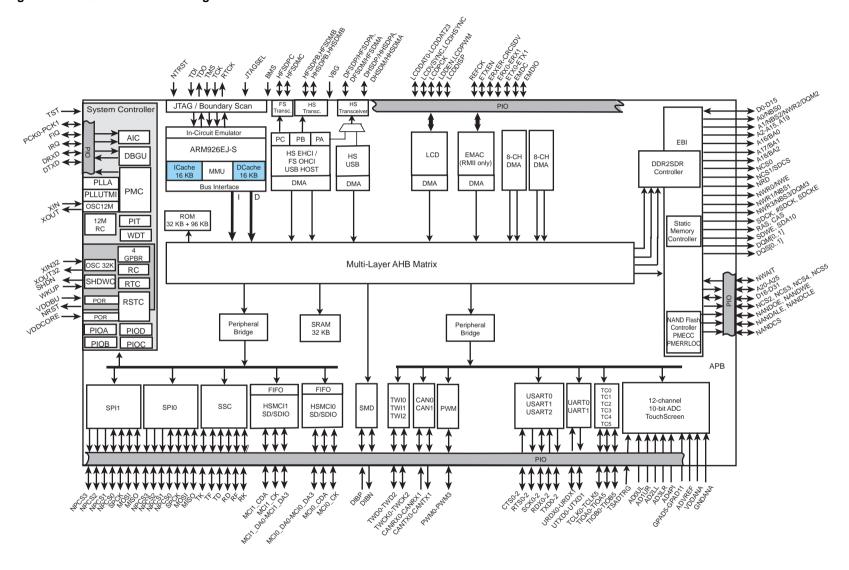

#### Package

217-ball BGA, pitch 0.8 mm

# 1. Block Diagram

Figure 1-1. SAM9X35 Block Diagram

# 2. Signal Description

Table 2-1 gives details on the signal name classified by peripheral.

Table 2-1. Signal Description List

| Signal Name  | Function                                 | Туре   | Active Level |
|--|--|--------|--------------|
| Clocks, Oscillators and PLLs  XIN Main Oscillator Input Input  XCOUT Main Oscillator Output Output  XIN32 Slow Clock Oscillator Input Input  XXOUT32 Slow Clock Oscillator Output Output  XXOUT32 Slow Clock Oscillator Output  XXOUT32 Slow Clock Output  XXOUT32 Slow |  |        |              |
| XIN  | Main Oscillator Input                    | Input  |              |
| XOUT   | Main Oscillator Output                   | Output |              |
| XIN32  | Slow Clock Oscillator Input              | Input  |              |
| XOUT32   | Slow Clock Oscillator Output             | Output |              |
| VBG  | Bias Voltage Reference for USB           | Analog |              |
| PCK0-PCK1  | Programmable Clock Output                | Output |              |
|  | Shutdown, Wakeup Logic                   |        |              |
| SHDN   | Shutdown Control                         | Output |              |
| WKUP   | Wake-Up Input                            | Input  |              |
|  | ICE and JTAG                             |        |              |
| TCK  | Test Clock                               | Input  |              |
| TDI  | Test Data In                             | Input  |              |
| TDO  | Test Data Out                            | Output |              |
| TMS  | Test Mode Select                         | Input  |              |
| JTAGSEL  | JTAG Selection                           | Input  |              |
| RTCK   | Return Test Clock                        | Output |              |
|  | Reset/Test                               |        |              |
| NRST   | Microcontroller Reset                    | I/O    | Low          |
| TST  | Test Mode Select                         | Input  |              |
| NTRST  | Test Reset Signal                        | Input  |              |
| BMS  | Boot Mode Select                         | Input  |              |
|  | Debug Unit - DBGU                        |        |              |
| DRXD   | Debug Receive Data                       | Input  |              |
| DTXD   | Debug Transmit Data                      | Output |              |
|  | Advanced Interrupt Controller - AIC      |        |              |
| IRQ  | External Interrupt Input                 | Input  |              |
| FIQ  | Fast Interrupt Input                     | Input  |              |
|  | PIO Controller - PIOA - PIOB - PIOC - PI | OD     |              |
| PA0-PA31   | Parallel IO Controller A                 | I/O    |              |
| PB0-PB18   | Parallel IO Controller B                 | I/O    |              |
| PC0-PC31   | Parallel IO Controller C                 | I/O    |              |
| PD0-PD21   | Parallel IO Controller D                 | I/O    |              |

Table 2-1. Signal Description List (Continued)

| Signal Name        | Function  | Туре         | Active Level |
|--------------------|---|--------------|--------------|
|                    | External Bus Interface - EBI                      |              |              |
| D0-D15             | Data Bus  | I/O          |              |
| D16-D31            | Data Bus  | I/O          |              |
| A0-A25             | Address Bus                                       | Output       |              |
| NWAIT              | External Wait Signal                              | Input        | Low          |
|                    | Static Memory Controller - SMC                    |              |              |
| NCS0-NCS5          | Chip Select Lines                                 | Output       | Low          |
| NWR0-NWR3          | Write Signal                                      | Output       | Low          |
| NRD                | Read Signal                                       | Output       | Low          |
| NWE                | Write Enable                                      | Output       | Low          |
| NBS0-NBS3          | Byte Mask Signal                                  | Output       | Low          |
|                    | NAND Flash Support                                | ,            |              |
| NFD0-NFD16         | NAND Flash I/O                                    | I/O          |              |
| NANDCS             | NAND Flash Chip Select                            | Output       | Low          |
| NANDOE             | NAND Flash Output Enable                          | Output       | Low          |
| NANDWE             | NAND Flash Write Enable                           | Output       | Low          |
|                    | DDR2/SDRAM/LPDDR Controller                       |              |              |
| SDCK,#SDCK         | DDR2/SDRAM Differential Clock                     | Output       |              |
| SDCKE              | DDR2/SDRAM Clock Enable                           | Output       | High         |
| SDCS               | DDR2/SDRAM Controller Chip Select                 | Output       | Low          |
| BA[02]             | Bank Select                                       | Output       | Low          |
| SDWE               | DDR2/SDRAM Write Enable                           | Output       | Low          |
| RAS-CAS            | Row and Column Signal                             | Output       | Low          |
| SDA10              | SDRAM Address 10 Line                             | Output       |              |
| DQS[01]            | Data Strobe                                       | I/O          |              |
| DQM[03]            | Write Data Mask                                   | Output       |              |
|                    | High Speed MultiMedia Card Interface - HSMCI      | 0–1          |              |
| MCI0_CK, MCI1_CK   | Multimedia Card Clock                             | I/O          |              |
| MCI0_CDA, MCI1_CDA | Multimedia Card Slot Command                      | I/O          |              |
| MCI0_DA0-MCI0_DA3  | Multimedia Card 0 Slot A Data                     | I/O          |              |
| MCI1_DA0-MCI1_DA3  | Multimedia Card 1 Slot A Data                     | I/O          |              |
| Univ               | versal Synchronous Asynchronous Receiver Transmit | ter - USARTx |              |
| SCKx               | USARTx Serial Clock                               | I/O          |              |
| TXDx               | USARTx Transmit Data                              | Output       |              |
| RXDx               | USARTx Receive Data                               | Input        |              |
| RTSx               | USARTx Request To Send                            | Output       |              |
| CTSx               | USARTx Clear To Send                              | Input        |              |

Table 2-1. Signal Description List (Continued)

| Signal Name           | Function                                      | Туре   | Active Level |

# 3. Package and Pinout

The SAM9X35 is available in a 217-ball BGA package.

# 3.1 Overview of the 217-ball BGA Package

Figure 3-1 shows the orientation of the 217-ball BGA Package.

Figure 3-1. Orientation of the 217-ball BGA Package

# 3.2 I/O Description

Table 3-1. I/O Type Description

| I/O Type  | Voltage Range        | Analog | Pull-up     | Pull-down   | Schmitt Trigger |
|-----------|----------------------|--------|-------------|-------------|-----------------|
| GPIO      | 1.65–3.6V            |        | Switchable  | Switchable  | Switchable      |
| GPIO_CLK  | 1.65–3.6V            |        | Switchable  | Switchable  | Switchable      |
| GPIO_CLK2 | 1.65–3.6V            |        | Switchable  | Switchable  | Switchable      |
| GPIO_ANA  | 3.0-3.6V             | I      | Switchable  |             | Switchable      |
| EBI       | 1.65–1.95V, 3.0–3.6V |        | Switchable  | Switchable  |                 |
| EBI_O     | 1.65-1.95V, 3.0-3.6V |        | Reset State | Reset State |                 |
| EBI_CLK   | 1.65–1.95V, 3.0–3.6V |        |             |             |                 |
| RSTJTAG   | 3.0-3.6V             |        | Reset State | Reset State | Reset State     |
| SYSC      | 1.65–3.6V            |        | Reset State | Reset State | Reset State     |
| VBG       | 1.15–1.25V           | I      |             |             |                 |
| USBFS     | 3.0-3.6V             | I/O    |             |             |                 |
| USBHS     | 3.0-3.6V             | I/O    |             |             |                 |
| CLOCK     | 1.65–3.6V            | I/O    |             |             |                 |
| DIB       | 3.0-3.6V             | I/O    |             |             |                 |

When "Reset State" is mentioned, the configuration is defined by the "Reset State" column of the Pin Description table.

Table 3-2. I/O Type Assignment and Frequency

| I/O Type  | I/O Frequency<br>(MHz) | Charge Load<br>(pF)    | Output Current      | Signal Name  |
|-----------|------------------------|------------------------|---------------------|--|
| CLOCK     | 50                     | 50                     |                     | XIN, XOUT, XIN32, XOUT32                                   |
| DIB       | 25                     | 25                     |                     | DIBN, DIBP   |
| EBI       | 133                    | 50 (3.3V)<br>30 (1.8V) |                     | All Data lines (Input/output)                              |
| EBI_CLK   | 133                    | 10                     |                     | CK, #CK  |
| EBI_O     | 66                     | 50 (3.3V)<br>30 (1.8V) |                     | All Address and control lines (output only) except EBI_CLK |
| GPIO      | 40                     | 10                     |                     | All PIO lines except GPIO_CLK, GPIO_CLK2, and GPIO_ANA     |
| GPIO_ANA  | 25                     | 10                     | 16 mA, 40 mA (peak) | ADx, GPADx   |
| GPIO_CLK  | 54                     | 10                     |                     | MCIOCK, MCI1CK, SPI0SPCK, SPI1SPCK, EMACx_ETXCK            |
| GPIO_CLK2 | 75                     | 10                     |                     | LCDDOTCK   |
| RSTJTAG   | 10                     | 10                     |                     | NRST, NTRST, BMS, TCK, TDI, TMS, TDO, RTCK                 |
| SYSC      | 0.25                   | 10                     |                     | WKUP, SHDN, JTAGSEL, TST, SHDN                             |
| USBFS     | 12                     | 10                     |                     | HFSDPA, HFSDPB/DFSDP, HFSDPC, HFSDMA, HFSDMB/DFSDM, HFSDMC |
| USBHS     | 480                    | 10                     |                     | HHSDPA, HHSDPB/DHSDP, HHSDMA, HHSDMB/DHSDM                 |
| VBG       | 0.25                   | 10                     |                     | VBG  |

#### 3.2.1 Reset State

In the tables that follow, the column "Reset State" indicates the reset state of the line with mnemonics.

"PIO" "/" signal

Indicates whether the PIO Line resets in I/O mode or in peripheral mode. If "PIO" is mentioned, the PIO Line is maintained in a static state as soon as the reset is released. As a result, the bit corresponding to the PIO Line in the register PIO\_PSR (Peripheral Status Register) resets low.

If a signal name is mentioned in the "Reset State" column, the PIO Line is assigned to this function and the corresponding bit in PIO\_PSR resets high. This is the case of pins controlling memories, in particular the address lines, which require the pin to be driven as soon as the reset is released.

• "I"/"O"

Indicates whether the signal is input or output state.

"PU"/"PD"

Indicates whether Pull-Up, Pull-Down or nothing is enabled.

"ST"

Indicates if Schmitt Trigger is enabled.

Example:

The PB18 "Reset State" column shows "PIO, I, PU, ST". That means the line PIO18 is configured as an Input with Pull-Up and Schmitt Trigger enabled. PD14 reset state is "PIO, I, PU". That means PIO Input with Pull-Up. PD15 reset state is "A20, O, PD" which means output address line 20 with Pull-Down.

# 3.3 217-ball BGA Package Pinout

Table 3-3. Pin Description BGA217

|      |            |          | Primary |     | Alternate |     | PIO Periphera | l A | PIO Periphera | ΙB  | PIO Periphera | I C | Reset State                |

# 4. Power Considerations

# 4.1 Power Supplies

The SAM9X35 has several types of power supply pins. For complete details about power-up and power-down sequences, please refer to Section 46.15 "Power Sequence Requirements".

Table 4-1. Power Supplies

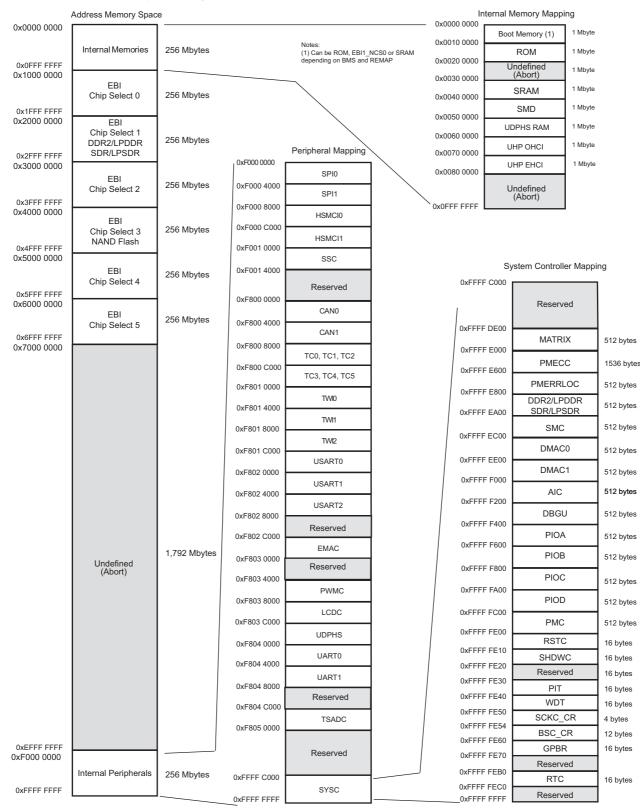

| Name     | Voltage Range,<br>nominal          | Powers  | Associated<br>Ground |
|----------|------------------------------------|---|----------------------|
| VDDANA   | 3.0-3.6V, 3.3V                     | Analog-to-Digital Converter   | GNDANA               |
| VDDBU    | 1.65–3.6V                          | Slow Clock oscillator, internal 32 kHz RC oscillator and backup part of the System Controller | GNDBU                |
| VDDCORE  | 0.9–1.1V, 1.0V                     | ARM core, internal memories, internal peripherals and part of the system controller           | GNDCORE              |
| VDDIOM   | 1.65–1.95V, 1.8V<br>3.0–3.6V, 3.3V | External Memory Interface I/O lines   | GNDIOM               |

| VDDIOP1  | 1.65–3.6V                          | Part of peripheral I/O lines (1)  | GNDIOP               |
| VDDNF    | 1.65–1.95V, 1.8V<br>3.0–3.6V, 3.3V | NAND Flash I/O and control, D16–D31 and multiplexed SMC lines                                 | GNDIOM               |
| VDDOSC   | 1.65–3.6V                          | Main Oscillator cells   | GNDOSC               |
| VDDPLLA  | 0.9–1.1V, 1.0V                     | PLLA and PLLUTMI cells  | GNDOSC               |
| VDDUTMIC | 0.9–1.1V, 1.0V                     | USB transceiver core logic  | GNDUTMI              |
| VDDUTMII | 3.0-3.6V, 3.3V                     | USB transceiver interface   | GNDUTMI              |

Note: 1. Refer to Table 3-2 for more details.

# 5. Memories

Figure 5-1. SAM9X35 Memory Mapping

# 5.1 Memory Mapping

A first level of address decoding is performed by the AHB Bus Matrix, i.e., the implementation of the Advanced High performance Bus (AHB) for its Master and Slave interfaces with additional features.

Decoding breaks up the 4 Gbytes of address space into 16 banks of 256 Mbytes. Banks 1 to 6 are directed to the EBI that associates these banks to the external chip selects, EBI\_NCS0 to EBI\_NCS5. Bank 0 is reserved for the addressing of the internal memories, and a second level of decoding provides 1 Mbyte of internal memory area. Bank 15 is reserved for the peripherals and provides access to the Advanced Peripheral Bus (APB).

Other areas are unused and performing an access within them provides an abort to the master requesting such an access.

## 5.2 Embedded Memories

#### 5.2.1 Internal SRAM

The SAM9X35 embeds a total of 32 Kbytes of high-speed SRAM.

After reset and until the Remap Command is performed, the SRAM is only accessible at address 0x0030 0000.

After Remap, the SRAM also becomes available at address 0x0.

#### 5.2.2 Internal ROM

The SAM9X35 embeds an Internal ROM, which contains the SAM-BA® program.

At any time, the ROM is mapped at address  $0x0010\ 0000$ . It is also accessible at address  $0x0\ (BMS = 1)$  after the reset and before the Remap Command.

#### 5.3 External Memories

### 5.3.1 External Bus Interface

- Integrates three External Memory Controllers:
  - Static Memory Controller
  - DDR2/SDRAM Controller
  - MLC NAND Flash ECC Controller
- Additional logic for NAND Flash and CompactFlash<sup>®</sup>
- Up to 26-bit Address Bus (up to 64 Mbytes linear per chip select)
- Up to 6 chip selects, Configurable Assignment:
  - Static Memory Controller on NCS0, NCS1, NCS2, NCS3, NCS4, NCS5
  - DDR2/SDRAM Controller (SDCS) or Static Memory Controller on NCS1
  - Optional NAND Flash support on NCS3

### 5.3.2 Static Memory Controller

- 8-bit, 16-bit, or 32-bit Data Bus
- Multiple Access Modes supported
  - Byte Write or Byte Select Lines
  - Asynchronous read in Page Mode supported (4- up to 16-byte page size)
- Multiple device adaptability
  - Control signals programmable setup, pulse and hold time for each Memory Bank
- Multiple Wait State Management
  - Programmable Wait State Generation
  - External Wait Request
  - Programmable Data Float Time
- Slow Clock mode supported

#### 5.3.3 DDR2SDR Controller

- Supports 4-bank and 8-bank DDR2, LPDDR, SDR and LPSDR
- Numerous Configurations Supported
  - 2K, 4K, 8K, 16K Row Address Memory Parts
  - SDRAM with 8 Internal Banks
  - SDR-SDRAM with 32-bit Data Path
  - DDR2/LPDDR with 16-bit Data Path
  - One Chip Select for SDRAM Device (256 Mbyte Address Space)
- Programming Facilities
  - Multibank Ping-pong Access (Up to 8 Banks Opened at Same Time = Reduces Average Latency of Transactions)
  - Timing Parameters Specified by Software
  - Automatic Refresh Operation, Refresh Rate is Programmable
  - Automatic Update of DS, TCR and PASR Parameters (LPSDR)
- Energy-saving Capabilities
  - Self-refresh, Power-down and Deep Power Modes Supported
- SDRAM Power-up Initialization by Software
- CAS Latency of 2, 3 Supported
- Auto Precharge Command Not Used
- SDR-SDRAM with 16-bit Datapath and Eight Columns Not Supported
  - Clock Frequency Change in Precharge Power-down Mode Not Supported

# 6. System Controller

The System Controller is a set of peripherals that allows handling of key elements of the system, such as power, resets, clocks, time, interrupts, watchdog, etc.

The System Controller User Interface also embeds the registers that configure the Matrix and a set of registers for the chip configuration. The chip configuration registers configure the EBI chip select assignment and voltage range for external memories.

The System Controller's peripherals are all mapped within the highest 16 Kbytes of address space, between addresses 0xFFFF\_C000 and 0xFFFF\_FFF.

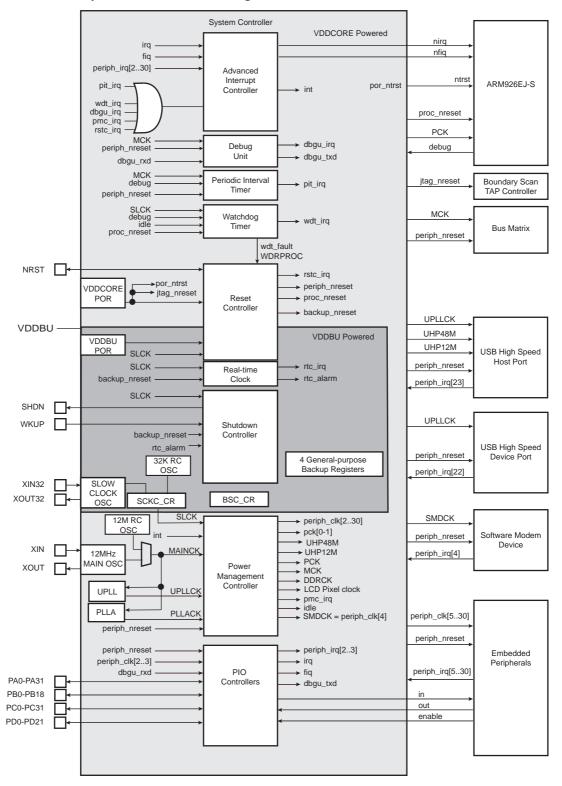

However, all the registers of System Controller are mapped on the top of the address space. All the registers of the System Controller can be addressed from a single pointer by using the standard ARM instruction set, as the Load/Store instruction have an indexing mode of ±4 Kbytes.

Figure 1-1 on page 3 shows the System Controller block diagram.

Figure 5-1 on page 18 shows the mapping of the User Interface of the System Controller peripherals.

Figure 6-1. SAM9X35 System Controller Block Diagram

# 6.1 Chip Identification

Chip ID: 0x819A\_05A1Chip ID Extension: 2JTAG ID: 0x05B2\_F03F

ARM926 TAP ID: 0x0792\_603F

# 6.2 Backup Area

The SAM9X35 features a Backup Area that embeds:

- RC Oscillator
- Slow Clock Oscillator
- Real Time Counter (RTC)
- Shutdown Controller (SHDWC)
- 4 Backup Registers (GPBR)
- Slow Clock Controller Configuration Register (SCKC\_CR)
- Boot Sequence Configuration Register (BSC\_CR)
- A part of the Reset Controller (RSTC)

This section is powered by the VDDBU rail.

# 7. Peripherals

# 7.1 Peripheral Mapping

As shown in Figure 5-1 on page 18, the Peripherals are mapped in the upper 256 Mbytes of the address space between the addresses 0xF000\_0000 and 0xFFFF\_C000.

Each user peripheral is allocated 16 Kbytes of address space.

# 7.2 Peripheral Identifiers

Table 7-1 defines the Peripheral Identifiers of the SAM9X35. A peripheral identifier is required for the control of the peripheral interrupt with the Advanced Interrupt Controller and for the control of the peripheral clock with the Power Management Controller.

Table 7-1. Peripheral Identifiers

| Instance ID | Instance Name | Instance Description   | External interrupt | Wired-OR interrupt   |
|-------------|---------------|--|--------------------|--|
| 0           | AIC           | Advanced Interrupt Controller                                | FIQ                |  |
| 1           | SYS           | System Controller  |                    | DBGU, PMC, SYSC, PMECC,<br>PMERRLOC, RTSC, SHDWC,<br>PIT, WDT, RTC |
| 2           | PIOA, PIOB    | Parallel I/O Controller A and B                              |                    |  |
| 3           | PIOC, PIOD    | Parallel I/O Controller C and D                              |                    |  |

# 7.3 Peripheral Signal Multiplexing on I/O Lines

The SAM9X35 features four PIO controllers (PIOA, PIOB, PIOC, and PIOD) which multiplex the I/O lines of the peripheral set.

Each PIO controller controls a number of lines:

32 lines for PIOA

19 lines for PIOB

32 lines for PIOC

22 lines for PIOD

Each line can be assigned to one of three peripheral functions, A, B or C. Refer to Table 3-3, "Pin Description BGA217," on page 11 to see the PIO assignments.

# 8. ARM926EJ-S<sup>™</sup>

### 8.1 Description

The ARM926EJ-S processor is a member of the ARM9<sup>™</sup> family of general-purpose microprocessors. The ARM926EJ-S implements ARM architecture version 5TEJ and is targeted at multi-tasking applications where full memory management, high performance, low die size and low power are all important features.

The ARM926EJ-S processor supports the 32-bit ARM and 16-bit THUMB instruction sets, enabling the user to trade off between high performance and high code density. It also supports 8-bit Java instruction set and includes features for efficient execution of Java bytecode, providing a Java performance similar to a JIT (Just-In-Time compilers), for the next generation of Java-powered wireless and embedded devices. It includes an enhanced multiplier design for improved DSP performance.

The ARM926EJ-S processor supports the ARM debug architecture and includes logic to assist in both hardware and software debug.

The ARM926EJ-S provides a complete high performance processor subsystem, including:

- An ARM9EJ-S<sup>™</sup> integer core
- A Memory Management Unit (MMU)
- Separate instruction and data AMBA AHB bus interfaces

### 8.2 Embedded Characteristics

- ARM9EJ-S<sup>™</sup> Based on ARM<sup>®</sup> Architecture v5TEJ with Jazelle Technology
- Three Instruction Sets
  - ARM<sup>®</sup> High-performance 32-bit Instruction Set
  - Thumb<sup>®</sup> High Code Density 16-bit Instruction Set
  - Jazelle<sup>®</sup> 8-bit Instruction Set
- 5-Stage Pipeline Architecture when Jazelle is not Used
  - Fetch (F)
  - Decode (D)
  - Execute (E)
  - Memory (M)
  - Writeback (W)
- 6-Stage Pipeline when Jazelle is Used
  - Fetch
  - Jazelle/Decode (Two Cycles)
  - Execute
  - Memory
  - Writeback
- ICache and DCache
  - Virtually-addressed 4-way Set Associative Caches
  - 8 Words per Line
  - Critical-word First Cache Refilling
  - Write-though and Write-back Operation for DCache Only
  - Pseudo-random or Round-robin Replacement
  - Cache Lockdown Registers
  - Cache Maintenance

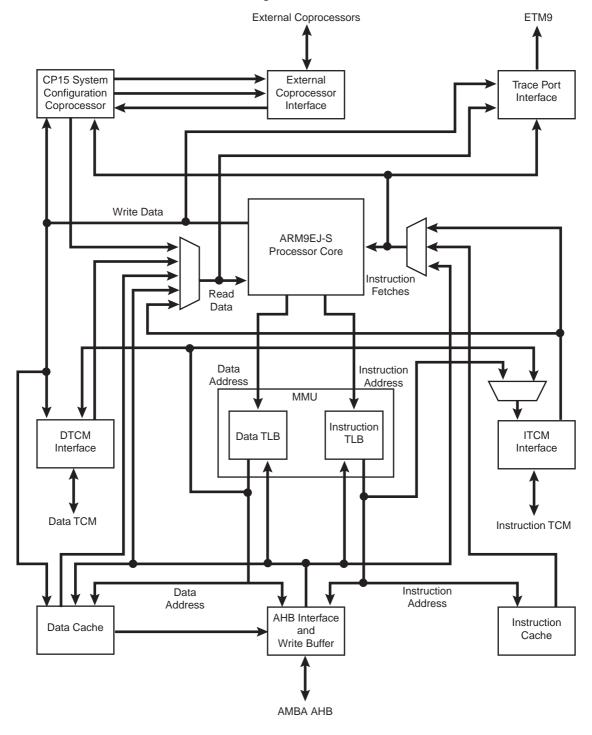

- Write Buffer
  - 16-word Data Buffer
  - 4-address Address Buffer
  - Software Control Drain
- DCache Write-back Buffer
  - 8 Data Word Entries
  - One Address Entry
  - Software Control Drain
- Memory Management Unit (MMU)
  - Access Permission for Sections
  - Access Permission for Large Pages and Small Pages
  - 16 Embedded Domains
  - 64 Entry Instruction TLB and 64 Entry Data TLB
- Memory Access
  - 8-, 16-, and 32-bit Data Types
  - Separate AMBA AHB Buses for Both the 32-bit Data Interface and the 32-bit Instructions Interface
- Bus Interface Unit
  - Arbitrates and Schedules AHB Requests
  - Enables Multi-layer AHB to be Implemented
  - Increases Overall Bus Bandwidth
  - Makes System Architecture Mode Flexible

# 8.3 Block Diagram

Figure 8-1. ARM926EJ-S Internal Functional Block Diagram

### 8.4 ARM9EJ-S Processor

### 8.4.1 ARM9EJ-S Operating States

The ARM9EJ-S processor can operate in three different states, each with a specific instruction set:

- ARM state: 32-bit, word-aligned ARM instructions.
- THUMB state: 16-bit, halfword-aligned Thumb instructions.
- Jazelle state: variable length, byte-aligned Jazelle instructions.

In Jazelle state, all instruction Fetches are in words.

### 8.4.2 Switching State

The operating state of the ARM9EJ-S core can be switched between:

- ARM state and THUMB state using the BX and BLX instructions, and loads to the PC
- ARM state and Jazelle state using the BXJ instruction

All exceptions are entered, handled and exited in ARM state. If an exception occurs in Thumb or Jazelle states, the processor reverts to ARM state. The transition back to Thumb or Jazelle states occurs automatically on return from the exception handler.

### 8.4.3 Instruction Pipelines

The ARM9EJ-S core uses two kinds of pipelines to increase the speed of the flow of instructions to the processor.

A five-stage (five clock cycles) pipeline is used for ARM and Thumb states. It consists of Fetch, Decode, Execute, Memory and Writeback stages.

A six-stage (six clock cycles) pipeline is used for Jazelle state It consists of Fetch, Jazelle/Decode (two clock cycles), Execute, Memory and Writeback stages.

### 8.4.4 Memory Access

The ARM9EJ-S core supports byte (8-bit), half-word (16-bit) and word (32-bit) access. Words must be aligned to four-byte boundaries, half-words must be aligned to two-byte boundaries and bytes can be placed on any byte boundary.

Because of the nature of the pipelines, it is possible for a value to be required for use before it has been placed in the register bank by the actions of an earlier instruction. The ARM9EJ-S control logic automatically detects these cases and stalls the core or forward data.

#### 8.4.5 Jazelle Technology

The Jazelle technology enables direct and efficient execution of Java byte codes on ARM processors, providing high performance for the next generation of Java-powered wireless and embedded devices.

The new Java feature of ARM9EJ-S can be described as a hardware emulation of a JVM (Java Virtual Machine). Java mode will appear as another state: instead of executing ARM or Thumb instructions, it executes Java byte codes. The Java byte code decoder logic implemented in ARM9EJ-S decodes 95% of executed byte codes and turns them into ARM instructions without any overhead, while less frequently used byte codes are broken down into optimized sequences of ARM instructions. The hardware/software split is invisible to the programmer, invisible to the application and invisible to the operating system. All existing ARM registers are re-used in Jazelle state and all registers then have particular functions in this mode.

Minimum interrupt latency is maintained across both ARM state and Java state. Since byte codes execution can be restarted, an interrupt automatically triggers the core to switch from Java state to ARM state for the execution of the interrupt handler. This means that no special provision has to be made for handling interrupts while executing byte codes, whether in hardware or in software.

### 8.4.6 ARM9EJ-S Operating Modes

In all states, there are seven operation modes:

- User mode is the usual ARM program execution state. It is used for executing most application programs
- Fast Interrupt (FIQ) mode is used for handling fast interrupts. It is suitable for high-speed data transfer or channel process
- Interrupt (IRQ) mode is used for general-purpose interrupt handling
- Supervisor mode is a protected mode for the operating system
- Abort mode is entered after a data or instruction prefetch abort
- System mode is a privileged user mode for the operating system
- Undefined mode is entered when an undefined instruction exception occurs

Mode changes may be made under software control, or may be brought about by external interrupts or exception processing. Most application programs execute in User Mode. The non-user modes, known as privileged modes, are entered in order to service interrupts or exceptions or to access protected resources.

#### 8.4.7 ARM9EJ-S Registers

The ARM9EJ-S core has a total of 37 registers.

- 31 general-purpose 32-bit registers
- 6 32-bit status registers

Table 8-1 shows all the registers in all modes.

Table 8-1. ARM9TDMI Modes and Registers Layout

| User and System Mode | Supervisor Mode | Abort Mode | Undefined Mode | Interrupt Mode | Fast Interrupt Mode |
|----------------------|-----------------|------------|----------------|----------------|---------------------|
| R0                   | R0              | R0         | R0             | R0             | R0                  |
| R1                   | R1              | R1         | R1             | R1             | R1                  |
| R2                   | R2              | R2         | R2             | R2             | R2                  |
| R3                   | R3              | R3         | R3             | R3             | R3                  |
| R4                   | R4              | R4         | R4             | R4             | R4                  |
| R5                   | R5              | R5         | R5             | R5             | R5                  |
| R6                   | R6              | R6         | R6             | R6             | R6                  |
| R7                   | R7              | R7         | R7             | R7             | R7                  |
| R8                   | R8              | R8         | R8             | R8             | R8_FIQ              |
| R9                   | R9              | R9         | R9             | R9             | R9_FIQ              |
| R10                  | R10             | R10        | R10            | R10            | R10_FIQ             |
| R11                  | R11             | R11        | R11            | R11            | R11_FIQ             |
| R12                  | R12             | R12        | R12            | R12            | R12_FIQ             |
| R13                  | R13_SVC         | R13_ABORT  | R13_UNDEF      | R13_IRQ        | R13_FIQ             |
| R14                  | R14_SVC         | R14_ABORT  | R14_UNDEF      | R14_IRQ        | R14_FIQ             |
| PC                   | PC              | PC         | PC             | PC             | PC                  |

| CPSR | CPSR     | CPSR       | CPSR       | CPSR     | CPSR     |
|------|----------|------------|------------|----------|----------|
|      | SPSR_SVC | SPSR_ABORT | SPSR_UNDEF | SPSR_IRQ | SPSR_FIQ |

Mode-specific banked registers

The ARM state register set contains 16 directly-accessible registers, r0 to r15, and an additional register, the Current Program Status Register (CPSR). Registers r0 to r13 are general-purpose registers used to hold either data or address values. Register r14 is used as a Link register that holds a value (return address) of r15 when BL or BLX is executed. Register r15 is used as a program counter (PC), whereas the Current Program Status Register (CPSR) contains condition code flags and the current mode bits.

In privileged modes (FIQ, Supervisor, Abort, IRQ, Undefined), mode-specific banked registers (r8 to r14 in FIQ mode or r13 to r14 in the other modes) become available. The corresponding banked registers r14\_fiq, r14\_svc, r14\_abt, r14\_irq, r14\_und are similarly used to hold the values (return address for each mode) of r15 (PC) when interrupts and exceptions arise, or when BL or BLX instructions are executed within interrupt or exception routines. There is another register called Saved Program Status Register (SPSR) that becomes available in privileged modes instead of CPSR. This register contains condition code flags and the current mode bits saved as a result of the exception that caused entry to the current (privileged) mode.

In all modes and due to a software agreement, register r13 is used as stack pointer.

The use and the function of all the registers described above should obey ARM Procedure Call Standard (APCS) which defines:

- Constraints on the use of registers
- Stack conventions
- Argument passing and result return

For more details, refer to ARM Software Development Kit.

The Thumb state register set is a subset of the ARM state set. The programmer has direct access to:

- Eight general-purpose registers r0-r7
- Stack pointer, SP
- Link register, LR (ARM r14)
- PC
- CPSR

There are banked registers SPs, LRs and SPSRs for each privileged mode (for more details see the ARM9EJ-S Technical Reference Manual, revision r1p2 page 2-12).

#### 8.4.7.1 Status Registers

The ARM9EJ-S core contains one CPSR, and five SPSRs for exception handlers to use. The program status registers:

- Hold information about the most recently performed ALU operation
- Control the enabling and disabling of interrupts
- Set the processor operation mode

Figure 8-2. Status Register Format

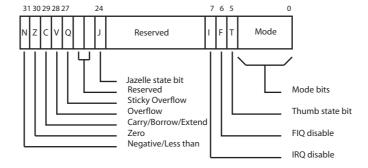

Figure 8-2 shows the status register format, where:

- N: Negative, Z: Zero, C: Carry, and V: Overflow are the four ALU flags
- The Sticky Overflow (Q) flag can be set by certain multiply and fractional arithmetic instructions like QADD, QDADD, QSUB, QDSUB, SMLAxy, and SMLAWy needed to achieve DSP operations.
   The Q flag is sticky in that, when set by an instruction, it remains set until explicitly cleared by an MSR

instruction writing to the CPSR. Instructions cannot execute conditionally on the status of the Q flag.

- The J bit in the CPSR indicates when the ARM9EJ-S core is in Jazelle state, where:
  - J = 0: The processor is in ARM or Thumb state, depending on the T bit
  - J = 1: The processor is in Jazelle state.
- Mode: five bits to encode the current processor mode

### 8.4.7.2 Exceptions

Exception Types and Priorities

The ARM9EJ-S supports five types of exceptions. Each type drives the ARM9EJ-S in a privileged mode. The types of exceptions are:

- Fast interrupt (FIQ)
- Normal interrupt (IRQ)
- Data and Prefetched aborts (Abort)
- Undefined instruction (Undefined)
- Software interrupt and Reset (Supervisor)

When an exception occurs, the banked version of R14 and the SPSR for the exception mode are used to save the state.

More than one exception can happen at a time, therefore the ARM9EJ-S takes the arisen exceptions according to the following priority order:

- Reset (highest priority)
- Data Abort
- FIQ
- IRQ
- Prefetch Abort
- BKPT, Undefined instruction, and Software Interrupt (SWI) (Lowest priority)

The BKPT, or Undefined instruction, and SWI exceptions are mutually exclusive.

Note that there is one exception in the priority scheme: when FIQs are enabled and a Data Abort occurs at the same time as an FIQ, the ARM9EJ-S core enters the Data Abort handler, and proceeds immediately to FIQ vector. A normal return from the FIQ causes the Data Abort handler to resume execution. Data Aborts must have higher priority than FIQs to ensure that the transfer error does not escape detection.

### Exception Modes and Handling

Exceptions arise whenever the normal flow of a program must be halted temporarily, for example, to service an interrupt from a peripheral.

When handling an ARM exception, the ARM9EJ-S core performs the following operations:

- 1. Preserves the address of the next instruction in the appropriate Link Register that corresponds to the new mode that has been entered. When the exception entry is from:
  - ARM and Jazelle states, the ARM9EJ-S copies the address of the next instruction into LR (current PC(r15) + 4 or PC + 8 depending on the exception).
  - THUMB state, the ARM9EJ-S writes the value of the PC into LR, offset by a value (current PC + 2, PC + 4 or PC + 8 depending on the exception) that causes the program to resume from the correct place on return.
- 2. Copies the CPSR into the appropriate SPSR.
- 3. Forces the CPSR mode bits to a value that depends on the exception.
- 4. Forces the PC to fetch the next instruction from the relevant exception vector.

The register r13 is also banked across exception modes to provide each exception handler with private stack pointer.

The ARM9EJ-S can also set the interrupt disable flags to prevent otherwise unmanageable nesting of exceptions.

When an exception has completed, the exception handler must move both the return value in the banked LR minus an offset to the PC and the SPSR to the CPSR. The offset value varies according to the type of exception. This action restores both PC and the CPSR.

The fast interrupt mode has seven private registers r8 to r14 (banked registers) to reduce or remove the requirement for register saving which minimizes the overhead of context switching.

The Prefetch Abort is one of the aborts that indicates that the current memory access cannot be completed. When a Prefetch Abort occurs, the ARM9EJ-S marks the prefetched instruction as invalid, but does not take the exception until the instruction reaches the Execute stage in the pipeline. If the instruction is not executed, for example because a branch occurs while it is in the pipeline, the abort does not take place.

The breakpoint (BKPT) instruction is a new feature of ARM9EJ-S that is destined to solve the problem of the Prefetch Abort. A breakpoint instruction operates as though the instruction caused a Prefetch Abort.

A breakpoint instruction does not cause the ARM9EJ-S to take the Prefetch Abort exception until the instruction reaches the Execute stage of the pipeline. If the instruction is not executed, for example because a branch occurs while it is in the pipeline, the breakpoint does not take place.

#### 8.4.8 ARM Instruction Set Overview

The ARM instruction set is divided into:

- Branch instructions
- Data processing instructions
- Status register transfer instructions
- Load and Store instructions
- Coprocessor instructions
- Exception-generating instructions

ARM instructions can be executed conditionally. Every instruction contains a 4-bit condition code field (bits[31:28]).

For further details, see the ARM Technical Reference Manual.

Table 8-2 gives the ARM instruction mnemonic list.

Table 8-2. ARM Instruction Mnemonic List

| Mnemonic | Operation                              |
|----------|--|
| MOV      | Move                                   |
| ADD      | Add                                    |
| SUB      | Subtract                               |
| RSB      | Reverse Subtract                       |
| CMP      | Compare                                |
| TST      | Test                                   |
| AND      | Logical AND                            |
| EOR      | Logical Exclusive OR                   |
| MUL      | Multiply                               |
| SMULL    | Sign Long Multiply                     |
| SMLAL    | Signed Long Multiply<br>Accumulate     |
| MSR      | Move to Status Register                |
| В        | Branch                                 |
| BX       | Branch and Exchange                    |
| LDR      | Load Word                              |
| LDRSH    | Load Signed Halfword                   |
| LDRSB    | Load Signed Byte                       |
| LDRH     | Load Half Word                         |
| LDRB     | Load Byte                              |
| LDRBT    | Load Register Byte with<br>Translation |
| LDRT     | Load Register with<br>Translation      |
| LDM      | Load Multiple                          |
| SWP      | Swap Word                              |
| MCR      | Move To Coprocessor                    |
| LDC      | Load To Coprocessor                    |
| CDP      | Coprocessor Data<br>Processing         |

| Mnemonic | Operation                               |
|----------|---|
| MVN      | Move Not                                |
| ADC      | Add with Carry                          |
| SBC      | Subtract with Carry                     |
| RSC      | Reverse Subtract with Carry             |
| CMN      | Compare Negated                         |
| TEQ      | Test Equivalence                        |
| BIC      | Bit Clear                               |
| ORR      | Logical (inclusive) OR                  |
| MLA      | Multiply Accumulate                     |
| UMULL    | Unsigned Long Multiply                  |
| UMLAL    | Unsigned Long Multiply<br>Accumulate    |
| MRS      | Move From Status Register               |
| BL       | Branch and Link                         |
| SWI      | Software Interrupt                      |
| STR      | Store Word                              |
|          |   |
|          |   |
| STRH     | Store Half Word                         |
| STRB     | Store Byte                              |
| STRBT    | Store Register Byte with<br>Translation |
| STRT     | Store Register with<br>Translation      |
| STM      | Store Multiple                          |
| SWPB     | Swap Byte                               |
| MRC      | Move From Coprocessor                   |
| STC      | Store From Coprocessor                  |
|          |   |

### 8.4.9 New ARM Instruction Set

Table 8-3. New ARM Instruction Mnemonic List

| Mnemonic | Operation                              |
|----------|--|
| BXJ      | Branch and exchange to Java            |
| BLX (1)  | Branch, Link and exchange              |
| SMLAxy   | Signed Multiply Accumulate 16 * 16 bit |
| SMLAL    | Signed Multiply Accumulate Long        |
| SMLAWy   | Signed Multiply Accumulate 32 * 16 bit |
| SMULxy   | Signed Multiply 16 * 16 bit            |
| SMULWy   | Signed Multiply 32 * 16 bit            |
| QADD     | Saturated Add                          |
| QDADD    | Saturated Add with Double              |
| QSUB     | Saturated subtract                     |
| QDSUB    | Saturated Subtract with double         |

| Mnemonic | Operation   |
|----------|---|
| MRRC     | Move double from coprocessor                      |
| MCR2     | Alternative move of ARM reg to coprocessor        |
| MCRR     | Move double to coprocessor                        |
| CDP2     | Alternative Coprocessor<br>Data Processing        |
| ВКРТ     | Breakpoint  |
| PLD      | Soft Preload, Memory prepare to load from address |
| STRD     | Store Double                                      |
| STC2     | Alternative Store from Coprocessor                |
| LDRD     | Load Double                                       |
| LDC2     | Alternative Load to<br>Coprocessor                |
| CLZ      | Count Leading Zeroes                              |

Notes: 1. A Thumb BLX contains two consecutive Thumb instructions, and takes four cycles.

### 8.4.10 Thumb Instruction Set Overview

The Thumb instruction set is a re-encoded subset of the ARM instruction set.

The Thumb instruction set is divided into:

- Branch instructions
- Data processing instructions
- Load and Store instructions
- Load and Store multiple instructions
- Exception-generating instruction

For further details, see the ARM Technical Reference Manual.

Table 8-4 gives the Thumb instruction mnemonic list.

Table 8-4. Thumb Instruction Mnemonic List

| Mnemonic | Operation              |
|----------|------------------------|
| MOV      | Move                   |
| ADD      | Add                    |
| SUB      | Subtract               |
| CMP      | Compare                |
| TST      | Test                   |
| AND      | Logical AND            |
| EOR      | Logical Exclusive OR   |
| LSL      | Logical Shift Left     |
| ASR      | Arithmetic Shift Right |
| MUL      | Multiply               |
| В        | Branch                 |
| BX       | Branch and Exchange    |
| LDR      | Load Word              |
| LDRH     | Load Half Word         |
| LDRB     | Load Byte              |
| LDRSH    | Load Signed Halfword   |
| LDMIA    | Load Multiple          |
| PUSH     | Push Register to stack |
| BCC      | Conditional Branch     |

| Mnemonic | Operation                  |
|----------|----------------------------|
| MVN      | Move Not                   |
| ADC      | Add with Carry             |
| SBC      | Subtract with Carry        |
| CMN      | Compare Negated            |
| NEG      | Negate                     |
| BIC      | Bit Clear                  |
| ORR      | Logical (inclusive) OR     |
| LSR      | Logical Shift Right        |
| ROR      | Rotate Right               |
| BLX      | Branch, Link, and Exchange |
| BL       | Branch and Link            |
| SWI      | Software Interrupt         |
| STR      | Store Word                 |
| STRH     | Store Half Word            |
| STRB     | Store Byte                 |
| LDRSB    | Load Signed Byte           |
| STMIA    | Store Multiple             |
| POP      | Pop Register from stack    |
| BKPT     | Breakpoint                 |

# 8.5 CP15 Coprocessor

Coprocessor 15, or System Control Coprocessor CP15, is used to configure and control all the items in the list below:

- ARM9EJ-S
- Caches (ICache, DCache and write buffer)
- TCM
- MMU
- Other system options

To control these features, CP15 provides 16 additional registers. See Table 8-5.

Table 8-5. CP15 Registers

| Register | Name                                    | Read/Write          |
|----------|---|---------------------|
| 0        | ID Code <sup>(1)</sup>                  | Read/Unpredictable  |
| 0        | Cache type <sup>(1)</sup>               | Read/Unpredictable  |
| 0        | TCM status <sup>(1)</sup>               | Read/Unpredictable  |
| 1        | Control                                 | Read/write          |
| 2        | Translation Table Base                  | Read/write          |
| 3        | Domain Access Control                   | Read/write          |
| 4        | Reserved                                | None                |
| 5        | Data fault Status <sup>(1)</sup>        | Read/write          |
| 5        | Instruction fault status <sup>(1)</sup> | Read/write          |
| 6        | Fault Address                           | Read/write          |
| 7        | Cache Operations                        | Read/Write          |
| 8        | TLB operations                          | Unpredictable/Write |
| 9        | cache lockdown <sup>(2)</sup>           | Read/write          |
| 9        | TCM region                              | Read/write          |
| 10       | TLB lockdown                            | Read/write          |
| 11       | Reserved                                | None                |
| 12       | Reserved                                | None                |
| 13       | FCSE PID <sup>(1)</sup>                 | Read/write          |
| 13       | Context ID <sup>(1)</sup>               | Read/Write          |
| 14       | Reserved                                | None                |
| 15       | Test configuration                      | Read/Write          |

Notes: 1.

- 1. Register locations 0,5, and 13 each provide access to more than one register. The register accessed depends on the value of the opcode\_2 field.
- 2. Register location 9 provides access to more than one register. The register accessed depends on the value of the CRm field.

## 8.5.1 CP15 Registers Access

CP15 registers can only be accessed in privileged mode by:

- MCR (Move to Coprocessor from ARM Register) instruction is used to write an ARM register to CP15.
- MRC (Move to ARM Register from Coprocessor) instruction is used to read the value of CP15 to an ARM register.

Other instructions like CDP, LDC, STC can cause an undefined instruction exception.

The assembler code for these instructions is:

 $\label{eq:mcr_mrc} \texttt{MCR/MRC}\{\texttt{cond}\} \ \texttt{p15}, \ \texttt{opcode\_1}, \ \texttt{Rd}, \ \texttt{CRn}, \ \texttt{CRm}, \ \texttt{opcode\_2}.$ 

The MCR, MRC instructions bit pattern is shown below:

| 31 | 30       | 29 | 28 | 27  | 26 | 25 | 24 |  |  |
|----|----------|----|----|-----|----|----|----|--|--|
|    | CO       | nd |    | 1   | 1  | 1  | 0  |  |  |
| 23 | 22       | 21 | 20 | 19  | 18 | 17 | 16 |  |  |
|    | opcode_1 |    | L  | CRn |    |    |    |  |  |
| 15 | 14       | 13 | 12 | 11  | 10 | 9  | 8  |  |  |
|    | R        | d  |    | 1   | 1  | 1  | 1  |  |  |
| 7  | 6        | 5  | 4  | 3   | 2  | 1  | 0  |  |  |
|    | opcode_2 |    | 1  |     | CF | Rm |    |  |  |

## • CRm[3:0]: Specified Coprocessor Action

Determines specific coprocessor action. Its value is dependent on the CP15 register used. For details, refer to CP15 specific register behavior.

### opcode\_2[7:5]

Determines specific coprocessor operation code. By default, set to 0.

#### Rd[15:12]: ARM Register

Defines the ARM register whose value is transferred to the coprocessor. If R15 is chosen, the result is unpredictable.

#### • CRn[19:16]: Coprocessor Register

Determines the destination coprocessor register.

#### • L: Instruction Bit

0 = MCR instruction

1 = MRC instruction

# • opcode\_1[23:20]: Coprocessor Code

Defines the coprocessor specific code. Value is c15 for CP15.

## • cond [31:28]: Condition

For more details, see Chapter 2 in ARM926EJ-S TRM.

# 8.6 Memory Management Unit (MMU)

The ARM926EJ-S processor implements an enhanced ARM architecture v5 MMU to provide virtual memory features required by operating systems like Symbian OS, WindowsCE, and Linux. These virtual memory features are memory access permission controls and virtual to physical address translations.

The Virtual Address generated by the CPU core is converted to a Modified Virtual Address (MVA) by the FCSE (Fast Context Switch Extension) using the value in CP15 register13. The MMU translates modified virtual addresses to physical addresses by using a single, two-level page table set stored in physical memory. Each entry in the set contains the access permissions and the physical address that correspond to the virtual address.

The first level translation tables contain 4096 entries indexed by bits [31:20] of the MVA. These entries contain a pointer to either a 1 MB section of physical memory along with attribute information (access permissions, domain, etc.) or an entry in the second level translation tables; coarse table and fine table.

The second level translation tables contain two subtables, coarse table and fine table. An entry in the coarse table contains a pointer to both large pages and small pages along with access permissions. An entry in the fine table contains a pointer to large, small and tiny pages.

Table 7 shows the different attributes of each page in the physical memory.

Table 8-6. Mapping Details

| Mapping Name | Mapping Size | Access Permission By | Subpage Size |
|--------------|--------------|----------------------|--------------|
| Section      | 1M byte      | Section              | -            |
| Large Page   | 64K bytes    | 4 separated subpages | 16K bytes    |
| Small Page   | 4K bytes     | 4 separated subpages | 1K byte      |
| Tiny Page    | 1K byte      | Tiny Page            | -            |

#### The MMU consists of:

- Access control logic
- Translation Look-aside Buffer (TLB)
- Translation table walk hardware

## 8.6.1 Access Control Logic

The access control logic controls access information for every entry in the translation table. The access control logic checks two pieces of access information: domain and access permissions. The domain is the primary access control mechanism for a memory region; there are 16 of them. It defines the conditions necessary for an access to proceed. The domain determines whether the access permissions are used to qualify the access or whether they should be ignored.

The second access control mechanism is access permissions that are defined for sections and for large, small and tiny pages. Sections and tiny pages have a single set of access permissions whereas large and small pages can be associated with 4 sets of access permissions, one for each subpage (quarter of a page).

## 8.6.2 Translation Look-aside Buffer (TLB)

The Translation Look-aside Buffer (TLB) caches translated entries and thus avoids going through the translation process every time. When the TLB contains an entry for the MVA (Modified Virtual Address), the access control logic determines if the access is permitted and outputs the appropriate physical address corresponding to the MVA. If access is not permitted, the MMU signals the CPU core to abort.

If the TLB does not contain an entry for the MVA, the translation table walk hardware is invoked to retrieve the translation information from the translation table in physical memory.

#### 8.6.3 Translation Table Walk Hardware

The translation table walk hardware is a logic that traverses the translation tables located in physical memory, gets the physical address and access permissions and updates the TLB.

The number of stages in the hardware table walking is one or two depending whether the address is marked as a section-mapped access or a page-mapped access.

There are three sizes of page-mapped accesses and one size of section-mapped access. Page-mapped accesses are for large pages, small pages and tiny pages. The translation process always begins with a level one fetch. A section-mapped access requires only a level one fetch, but a page-mapped access requires an additional level two fetch. For further details on the MMU, please refer to chapter 3 in ARM926EJ-S Technical Reference Manual.

#### 8.6.4 MMU Faults

The MMU generates an abort on the following types of faults:

- Alignment faults (for data accesses only)
- Translation faults
- Domain faults
- Permission faults

The access control mechanism of the MMU detects the conditions that produce these faults. If the fault is a result of memory access, the MMU aborts the access and signals the fault to the CPU core. The MMU retains status and address information about faults generated by the data accesses in the data fault status register and fault address register. It also retains the status of faults generated by instruction fetches in the instruction fault status register.

The fault status register (register 5 in CP15) indicates the cause of a data or prefetch abort, and the domain number of the aborted access when it happens. The fault address register (register 6 in CP15) holds the MVA associated with the access that caused the Data Abort. For further details on MMU faults, please refer to chapter 3 in ARM926EJ-S Technical Reference Manual.

### 8.7 Caches and Write Buffer

The ARM926EJ-S contains a 16KB Instruction Cache (ICache), a 16KB Data Cache (DCache), and a write buffer. Although the ICache and DCache share common features, each still has some specific mechanisms.

The caches (ICache and DCache) are four-way set associative, addressed, indexed and tagged using the Modified Virtual Address (MVA), with a cache line length of eight words with two dirty bits for the DCache. The ICache and DCache provide mechanisms for cache lockdown, cache pollution control, and line replacement.

A new feature is now supported by ARM926EJ-S caches called allocate on read-miss commonly known as wrapping. This feature enables the caches to perform critical word first cache refilling. This means that when a request for a word causes a read-miss, the cache performs an AHB access. Instead of loading the whole line (eight words), the cache loads the critical word first, so the processor can reach it quickly, and then the remaining words, no matter where the word is located in the line.

The caches and the write buffer are controlled by the CP15 register 1 (Control), CP15 register 7 (cache operations) and CP15 register 9 (cache lockdown).

## 8.7.1 Instruction Cache (ICache)

The ICache caches fetched instructions to be executed by the processor. The ICache can be enabled by writing 1 to I bit of the CP15 Register 1 and disabled by writing 0 to this same bit.

When the MMU is enabled, all instruction fetches are subject to translation and permission checks. If the MMU is disabled, all instructions fetches are cachable, no protection checks are made and the physical address is flat-mapped to the modified virtual address. With the MVA use disabled, context switching incurs ICache cleaning and/or invalidating.

When the ICache is disabled, all instruction fetches appear on external memory (AHB) (see Tables 4-1 and 4-2 in page 4-4 in ARM926EJ-S TRM).

On reset, the ICache entries are invalidated and the ICache is disabled. For best performance, ICache should be enabled as soon as possible after reset.

## 8.7.2 Data Cache (DCache) and Write Buffer

ARM926EJ-S includes a DCache and a write buffer to reduce the effect of main memory bandwidth and latency on data access performance. The operations of DCache and write buffer are closely connected.

#### 8.7.2.1 DCache

The DCache needs the MMU to be enabled. All data accesses are subject to MMU permission and translation checks. Data accesses that are aborted by the MMU do not cause linefills or data accesses to appear on the AMBA ASB interface. If the MMU is disabled, all data accesses are noncachable, nonbufferable, with no protection checks, and appear on the AHB bus. All addresses are flat-mapped, VA = MVA = PA, which incurs DCache cleaning and/or invalidating every time a context switch occurs.

The DCache stores the Physical Address Tag (PA Tag) from which every line was loaded and uses it when writing modified lines back to external memory. This means that the MMU is not involved in write-back operations.

Each line (8 words) in the DCache has two dirty bits, one for the first four words and the other one for the second four words. These bits, if set, mark the associated half-lines as dirty. If the cache line is replaced due to a linefill or a cache clean operation, the dirty bits are used to decide whether all, half or none is written back to memory.

DCache can be enabled or disabled by writing either 1 or 0 to bit C in register 1 of CP15 (see Tables 4-3 and 4-4 on page 4-5 in ARM926EJ-S TRM).

The DCache supports write-through and write-back cache operations, selected by memory region using the C and B bits in the MMU translation tables.

The DCache contains an eight data word entry, single address entry write-back buffer used to hold write-back data for cache line eviction or cleaning of dirty cache lines.

The Write Buffer can hold up to 16 words of data and four separate addresses. DCache and Write Buffer operations are closely connected as their configuration is set in each section by the page descriptor in the MMU translation table.

### 8.7.2.2 Write Buffer

The ARM926EJ-S contains a write buffer that has a 16-word data buffer and a four- address buffer. The write buffer is used for all writes to a bufferable region, write-through region and write-back region. It also allows to avoid stalling the processor when writes to external memory are performed. When a store occurs, data is written to the write buffer at core speed (high speed). The write buffer then completes the store to external memory at bus speed (typically slower than the core speed). During this time, the ARM9EJ-S processor can preform other tasks.

DCache and Write Buffer support write-back and write-through memory regions, controlled by C and B bits in each section and page descriptor within the MMU translation tables.

#### Write-though Operation

When a cache write hit occurs, the DCache line is updated. The updated data is then written to the write buffer which transfers it to external memory.

When a cache write miss occurs, a line, chosen by round robin or another algorithm, is stored in the write buffer which transfers it to external memory.

## Write-back Operation

When a cache write hit occurs, the cache line or half line is marked as dirty, meaning that its contents are not up-to-date with those in the external memory.

When a cache write miss occurs, a line, chosen by round robin or another algorithm, is stored in the write buffer which transfers it to external memory.

### 8.8 Bus Interface Unit

The ARM926EJ-S features a Bus Interface Unit (BIU) that arbitrates and schedules AHB requests. The BIU implements a multi-layer AHB, based on the AHB-Lite protocol, that enables parallel access paths between multiple AHB masters and slaves in a system. This is achieved by using a more complex interconnection matrix and gives the benefit of increased overall bus bandwidth, and a more flexible system architecture.

The multi-master bus architecture has a number of benefits:

- It allows the development of multi-master systems with an increased bus bandwidth and a flexible architecture.
- Each AHB layer becomes simple because it only has one master, so no arbitration or master-to-slave muxing is required. AHB layers, implementing AHB-Lite protocol, do not have to support request and grant, nor do they have to support retry and split transactions.
- The arbitration becomes effective when more than one master wants to access the same slave simultaneously.

## 8.8.1 Supported Transfers

The ARM926EJ-S processor performs all AHB accesses as single word, bursts of four words, or bursts of eight words. Any ARM9EJ-S core request that is not 1, 4, 8 words in size is split into packets of these sizes. Note that the Atmel bus is AHB-Lite protocol compliant, hence it does not support split and retry requests.

Table 8-7 gives an overview of the supported transfers and different kinds of transactions they are used for.

Table 8-7. Supported Transfers

| HBurst[2:0] | Description                   |  |
|-------------|-------------------------------|--|
| SINGLE      | Single transfer               | Single transfer of word, half-word, or byte:  Data write (NCNB, NCB, WT, or WB that has missed in DCache)  Data read (NCNB or NCB)  NC instruction fetch (prefetched and non-prefetched)  Page table walk read |
| INCR4       | Four-word incrementing burst  | Half-line cache write-back, Instruction prefetch, if enabled. Four-word burst NCNB, NCB, WT, or WB write.  |
| INCR8       | Eight-word incrementing burst | Full-line cache write-back, eight-word burst NCNB, NCB, WT, or WB write.   |
| WRAP8       | Eight-word wrapping burst     | Cache linefill   |

## 8.8.2 Thumb Instruction Fetches

All instructions fetches, regardless of the state of ARM9EJ-S core, are made as 32-bit accesses on the AHB. If the ARM9EJ-S is in Thumb state, then two instructions can be fetched at a time.

## 8.8.3 Address Alignment

The ARM926EJ-S BIU performs address alignment checking and aligns AHB addresses to the necessary boundary. 16-bit accesses are aligned to halfword boundaries, and 32-bit accesses are aligned to word boundaries.

# 9. Debug and Test

# 9.1 Description

The SAM9X35 features a number of complementary debug and test capabilities. A common JTAG/ICE (In-Circuit Emulator) port is used for standard debugging functions, such as downloading code and single-stepping through programs. The Debug Unit provides a two-pin UART that can be used to upload an application into internal SRAM. It manages the interrupt handling of the internal COMMTX and COMMRX signals that trace the activity of the Debug Communication Channel.

A set of dedicated debug and test input/output pins gives direct access to these capabilities from a PC-based test environment.

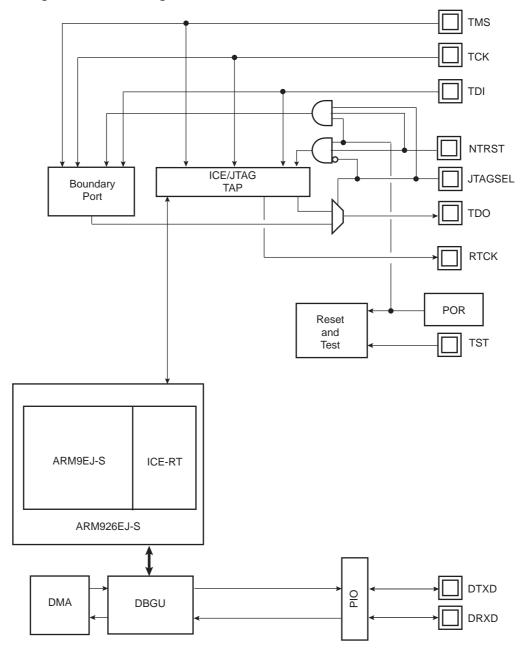

## 9.2 Embedded Characteristics

- ARM926 Real-time In-circuit Emulator
  - Two real-time Watchpoint Units
  - Two Independent Registers: Debug Control Register and Debug Status Register
  - Test Access Port Accessible through JTAG Protocol
  - Debug Communications Channel
- Debug Unit
  - Two-pin UART
  - Debug Communication Channel Interrupt Handling
  - Chip ID Register
- IEEE1149.1 JTAG Boundary-scan on All Digital Pins

# 9.4 Application Examples

## 9.4.1 Debug Environment

Figure 9-2 shows a complete debug environment example. The ICE/JTAG interface is used for standard debugging functions, such as downloading code and single-stepping through the program. A software debugger running on a personal computer provides the user interface for configuring a Trace Port interface utilizing the ICE/JTAG interface.

Figure 9-2. Application Debug and Trace Environment Example

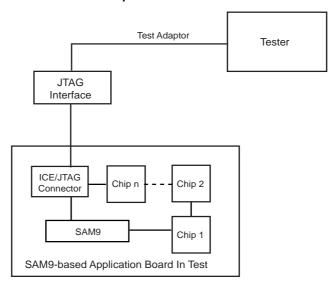

#### 9.4.2 Test Environment

Figure 9-3 shows a test environment example. Test vectors are sent and interpreted by the tester. In this example, the "board in test" is designed using a number of JTAG-compliant devices. These devices can be connected to form a single scan chain.

Figure 9-3. Application Test Environment Example

# 9.5 Debug and Test Pin Description

Table 9-1. Debug and Test Pin List

| Pin Name | Function              | Туре         | Active Level |
|----------|-----------------------|--------------|--------------|
|          | Reset/Test            |              |              |
| NRST     | Microcontroller Reset | Input/Output | Low          |
| TST      | Test Mode Select      | Input        | High         |
|          | ICE and JTAG          |              |              |
| NTRST    | Test Reset Signal     | Input        | Low          |
| TCK      | Test Clock            | Input        |              |
| TDI      | Test Data In          | Input        |              |
| TDO      | Test Data Out         | Output       |              |

# 9.6 Functional Description

#### 9.6.1 Test Pin

One dedicated pin, TST, is used to define the device operating mode. The user must make sure that this pin is tied at low level to ensure normal operating conditions. Other values associated with this pin are reserved for manufacturing test.

#### 9.6.2 EmbeddedICE<sup>™</sup>

The ARM9EJ-S EmbeddedICE-RT<sup>™</sup> is supported via the ICE/JTAG port. It is connected to a host computer via an ICE interface. Debug support is implemented using an ARM9EJ-S core embedded within the ARM926EJ-S. The internal state of the ARM926EJ-S is examined through an ICE/JTAG port which allows instructions to be serially inserted into the pipeline of the core without using the external data bus. Therefore, when in debug state, a store-multiple (STM) can be inserted into the instruction pipeline. This exports the contents of the ARM9EJ-S registers. This data can be serially shifted out without affecting the rest of the system.

There are two scan chains inside the ARM9EJ-S processor which support testing, debugging, and programming of the EmbeddedICE-RT. The scan chains are controlled by the ICE/JTAG port.

EmbeddedICE mode is selected when JTAGSEL is low. It is not possible to switch directly between ICE and JTAG operations. A chip reset must be performed after JTAGSEL is changed.

For further details on the EmbeddedICE-RT, see the ARM document *ARM9EJ-S Technical Reference Manual* (DDI 0222A).

## 9.6.3 JTAG Signal Description

TMS is the Test Mode Select input which controls the transitions of the test interface state machine.

TDI is the Test Data Input line which supplies the data to the JTAG registers (Boundary Scan Register, Instruction Register, or other data registers).

TDO is the Test Data Output line which is used to serially output the data from the JTAG registers to the equipment controlling the test. It carries the sampled values from the boundary scan chain (or other JTAG registers) and propagates them to the next chip in the serial test circuit.

NTRST (optional in IEEE Standard 1149.1) is a Test-ReSeT input which is mandatory in ARM cores and used to reset the debug logic. On Atmel ARM926EJ-S-based cores, NTRST is a Power On Reset output. It is asserted on power on. If necessary, the user can also reset the debug logic with the NTRST pin assertion during 2.5 MCK periods.

TCK is the Test Clock input which enables the test interface. TCK is pulsed by the equipment controlling the test and not by the tested device. It can be pulsed at any frequency. Note the maximum JTAG clock rate on ARM926EJ-S cores is 1/6th the clock of the CPU. This gives 5.45 kHz maximum initial JTAG clock rate for an ARM9E running from the 32.768 kHz slow clock.

RTCK is the Return Test Clock. Not an IEEE Standard 1149.1 signal added for a better clock handling by emulators. From some ICE Interface probes, this return signal can be used to synchronize the TCK clock and take not care about the given ratio between the ICE Interface clock and system clock equal to 1/6th. This signal is only available in JTAG ICE Mode and not in boundary scan mode.

## 9.6.4 Debug Unit

The Debug Unit provides a two-pin (DXRD and TXRD) USART that can be used for several debug and trace purposes and offers an ideal means for in-situ programming solutions and debug monitor communication. Moreover, the association with two peripheral data controller channels permits packet handling of these tasks with processor time reduced to a minimum.

The Debug Unit also manages the interrupt handling of the COMMTX and COMMRX signals that come from the ICE and that trace the activity of the Debug Communication Channel. The Debug Unit allows blockage of access to the system through the ICE interface.

A specific register, the Debug Unit Chip ID Register, gives information about the product version and its internal configuration.

The device Debug Unit Chip ID value is 0x819A\_05A1 on 32-bit width.

For further details on the Debug Unit, see the Debug Unit section.

## 9.6.5 IEEE 1149.1 JTAG Boundary Scan

IEEE 1149.1 JTAG Boundary Scan allows pin-level access independent of the device packaging technology.

IEEE 1149.1 JTAG Boundary Scan is enabled when JTAGSEL is high. The SAMPLE, EXTEST and BYPASS functions are implemented. In ICE debug mode, the ARM processor responds with a non-JTAG chip ID that identifies the processor to the ICE system. This is not IEEE 1149.1 JTAG-compliant.

It is not possible to switch directly between JTAG and ICE operations. A chip reset must be performed after JTAGSEL is changed.

A Boundary-scan Descriptor Language (BSDL) file is provided to set up test.

JTAG ID Code value is 0x05B2\_F03F.

# 10. Boot Strategies

The system always boots at address 0x0. To ensure maximum boot possibilities, the memory layout can be changed with the BMS pin. This allows the user to lay out the ROM or an external memory to 0x0. The sampling of the BMS pin is done at reset.

If BMS is detected at 0, the controller boots on the memory connected to Chip Select 0 of the External Bus Interface.

In this boot mode, the chip starts with its default parameters (all registers in their reset state), including as follows:

- The main clock is the on-chip 12 MHz RC oscillator
- The Static Memory Controller is configured with its default parameters

The user software in the external memory performs a complete configuration:

- Enables the 32768 Hz oscillator if best accuracy is needed
- Programs the PMC (main oscillator enable or bypass mode)
- Programs and starts the PLL
- Reprograms the SMC setup, cycle, hold, mode timing registers for EBI CS0, to adapt them to the new clock
- Switches the system clock to the new value

If BMS is detected at 1, the boot memory is the embedded ROM and the Boot Program described below is executed. (Section 10.1 "ROM Code").

## 10.1 ROM Code

The ROM code is a boot program contained in the embedded ROM. It is also called "First level bootloader".

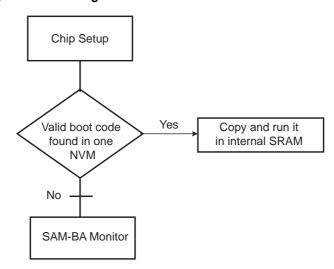

The ROM code performs several steps:

- Basic chip initialization: XTal or external clock frequency detection
- Attempt to retrieve a valid code from external non-volatile memories (NVM)
- Execution of a monitor called SAM-BA Monitor, in case no valid application has been found on any NVM

## 10.2 Flow Diagram

The ROM code implements the algorithm shown in Figure 10-1.

Figure 10-1. ROM Code Algorithm Flow Diagram

# 10.3 Chip Setup

At boot start-up, the processor clock (PCK) and the master clock (MCK) source is the 12 MHz Fast RC Oscillator. Initialization follows the steps described below:

- 1. **Stack setup** for ARM supervisor mode.
- 2. **Main Oscillator Detection:** The Main Clock is switched to the 32 kHz RC oscillator to allow external clock frequency to be measured. Then the Main Oscillator is enabled and set in Bypass mode. If the MOSCSELS bit rises, an external clock is connected, and the next step is Main Clock Selection (3). If not, the Bypass mode is cleared to attempt external quartz detection. This detection is successful when the MOSCXTS and MOSCSELS bits rise, else the 12 MHz Fast RC internal oscillator is used as the Main Clock.
- 3. **Main Clock Selection**: The Master Clock source is switched from the Slow Clock to the Main Oscillator without prescaler. The PMC Status Register is polled to wait for MCK Ready. PCK and MCK are now the Main Clock.
- 4. **C variable initialization:** Non zero-initialized data is initialized in the RAM (copy from ROM to RAM). Zero-initialized data is set to 0 in the RAM.
- 5. PLLA initialization: PLLA is configured to get a PCK at 96 MHz and an MCK at 48 MHz. If an external clock or crystal frequency running at 12 MHz is found, then the PLLA is configured to allow communication on the USB link for the SAM-BA monitor; else the Main Clock is switched to the internal 12 MHz Fast RC, but USB will not be activated.

Table 10-1. External Clock and Crystal Frequencies allowed for Boot Sequence (in MHz)

| Boot Sequence               | <b>⊴4</b> | 12  | ≥ 28 |
|-----------------------------|-----------|-----|------|
| Boot on External Memories   | Yes       | Yes | Yes  |
| SAM-BA Monitor through DBGU | Yes       | Yes | Yes  |
| SAM-BA Monitor through USB  | No        | Yes | No   |

Note that if the clock frequency is provided not at 12 MHz but between 4 and 28 MHz, it is considered by the ROM code as the 12 MHz clock frequency, and the PLL settings are configured accordingly.

#### 10.4 NVM Boot

#### 10.4.1 NVM Boot Sequence

The boot sequence on external memory devices can be controlled using the Boot Sequence Configuration Register (BSC\_CR). The three LSBs of the BSC\_CR are available to control the sequence. See the "Boot Sequence Controller (BSC)" section for more details.

The user can then choose to bypass some steps shown in Figure 10-2 "NVM Bootloader Sequence Diagram" according to the BSC\_CR value.

Table 10-2. Boot Sequence Configuration Register Values

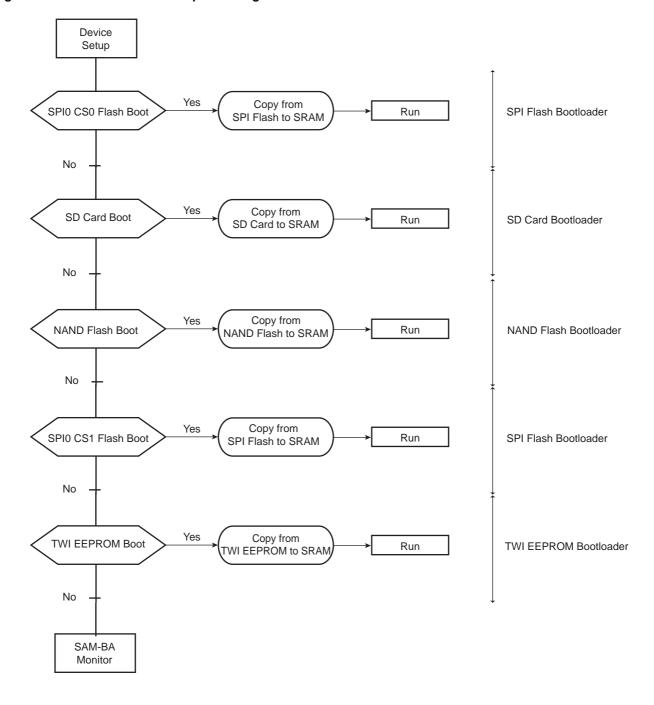

| BOOT<br>Value | SPI0 NPCS0 | SD Card | NAND Flash | SPI0 NPCS1 | TWI EEPROM | SAM-BA<br>Monitor |
|---------------|------------|---------|------------|------------|------------|-------------------|
| 0             | Υ          | Υ       | Υ          | Υ          | Υ          | Υ                 |
| 1             | Υ          | -       | Υ          | Υ          | Υ          | Υ                 |
| 2             | Y          | _       | _          | Y          | Y          | Υ                 |
| 3             | Y          | _       | _          | Y          | Y          | Υ                 |
| 4             | Y          | _       | _          | _          | Y          | Y                 |

Table 10-2. Boot Sequence Configuration Register Values (Continued)

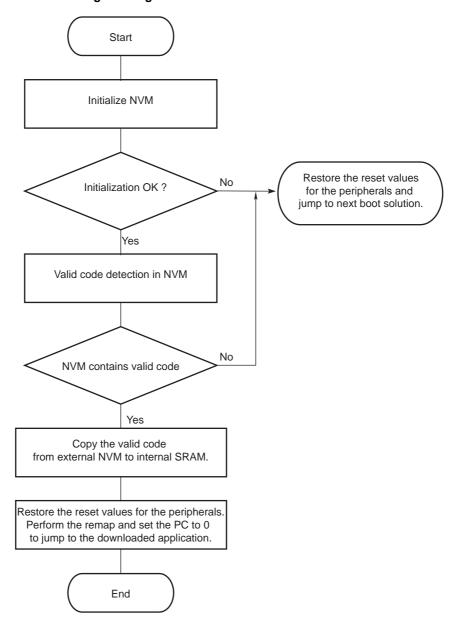

| BOOT<br>Value | SPI0 NPCS0 | SD Card | NAND Flash | SPI0 NPCS1 | TWI EEPROM | SAM-BA<br>Monitor |
|---------------|------------|---------|------------|------------|------------|-------------------|
| 5             | _          | -       | _          | _          | _          | Υ                 |
| 6             | _          | _       | _          | _          | _          | Y                 |
| 7             | _          | _       | _          | _          | _          | Y                 |

Figure 10-2. NVM Bootloader Sequence Diagram

## 10.4.2 NVM Bootloader Program Description

Figure 10-3. NVM Bootloader Program Diagram

The NVM bootloader program first initializes the PIOs related to the NVM device. Then it configures the right peripheral depending on the NVM and tries to access this memory. If the initialization fails, it restores the reset values for the PIO and the peripheral and then tries the same operations on the next NVM of the sequence.

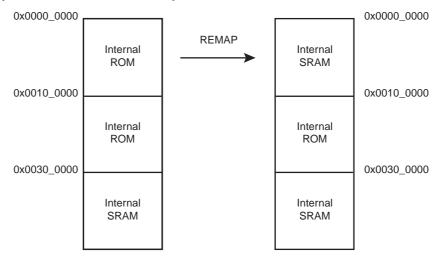

If the initialization is successful, the NVM bootloader program reads the beginning of the NVM and determines if the NVM contains valid code.

If the NVM does not contain valid code, the NVM bootloader program restores the reset value for the peripherals and then tries the same operations on the next NVM of the sequence.

If valid code is found, this code is loaded from NVM into internal SRAM and executed by branching at address 0x0000\_0000 after remap. This code may be the application code or a second-level bootloader. All the calls to functions are PC relative and do not use absolute addresses.

Figure 10-4. Remap Action After Download Completion

#### 10.4.3 Valid Code Detection

There are two kinds of valid code detection.

## 10.4.3.1 ARM Exception Vectors Check

The NVM bootloader program reads and analyzes the first 28 bytes corresponding to the first seven ARM exception vectors. Except for the sixth vector, these bytes must implement the ARM instructions for either branch or load PC with PC relative addressing.

Figure 10-5. LDR Opcode

| 31 |   |   | 28 | 27 |   |   | 24 | 23 |   |   | 20 | 19 | 16 | 15 | 12 | 11 | (     | ) |
|----|---|---|----|----|---|---|----|----|---|---|----|----|----|----|----|----|-------|---|
| 1  | 1 | 1 | 0  | 0  | 1 | Т | Р  | U  | 1 | W | 0  |    | Rn |    | Rd |    | O set | ٦ |

Figure 10-6. B Opcode

| 3 |   |   |   | 28 | 27 |   |   | 24 | 23              | 0 |
|---|---|---|---|----|----|---|---|----|-----------------|---|
|   | 1 | 1 | 1 | 0  | 1  | 0 | 1 | 0  | O set (24 bits) |   |

Unconditional instruction: 0xE for bits 31 to 28

Load PC with PC relative addressing instruction:

- Rn = Rd = PC = 0xF
- I==0 (12-bit immediate value)
- P==1 (pre-indexed)
- U offset added (U==1) or subtracted (U==0)
- W=='

The sixth vector, at offset 0x14, contains the size of the image to download. The user must replace this vector with the user's own vector. This information is described below.

Figure 10-7. Structure of the ARM Vector 6

The value has to be smaller than 24 Kbytes. This size is the internal SRAM size minus the stack size used by the ROM Code at the end of the internal SRAM.

| Example: | valid vectors: |          |       |
|----------|----------------|----------|-------|
| 00       |                | ea000006 | B0x20 |
| 04       |                | eafffffe | B0x04 |
|          |                |          |       |

08 ea00002f B\_main
0c eafffffe B0x0c
10 eafffffe B0x10
14 00001234 B0x14 ←Co

14 00001234  $B0x14 \leftarrow Code size = 4660 bytes$ 18 eafffffe B0x18

#### 10.4.3.2 boot.bin File Check

This method is the one used on FAT formatted SD cards. The boot program must be a file named "boot.bin" written in the root directory of the filesystem. Its size must not exceed the maximum size allowed: 24 Kbytes (0x6000).

### 10.4.4 Detailed Memory Boot Procedures

#### 10.4.4.1 NAND Flash Boot: NAND Flash Detection

\/=!:-|..........

After NAND Flash interface configuration, a reset command is sent to the memory.

The Boot Program first tries to find valid software on a NAND Flash device connected to EBI CS3, with data lines connected to D0–D7, then on NAND Flash connected to D16–D23. Hardware ECC detection and correction are provided by the PMECC peripheral (refer to the PMECC section in the datasheet for more information).

The Boot Program is able to retrieve NAND Flash parameters and ECC requirements using two methods as follows:

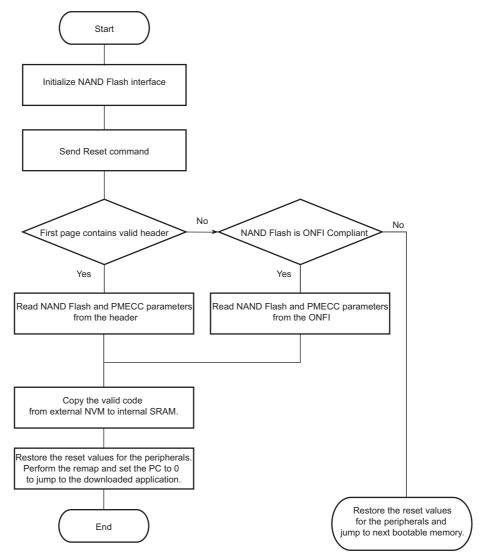

the detection of a specific header written at the beginning of the first page of NAND Flash,

or

through the ONFI parameters for ONFI compliant memories.

Figure 10-8. Boot NAND Flash Download

## **NAND Flash Specific Header Detection**

This is the first method used to determine NAND Flash parameters. After Initialization and Reset command, the Boot Program reads the first page without ECC check, to determine if the NAND parameter header is present. The header is made of 52 times the same 32-bit word (for redundancy reasons) which must contain NAND and PMECC parameters used to correctly perform the read of the rest of the data in the NAND. This 32-bit word is described below:

| 31 | 30        | 29   | 28     | 27        | 26              | 25        | 24       |
|----|-----------|------|--------|-----------|-----------------|-----------|----------|
|    | ke        | еу   |        | _         |                 | eccOffset |          |
| 23 | 22        | 21   | 20     | 19        | 18              | 17        | 16       |
|    |           | ecc0 | Offset |           |                 | secto     | orSize   |
| 15 | 14        | 13   | 12     | 11        | 10              | 9         | 8        |
|    | eccBitReq |      |        | spareSize |                 |           |          |
| 7  | 6         | 5    | 4      | 3         | 2               | 1         | 0        |
|    | spareSize |      |        | 1         | nbSectorPerPage | е         | usePmecc |

usePmecc: Use PMECC

0: Do not use PMECC to detect and correct the data.

1: Use PMECC to detect and correct the data.

• nbSectorPerPage: Number of sectors per page

spareSize: Size of the spare zone in bytes

eccBitReq: Number of ECC bits required

· sectorSize: Size of the ECC sector

0: 512 bytes

1: 1024 bytes per sector

Other value for future use.

eccOffset: Offset of the first ECC byte in the spare zone

A value below 2 is not allowed and will be considered as 2.

key: value 0xC must be written here to validate the content of the whole word.

If the header is valid, the Boot Program will continue with the detection of valid code.

## **ONFI 2.2 Parameters**

In case no valid header has been found, the Boot Program will check if the NAND Flash is ONFI compliant, sending a Read Id command (0x90) with 0x20 as parameter for the address. If the NAND Flash is ONFI compliant, the Boot Program retrieves the following parameters with the help of the Get Parameter Page command:

- Number of bytes per page (byte 80)
- Number of bytes in spare zone (byte 84)
- Number of ECC bit correction required (byte 112)
- ECC sector size: by default set to 512 bytes, or 1024 bytes if the ECC bit capability above is 0xFF

By default, ONFI NAND Flash detection will turn ON the usePmecc parameter, and ECC correction algorithm is automatically activated.

Once the Boot Program retrieves the parameter, using one of the two methods described above, it will read the first page again, with or without ECC, depending on the usePmecc parameter. Then it looks for a valid code programmed just after the header offset 0xD0. If the code is valid, the program is copied at the beginning of the internal SRAM.

Note: Booting on 16-bit NAND Flash is not possible; only 8-bit NAND Flash memories are supported.

#### 10.4.4.2 NAND Flash Boot: PMECC Error Detection and Correction

NAND Flash boot procedure uses PMECC to detect and correct errors during NAND Flash read operations in two cases:

- When the usePmecc flag is set in the specific NAND header. If the flag is not set, no ECC correction is performed during NAND Flash page read.
- When the NAND Flash has been detected using ONFI parameters.

The ROM code embeds the software used in the process of ECC detection/correction: the Galois Field tables, and the function PMECC\_CorrectionAlgo(). The user does not need to embed it in other software.

This function can be called by user software when PMECC status returns errors after a read page command.

Its address can be retrieved by reading the third vector of the ROM code interrupt vector table, at address 0x100008.

The API of this function is:

```
unsigned int PMECC_CorrectionAlgo(AT91PS_PMECC pPMECC,

AT91PS_PMERRLOC pPMERRLOC,

PMECC_paramDesc_struct *PMECC_desc,

unsigned int PMECC_status,

unsigned int pageBuffer)
```

pPMECC: pointer to the PMECC base address,

pPMERRLOC: pointer to the PMERRLOC base address,

PMECC\_desc: pointer to the PMECC descriptor,

PMECC status: the status returned by the read of PMECCISR register;

pageBuffer: address of the buffer containing the page to be corrected.

The PMECC descriptor structure is:

```
typedef struct _PMECC_paramDesc_struct {
    unsigned int pageSize;
    unsigned int spareSize;
    unsigned int sectorSize; // 0 for 512, 1 for 1024 bytes
    unsigned int errBitNbrCapability;
    unsigned int eccSizeByte;
    unsigned int eccStartAddr;
    unsigned int eccEndAddr;
    unsigned int nandWR;
    unsigned int spareEna;
    unsigned int modeAuto;
    unsigned int clkCtrl;
    unsigned int interrupt;
    int tt;
    int mm;
    int nn;
    short *alpha_to;
    short *index_of;
```

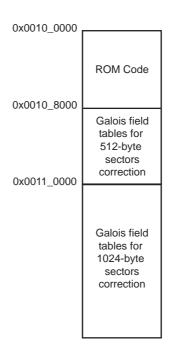

```
short partialSyn[100];
short si[100];

/* sigma table */
short smu[TT_MAX + 2][2 * TT_MAX + 1];
/* polynom order */
short lmu[TT_MAX + 1];

} PMECC_paramDesc_struct;
```

The Galois field tables are mapped in the ROM just after the ROM code, as described in Figure 10-9.

Figure 10-9. Galois Field Table Mapping

For a full description and an example of how to use the PMECC detection and correction feature, refer to the software package dedicated to this device on the Atmel web site.

#### 10.4.4.3 SD Card Boot

The SD Card bootloader uses MCI0. It looks for a "boot.bin" file in the root directory of a FAT12/16/32 formatted SD Card.

## **Supported SD Card Devices**

SD Card Boot supports all SD Card memories compliant with SD Memory Card Specification V2.0. This includes SDHC cards.

#### 10.4.4.4 SPI Flash Boot

Two kinds of SPI Flash are supported: SPI Serial Flash and SPI DataFlash.

The SPI Flash bootloader tries to boot on SPI0 Chip Select 0, first looking for SPI Serial Flash, and then for SPI DataFlash.

It uses only one valid code detection: analysis of ARM exception vectors.

The SPI Flash read is done by means of a Continuous Read command from address 0x0. This command is 0xE8 for DataFlash and 0x0B for Serial Flash devices.

## **Supported DataFlash Devices**

The SPI Flash Boot program supports the DataFlash devices listed in Table 10-3.

Table 10-3. DataFlash Device

| Device    | Density  | Page Size (bytes) | Number of Pages |
|-----------|----------|-------------------|-----------------|
| AT45DB011 | 1 Mbit   | 264               | 512             |
| AT45DB021 | 2 Mbits  | 264               | 1024            |
| AT45DB041 | 4 Mbits  | 264               | 2048            |
| AT45DB081 | 8 Mbits  | 264               | 4096            |
| AT45DB161 | 16 Mbits | 528               | 4096            |
| AT45DB321 | 32 Mbits | 528               | 8192            |
| AT45DB642 | 64 Mbits | 1056              | 8192            |

## **Supported Serial Flash Devices**

The SPI Flash Boot program supports all SPI Serial Flash devices responding correctly at both Get Status and Continuous Read commands.

#### 10.4.4.5 TWI EEPROM Boot

The TWI EEPROM Bootloader uses the TWI0. It uses only one valid code detection. It analyzes the ARM exception vectors.

#### **Supported TWI EEPROM Devices**

TWI EEPROM Boot supports all I<sup>2</sup>C-compatible TWI EEPROM memories using 7-bit device address 0x50.

#### 10.4.5 Hardware and Software Constraints

The NVM drivers use several PIOs in peripheral mode to communicate with external memory devices. Care must be taken when these PIOs are used by the application. The devices connected could be unintentionally driven at boot time, and electrical conflicts between output pins used by the NVM drivers and the connected devices may occur.

To assure correct functionality, it is recommended to plug in critical devices to other pins not used by NVM.

Table 10-4 contains a list of pins that are driven during the boot program execution. These pins are driven during the boot sequence for a period of less than 1 second if no correct boot program is found.

Before performing the jump to the application in internal SRAM, all the PIOs and peripherals used in the boot program are set to their reset state.

Table 10-4. PIO Driven During Boot Program Execution

| NVM Bootloader   | Peripheral  | Pin           | PIO Line |
|------------------|-------------|---------------|----------|
|                  | EBI CS3 SMC | NANDOE        | PIOD0    |
|                  | EBI CS3 SMC | NANDWE        | PIOD1    |
| NIAND            | EBI CS3 SMC | NANDCS        | PIOD4    |
| NAND             | EBI CS3 SMC | NAND ALE      | A21      |
|                  | EBI CS3 SMC | NAND CLE      | A22      |
|                  | EBI CS3 SMC | Cmd/Addr/Data | D[16:0]  |
|                  | MCI0        | MCI0_CK       | PIOA17   |
|                  | MCI0        | MCI0_D0       | PIOA15   |
| SD Card          | MCI0        | MCI0_D1       | PIOA18   |
|                  | MCI0        | MCI0_D2       | PIOA19   |
|                  | MCI0        | MCI0_D3       | PIOA20   |
|                  | SPI0        | MOSI          | PIOA10   |
|                  | SPI0        | MISO          | PIOA11   |
| SPI Flash        | SPI0        | SPCK          | PIOA13   |
|                  | SPI0        | NPCS0         | PIOA14   |
|                  | SPI0        | NPCS1         | PIOA7    |
| TWO EEDDOM       | TWI0        | TWD0          | PIOA30   |
| TWI0 EEPROM      | TWI0        | TWCK0         | PIOA31   |
| CANA DA Marritar | DBGU        | DRXD          | PIOA9    |
| SAM-BA Monitor   | DBGU        | DTXD          | PIOA10   |

## 10.5 SAM-BA Monitor

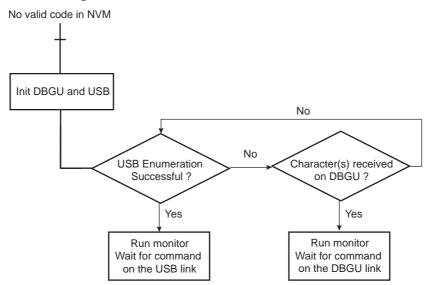

If no valid code has been found in NVM during the NVM bootloader sequence, the SAM-BA Monitor program is launched.

The SAM-BA Monitor principle is to:

- Initialize DBGU and USB
- Check if USB Device enumeration has occurred
- Check if characters have been received on the DBGU

Once the communication interface is identified, the application runs in an infinite loop waiting for different commands as listed in Table 10-5.

Figure 10-10. SAM-BA Monitor Diagram

## 10.5.1 Command List

Table 10-5. Commands Available Through the SAM-BA Monitor

| Command | Action            | Argument(s)         | Example               |
|---------|-------------------|---------------------|-----------------------|
| N       | set Normal mode   | No argument         | N#                    |
| Т       | set Terminal mode | No argument         | Т#                    |
| 0       | write a byte      | Address, Value#     | <b>O</b> 200001,CA#   |
| 0       | read a byte       | Address,#           | <b>o</b> 200001,#     |
| Н       | write a half word | Address, Value#     | <b>H</b> 200002,CAFE# |
| h       | read a half word  | Address,#           | h200002,#             |
| w       | write a word      | Address, Value#     | W200000,CAFEDECA#     |
| w       | read a word       | Address,#           | <b>w</b> 200000,#     |
| s       | send a file       | Address,#           | <b>\$</b> 200000,#    |
| R       | receive a file    | Address, NbOfBytes# | R200000,1234#         |
| G       | go                | Address#            | <b>G</b> 200200#      |
| V       | display version   | No argument         | V#                    |

- Mode commands:
  - Normal mode configures SAM-BA Monitor to send / receive data in binary format,
  - Terminal mode configures SAM-BA Monitor to send / receive data in ascii format.
- Write commands: Write a byte (**O**), a halfword (**H**) or a word (**W**) to the target.
  - Address: Address in hexadecimal.
  - Value: Byte, halfword or word to write in hexadecimal.
  - Output: '>'
- Read commands: Read a byte (o), a halfword (h) or a word (w) from the target.
  - Address: Address in hexadecimal.
  - Output: The byte, halfword or word read in hexadecimal followed by '>'
- Send a file (S): Send a file to a specified address.
  - Address: Address in hexadecimal.
  - Output: '>'

Note: There is a time-out on this command which is reached when the prompt '>' appears before the end of the command execution.

- Receive a file (R): Receive data into a file from a specified address
  - Address: Address in hexadecimal.
  - NbOfBvtes: Number of bytes in hexadecimal to receive.
  - Output: '>'
- Go (G): Jump to a specified address and execute the code.
  - Address: Address to jump in hexadecimal.
  - Output: '>'once returned from the program execution. If the executed program does not handle the link register at its entry and does not return, the prompt will not be displayed.
- Get Version (V): Return the Boot Program version.
  - Output: version, date and time of ROM code followed by '>'.

#### 10.5.2 DBGU Serial Port

Communication is performed through the DBGU serial port initialized to 115,200 baud, 8 bits of data, no parity, 1 stop bit.

## 10.5.2.1 Supported External Crystal/External Clocks

The SAM-BA monitor supports a frequency of 12 MHz to allow DBGU communication for both external crystal and external clock.

#### 10.5.2.2 Xmodem Protocol

The Send and Receive File commands use the Xmodem protocol to communicate. Any terminal performing this protocol can be used to send the application file to the target. The size of the binary file to send depends on the SRAM size embedded in the product. In all cases, the size of the binary file must be lower than the SRAM size because the Xmodem protocol requires some SRAM memory in order to work.

The Xmodem protocol supported is the 128-byte length block. This protocol uses a two-character CRC16 to guarantee detection of a maximum bit error.

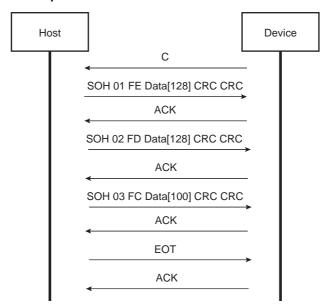

Xmodem protocol with CRC is accurate provided both sender and receiver report successful transmission. Each block of the transfer looks like:

<SOH><blk #><255-blk #><--128 data bytes--><checksum> in which:

- <SOH> = 01 hex
- <blk #> = binary number, starts at 01, increments by 1, and wraps 0FFH to 00H (not to 01)
- <255-blk #> = 1's complement of the blk#.
- <checksum> = 2 bytes CRC16

Figure 10-11 shows a transmission using this protocol.

Figure 10-11. Xmodem Transfer Example

#### 10.5.3 USB Device Port

#### 10.5.3.1 Supported External Crystal / External Clocks

The only frequency supported by SAM-BA Monitor to allow USB communication is a 12 MHz crystal or external clock.

#### 10.5.3.2 USB Class

The device uses the USB Communication Device Class (CDC) drivers to take advantage of the installed PC RS-232 software to talk over the USB. The CDC class is implemented in all releases of Windows<sup>®</sup>, beginning with Windows 98SE<sup>®</sup>. The CDC document, available at <a href="https://www.usb.org">www.usb.org</a>, describes how to implement devices such as ISDN modems and virtual COM ports.

The Vendor ID is Atmel's vendor ID 0x03EB. The product ID is 0x6124. These references are used by the host operating system to mount the correct driver. On Windows systems, the INF files contain the correspondence between vendor ID and product ID.

## 10.5.3.3 Enumeration Process

The USB protocol is a master/slave protocol. The host starts the enumeration, sending requests to the device through the control endpoint. The device handles standard requests as defined in the USB Specification.

Table 10-6. Handled Standard Requests

| Request           | Definition  |
|-------------------|---|
| GET_DESCRIPTOR    | Returns the current device configuration value.       |
| SET_ADDRESS       | Sets the device address for all future device access. |
| SET_CONFIGURATION | Sets the device configuration.                        |
| GET_CONFIGURATION | Returns the current device configuration value.       |
| GET_STATUS        | Returns status for the specified recipient.           |
| SET_FEATURE       | Used to set or enable a specific feature.             |
| CLEAR_FEATURE     | Used to clear or disable a specific feature.          |

The device also handles some class requests defined in the CDC class.

Table 10-7. Handled Class Requests

| Request                | Definition   |
|------------------------|--|
| SET_LINE_CODING        | Configures DTE rate, stop bits, parity and number of character bits.       |
| GET_LINE_CODING        | Requests current DTE rate, stop bits, parity and number of character bits. |
| SET_CONTROL_LINE_STATE | RS-232 signal used to tell the DCE device the DTE device is now present.   |

Unhandled requests are STALLed.

## 10.5.3.4 Communication Endpoints

There are two communication endpoints and endpoint 0 is used for the enumeration process. Endpoint 1 is a 64-byte Bulk OUT endpoint and endpoint 2 is a 64-byte Bulk IN endpoint. SAM-BA Boot commands are sent by the host through endpoint 1. If required, the message is split by the host into several data payloads by the host driver.

If the command requires a response, the host can send IN transactions to pick up the response.

# 11. Boot Sequence Controller (BSC)

# 11.1 Description

The System Controller embeds a Boot Sequence Controller (BSC). The boot sequence is programmable through the Boot Sequence Controller Configuration Register (BSC\_CR) to save timeout delays on boot.

The BSC\_CR is powered by VDDBU. Any modification of the register value is stored and applied after the next reset. The register defaults to the factory value in case of battery removal.

The BSC\_CR is programmable with user programs or SAM-BA and is key-protected.

## 11.2 Embedded Characteristics

# • BOOT: Boot Media Sequence

This value is defined in the device datasheet section "Standard Boot Strategies". It is only written if WPKEY carries the valid value.

## • WPKEY: Write Protection Key (Write-only)

| Value  | Name   | Description   |
|--------|--------|---|
| 0x6683 | PASSWD | Writing any other value in this field aborts the write operation of the BOOT field.  Always reads as 0. |

# 12. Advanced Interrupt Controller (AIC)

## 12.1 Description

The Advanced Interrupt Controller (AIC) is an 8-level priority, individually maskable, vectored interrupt controller, providing handling of up to 32 interrupt sources. It is designed to substantially reduce the software and real-time overhead in handling internal and external interrupts.

The AIC drives the nFIQ (fast interrupt request) and the nIRQ (standard interrupt request) inputs of an ARM processor. Inputs of the AIC are either internal peripheral interrupts or external interrupts coming from the product's pins.

The 8-level Priority Controller allows the user to define the priority for each interrupt source, thus permitting higher priority interrupts to be serviced even if a lower priority interrupt is being treated.

Internal interrupt sources can be programmed to be level sensitive or edge triggered. External interrupt sources can be programmed to be positive-edge or negative-edge triggered or high-level or low-level sensitive.

The Fast Forcing feature redirects any internal or external interrupt source to provide a fast interrupt rather than a normal interrupt.

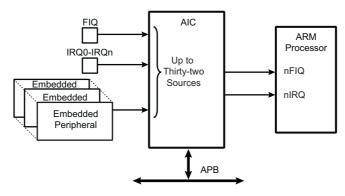

### 12.2 Embedded Characteristics

- Controls the Interrupt Lines (nIRQ and nFIQ) of an ARM<sup>®</sup> Processor
- 32 Individually Maskable and Vectored Interrupt Sources
  - Source 0 is Reserved for the Fast Interrupt Input (FIQ)
  - Source 1 is Reserved for System Peripherals
  - Source 2 to Source 31 Control up to 30 Embedded Peripheral Interrupts or External Interrupts
  - Programmable Edge-triggered or Level-sensitive Internal Sources
  - Programmable Positive/Negative Edge-triggered or High/Low Level-sensitive External Sources
- 8-level Priority Controller
  - Drives the Normal Interrupt of the Processor
  - Handles Priority of the Interrupt Sources 1 to 31
  - Higher Priority Interrupts Can Be Served During Service of Lower Priority Interrupt
- Vectoring
  - Optimizes Interrupt Service Routine Branch and Execution
  - One 32-bit Vector Register per Interrupt Source
  - Interrupt Vector Register Reads the Corresponding Current Interrupt Vector
- Protect Mode
  - Easy Debugging by Preventing Automatic Operations when Protect Models Are Enabled
- Fast Forcing
  - Permits Redirecting any Normal Interrupt Source to the Fast Interrupt of the Processor
- General Interrupt Mask
  - Provides Processor Synchronization on Events Without Triggering an Interrupt
- Register Write Protection

# 12.4 Application Block Diagram

Figure 12-2. Description of the Application Block

# 12.5 AIC Detailed Block Diagram

Figure 12-3. AIC Detailed Block Diagram

# 12.6 I/O Line Description

Table 12-1. I/O Line Description

| Pin Name Pin Description |                         | Туре  |
|--------------------------|-------------------------|-------|
| FIQ                      | Fast Interrupt          | Input |
| IRQ0-IRQn                | Interrupt 0-Interrupt n | Input |

# 12.7 Product Dependencies

#### 12.7.1 I/O Lines

The interrupt signals FIQ and IRQ0 to IRQn are normally multiplexed through the PIO controllers. Depending on the features of the PIO controller used in the product, the pins must be programmed in accordance with their assigned interrupt function. This is not applicable when the PIO controller used in the product is transparent on the input path.

Table 12-2. I/O Lines

| Instance | Signal | I/O Line | Peripheral |
|----------|--------|----------|------------|
| AIC      | FIQ    | PC31     | Α          |
| AIC      | IRQ    | PB18     | Α          |

### 12.7.2 Power Management

The Advanced Interrupt Controller is continuously clocked. The Power Management Controller has no effect on the Advanced Interrupt Controller behavior.

The assertion of the Advanced Interrupt Controller outputs, either nIRQ or nFIQ, wakes up the ARM processor while it is in Idle Mode. The General Interrupt Mask feature enables the AIC to wake up the processor without asserting the interrupt line of the processor, thus providing synchronization of the processor on an event.

### 12.7.3 Interrupt Sources

The Interrupt Source 0 is always located at FIQ. If the product does not feature an FIQ pin, the Interrupt Source 0 cannot be used.

The Interrupt Source 1 is always located at System Interrupt. This is the result of the OR-wiring of the system peripheral interrupt lines. When a system interrupt occurs, the service routine must first distinguish the cause of the interrupt. This is performed by reading successively the status registers of the above mentioned system peripherals.

The interrupt sources 2 to 31 can either be connected to the interrupt outputs of an embedded user peripheral or to external interrupt lines. The external interrupt lines can be connected directly, or through the PIO Controller.

The PIO Controllers are considered as user peripherals in the scope of interrupt handling. Accordingly, the PIO Controller interrupt lines are connected to the Interrupt Sources 2 to 31.

The peripheral identification defined at the product level corresponds to the interrupt source number (as well as the bit number controlling the clock of the peripheral). Consequently, to simplify the description of the functional operations and the user interface, the interrupt sources are named FIQ, SYS, and PID2 to PID31.

# 12.8 Functional Description

## 12.8.1 Interrupt Source Control

#### 12.8.1.1 Interrupt Source Mode

The AIC independently programs each interrupt source. The SRCTYPE field of the corresponding Source Mode Register (AIC\_SMR) selects the interrupt condition of each source.

The internal interrupt sources wired on the interrupt outputs of the embedded peripherals can be programmed either in level-sensitive mode or in edge-triggered mode. The active level of the internal interrupts is not important for the user.

The external interrupt sources can be programmed either in high level-sensitive or low level-sensitive modes, or in positive edge-triggered or negative edge-triggered modes.

## 12.8.1.2 Interrupt Source Enabling

Each interrupt source, including the FIQ in source 0, can be enabled or disabled by using the command registers AIC\_IECR (Interrupt Enable Command Register) and AIC\_IDCR (Interrupt Disable Command Register). This set of registers conducts enabling or disabling in one instruction. The interrupt mask can be read in the Interrupt Mask Register (AIC\_IMR). A disabled interrupt does not affect servicing of other interrupts.

### 12.8.1.3 Interrupt Clearing and Setting

All interrupt sources programmed to be edge-triggered (including the FIQ in source 0) can be individually set or cleared by writing respectively the Interrupt Set Command Register (AIC\_ISCR) and the Interrupt Clear Command Register (AIC\_ICCR). Clearing or setting interrupt sources programmed in level-sensitive mode has no effect.

The clear operation is perfunctory, as the software must perform an action to reinitialize the "memorization" circuitry activated when the source is programmed in edge-triggered mode. However, the set operation is available for auto-test or software debug purposes. It can also be used to execute an AIC implementation of a software interrupt.

The AIC features an automatic clear of the current interrupt when the AIC\_IVR (Interrupt Vector Register) is read. Only the interrupt source being detected by the AIC as the current interrupt is affected by this operation (see Section 12.8.3.1 "Priority Controller" on page 75). The automatic clear reduces the operations required by the interrupt service routine entry code to reading the AIC\_IVR. Note that the automatic interrupt clear is disabled if the interrupt source has the Fast Forcing feature enabled as it is considered uniquely as a FIQ source. (For further details, see "Fast Forcing" on page 80).

The automatic clear of the interrupt source 0 is performed when the FIQ Vector Register (AIC\_FVR) is read.

#### 12.8.1.4 Interrupt Status

For each interrupt, the AIC operation originates in the Interrupt Pending Register (AIC\_IPR) and its mask in the AIC\_IMR. The AIC\_IPR enables the actual activity of the sources, whether masked or not.

The Interrupt Status Register (AIC\_ISR) reads the number of the current interrupt (see "Priority Controller" on page 75) and the Core Interrupt Status Register (AIC\_CISR) gives an image of the signals nIRQ and nFIQ driven on the processor.

Each status referred to above can be used to optimize the interrupt handling of the systems.

Figure 12-4. Internal Interrupt Source Input Stage

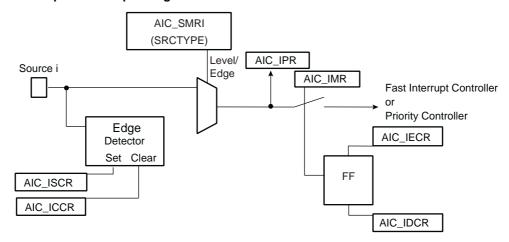

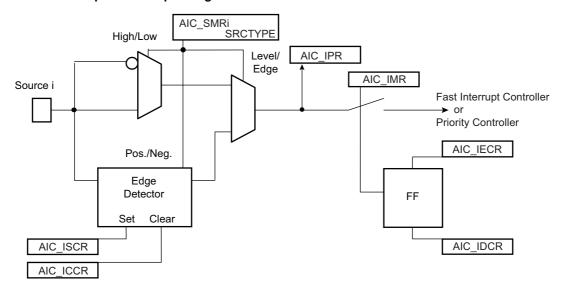

Figure 12-5. External Interrupt Source Input Stage

#### 12.8.2 Interrupt Latencies

Global interrupt latencies depend on several parameters, including:

- The time the software masks the interrupts.
- Occurrence, either at the processor level or at the AIC level.
- The execution time of the instruction in progress when the interrupt occurs.
- The treatment of higher priority interrupts and the resynchronization of the hardware signals.

This section addresses only the hardware resynchronizations. It gives details of the latency times between the event on an external interrupt leading in a valid interrupt (edge or level) or the assertion of an internal interrupt source and the assertion of the nIRQ or nFIQ line on the processor. The resynchronization time depends on the programming of the interrupt source and on its type (internal or external). For the standard interrupt, resynchronization times are given assuming there is no higher priority in progress.

The PIO Controller multiplexing has no effect on the interrupt latencies of the external interrupt sources.

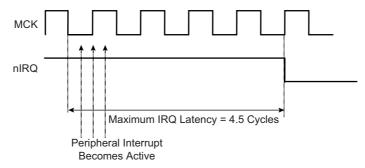

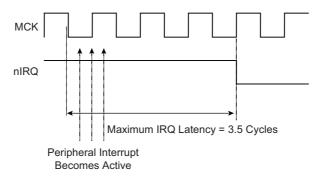

Figure 12-9. Internal Interrupt Level Sensitive Source

#### 12.8.3 Normal Interrupt

#### 12.8.3.1 Priority Controller

An 8-level priority controller drives the nIRQ line of the processor, depending on the interrupt conditions occurring on the interrupt sources 1 to 31 (except for those programmed in Fast Forcing).

Each interrupt source has a programmable priority level of 7 to 0, which is user-definable by writing the PRIOR field of the corresponding AIC\_SMR. Level 7 is the highest priority and level 0 the lowest.

As soon as an interrupt condition occurs, as defined by the SRCTYPE field of the AIC\_SMR, the nIRQ line is asserted. As a new interrupt condition might have happened on other interrupt sources since the nIRQ has been asserted, the priority controller determines the current interrupt at the time the Interrupt Vector Register (AIC\_IVR) is read. The read of AIC\_IVR is the entry point of the interrupt handling which allows the AIC to consider that the interrupt has been taken into account by the software.

The current priority level is defined as the priority level of the current interrupt.

If several interrupt sources of equal priority are pending and enabled when the AIC\_IVR is read, the interrupt with the lowest interrupt source number is serviced first.

The nIRQ line can be asserted only if an interrupt condition occurs on an interrupt source with a higher priority. If an interrupt condition happens (or is pending) during the interrupt treatment in progress, it is delayed until the software indicates to the AIC the end of the current service by writing the End of Interrupt Command Register (AIC EOICR). The write of AIC EOICR is the exit point of the interrupt handling.

#### 12.8.3.2 Interrupt Nesting

The priority controller utilizes interrupt nesting in order for the high priority interrupt to be handled during the service of lower priority interrupts. This requires the interrupt service routines of the lower interrupts to re-enable the interrupt at the processor level.

When an interrupt of a higher priority happens during an already occurring interrupt service routine, the nIRQ line is re-asserted. If the interrupt is enabled at the core level, the current execution is interrupted and the new interrupt service routine should read the AIC\_IVR. At this time, the current interrupt number and its priority level are pushed into an embedded hardware stack, so that they are saved and restored when the higher priority interrupt servicing is finished and the AIC\_EOICR is written.

The AIC is equipped with an 8-level wide hardware stack in order to support up to eight interrupt nestings pursuant to having eight priority levels.

#### 12.8.3.3 Interrupt Vectoring

The interrupt handler addresses corresponding to each interrupt source can be stored in the registers AIC\_SVR1 to AIC\_SVR31 (Source Vector Register 1 to 31). When the processor reads AIC\_IVR (Interrupt Vector Register), the value written into AIC\_SVR corresponding to the current interrupt is returned.

This feature offers a way to branch in one single instruction to the handler corresponding to the current interrupt, as AIC\_IVR is mapped at the absolute address 0xFFFFF100 and thus accessible from the ARM interrupt vector at address 0x00000018 through the following instruction:

When the processor executes this instruction, it loads the read value in AIC\_IVR in its program counter, thus branching the execution on the correct interrupt handler.

This feature is often not used when the application is based on an operating system (either real time or not). Operating systems often have a single entry point for all the interrupts and the first task performed is to discern the source of the interrupt.

However, it is strongly recommended to port the operating system on AT91 products by supporting the interrupt vectoring. This can be performed by defining all the AIC\_SVR of the interrupt source to be handled by the operating system at the address of its interrupt handler. When doing so, the interrupt vectoring permits a critical interrupt to transfer the execution on a specific very fast handler and not onto the operating system's general interrupt handler. This facilitates the support of hard real-time tasks (input/outputs of voice/audio buffers and software peripheral handling) to be handled efficiently and independently of the application running under an operating system.

#### 12.8.3.4 Interrupt Handlers

This section gives an overview of the fast interrupt handling sequence when using the AIC. It is assumed that the programmer understands the architecture of the ARM processor, and especially the processor interrupt modes and the associated status bits.

#### It is assumed that:

- The Advanced Interrupt Controller has been programmed, Source Vector registers are loaded with corresponding interrupt service routine addresses and interrupts are enabled.
- The instruction at the ARM interrupt exception vector address is required to work with the vectoring
   LDR PC, [PC, # -&F20]

When nIRQ is asserted, if the bit "I" of CPSR is 0, the sequence is as follows:

- 1. The CPSR is stored in SPSR\_irq, the current value of the Program Counter is loaded in the Interrupt link register (R14\_irq) and the Program Counter (R15) is loaded with 0x18. In the following cycle during fetch at address 0x1C, the ARM core adjusts R14\_irq, decrementing it by four.
- 2. The ARM core enters Interrupt mode, if it has not already done so.
- 3. When the instruction loaded at address 0x18 is executed, the program counter is loaded with the value read in AIC\_IVR. Reading the AIC\_IVR has the following effects:
  - Sets the current interrupt to be the pending and enabled interrupt with the highest priority. The current level is the priority level of the current interrupt.
  - De-asserts the nIRQ line on the processor. Even if vectoring is not used, AIC\_IVR must be read in order to de-assert nIRQ.
  - Automatically clears the interrupt, if it has been programmed to be edge-triggered.
  - Pushes the current level and the current interrupt number on to the stack.
  - Returns the value written in the AIC\_SVR corresponding to the current interrupt.
- 4. The previous step has the effect of branching to the corresponding interrupt service routine. This should start by saving the link register (R14\_irq) and SPSR\_IRQ. The link register must be decremented by four when it is saved if it is to be restored directly into the program counter at the end of the interrupt. For example, the instruction SUB PC, LR, #4 may be used.
- 5. Further interrupts can then be unmasked by clearing the "I" bit in CPSR, allowing re-assertion of the nIRQ to be taken into account by the core. This can happen if an interrupt with a higher priority than the current interrupt occurs.
- 6. The interrupt handler can then proceed as required, saving the registers that will be used and restoring them at the end. During this phase, an interrupt of higher priority than the current level will restart the sequence from step 1.

Note: If the interrupt is programmed to be level sensitive, the source of the interrupt must be cleared during this phase.

- 7. The "I" bit in CPSR must be set in order to mask interrupts before exiting to ensure that the interrupt is completed in an orderly manner.
- 8. The AIC\_EOICR must be written in order to indicate to the AIC that the current interrupt is finished. This causes the current level to be popped from the stack, restoring the previous current level if one exists on the stack. If another interrupt is pending, with lower or equal priority than the old current level but with higher priority than the new current level, the nIRQ line is re-asserted, but the interrupt sequence does not immediately start because the "I" bit is set in the core. SPSR\_irq is restored. Finally, the saved value of the link register is restored directly into the PC. This has the effect of returning from the interrupt to whatever was being executed before, and of loading the CPSR with the stored SPSR, masking or unmasking the interrupts depending on the state saved in SPSR\_irq.

Note: The "I" bit in SPSR is significant. If it is set, it indicates that the ARM core was on the verge of masking an interrupt when the mask instruction was interrupted. Hence, when SPSR is restored, the mask instruction is completed (interrupt is masked).

#### 12.8.4 Fast Interrupt

#### 12.8.4.1 Fast Interrupt Source

The interrupt source 0 is the only source which can raise a fast interrupt request to the processor except if Fast Forcing is used. The interrupt source 0 is generally connected to a FIQ pin of the product, either directly or through a PIO Controller.

#### 12.8.4.2 Fast Interrupt Control

The fast interrupt logic of the AIC has no priority controller. The mode of interrupt source 0 is programmed with the AIC\_SMR0 and the field PRIOR of this register is not used even if it reads what has been written. The field SRCTYPE of AIC\_SMR0 enables programming the fast interrupt source to be positive-edge triggered or negative-edge triggered or high-level sensitive or low-level sensitive

Writing 0x1 in the AIC\_IECR and AIC\_IDCR respectively enables and disables the fast interrupt. The bit 0 of AIC\_IMR indicates whether the fast interrupt is enabled or disabled.

#### 12.8.4.3 Fast Interrupt Vectoring

The fast interrupt handler address can be stored in AIC\_SVR0 (Source Vector Register 0). The value written into this register is returned when the processor reads AIC\_FVR. This offers a way to branch in one single instruction to the interrupt handler, as AIC\_FVR is mapped at the absolute address 0xFFFFF104 and thus accessible from the ARM fast interrupt vector at address 0x0000001C through the following instruction:

When the processor executes this instruction it loads the value read in AIC\_FVR in its program counter, thus branching the execution on the fast interrupt handler. It also automatically performs the clear of the fast interrupt source if it is programmed in edge-triggered mode.

#### 12.8.4.4 Fast Interrupt Handlers

This section gives an overview of the fast interrupt handling sequence when using the AIC. It is assumed that the programmer understands the architecture of the ARM processor, and especially the processor interrupt modes and associated status bits.

It is assumed that:

- The Advanced Interrupt Controller has been programmed, AIC\_SVR0 is loaded with the fast interrupt service routine address, and the interrupt source 0 is enabled.
- The Instruction at address 0x1C (FIQ exception vector address) is required to vector the fast interrupt:
- LDR PC, [PC, # -&F20]
- The user does not need nested fast interrupts.

When nFIQ is asserted, if the bit "F" of CPSR is 0, the sequence is:

- 1. The CPSR is stored in SPSR\_fiq, the current value of the program counter is loaded in the FIQ link register (R14\_FIQ) and the program counter (R15) is loaded with 0x1C. In the following cycle, during fetch at address 0x20, the ARM core adjusts R14 fig, decrementing it by four.
- 2. The ARM core enters FIQ mode.
- 3. When the instruction loaded at address 0x1C is executed, the program counter is loaded with the value read in AIC\_FVR. Reading the AIC\_FVR has effect of automatically clearing the fast interrupt, if it has been programmed to be edge triggered. In this case only, it de-asserts the nFIQ line on the processor.
- 4. The previous step enables branching to the corresponding interrupt service routine. It is not necessary to save the link register R14 fig and SPSR fig if nested fast interrupts are not needed.
- 5. The Interrupt Handler can then proceed as required. It is not necessary to save registers R8 to R13 because FIQ mode has its own dedicated registers and the user R8 to R13 are banked. The other registers, R0 to R7, must be saved before being used, and restored at the end (before the next step). Note that if the fast

- interrupt is programmed to be level sensitive, the source of the interrupt must be cleared during this phase in order to de-assert the interrupt source 0.
- 6. Finally, the Link Register R14\_fiq is restored into the PC after decrementing it by four (with instruction SUB PC, LR, #4 for example). This has the effect of returning from the interrupt to whatever was being executed before, loading the CPSR with the SPSR and masking or unmasking the fast interrupt depending on the state saved in the SPSR.

Note: The "F" bit in SPSR is significant. If it is set, it indicates that the ARM core was just about to mask FIQ interrupts when the mask instruction was interrupted. Hence when the SPSR is restored, the interrupted instruction is completed (FIQ is masked).

Another way to handle the fast interrupt is to map the interrupt service routine at the address of the ARM vector 0x1C. This method does not use the vectoring, so that reading AIC\_FVR must be performed at the very beginning of the handler operation. However, this method saves the execution of a branch instruction.

#### 12.8.4.5 Fast Forcing

The Fast Forcing feature of the advanced interrupt controller provides redirection of any normal Interrupt source on the fast interrupt controller.

Fast Forcing is enabled or disabled by writing to the Fast Forcing Enable Register (AIC\_FFER) and the Fast Forcing Disable Register (AIC\_FFDR). Writing to these registers results in an update of the Fast Forcing Status Register (AIC\_FFSR) that controls the feature for each internal or external interrupt source.

When Fast Forcing is disabled, the interrupt sources are handled as described in the previous pages.

When Fast Forcing is enabled, the edge/level programming and, in certain cases, edge detection of the interrupt source is still active but the source cannot trigger a normal interrupt to the processor and is not seen by the priority handler.

If the interrupt source is programmed in level-sensitive mode and an active level is sampled, Fast Forcing results in the assertion of the nFIQ line to the core.

If the interrupt source is programmed in edge-triggered mode and an active edge is detected, Fast Forcing results in the assertion of the nFIQ line to the core.

The Fast Forcing feature does not affect the Source 0 pending bit in the AIC\_IPR.

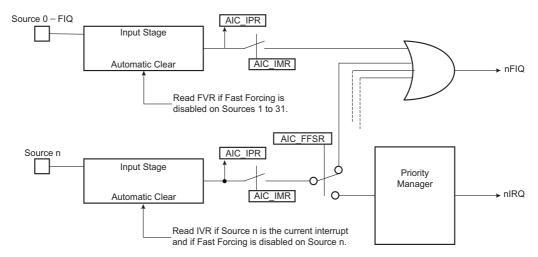

The AIC\_FVR reads the contents of AIC\_SVR0, whatever the source of the fast interrupt may be. The read of the FVR does not clear the Source 0 when the Fast Forcing feature is used and the interrupt source should be cleared by writing to the AIC\_ICCR.

All enabled and pending interrupt sources that have the Fast Forcing feature enabled and that are programmed in edge-triggered mode must be cleared by writing to the AIC\_ICCR. In doing so, they are cleared independently and thus lost interrupts are prevented.

The read of AIC\_IVR does not clear the source that has the Fast Forcing feature enabled.

The source 0, reserved to the fast interrupt, continues operating normally and becomes one of the Fast Interrupt sources.

Figure 12-10. Fast Forcing

#### 12.8.5 Protect Mode

The Protect Mode permits reading the Interrupt Vector Register without performing the associated automatic operations. This is necessary when working with a debug system. When a debugger, working either with a Debug Monitor or the ARM processor's ICE, stops the applications and updates the opened windows, it might read the AIC User Interface and thus the AIC IVR. This has undesirable consequences:

- If an enabled interrupt with a higher priority than the current one is pending, it is stacked.
- If there is no enabled pending interrupt, the spurious vector is returned.

In either case, an End of Interrupt command is necessary to acknowledge and to restore the context of the AIC. This operation is generally not performed by the debug system as the debug system would become strongly intrusive and cause the application to enter an undesired state.

This is avoided by using the Protect Mode. Writing a one to the PROT bit in the Debug Control Register (AIC\_DCR) enables the Protect Mode.

When the Protect Mode is enabled, the AIC performs interrupt stacking only when a write access is performed on the AIC\_IVR. Therefore, the Interrupt Service Routines must write (arbitrary data) to the AIC\_IVR just after reading it. The new context of the AIC, including the value of the AIC\_ISR, is updated with the current interrupt only when AIC\_IVR is written.

An AIC\_IVR read on its own (e.g., by a debugger), modifies neither the AIC context nor the AIC\_ISR. Extra AIC\_IVR reads perform the same operations. However, it is recommended to not stop the processor between the read and the write of AIC\_IVR of the interrupt service routine to make sure the debugger does not modify the AIC context.

To summarize, in normal operating mode, the read of AIC\_IVR performs the following operations within the AIC:

- 1. Calculates active interrupt (higher than current or spurious).
- 2. Determines and returns the vector of the active interrupt.
- 3. Memorizes the interrupt.
- 4. Pushes the current priority level onto the internal stack.
- 5. Acknowledges the interrupt.

However, while the Protect Mode is activated, only operations 1 to 3 are performed when AIC\_IVR is read. Operations 4 and 5 are only performed by the AIC when AIC\_IVR is written.

Software that has been written and debugged using the Protect Mode runs correctly in Normal Mode without modification. However, in Normal Mode the AIC\_IVR write has no effect and can be removed to optimize the code.

#### 12.8.6 Spurious Interrupt

The AIC features protection against spurious interrupts. A spurious interrupt is defined as being the assertion of an interrupt source long enough for the AIC to assert the nIRQ, but no longer present when AIC\_IVR is read. This is most prone to occur when:

- An external interrupt source is programmed in level-sensitive mode and an active level occurs for only a short time.
- An internal interrupt source is programmed in level sensitive and the output signal of the corresponding embedded peripheral is activated for a short time (as in the case for the Watchdog).
- An interrupt occurs just a few cycles before the software begins to mask it, thus resulting in a pulse on the interrupt source.

The AIC detects a spurious interrupt at the time the AIC\_IVR is read while no enabled interrupt source is pending. When this happens, the AIC returns the value stored by the programmer in the Spurious Vector Register (AIC\_SPU). The programmer must store the address of a spurious interrupt handler in AIC\_SPU as part of the application, to enable an as fast as possible return to the normal execution flow. This handler writes in AIC\_EOICR and performs a return from interrupt.

#### 12.8.7 General Interrupt Mask

The AIC features a General Interrupt Mask bit (GMSK in AIC\_DCR) to prevent interrupts from reaching the processor. Both the nIRQ and the nFIQ lines are driven to their inactive state if GMSK is set. However, this mask does not prevent waking up the processor if it has entered Idle Mode. This function facilitates synchronizing the processor on a next event and, as soon as the event occurs, performs subsequent operations without having to handle an interrupt. It is strongly recommended to use this mask with caution.

#### 12.8.8 Register Write Protection

To prevent any single software error from corrupting AIC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the AIC Write Protection Mode Register (AIC\_WPMR).

If a write access to a write-protected register is detected, the WPVS bit in the AIC Write Protection Status Register (AIC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the AIC WPSR.

The following registers can be write-protected:

- AIC Source Mode Register
- AIC Source Vector Register
- AIC Spurious Interrupt Vector Register
- AIC Debug Control Register

# Advanced Interrupt Controller (AIC) User Interface

The AIC is mapped at the address 0xFFFFF000. It has a total 4 Kbyte addressing space. This permits the vectoring feature, as the PC-relative load/store instructions of the ARM processor support only a ± 4 Kbyte offset.

Table 12-3. **Register Mapping** 

| Offset      | Register  | Name      | Access     | Reset              |
|-------------|---|-----------|------------|--------------------|
| 0x00        | Source Mode Register 0                            | AIC_SMR0  | Read/Write | 0x0                |
| 0x04        | Source Mode Register 1                            | AIC_SMR1  | Read/Write | 0x0                |
|             |   |           |            |                    |

|    | IRQV |    |    |    |    |    |    |  |  |  |  |

#### • IRQV: Interrupt Vector Register

The Interrupt Vector Register contains the vector programmed by the user in the Source Vector Register corresponding to the current interrupt.

The Source Vector Register is indexed using the current interrupt number when the Interrupt Vector Register is read.

When there is no current interrupt, the Interrupt Vector Register reads the value stored in AIC\_SPU.

# 12.9.4 AIC FIQ Vector Register

Name: AIC\_FVR
Address: 0xFFFFF104

Access: Read-only

Reset: 0x0

| 31 | 30   | 29 | 28  | 27 | 26 | 25 | 24 |  |  |  |  |
|----|------|----|-----|----|----|----|----|--|--|--|--|

#### • WPVS: Write Protection Violation Status

0: No write protection violation has occurred since the last read of the AIC\_WPSR.

#### • WPVSRC: Write Protection Violation Source

When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

<sup>1:</sup> A write protection violation has occurred since the last read of the AIC\_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

# 13. Reset Controller (RSTC)

#### 13.1 Description

The Reset Controller (RSTC), based on power-on reset cells, handles all the resets of the system without any external components. It reports which reset occurred last.

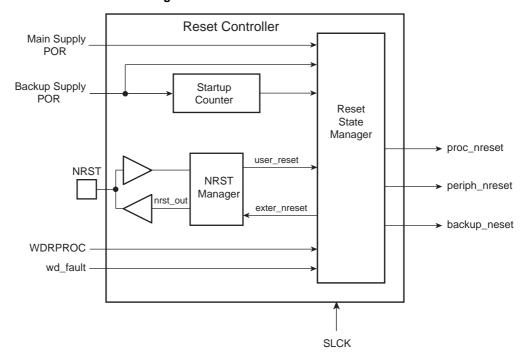

The Reset Controller also drives independently or simultaneously the external reset and the peripheral and processor resets.

#### 13.2 Embedded Characteristics

- Manages All Resets of the System, Including
  - External Devices Through the NRST Pin
  - Processor Reset
  - Peripheral Set Reset
  - Backed-up Peripheral Reset
- Based on 2 Embedded Power-on Reset Cells
- Reset Source Status
  - Status of the Last Reset
  - Either General Reset, Wake-up Reset, Software Reset, User Reset, Watchdog Reset
- External Reset Signal Shaping

# 13.3 Block Diagram

Figure 13-1. Reset Controller Block Diagram

# 13.4 Functional Description

#### 13.4.1 Reset Controller Overview

The Reset Controller is made up of an NRST Manager, a Startup Counter and a Reset State Manager. It runs at Slow Clock and generates the following reset signals:

- proc\_nreset: Processor reset line. It also resets the Watchdog Timer.
- backup\_nreset: Affects all the peripherals powered by VDDBU.
- periph\_nreset: Affects the whole set of embedded peripherals.
- nrst\_out: Drives the NRST pin.

These reset signals are asserted by the Reset Controller, either on external events or on software action. The Reset State Manager controls the generation of reset signals and provides a signal to the NRST Manager when an assertion of the NRST pin is required.

The NRST Manager shapes the NRST assertion during a programmable time, thus controlling external device resets.

The startup counter waits for the complete crystal oscillator startup. The wait delay is given by the crystal oscillator startup time maximum value that can be found in the section "Crystal Oscillator Characteristics" in the "Electrical Characteristics" section of the product datasheet.

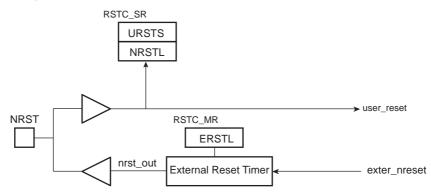

The Reset Controller Mode Register (RSTC\_MR), used to configure the reset controller, is powered with VDDBU, so that its configuration is saved as long as VDDBU is on.

#### 13.4.2 NRST Manager

After power-up, NRST is an output during the External Reset Length (ERSTL) time defined in the RSTC. When the ERSTL time has elapsed, the pin behaves as an input and all the system is held in reset if NRST is tied to GND by an external signal.

The NRST Manager samples the NRST input pin and drives this pin low when required by the Reset State Manager. Figure 13-2 shows the block diagram of the NRST Manager.

Figure 13-2. NRST Manager

#### 13.4.2.1 NRST Signal

The NRST Manager handles the NRST input line asynchronously. When the line is low, a User Reset is immediately reported to the Reset State Manager. When the NRST goes from low to high, the internal reset is synchronized with the Slow Clock to provide a safe internal de-assertion of reset.

The level of the pin NRST can be read at any time in the bit NRSTL (NRST level) in the Reset Controller Status Register (RSTC\_SR). As soon as the pin NRST is asserted, the bit URSTS in the RSTC\_SR is set. This bit clears only when RSTC\_SR is read.

#### 13.4.2.2 NRST External Reset Control

The Reset State Manager asserts the signal ext\_nreset to assert the NRST pin. When this occurs, the "nrst\_out" signal is driven low by the NRST Manager for a time programmed by the field ERSTL in the RSTC\_MR. This assertion duration, named EXTERNAL\_RESET\_LENGTH, lasts 2<sup>(ERSTL+1)</sup> Slow Clock cycles. This gives the approximate duration of an assertion between 60 µs and 2 seconds. Note that ERSTL at 0 defines a two-cycle duration for the NRST pulse.

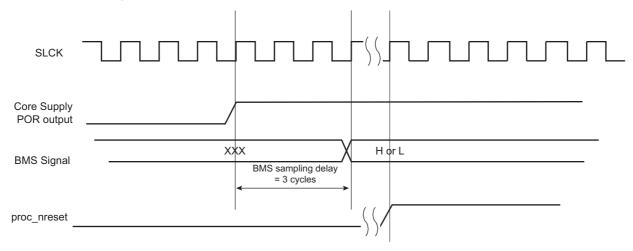

This feature allows the reset controller to shape the NRST pin level, and thus to guarantee that the NRST line is driven low for a time compliant with potential external devices connected on the system reset.

As the field is within RSTC\_MR, which is backed-up, this field can be used to shape the system power-up reset for devices requiring a longer startup time than the Slow Clock Oscillator.

#### 13.4.3 BMS Sampling

The product matrix manages a boot memory that depends on the level on the BMS pin at reset. The BMS signal is sampled three slow clock cycles after the Core Power-On-Reset output rising edge.

Figure 13-3. BMS Sampling

#### 13.4.4 Reset States

The Reset State Manager handles the different reset sources and generates the internal reset signals. It reports the reset status in the field RSTTYP of the RSTC\_SR. The update of the field RSTTYP is performed when the processor reset is released.

#### 13.4.4.1 General Reset

A general reset occurs when VDDBU and VDDCORE are powered on. The backup supply POR cell output rises and is filtered with a Startup Counter, which operates at Slow Clock. The purpose of this counter is to make sure the Slow Clock oscillator is stable before starting up the device. The length of startup time is hardcoded to comply with the Slow Clock Oscillator startup time.

After this time, the processor clock is released at Slow Clock and all the other signals remain valid for 3 cycles for proper processor and logic reset. Then, all the reset signals are released and the field RSTTYP in the RSTC\_SR reports a General Reset. As the RSTC\_MR is reset, the NRST line rises two cycles after the backup\_nreset, as ERSTL defaults at value 0x0.

When VDDBU is detected low by the backup supply POR cell, all resets signals are immediately asserted, even if the main supply POR cell does not report a main supply shutdown.

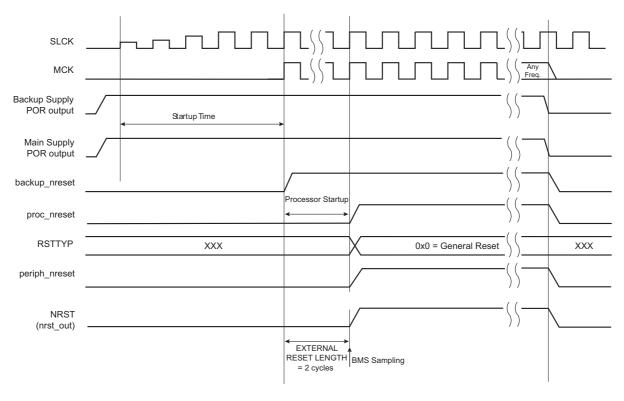

VDDBU only activates the backup nreset signal.

The backup\_nreset must be released so that any other reset can be generated by VDDCORE (main supply POR output).

Figure 13-4 shows how the General Reset affects the reset signals.

Figure 13-4. General Reset State

#### 13.4.4.2 Wake-up Reset

The wake-up reset occurs when the main supply is down. When the main supply POR output is active, all the reset signals are asserted except backup\_nreset. When the main supply powers up, the POR output is resynchronized on Slow Clock. The processor clock is then re-enabled during 3 Slow Clock cycles, depending on the requirements of the ARM processor.

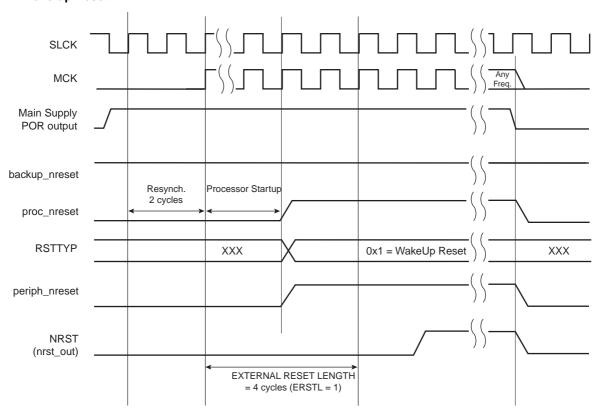

At the end of this delay, the processor and other reset signals rise. The field RSTTYP in the RSTC\_SR is updated to report a wake-up reset.

The "nrst\_out" remains asserted for EXTERNAL\_RESET\_LENGTH cycles. As RSTC\_MR is backed-up, the programmed number of cycles is applicable.

When the main supply is detected falling, the reset signals are immediately asserted. This transition is synchronous with the output of the main supply POR.

Figure 13-5. Wake-up Reset

#### 13.4.4.3 User Reset

The User Reset is entered when a low level is detected on the NRST pin. When a falling edge occurs on NRST (reset activation), internal reset lines are immediately asserted.

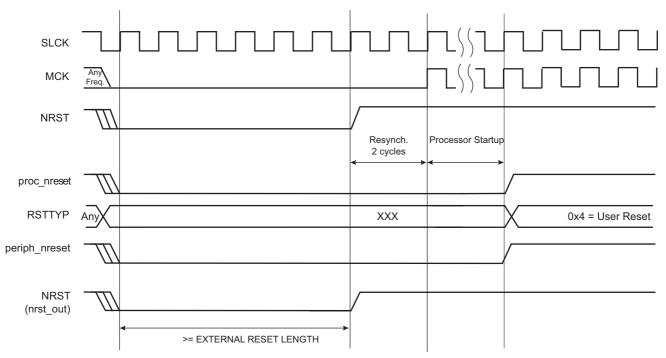

The Processor Reset and the Peripheral Reset are asserted.

The User Reset is left when NRST rises, after a two-cycle resynchronization time and a 3-cycle processor startup. The processor clock is re-enabled as soon as NRST is confirmed high.

When the processor reset signal is released, the RSTTYP field of the RSTC\_SR is loaded with the value 0x4, indicating a User Reset.

The NRST Manager guarantees that the NRST line is asserted for EXTERNAL\_RESET\_LENGTH Slow Clock cycles, as programmed in the field ERSTL. However, if NRST does not rise after EXTERNAL\_RESET\_LENGTH because it is driven low externally, the internal reset lines remain asserted until NRST actually rises.

Figure 13-6. User Reset State

#### 13.4.4.4 Software Reset

The Reset Controller offers several commands used to assert the different reset signals. These commands are performed by writing the Control Register (RSTC\_CR) with the following bits at 1:

- PROCRST: Writing a 1 to PROCRST resets the processor and the watchdog timer.
- PERRST: Writing a 1 to PERRST resets all the embedded peripherals, including the memory system, and, in particular, the Remap Command. The Peripheral Reset is generally used for debug purposes.
   PERRST must always be used in conjunction with PROCRST (PERRST and PROCRST bot set to 1 simultaneously.)
- EXTRST: Writing a 1 to EXTRST asserts low the NRST pin during a time defined by the field ERSTL in the Mode Register (RSTC\_MR).

The software reset is entered if at least one of these bits is set by the software. All these commands can be performed independently or simultaneously. The software reset lasts 3 Slow Clock cycles.

The internal reset signals are asserted as soon as the register write is performed. This is detected on the Master Clock (MCK). They are released when the software reset is left, i.e., synchronously to SLCK.

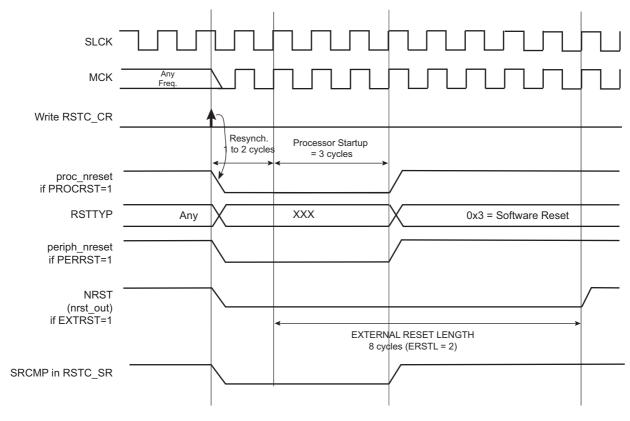

If EXTRST is set, the nrst\_out signal is asserted depending on the programming of the field ERSTL. However, the resulting falling edge on NRST does not lead to a User Reset.

If and only if the PROCRST bit is set, the reset controller reports the software status in the field RSTTYP of the RSTC\_SR. Other software resets are not reported in RSTTYP.

As soon as a software operation is detected, the bit SRCMP (Software Reset Command in Progress) is set in the RSTC\_SR. It is cleared as soon as the software reset is left. No other software reset can be performed while the SRCMP bit is set, and writing any value in the RSTC\_CR has no effect.

Figure 13-7. Software Reset

#### 13.4.4.5 Watchdog Reset

The Watchdog Reset is entered when a watchdog fault occurs. This state lasts 3 Slow Clock cycles.

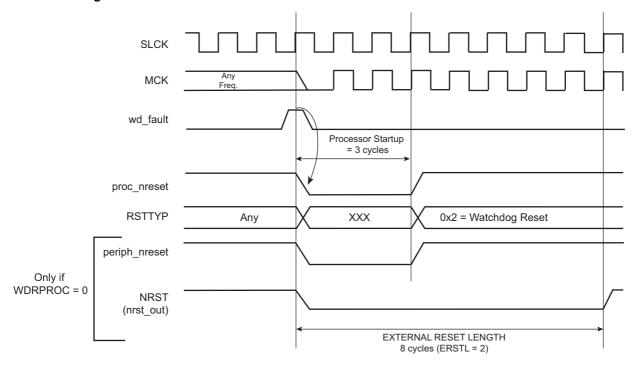

When in Watchdog Reset, assertion of the reset signals depends on the WDRPROC bit in WDT\_MR:

- If WDRPROC = 0, the Processor Reset and the Peripheral Reset are asserted. The NRST line is also asserted, depending on how field RSTC\_MR.ERSTL is programmed. However, the resulting low level on NRST does not result in a User Reset state.
- If WDRPROC = 1, only the processor reset is asserted.

The Watchdog Timer is reset by the proc\_nreset signal. As the watchdog fault always causes a processor reset if WDRSTEN in the WDT\_MR is set, the Watchdog Timer is always reset after a Watchdog Reset and the Watchdog is enabled by default and with a period set to a maximum.

When bit WDT\_MR.WDRSTEN is reset, the watchdog fault has no impact on the reset controller.

Figure 13-8. Watchdog Reset

#### 13.4.5 Reset State Priorities

The Reset State Manager manages the following priorities between the different reset sources, given in descending order:

- Backup Reset
- Wake-up Reset
- User Reset
- Watchdog Reset
- Software Reset

Particular cases are listed below:

- When in User Reset:
  - A watchdog event is impossible because the Watchdog Timer is being reset by the proc\_nreset signal.
  - A software reset is impossible, since the processor reset is being activated.
- When in Software Reset:
  - A watchdog event has priority over the current state.
  - The NRST has no effect.
- When in Watchdog Reset:
  - The processor reset is active and so a Software Reset cannot be programmed.
  - A User Reset cannot be entered.

# 13.5 Reset Controller (RSTC) User Interface

Table 13-1. Register Mapping

| Offset | Register         | Register Name Access Reset |            | Reset                      | Back-up Reset              |  |

| EXTRST PERRST _             | PROCRST |  |  |  |  |  |  |

#### • PROCRST: Processor Reset

0: No effect

1: If KEY value = 0xA5, resets the processor

# • PERRST: Peripheral Reset

0: No effect

1: If KEY value = 0xA5, resets the peripherals

#### • EXTRST: External Reset

0: No effect

1: If KEY value = 0xA5, asserts the NRST pin and resets the processor and the peripherals

#### • KEY: Write Access Password

| Value Name |        | Description   |  |  |
|------------|--------|---|--|--|
| 0xA5       | PASSWD | Writing any other value in this field aborts the write operation. |  |  |
| UXAS       |        | Always reads as 0.  |  |  |

#### 13.5.2 Reset Controller Status Register

Name: RSTC\_SR
Address: 0xFFFFE04
Access Type: Read-only

| 31 | 30 | 29 | 28 | 27 | 26 | 25     | 24    |
|----|----|----|----|----|----|--------|-------|
| _  | -  | _  | _  | _  | _  | _      | -     |
| 23 | 22 | 21 | 20 | 19 | 18 | 17     | 16    |
| _  | -  | _  | _  | _  | _  | SRCMP  | NRSTL |
| 15 | 14 | 13 | 12 | 11 | 10 | 9      | 8     |
| _  | -  | _  | _  | _  |    | RSTTYP |       |
| 7  | 6  | 5  | 4  | 3  | 2  | 1      | 0     |
| _  | _  | _  | _  | _  | _  | _      | URSTS |
|    |    |    |    |    |    |        |       |

#### URSTS: User Reset Status

A high-to-low transition of the NRST pin sets the URSTS bit. This transition is also detected on the Master Clock (MCK) rising edge. Reading the RSTC\_SR resets the URSTS bit.

0: No high-to-low edge on NRST happened since the last read of RSTC\_SR.

1: At least one high-to-low transition of NRST has been detected since the last read of RSTC\_SR.

#### • RSTTYP: Reset Type

This field reports the cause of the last processor reset. Reading this RSTC SR does not reset this field.

| Value | Name        | Description                              |
|-------|-------------|--|
| 0     | GENERAL_RST | Both VDDCORE and VDDBU rising            |
| 1     | WKUP_RST    | VDDCORE rising                           |
| 2     | WDT_RST     | Watchdog fault occurred                  |
| 3     | SOFT_RST    | Processor reset required by the software |
| 4     | USER_RST    | NRST pin detected low                    |

#### NRSTL: NRST Pin Level

This bit registers the NRST pin level sampled on each Master Clock (MCK) rising edge.

#### • SRCMP: Software Reset Command in Progress

When set, this bit indicates that a Software Reset Command is in progress and that no further software reset should be performed until the end of the current one. This bit is automatically cleared at the end of the current software reset.

0: No software command is being performed by the reset controller. The reset controller is ready for a software command.

1: A software reset command is being performed by the reset controller. The reset controller is busy.

## 13.5.3 Reset Controller Mode Register

Name: RSTC\_MR
Address: 0xFFFFE08
Access Type: Read/Write

| 31 | 30  | 29 | 28 | 27 | 26 | 25  | 24 |  |  |
|----|-----|----|----|----|----|-----|----|--|--|
|    | KEY |    |    |    |    |     |    |  |  |
| 23 | 22  | 21 | 20 | 19 | 18 | 17  | 16 |  |  |
| _  | _   | _  | _  | _  | _  | _   | _  |  |  |
| 15 | 14  | 13 | 12 | 11 | 10 | 9   | 8  |  |  |
| _  | _   | _  | _  |    | ER | STL |    |  |  |
| 7  | 6   | 5  | 4  | 3  | 2  | 1   | 0  |  |  |
| _  | _   |    | _  | _  | _  | -   | _  |  |  |

## • ERSTL: External Reset Length

This field defines the external reset length. The external reset is asserted during a time of  $2^{(ERSTL+1)}$  Slow Clock cycles. This allows the assertion duration to be programmed between 60  $\mu$ s and 2 seconds.

#### • KEY: Write Access Password

| Value | Name   | Description   |  |  |  |
|-------|--------|---|--|--|--|
| 0xA5  | PASSWD | Writing any other value in this field aborts the write operation. |  |  |  |
| UXAS  |        | Always reads as 0.  |  |  |  |

# 14. Real-time Clock (RTC)

## 14.1 Description

The Real-time Clock (RTC) peripheral is designed for very low power consumption. For optimal functionality, the RTC requires an accurate external 32.768 kHz clock, which can be provided by a crystal oscillator.

It combines a complete time-of-day clock with alarm and a Gregorian calendar, complemented by a programmable periodic interrupt. The alarm and calendar registers are accessed by a 32-bit data bus.

The time and calendar values are coded in binary-coded decimal (BCD) format. The time format can be 24-hour mode or 12-hour mode with an AM/PM indicator.

Updating time and calendar fields and configuring the alarm fields are performed by a parallel capture on the 32-bit data bus. An entry control is performed to avoid loading registers with incompatible BCD format data or with an incompatible date according to the current month/year/century.

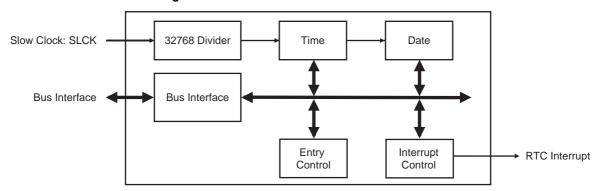

#### 14.2 Embedded Characteristics

- Full Asynchronous Design for Ultra Low Power Consumption
- Gregorian Mode Supported
- Programmable Periodic Interrupt
- Safety/security Features:
  - Valid Time and Date Programmation Check
- Register Write Protection

## 14.3 Block Diagram

Figure 14-1. Real-time Clock Block Diagram

## 14.4 Product Dependencies

#### 14.4.1 Power Management

The Real-time Clock is continuously clocked at 32.768 kHz. The Power Management Controller has no effect on RTC behavior.

## 14.4.2 Interrupt

Within the System Controller, the RTC interrupt is OR-wired with all the other module interrupts.

Only one System Controller interrupt line is connected on one of the internal sources of the interrupt controller.

RTC interrupt requires the interrupt controller to be programmed first.

When a System Controller interrupt occurs, the service routine must first determine the cause of the interrupt. This is done by reading each status register of the System Controller peripherals successively.

## 14.5 Functional Description

The RTC provides a full binary-coded decimal (BCD) clock that includes century (19/20), year (with leap years), month, date, day, hours, minutes and seconds reported in RTC Time Register (RTC\_TIMR) and RTC Calendar Register (RTC CALR).

The valid year range is up to 2099 in Gregorian mode.

The RTC can operate in 24-hour mode or in 12-hour mode with an AM/PM indicator.

Corrections for leap years are included (all years divisible by 4 being leap years except 1900). This is correct up to the year 2099.

#### 14.5.1 Reference Clock

The reference clock is the Slow Clock (SLCK). It can be driven internally or by an external 32.768 kHz crystal.

During low power modes of the processor, the oscillator runs and power consumption is critical. The crystal selection has to take into account the current consumption for power saving and the frequency drift due to temperature effect on the circuit for time accuracy.

#### 14.5.2 Timing

The RTC is updated in real time at one-second intervals in Normal mode for the counters of seconds, at one-minute intervals for the counter of minutes and so on.

Due to the asynchronous operation of the RTC with respect to the rest of the chip, to be certain that the value read in the RTC registers (century, year, month, date, day, hours, minutes, seconds) are valid and stable, it is necessary to read these registers twice. If the data is the same both times, then it is valid. Therefore, a minimum of two and a maximum of three accesses are required.

#### 14.5.3 Alarm

The RTC has five programmable fields: month, date, hours, minutes and seconds.

Each of these fields can be enabled or disabled to match the alarm condition:

- If all the fields are enabled, an alarm flag is generated (the corresponding flag is asserted and an interrupt generated if enabled) at a given month, date, hour/minute/second.
- If only the "seconds" field is enabled, then an alarm is generated every minute.

Depending on the combination of fields enabled, a large number of possibilities are available to the user ranging from minutes to 365/366 days.

Hour, minute and second matching alarm (SECEN, MINEN, HOUREN) can be enabled independently of SEC, MIN, HOUR fields.

Note: To change one of the SEC, MIN, HOUR, DATE, MONTH fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to the RTC\_TIMALR or RTC\_CALALR. The first access clears the enable corresponding to the field to change (SECEN, MINEN, HOUREN, DATEEN, MTHEN). If the field is already cleared, this access is not required. The second access performs the change of the value (SEC, MIN, HOUR, DATE, MONTH). The third access is required to re-enable the field by writing 1 in SECEN, MINEN, HOUREN, DATEEN, MTHEN fields.

#### 14.5.4 Error Checking when Programming

Verification on user interface data is performed when accessing the century, year, month, date, day, hours, minutes, seconds and alarms. A check is performed on illegal BCD entries such as illegal date of the month with regard to the year and century configured.

If one of the time fields is not correct, the data is not loaded into the register/counter and a flag is set in the validity register. The user can not reset this flag. It is reset as soon as an acceptable value is programmed. This avoids any further side effects in the hardware. The same procedure is followed for the alarm.

The following checks are performed:

- 1. Century (check if it is in range 19-20)
- 2. Year (BCD entry check)
- 3. Date (check range 01–31)
- 4. Month (check if it is in BCD range 01–12, check validity regarding "date")
- 5. Day (check range 1–7)
- 6. Hour (BCD checks: in 24-hour mode, check range 00–23 and check that AM/PM flag is not set if RTC is set in 24-hour mode; in 12-hour mode check range 01–12)
- 7. Minute (check BCD and range 00–59)
- 8. Second (check BCD and range 00-59)

Note: If the 12-hour mode is selected by means of the RTC Mode Register (RTC\_MR), a 12-hour value can be programmed and the returned value on RTC\_TIMR will be the corresponding 24-hour value. The entry control checks the value of the AM/PM indicator (bit 22 of RTC\_TIMR) to determine the range to be checked.

## 14.5.5 Updating Time/Calendar

To update any of the time/calendar fields, the user must first stop the RTC by setting the corresponding field in the Control Register (RTC\_CR). Bit UPDTIM must be set to update time fields (hour, minute, second) and bit UPDCAL must be set to update calendar fields (century, year, month, date, day).

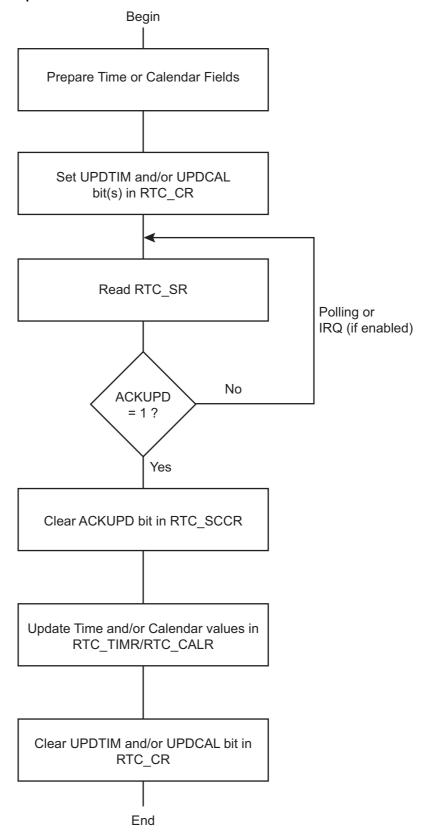

The ACKUPD bit is automatically set within a second after setting the UPDTIM and/or UPDCAL bit (meaning one second is the maximum duration of the polling or wait for interrupt period). Once ACKUPD is set, it is mandatory to clear this flag by writing the corresponding bit in the RTC\_SCCR, after which the user can write to the Time Register, the Calendar Register, or both.

Once the update is finished, the user must clear UPDTIM and/or UPDCAL in the RTC\_CR.

When entering the programming mode of the calendar fields, the time fields remain enabled. When entering the programming mode of the time fields, both time and calendar fields are stopped. This is due to the location of the calendar logic circuity (downstream for low-power considerations). It is highly recommended to prepare all the fields to be updated before entering programming mode. In successive update operations, the user must wait at least one second after resetting the UPDTIM/UPDCAL bit in the RTC\_CR before setting these bits again. This is done by waiting for the SEC flag in the RTC\_SR before setting UPDTIM/UPDCAL bit. After clearing UPDTIM/UPDCAL, the SEC flag must also be cleared.

Figure 14-2. Update Sequence

# 14.6 Real-time Clock (RTC) User Interface

Table 14-1. Register Mapping

| Offset    | Register                      | Name       | Access     | Reset      |
|-----------|-------------------------------|------------|------------|------------|
| 0x00      | Control Register              | RTC_CR     | Read/Write | 0x00000000 |
| 0x04      | Mode Register                 | RTC_MR     | Read/Write | 0x00000000 |
| 0x08      | Time Register                 | RTC_TIMR   | Read/Write | 0x00000000 |
| 0x0C      | Calendar Register             | RTC_CALR   | Read/Write | 0x01210720 |
| 0x10      | Time Alarm Register           | RTC_TIMALR | Read/Write | 0x00000000 |
| 0x14      | Calendar Alarm Register       | RTC_CALALR | Read/Write | 0x01010000 |
| 0x18      | Status Register               | RTC_SR     | Read-only  | 0x00000000 |
| 0x1C      | Status Clear Command Register | RTC_SCCR   | Write-only | _          |
| 0x20      | Interrupt Enable Register     | RTC_IER    | Write-only | _          |

| 0xD4-0xF8 | Reserved                      | _          | _          | _          |
| 0xFC      | Reserved                      | _          | _          | _          |

Note: If an offset is not listed in the table it must be considered as reserved.

#### 14.6.1 RTC Control Register

Name: RTC\_CR
Address: 0xFFFFEB0
Access: Read/Write

| 31 | 30 | 29 | 28 | 27 | 26 | 25       | 24     |
|----|----|----|----|----|----|----------|--------|
|    | 30 |    | 20 |    | 20 | 25       | 24     |
| _  | _  | _  | _  | _  | _  | -        | -      |
| 23 | 22 | 21 | 20 | 19 | 18 | 17       | 16     |
| _  | -  | _  | _  | _  | _  | CALEVSEL |        |
| 15 | 14 | 13 | 12 | 11 | 10 | 9        | 8      |
| _  | _  | _  | _  | _  | _  | TIME     | VSEL   |
| 7  | 6  | 5  | 4  | 3  | 2  | 1        | 0      |
| _  | _  | _  | _  | _  | _  | UPDCAL   | UPDTIM |

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

#### • UPDTIM: Update Request Time Register

0: No effect or, if UPDTIM has been previously written to 1, stops the update procedure.

1: Stops the RTC time counting.

Time counting consists of second, minute and hour counters. Time counters can be programmed once this bit is set and acknowledged by the bit ACKUPD of the RTC\_SR.

#### • UPDCAL: Update Request Calendar Register

0: No effect or, if UPDCAL has been previously written to 1, stops the update procedure.

1: Stops the RTC calendar counting.

Calendar counting consists of day, date, month, year and century counters. Calendar counters can be programmed once this bit is set and acknowledged by the bit ACKUPD of the RTC\_SR.

#### • TIMEVSEL: Time Event Selection

The event that generates the flag TIMEV in RTC\_SR depends on the value of TIMEVSEL.

| Value | Name     | Description           |
|-------|----------|-----------------------|
| 0     | MINUTE   | Minute change         |
| 1     | HOUR     | Hour change           |
| 2     | MIDNIGHT | Every day at midnight |
| 3     | NOON     | Every day at noon     |

#### • CALEVSEL: Calendar Event Selection

The event that generates the flag CALEV in RTC\_SR depends on the value of CALEVSEL

|   |           | generates the mag extent three general entire range of extent of e |  |  |  |  |
|---|-----------|--|--|--|--|--|
| j | Value     | Description  |  |  |  |  |
|   | 0         | WEEK   | Week change (every Monday at time 00:00:00)            |  |  |  |
|   | 1         | MONTH  | Month change (every 01 of each month at time 00:00:00) |  |  |  |
|   | 2 YEAR Ye |  | Year change (every January 1 at time 00:00:00)         |  |  |  |

# 14.6.2 RTC Mode Register

Name: RTC\_MR
Address: 0xFFFFEB4
Access: Read/Write

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24    |
|----|----|----|----|----|----|----|-------|
| _  | _  | _  | _  | -  | -  | _  | _     |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16    |
| _  | _  | _  | _  | -  | -  | _  | _     |
| 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8     |
| _  | _  | _  | _  | ı  | ı  | _  | _     |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0     |
| _  | _  | _  | _  | _  | _  | _  | HRMOD |

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

#### • HRMOD: 12-/24-hour Mode

0: 24-hour mode is selected.

1: 12-hour mode is selected.

## 14.6.3 RTC Time Register

Name: RTC\_TIMR
Address: 0xFFFFEB8
Access: Read/Write

| 31 | 30   | 29 | 28 | 27  | 26 | 25 | 24 |
|----|------|----|----|-----|----|----|----|
| _  | _    | -  | -  | _   | _  | -  | _  |
| 23 | 22   | 21 | 20 | 19  | 18 | 17 | 16 |
| _  | AMPM |    |    | НО  | UR |    |    |
| 15 | 14   | 13 | 12 | 11  | 10 | 9  | 8  |
| _  |      |    |    | MIN |    |    |    |
| 7  | 6    | 5  | 4  | 3   | 2  | 1  | 0  |
| _  |      |    |    | SEC |    |    |    |

#### • SEC: Current Second

The range that can be set is 0-59 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

#### • MIN: Current Minute

The range that can be set is 0-59 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

## • HOUR: Current Hour

The range that can be set is 1–12 (BCD) in 12-hour mode or 0–23 (BCD) in 24-hour mode.

#### • AMPM: Ante Meridiem Post Meridiem Indicator

This bit is the AM/PM indicator in 12-hour mode.

0: AM.

1: PM.

## 14.6.4 RTC Calendar Register

Name: RTC\_CALR
Address: 0xFFFFEBC
Access: Read/Write

| 31 | 30  | 29 | 28 | 27   | 26    | 25 | 24 |
|----|-----|----|----|------|-------|----|----|
| _  | _   |    |    | DA   | TE    |    |    |
| 23 | 22  | 21 | 20 | 19   | 18    | 17 | 16 |
|    | DAY |    |    |      | MONTH |    |    |
| 15 | 14  | 13 | 12 | 11   | 10    | 9  | 8  |
|    |     |    | YE | AR   |       |    |    |
| 7  | 6   | 5  | 4  | 3    | 2     | 1  | 0  |
| _  |     |    |    | CENT |       |    |    |

## • CENT: Current Century

Only the BCD value 20 can be configured.

The lowest four bits encode the units. The higher bits encode the tens.

#### • YEAR: Current Year

The range that can be set is 00-99 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

#### • MONTH: Current Month

The range that can be set is 01-12 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

#### DAY: Current Day in Current Week

The range that can be set is 1–7 (BCD).

The coding of the number (which number represents which day) is user-defined as it has no effect on the date counter.

#### • DATE: Current Day in Current Month

The range that can be set is 01-31 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

#### 14.6.5 RTC Time Alarm Register

Name: RTC\_TIMALR
Address: 0xFFFFEC0
Access: Read/Write

| 31     | 30   | 29 | 28 | 27  | 26 | 25 | 24 |
|--------|------|----|----|-----|----|----|----|
| _      | -    | _  | _  | _   | 1  | 1  | _  |
| 23     | 22   | 21 | 20 | 19  | 18 | 17 | 16 |
| HOUREN | AMPM |    |    | НО  | UR |    |    |
| 15     | 14   | 13 | 12 | 11  | 10 | 9  | 8  |
| MINEN  |      |    |    | MIN |    |    |    |
| 7      | 6    | 5  | 4  | 3   | 2  | 1  | 0  |
| SECEN  |      |    |    | SEC |    |    |    |

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

Note: To change one of the SEC, MIN, HOUR fields, it is recommended to disable the field before changing the value and then reenable it after the change has been made. This requires up to three accesses to the RTC\_TIMALR. The first access clears the enable corresponding to the field to change (SECEN, MINEN, HOUREN). If the field is already cleared, this access is not required. The second access performs the change of the value (SEC, MIN, HOUR). The third access is required to re-enable the field by writing 1 in SECEN, MINEN, HOUREN fields.

#### • SEC: Second Alarm

This field is the alarm field corresponding to the BCD-coded second counter.

#### SECEN: Second Alarm Enable

0: The second-matching alarm is disabled.

1: The second-matching alarm is enabled.

#### MIN: Minute Alarm

This field is the alarm field corresponding to the BCD-coded minute counter.

#### • MINEN: Minute Alarm Enable

0: The minute-matching alarm is disabled.

1: The minute-matching alarm is enabled.

#### HOUR: Hour Alarm

This field is the alarm field corresponding to the BCD-coded hour counter.

## AMPM: AM/PM Indicator

This field is the alarm field corresponding to the BCD-coded hour counter.

#### HOUREN: Hour Alarm Enable

0: The hour-matching alarm is disabled.

1: The hour-matching alarm is enabled.

#### 14.6.6 RTC Calendar Alarm Register

Name: RTC\_CALALR
Address: 0xFFFFEC4
Access: Read/Write

| 31     | 30 | 29 | 28 | 27 | 26    | 25 | 24 |
|--------|----|----|----|----|-------|----|----|
| DATEEN | _  |    |    | DA | TE    |    |    |
| 23     | 22 | 21 | 20 | 19 | 18    | 17 | 16 |
| MTHEN  | _  | _  |    |    | MONTH |    |    |
| 15     | 14 | 13 | 12 | 11 | 10    | 9  | 8  |
| _      | _  | _  | _  | _  | _     | ı  | _  |
| 7      | 6  | 5  | 4  | 3  | 2     | 1  | 0  |
| _      | _  | _  | _  | _  | _     | _  | _  |

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

Note: To change one of the DATE, MONTH fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to the RTC\_CALALR. The first access clears the enable corresponding to the field to change (DATEEN, MTHEN). If the field is already cleared, this access is not required. The second access performs the change of the value (DATE, MONTH). The third access is required to re-enable the field by writing 1 in DATEEN, MTHEN fields.

#### MONTH: Month Alarm

This field is the alarm field corresponding to the BCD-coded month counter.

#### • MTHEN: Month Alarm Enable

0: The month-matching alarm is disabled.

1: The month-matching alarm is enabled.

#### DATE: Date Alarm

This field is the alarm field corresponding to the BCD-coded date counter.

#### • DATEEN: Date Alarm Enable

0: The date-matching alarm is disabled.

1: The date-matching alarm is enabled.

## 14.6.7 RTC Status Register

Name: RTC\_SR

Address: 0xFFFFEC8

Access: Read-only

| 31 | 30 | 29 | 28    | 27    | 26  | 25    | 24     |
|----|----|----|-------|-------|-----|-------|--------|
| _  | _  | ı  | _     | _     |     | ı     | _      |
| 23 | 22 | 21 | 20    | 19    | 18  | 17    | 16     |
| _  | _  | _  | _     | _     | _   | _     | _      |
| 15 | 14 | 13 | 12    | 11    | 10  | 9     | 8      |
| _  | _  | _  | _     | _     | _   | _     | _      |
| 7  | 6  | 5  | 4     | 3     | 2   | 1     | 0      |
| _  | _  |    | CALEV | TIMEV | SEC | ALARM | ACKUPD |

## • ACKUPD: Acknowledge for Update

| Value Name Description |   |         |  |
|------------------------|---|---------|--|
|                        | 0 | FREERUN | Time and calendar registers cannot be updated. |
|                        | 1 | UPDATE  | Time and calendar registers can be updated.    |

#### ALARM: Alarm Flag

| Ī | Value Name      |            | Description                               |
|---|-----------------|------------|---|
| Ī | 0 NO_ALARMEVENT |            | No alarm matching condition occurred.     |
| Ī | 1               | ALARMEVENT | An alarm matching condition has occurred. |

#### • SEC: Second Event

| Value | Name        | Description  |
|-------|-------------|--|
| 0     | NO_SECEVENT | No second event has occurred since the last clear.           |
| 1     | SECEVENT    | At least one second event has occurred since the last clear. |

#### • TIMEV: Time Event

| Value Name Description |   | Description |  |
|------------------------|---|-------------|--|
| Ī                      | 0 | NO_TIMEVENT | No time event has occurred since the last clear.           |
|                        | 1 | TIMEVENT    | At least one time event has occurred since the last clear. |

Note: The time event is selected in the TIMEVSEL field in the Control Register (RTC\_CR) and can be any one of the following events: minute change, hour change, noon, midnight (day change).

## • CALEV: Calendar Event

| I  | Value | Value Name Description                               |  |
|--|-------|--|--|
| 0 NO_CALEVENT No calendar event has occurred since the last clear. |       | No calendar event has occurred since the last clear. |  |
|  | 1     | CALEVENT   | At least one calendar event has occurred since the last clear. |

Note: The calendar event is selected in the CALEVSEL field in the Control Register (RTC\_CR) and can be any one of the following events: week change, month change and year change.

## 14.6.8 RTC Status Clear Command Register

Name: RTC\_SCCR Address: 0xFFFFECC

Access: Write-only

| 31 | 30 | 29 | 28     | 27     | 26     | 25     | 24     |
|----|----|----|--------|--------|--------|--------|--------|
| _  | _  | 1  | -      |        |        | -      | _      |
| 23 | 22 | 21 | 20     | 19     | 18     | 17     | 16     |
| _  | _  | ı  | -      |        |        | -      | _      |
| 15 | 14 | 13 | 12     | 11     | 10     | 9      | 8      |
| _  | _  | -  | _      | _      | _      | _      | _      |
| 7  | 6  | 5  | 4      | 3      | 2      | 1      | 0      |
| _  | _  | -  | CALCLR | TIMCLR | SECCLR | ALRCLR | ACKCLR |

#### • ACKCLR: Acknowledge Clear

0: No effect.

1: Clears corresponding status flag in the Status Register (RTC\_SR).

#### • ALRCLR: Alarm Clear

0: No effect.

1: Clears corresponding status flag in the Status Register (RTC\_SR).

## • SECCLR: Second Clear

0: No effect.

1: Clears corresponding status flag in the Status Register (RTC\_SR).

#### • TIMCLR: Time Clear

0: No effect.

1: Clears corresponding status flag in the Status Register (RTC\_SR).

#### • CALCLR: Calendar Clear

0: No effect.

1: Clears corresponding status flag in the Status Register (RTC\_SR).

## 14.6.9 RTC Interrupt Enable Register

Name: RTC\_IER
Address: 0xFFFFED0
Access: Write-only

| 31 | 30 | 29 | 28    | 27    | 26    | 25    | 24    |
|----|----|----|-------|-------|-------|-------|-------|

# 15. Periodic Interval Timer (PIT)

# 15.1 Description

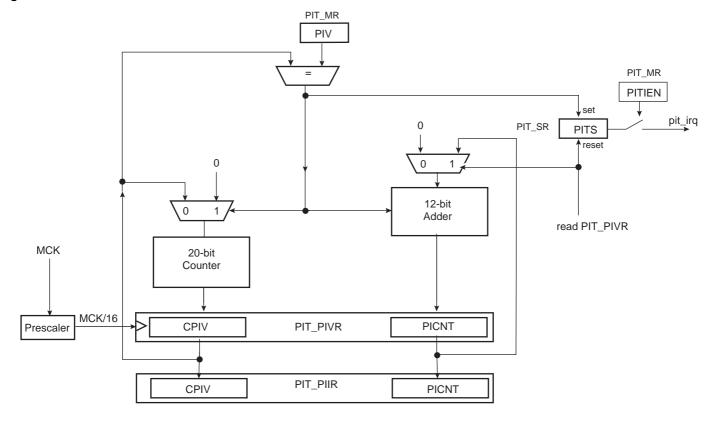

The Periodic Interval Timer (PIT) provides the operating system's scheduler interrupt. It is designed to offer maximum accuracy and efficient management, even for systems with long response time.

#### 15.2 Embedded Characteristics

- 20-bit Programmable Counter plus 12-bit Interval Counter
- Reset-on-read Feature
- Both Counters Work on Master Clock/16

# 15.3 Block Diagram

Figure 15-1. Periodic Interval Timer

## 15.4 Functional Description

The Periodic Interval Timer aims at providing periodic interrupts for use by operating systems.

The PIT provides a programmable overflow counter and a reset-on-read feature. It is built around two counters: a 20-bit CPIV counter and a 12-bit PICNT counter. Both counters work at Master Clock /16.

The first 20-bit CPIV counter increments from 0 up to a programmable overflow value set in the field PIV of the Mode Register (PIT\_MR). When the counter CPIV reaches this value, it resets to 0 and increments the Periodic Interval Counter, PICNT. The status bit PITS in the Status Register (PIT\_SR) rises and triggers an interrupt, provided the interrupt is enabled (PITIEN in PIT\_MR).

Writing a new PIV value in PIT\_MR does not reset/restart the counters.

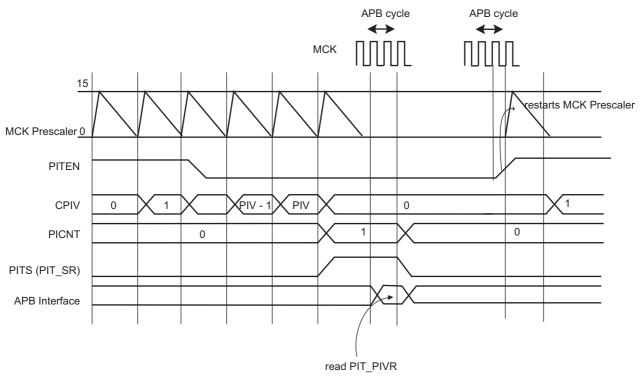

When CPIV and PICNT values are obtained by reading the Periodic Interval Value Register (PIT\_PIVR), the overflow counter (PICNT) is reset and the PITS bit is cleared, thus acknowledging the interrupt. The value of PICNT gives the number of periodic intervals elapsed since the last read of PIT\_PIVR.

When CPIV and PICNT values are obtained by reading the Periodic Interval Image Register (PIT\_PIIR), there is no effect on the counters CPIV and PICNT, nor on the bit PITS. For example, a profiler can read PIT\_PIIR without clearing any pending interrupt, whereas a timer interrupt clears the interrupt by reading PIT\_PIVR.

The PIT may be enabled/disabled using the PITEN bit in the PIT\_MR register (disabled on reset). The PITEN bit only becomes effective when the CPIV value is 0. Figure 15-2 illustrates the PIT counting. After the PIT Enable bit is reset (PITEN = 0), the CPIV goes on counting until the PIV value is reached, and is then reset. PIT restarts counting, only if the PITEN is set again.

The PIT is stopped when the core enters debug state.

Returns the number of occurrences of periodic intervals since the last read of PIT\_PIVR.

# 16. Watchdog Timer (WDT)

## 16.1 Description

The Watchdog Timer (WDT) is used to prevent system lock-up if the software becomes trapped in a deadlock. It features a 12-bit down counter that allows a watchdog period of up to 16 seconds (slow clock around 32 kHz). It can generate a general reset or a processor reset only. In addition, it can be stopped while the processor is in Debug mode or Idle mode.

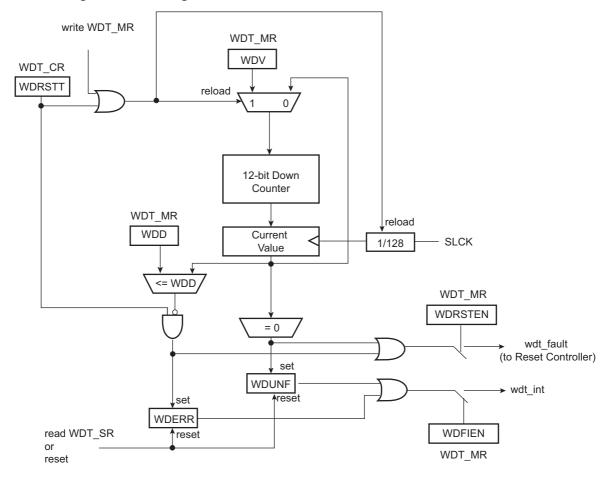

#### 16.2 Embedded Characteristics

- 12-bit Key-protected Programmable Counter
- Watchdog Clock is Independent from Processor Clock
- Provides Reset or Interrupt Signals to the System
- Counter May Be Stopped while the Processor is in Debug State or in Idle Mode

# 16.3 Block Diagram

Figure 16-1. Watchdog Timer Block Diagram

## 16.4 Functional Description

The Watchdog Timer is used to prevent system lock-up if the software becomes trapped in a deadlock. It is supplied with VDDCORE. It restarts with initial values on processor reset.

The watchdog is built around a 12-bit down counter, which is loaded with the value defined in the field WDV of the Mode Register (WDT\_MR). The Watchdog Timer uses the slow clock divided by 128 to establish the maximum watchdog period to be 16 seconds (with a typical slow clock of 32.768 kHz).

After a processor reset, the value of WDV is 0xFFF, corresponding to the maximum value of the counter with the external reset generation enabled (field WDRSTEN at 1 after a backup reset). This means that a default watchdog is running at reset, i.e., at power-up. The user can either disable the WDT by setting bit WDT\_MR.WDDIS or reprogram the WDT to meet the maximum watchdog period the application requires.

When the WDDIS bit is set, the fields WDV and WDD must not be modified.

If the watchdog is restarted by writing into the Control Register (WDT\_CR), WDT\_MR must not be programmed during a period of time of three slow clock periods following the WDT\_CR write access. In any case, programming a new value in WDT\_MR automatically initiates a restart instruction.

WDT\_MR can be written only once. Only a processor reset resets it. Writing WDT\_MR reloads the timer with the newly programmed mode parameters.

In normal operation, the user reloads the watchdog at regular intervals before the timer underflow occurs, by setting bit WDT\_CR.WDRSTT. The watchdog counter is then immediately reloaded from WDT\_MR and restarted, and the slow clock 128 divider is reset and restarted. WDT\_CR is write-protected. As a result, writing WDT\_CR without the correct hard-coded key has no effect. If an underflow does occur, the "wdt\_fault" signal to the Reset Controller is asserted if bit WDT\_MR.WDRSTEN is set. Moreover, the bit WDUNF is set in the Status Register (WDT\_SR).

To prevent a software deadlock that continuously triggers the watchdog, the reload of the watchdog must occur while the watchdog counter is within a window between 0 and WDD. WDD is defined in WDT\_MR.

Any attempt to restart the watchdog while the watchdog counter is between WDV and WDD results in a watchdog error, even if the watchdog is disabled. The bit WDT\_SR.WDERR is updated and the "wdt\_fault" signal to the Reset Controller is asserted.

Note that this feature can be disabled by programming a WDD value greater than or equal to the WDV value. In such a configuration, restarting the Watchdog Timer is permitted in the whole range [0; WDV] and does not generate an error. This is the default configuration on reset (the WDD and WDV values are equal).

The status bits WDUNF (Watchdog Underflow) and WDERR (Watchdog Error) trigger an interrupt, provided the bit WDT\_MR.WDFIEN is set. The signal "wdt\_fault" to the Reset Controller causes a watchdog reset if the WDRSTEN bit is set as already explained in the Reset Controller documentation. In this case, the processor and the Watchdog Timer are reset, and the WDERR and WDUNF flags are reset.

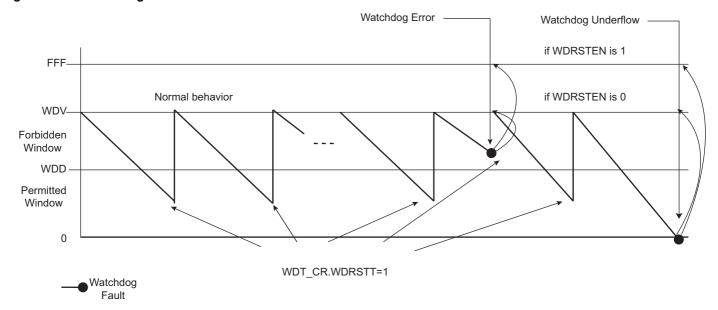

If a reset is generated or if WDT\_SR is read, the status bits are reset, the interrupt is cleared, and the "wdt\_fault" signal to the reset controller is deasserted.

Writing WDT MR reloads and restarts the down counter.

While the processor is in debug state or in idle mode, the counter may be stopped depending on the value programmed for the bits WDIDLEHLT and WDDBGHLT in WDT\_MR.

Figure 16-2. Watchdog Behavior

# 16.5 Watchdog Timer (WDT) User Interface

Address: 0xFFFFE44
Access: Read/Write Once

| 31    | 30      | 29        | 28       | 27 | 26 | 25   | 24 |  |  |
|-------|---------|-----------|----------|----|----|------|----|--|--|
| _     | _       | WDIDLEHLT | WDDBGHLT |    | WI | DD   |    |  |  |
| 23    | 22      | 21        | 20       | 19 | 18 | 17   | 16 |  |  |
|       | WDD     |           |          |    |    |      |    |  |  |
| 15    | 14      | 13        | 12       | 11 | 10 | 9    | 8  |  |  |
| WDDIS | WDRPROC | WDRSTEN   | WDFIEN   |    | W  | OV . |    |  |  |
| 7     | 6       | 5         | 4        | 3  | 2  | 1    | 0  |  |  |
|       |         |           | WI       | ΟV |    |      |    |  |  |

Note: The first write access prevents any further modification of the value of this register. Read accesses remain possible.

Note: The WDT\_MR register values must not be modified within three slow clock periods following a restart of the watchdog performed by a write access in WDT\_CR. Any modification will cause the watchdog to trigger an end of period earlier than expected.

### WDV: Watchdog Counter Value

Defines the value loaded in the 12-bit watchdog counter.

### WDFIEN: Watchdog Fault Interrupt Enable

0: A watchdog fault (underflow or error) has no effect on interrupt.

1: A watchdog fault (underflow or error) asserts interrupt.

### WDRSTEN: Watchdog Reset Enable

0: A watchdog fault (underflow or error) has no effect on the resets.

1: A watchdog fault (underflow or error) triggers a watchdog reset.

### • WDRPROC: Watchdog Reset Processor

0: If WDRSTEN is 1, a watchdog fault (underflow or error) activates all resets.

1: If WDRSTEN is 1, a watchdog fault (underflow or error) activates the processor reset.

#### WDDIS: Watchdog Disable

0: Enables the Watchdog Timer.

1: Disables the Watchdog Timer.

Note: When the WDDIS bit is set, the fields WDV and WDD must not be modified.

#### WDD: Watchdog Delta Value

Defines the permitted range for reloading the Watchdog Timer.

If the Watchdog Timer value is less than or equal to WDD, setting bit WDT\_CR.WDRSTT restarts the timer.

If the Watchdog Timer value is greater than WDD, setting bit WDT\_CR.WDRSTT causes a watchdog error.

# • WDDBGHLT: Watchdog Debug Halt

- 0: The watchdog runs when the processor is in debug state.
- 1: The watchdog stops when the processor is in debug state.

## • WDIDLEHLT: Watchdog Idle Halt

- 0: The watchdog runs when the system is in idle state.
- 1: The watchdog stops when the system is in idle state.

# 16.5.3 Watchdog Timer Status Register

Name: WDT\_SR Address: 0xFFFFE48 **Access** Read-only \_ WDERR WDUNF

# • WDUNF: Watchdog Underflow (cleared on read)

0: No watchdog underflow occurred since the last read of WDT\_SR.

1: At least one watchdog underflow occurred since the last read of WDT\_SR.

## • WDERR: Watchdog Error (cleared on read)

0: No watchdog error occurred since the last read of WDT\_SR.

1: At least one watchdog error occurred since the last read of WDT\_SR.

# 17. Shutdown Controller (SHDWC)

# 17.1 Description

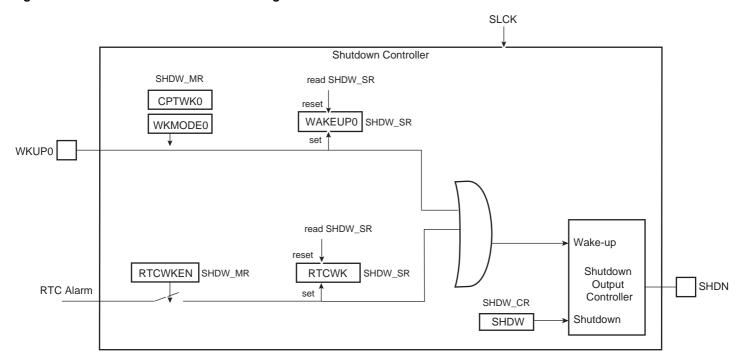

The Shutdown Controller (SHDWC) controls the power supplies VDDIO and VDDCORE and the wake-up detection on debounced input lines.

### 17.2 Embedded Characteristics

- Shutdown and Wake-up Logic
  - Software Assertion of the Shutdown Output Pin (SHDN)
  - Programmable De-assertion from the WKUP Input Pins

# 17.3 Block Diagram

Figure 17-1. Shutdown Controller Block Diagram

# 17.4 I/O Lines Description

Table 17-1. I/O Lines Description

| Name Description |                 | Туре   |
|------------------|-----------------|--------|
| WKUP0            | Wake-up 0 input | Input  |
| SHDN             | Shutdown output | Output |

# 17.5 Product Dependencies

# 17.5.1 Power Management

The Shutdown Controller is continuously clocked by the Slow Clock (SLCK). The Power Management Controller has no effect on the behavior of the Shutdown Controller.

# 17.6 Functional Description

The Shutdown Controller manages the main power supply. To do so, it is supplied with VDDBU and manages wake-up input pins and one output pin, SHDN.

A typical application connects the pin SHDN to the shutdown input of the DC/DC Converter providing the main power supplies of the system, and especially VDDCORE and/or VDDIO. The wake-up inputs (WKUP0) connect to any push-buttons or signal that wake up the system.

The software is able to control the pin SHDN by writing the Shutdown Control Register (SHDW\_CR) with the bit SHDW at 1. The shutdown is taken into account only two slow clock cycles after the write of SHDW\_CR. This register is password-protected and so the value written should contain the correct key for the command to be taken into account. As a result, the system should be powered down.

### 17.6.1 Wake-up Inputs

A level change on WKUP0 is used as a wake-up. Wake-up is configured in the Shutdown Mode Register (SHDW\_MR). The transition detector can be programmed to detect either a positive or negative transition or any level change on WKUP0. The detection can also be disabled. Programming is performed by defining WKMODE0

Moreover, a debouncing circuit can be programmed for WKUP0. The debouncing circuit filters pulses on WKUP0 shorter than the programmed number of 16 SLCK cycles in CPTWK0 of the SHDW\_MR. If the programmed level change is detected on a pin, a counter starts. When the counter reaches the value programmed in the corresponding field, CPTWK0, the SHDN pin is released. If a new input change is detected before the counter reaches the corresponding value, the counter is stopped and cleared. WAKEUP0 of the Status Register (SHDW\_SR) reports the detection of the programmed events on WKUP0 with a reset after the read of SHDW\_SR.

The Shutdown Controller can be programmed so as to activate the wake-up using the RTC alarm (the detection of the rising edge of the RTC alarm is synchronized with SLCK). This is done by writing the SHDW\_MR using the RTCWKEN field. When enabled, the detection of RTC alarm is reported in the RTCWK bit of the SHDW\_SR. They are reset after the read of SHDW\_SR. When using the RTC alarm to wake up the system, the user must ensure that RTC alarm status flag is cleared before shutting down the system. Otherwise, no rising edge of the status flags may be detected and the wake-up will fail.

# 19. Slow Clock Controller (SCKC)

# 19.1 Description

The System Controller embeds a Slow Clock Controller (SCKC). The SCKC selects the slow clock from one of two sources:

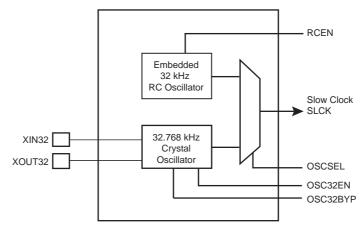

- External 32.768 kHz crystal oscillator
- Embedded 32 kHz (typical) RC oscillator

## 19.2 Embedded Characteristics

- 32 kHz (typical) RC Oscillator or 32.768 kHz Crystal Oscillator Selector
- VDDBU Powered

# 19.3 Block Diagram

Figure 19-1. Block Diagram

# 19.4 Functional Description

The bits RCEN, OSC32EN, OSCSEL, and OSC32BYP are located in the Slow Clock Controller Configuration Register (SCKC\_CR) located at the address 0xFFFFE50 in the backed-up part of the System Controller and, thus, they are preserved while VDDBU is present.

The embedded 32 kHz (typical) RC oscillator and the 32.768 kHz crystal oscillator can be enabled by setting to 1, respectively, the RCEN and OSC32EN bits. The Slow Clock Selector command (OSCSEL bit) selects the slow clock source.

The 32.768 kHz crystal oscillator can be bypassed by setting the OSC32BYP bit to accept an external slow clock on XIN32.

After the VDDBU power-on reset, the default configuration is RCEN = 1, OSC32EN = 0 and OSCSEL = 0, allowing the system to start on the embedded 32 kHz (typical) RC oscillator.

The programmer controls the slow clock switching by software and so must take precautions during the switching phase.

## 19.4.1 Switching from Embedded 32 kHz RC Oscillator to 32.768 kHz Crystal Oscillator

The sequence to switch from the embedded 32 kHz (typical) RC oscillator to the 32.768 kHz crystal oscillator is the following:

- 1. Switch the master clock to a source different from slow clock (PLL or Main Oscillator) through the Power Management Controller.
- 2. Enable the 32.768 kHz crystal oscillator by writing a 1 to the OSC32EN bit.
- 3. Wait for the 32.768 kHz crystal oscillator to stabilize (software loop).
- 4. Switch from the embedded 32 kHz (typical) RC oscillator to the 32.768 kHz crystal oscillator by writing a 1 to the OSCSEL bit.
- 5. Wait 5 slow clock cycles for internal resynchronization.
- 6. Disable the 32 kHz (typical) RC oscillator by writing a 0 to the RCEN bit.

### 19.4.2 Bypassing the 32.768 kHz Crystal Oscillator

The sequence to bypass the 32.768 kHz crystal oscillator is the following:

- 1. An external clock must be connected on XIN32.
- 2. Enable the bypass path by writing a 1 to the OSC32BYP bit.
- 3. Disable the 32.768 kHz crystal oscillator by writing a 0 to the OSC32EN bit.

#### 19.4.3 Switching from 32.768 kHz Crystal Oscillator to Embedded 32 kHz RC Oscillator

The sequence to switch from the 32.768 kHz crystal oscillator to the embedded 32 kHz (typical) RC oscillator is the following:

- 1. Switch the master clock to a source different from slow clock (PLL or Main Oscillator).
- 2. Enable the embedded 32 kHz (typical) RC oscillator for low power by writing a 1 to the RCEN bit.
- 3. Wait for the embedded 32 kHz (typical) RC oscillator to stabilize (software loop).
- 4. Switch from the 32.768 kHz crystal oscillator to the embedded RC oscillator by writing a 0 to the OSCSEL bit.
- 5. Wait 5 slow clock cycles for internal resynchronization.
- 6. Disable the 32.768 kHz crystal oscillator by writing a 0 to the OSC32EN bit.

### • OSCSEL: Slow Clock Selector

0 (RC): Slow clock is the embedded 32 kHz (typical) RC oscillator.

1 (XTAL): Slow clock is the 32.768 kHz crystal oscillator.

# 20. Clock Generator

## 20.1 Description

The Clock Generator User Interface is embedded within the Power Management Controller and is described in Section 21.17 "Power Management Controller (PMC) User Interface". However, the Clock Generator registers are named CKGR\_.

### 20.2 Embedded Characteristics

The Clock Generator is made up of:

- A low-power 32.768 kHz crystal oscillator with Bypass mode
- A low-power embedded 32 kHz (typical) RC oscillator generating the 32 kHz source clock
- A 12 to 16 MHz crystal oscillator, which can be bypassed (12 MHz needed in case of USB)
- 12 MHz RC oscillator
- 480 MHz UTMI PLL providing a clock for the USB High Speed Device Controller
- 400 to 800 MHz programmable PLL (input from 8 to 16 MHz), capable of providing the clock MCK to the processor and to the peripherals

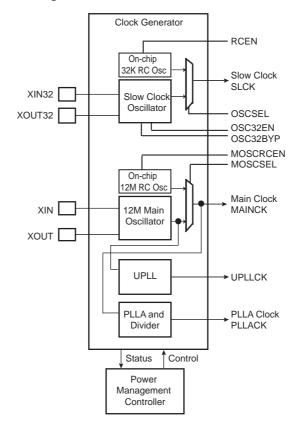

The Clock Generator provides the following clocks:

- SLCK, the Slow Clock, which is the only permanent clock within the system
- MAINCK is the output of the main clock oscillator selection: either 12 to 16 MHz crystal oscillator or 12 MHz RC oscillator
- PLLACK is the output of the divider and the 400 to 800 MHz programmable PLL (PLLA)
- UPLLCK is the output of the 480 MHz UTMI PLL (UPLL)

## 20.3 Block Diagram

Figure 20-1. Clock Generator Block Diagram

#### 20.4 Slow Clock

The Slow Clock Controller embeds a slow clock generator that is supplied with the VDDBU power supply. As soon as VDDBU is supplied, both the 32.768 kHz crystal oscillator and the embedded 32 kHz (typical) RC oscillator are powered, but only the RC oscillator is enabled. This allows the slow clock to be valid in a short time (about 100 µs).

The slow clock is generated either by the 32.768 kHz crystal oscillator or by the embedded 32 kHz (typical) RC oscillator.

The selection of the slow clock source is made via the OSCSEL bit in the Slow Clock Controller Configuration Register (SCKC\_CR).

SCKC\_CR.OSCSEL and PMC\_SR.OSCSELS report which oscillator is selected as the slow clock source. PMC\_SR.OSCSELS informs when the switch sequence initiated by a new value written in SCKC\_CR.OSCSEL is done.

#### 20.4.1 Embedded 32 kHz (typical) RC Oscillator

By default, the embedded 32 kHz (typical) RC oscillator is enabled and selected. The user has to take into account the possible drifts of this oscillator. Refer to the "DC Characteristics" in the section "Electrical Characteristics".

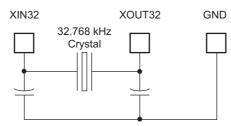

#### 20.4.2 32.768 kHz Crystal Oscillator

The Clock Generator integrates a low-power 32.768 kHz crystal oscillator. To use this oscillator, the XIN32 and XOUT32 pins must be connected to a 32.768 kHz crystal. Two external capacitors must be wired as shown in Figure 20-2. More details are given in the section "DC Characteristics".

Note that the user is not obliged to use the 32.768 kHz crystal oscillator and can use the 32 kHz (typical) RC oscillator instead.

Figure 20-2. Typical 32.768 kHz Crystal Oscillator Connection

The 32.768 kHz crystal oscillator provides a more accurate frequency than the 32 kHz (typical) RC oscillator.

To select the 32.768 kHz crystal oscillator as the source of the slow clock, the bit SCKC\_CR.OSCSEL must be set. This results in a sequence which enables the 32.768 kHz crystal oscillator. The switch of the slow clock source is glitch-free.

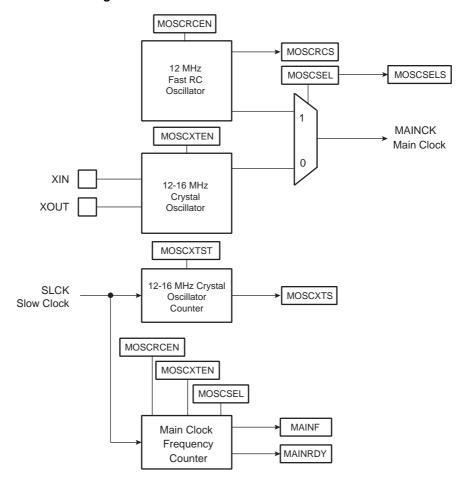

The user can also set the 32.768 kHz crystal oscillator in Bypass mode instead of connecting a crystal. In this case, the user must provide the external clock signal on XIN32. The input characteristics of the XIN32 pin are given in the section "Electrical Characteristics". To enter Bypass mode, the SCKC\_CR.OSC32BYP must be set prior to setting SCKC\_CR.OSCSEL.

## 20.5 Main Clock

The main clock has two sources:

- a 12 MHz RC oscillator with a fast startup time and used at startup
- a 12 to 16 MHz crystal oscillator which can be bypassed

Figure 20-3. Main Clock Block Diagram

#### 20.5.1 12 MHz RC Oscillator

After reset, the 12 MHz RC oscillator is enabled and it is selected as the source of MCK. MCK is the default clock selected to start up the system.

Refer to the table "DC Characteristics".

The software can disable or enable the 12 MHz RC oscillator with the MOSCRCEN bit in the CKGR\_MOR.

When disabling the main clock by clearing the MOSCRCEN bit in CKGR\_MOR, the MOSCRCS bit in the PMC\_SR is automatically cleared, indicating the main clock is off.

Setting the MOSCRCS bit in the Power Management Controller Interrupt Enable Register (PMC\_IER) can trigger an interrupt to the processor.

### 20.5.2 12 to 16 MHz Crystal Oscillator

After reset, the 12 to 16 MHz crystal oscillator is disabled and is not selected as the source of MAINCK.

As the source of MAINCK, the 12 to 16 MHz crystal oscillator provides an accurate frequency. The software enables or disables this oscillator in order to reduce power consumption via CKGR\_MOR.MOSCXTEN.

When disabling this oscillator by clearing the CKGR\_MOR.MOSCXTEN bit, the PMC\_SR.MOSCXTS bit is automatically cleared, indicating the 12 to 16 MHz crystal oscillator is off.

When enabling this oscillator, the user must initiate the startup time counter. This startup time depends on the characteristics of the external device connected to this oscillator. Refer to the section "Electrical Characteristics" for the startup time.

When CKGR\_MOR.MOSCXTEN and CKGR\_MOR.MOSCXTST are written to enable this oscillator, the PMC\_SR.MOSCXTS bit is cleared and the counter starts counting down on the slow clock divided by 8 from the MOSCXTST value. When the counter reaches 0, the PMC\_SR.MOSCXTS is set, indicating that the 12 to 16 MHz crystal oscillator is stabilized. Setting PMC\_IMR.MOSCXTS triggers an interrupt to the processor.

#### 20.5.3 Main Clock Source Selection

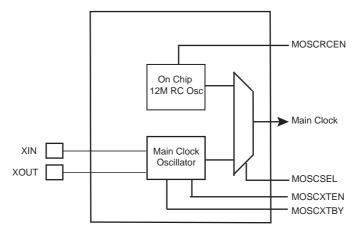

The main clock is generated by the 12 to 16 MHz crystal oscillator, or by the embedded 12 MHz RC oscillator.

The selection is made by writing CKGR\_MOR.MOSCSEL. The switch of the main clock source is glitch-free, so there is no need to run out of SLCK or PLLACK in order to change the selection. PMC\_SR.MOSCSELS indicates when the switch sequence is done.

Setting PMC\_IMR.MOSCSELS triggers an interrupt to the processor.

The 12 to 16 MHz crystal oscillator can be bypassed by setting the MOSCXTBY bit in the CKGR\_MOR to accept an external main clock on XIN (refer to Section 20.5.4 "Bypassing the 12 to 16 MHz Crystal Oscillator").

Figure 20-4. Main Clock Source Selection

MOSCRCEN, MOSCXTEN, MOSCSEL and MOSCXTBY bits are located in the PMC Clock Generator Main Oscillator Register (CKGR\_MOR).

After a VDDBU power-on reset, the default configuration is MOSCRCEN = 1, MOSCXTEN = 0 and MOSCSEL = 0, allowing the 12 MHz RC oscillator to start as Main clock.

### 20.5.4 Bypassing the 12 to 16 MHz Crystal Oscillator

Prior to bypassing the 12 to 16 MHz crystal oscillator, the external clock frequency provided on the XIN pin must be stable and within the values specified in the XIN Clock characteristics in the section "Electrical Characteristics".

The sequence to bypass the crystal oscillator is the following:

- 1. Ensure that an external clock is connected on XIN.
- 2. Enable the bypass by setting CKGR MOR.MOSCXTBY.
- Disable the 12 to 16 MHz crystal oscillator by clearing CKGR\_MOR.MOSCXTEN.

### 20.5.5 Main Clock Frequency Counter

The frequency counter is managed by CKGR\_MCFR.

During the measurement period, the frequency counter increments at the main clock speed.

A measurement is started in the following cases:

- When the 12 MHz RC oscillator is selected as the source of the main clock and when this oscillator becomes stable (i.e., when the MOSCRCS bit is set)
- When the 12 to 16 MHz crystal oscillator is selected as the source of the main clock and when this oscillator becomes stable (i.e., when the MOSCXTS bit is set)
- When the main clock source selection is modified

The measurement period ends at the 16th falling edge of slow clock, the MAINFRDY bit in the CKGR\_MCFR is set and the counter stops counting. Its value can be read in the MAINF field of CKGR\_MCFR and gives the number of main clock cycles during 16 periods of slow clock, so that the frequency of the 12 MHz RC oscillator or the crystal oscillator can be determined.

### 20.5.6 Switching Main Clock Between the RC Oscillator and the Crystal Oscillator

For USB operations an external 12 MHz crystal is required for better accuracy.

The programmer controls the main clock switching by software and so must take precautions during the switching phase.

To switch from internal 12 MHz RC oscillator to the 12 MHz crystal, the programmer must execute the following sequence:

- 1. Enable the 12 MHz oscillator by setting the bit MOSCXTEN to 1.
- 2. Wait that the 12 MHz oscillator status bit MOSCXTS is 1.
- 3. Switch from internal 12 MHz RC oscillator to the 12 MHz oscillator by setting the bit MOSCSEL to 1.
- 4. If not the bit MOSCSEL is set to 0 by the PMC.
- 5. Disable the 12 MHz RC oscillator by setting the bit MOSCRCEN to 0.

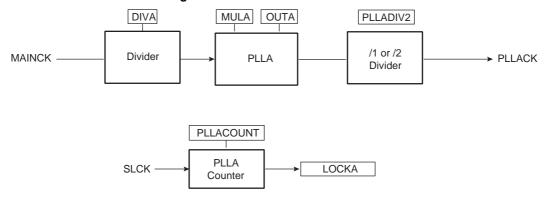

## 20.6 Divider and PLLA Block

The PLLA embeds an input divider to increase the accuracy of the resulting clock signals. However, the user must respect the PLLA minimum input frequency when programming the divider.

Figure 20-5 shows the block diagram of the divider and PLLA block.

Figure 20-5. Divider and PLLA Block Diagram

### 20.6.1 Divider and Phase Lock Loop Programming

The divider can be set between 1 and 255 in steps of 1. When a divider field (DIV) is cleared, the output of the corresponding divider and the PLL output is a continuous signal at level 0. On reset, each DIV field is cleared, thus the corresponding PLL input clock is stuck at 0.

The PLLA allows multiplication of the divider's outputs. The PLLA clock signal has a frequency that depends on the respective source signal frequency and on the parameters DIVA and MULA. The factor applied to the source signal frequency is (MULA + 1)/DIVA. When MULA is written to 0, the PLLA is disabled and its power consumption is saved. Re-enabling the PLLA can be performed by writing a value higher than 0 in the MUL field.

Whenever the PLLA is re-enabled or one of its parameters is changed, the LOCKA bit in PMC\_SR is automatically cleared. The values written in the PLLACOUNT field in CKGR\_PLLAR are loaded in the PLLA counter. The PLLA counter then decrements at the speed of the slow clock until it reaches 0. At this time, the LOCK bit is set in PMC\_SR and can trigger an interrupt to the processor. The user has to load the number of slow clock cycles required to cover the PLLA transient time into the PLLACOUNT field.

The PLLA clock can be divided by 2 by writing the PLLADIV2 bit in the PMC\_MCKR

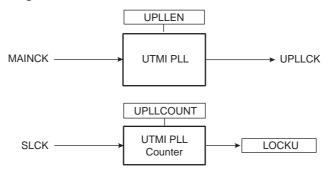

## 20.7 UTMI Phase Lock Loop Programming

The source clock of the UTMI PLL is the main clock (MAINCK). The MAINCK must select the fast crystal oscillator to meet the frequency accuracy required by USB.

A frequency of 12 MHz is required for the built-in UTMI PLL multiplier of x 40 to obtain the USB High Speed 480 MHz.

Figure 20-6. UTMI PLL Block Diagram

Whenever the UTMI PLL is enabled by writing UPLLEN in CKGR\_UCKR, the LOCKU bit in PMC\_SR is automatically cleared. The values written in the PLLCOUNT field in CKGR\_UCKR are loaded in the UTMI PLL counter. The UTMI PLL counter then decrements at the speed of the slow clock divided by 8 until it reaches 0. At this time, the LOCKU bit is set in PMC\_SR and can trigger an interrupt to the processor. The user has to load the number of slow clock cycles required to cover the UTMI PLL transient time into the PLLCOUNT field.

# 21. Power Management Controller (PMC)

## 21.1 Description

The Power Management Controller (PMC) optimizes power consumption by controlling all system and user peripheral clocks. The PMC enables/disables the clock inputs to many of the peripherals and the Core.

### 21.2 Embedded Characteristics

The Power Management Controller provides the following clocks:

- PMC input clocks:
  - UPLLCK: from UTMI PLL
  - PLLACK: from PLLA
  - SLCK: slow clock from external 32 kHz oscillator or internal 32 kHz RC oscillator
  - MAINCK: Main Clock from external 12 MHz oscillator or internal 12 MHz RC Oscillator
- PMC output clocks:
  - Processor Clock PCK
  - Master Clock MCK, in particular to the Matrix, the memory interfaces, the peripheral bridge. The divider can be 2, 3 or 4.
  - Each peripheral embeds its own divider, programmable in the PMC User Interface.
  - 133 MHz DDR clock

Note: DDR clock is not available when Master Clock (MCK) equals Processor Clock (PCK).

- LCD pixel clock that can use DDR clock or MCK, the choice is done in the LCD user interface.
- USB Host EHCl High speed clock (UPLLCK)
- USB OHCI clocks (UHP48M and UHP12M)
- Two programmable clock outputs: PCK0 and PCK1
- SMD clock

The PMC allows software control of five flexible operating modes:

- Normal Mode, processor and peripherals running at a programmable frequency
- Idle Mode, processor stopped waiting for an interrupt
- Slow Clock Mode, processor and peripherals running at low frequency
- Standby Mode, mix of Idle and Backup Mode, peripheral running at low frequency, processor stopped waiting for an interrupt
- Backup Mode, Main Power Supplies off, VDDBU powered by a battery

### 21.4 Master Clock Controller

The Master Clock Controller provides selection and division of the Master Clock (MCK). MCK is the source clock of the peripheral clocks.

Prescaler

/1./2./4..../64

Programmable Clock Controller

**SLCK** 

MAINCK

**UPLLCK** 

The Master Clock is selected from one of the clocks provided by the Clock Generator. Selecting the slow clock provides a slow clock signal to the whole device. Selecting the main clock saves power consumption of the PLLs.

The Master Clock Controller is made up of a clock selector and a prescaler. It also contains a Master Clock divider which allows the processor clock to be faster than the Master Clock.

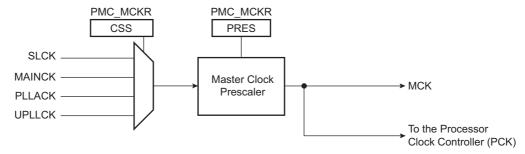

The Master Clock selection is made by writing the CSS (Clock Source Selection) field in the PMC\_MCKR (Master Clock Register). The prescaler supports the division by a power of 2 of the selected clock between 1 and 64, and the division by 6. The PRES field in PMC\_MCKR programs the prescaler.

Note: It is forbidden to modify MDIV and CSS at the same access. Each field must be modified separately with a wait for MCKRDY flag between the first field modification and the second field modification.

Each time PMC\_MCKR is written to define a new Master Clock, the MCKRDY bit is cleared in PMC\_SR. It reads 0 until the Master Clock is established. Then, the MCKRDY bit is set and can trigger an interrupt to the processor. This feature is useful when switching from a high-speed clock to a lower one to inform the software when the change is actually done.

Figure 21-2. Master Clock Controller

### 21.5 Processor Clock Controller

The PMC features a Processor Clock (PCK) Controller that implements the processor Idle mode.

The processor clock can be disabled by writing the PMC System Clock Disable Register (PMC\_SCDR). The status of this clock (at least for debug purposes) can be read in the PMC System Clock Status Register (PMC\_SCSR).

The processor clock is enabled after a reset and is automatically re-enabled by any enabled interrupt. The processor Idle mode is achieved by disabling the processor clock, which is automatically re-enabled by any enabled fast or normal interrupt, or by the reset of the product.

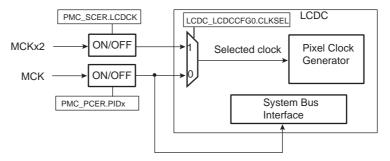

Note: The ARM Wait for Interrupt mode is entered by means of CP15 coprocessor operation. Refer to the Atmel application note *Optimizing Power Consumption for AT91SAM9261-based Systems*, (literature No. 6217).

When processor Idle mode is entered, the current instruction is finished before the clock is stopped, but this does not prevent data transfers from other masters of the system bus.

### 21.6 LCDC Clock Controller

In order to have more flexibility on the pixel clock, the LCDC can use MCK or MCKx2, if LCDCK is set in the PMC System Clock Enable Register (PMC\_SCER).

Figure 21-3. LCDCLK Clock Configuration

### 21.7 USB Device and Host Clocks

The USB Device and Host High Speed ports (UDPHS and UHPHS) clocks are enabled by the corresponding PIDx bits in PMC\_PCER. To save power on this peripheral when they are not used, the user can set these bits in the PMC\_PCDR. Corresponding PIDx bits in the PMC\_PCSR give the status of these clocks.

The PMC also provides the clocks UHP48M and UHP12M to the USB Host OHCI. The USB Host OHCI clocks are controlled by the UHP bit in PMC\_SCER. To save power on this peripheral when they are not used, the user can set the UHP bit in PMC\_SCDR. The UHP bit in PMC\_SCSR gives the status of this clock. The USB host OHCI requires both the 12/48 MHz signal and the Master Clock. The USBDIV field in PMC\_USB register is to be programmed to 9 (division by 10) for normal operations.

To further reduce power consumption the user can stop UTMI PLL, in this case USB high-speed operations are not possible. Nevertheless, as the USB OHCI Input clock can be selected with USBS bit (PLLA or UTMI PLL) in PMC\_USB register, OHCI full-speed operation remains possible.

The user must program the USB OHCI Input Clock and the USBDIV divider in the PMC\_USB register to generate a 48 MHz and a 12 MHz signal with an accuracy of ±0.25%.

### 21.8 DDR2/LPDDR Clock

The PMC controls the clocks of the DDR memory.

The DDR clock can be enabled and disabled with the DDRCK bit respectively in the PMC\_SCER and PMC\_SDER. At reset, the DDR clock is disabled to reduce power consumption.

In case MDIV = 0 (PCK = MCK), the DDRCK clock is not available.

If the input clock is PLLACK/PLLADIV2, the DDR Controller can drive DDR2 and LPDDR at up to 133 MHz with MDIV = 3.

To reduce PLLA power consumption, the user can choose UPLLCK as an input clock for the system. In this case the DDR Controller can drive LPDDR at up to 120 MHz.

### 21.9 Software Modem Clock

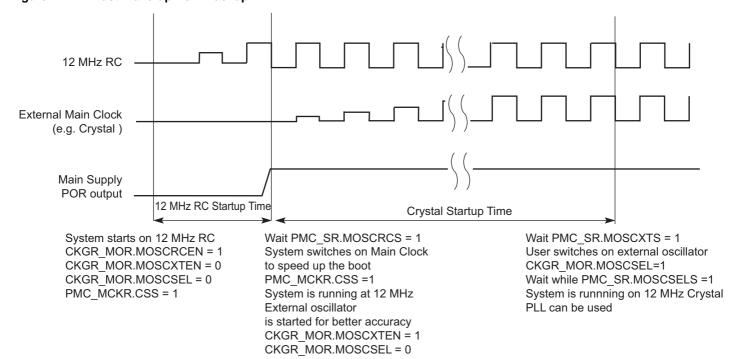

The PMC controls the clocks of the Software Modem.

SMDCK is a division of UPLL or PLLA.

## 21.10 Fast Wake-up from Backup Mode

To speed up the wake-up phase, the system boots on the 12 MHz RC oscillator. This allows the user to perform system configuration (PLL, DDR2, etc.) at 12 MHz instead of 32 kHz during 12 MHz Crystal oscillator start-up.

Figure 21-4. Fast Wake-up from Backup

## 21.11 Peripheral Clock Controller

The PMC controls the clocks of each embedded peripheral by means of the Peripheral Clock Controller. The user can individually enable and disable the clock on the peripherals and select a division factor from MCK. This is done in the Peripheral Control Register (PMC\_PCR).

When a peripheral clock is disabled, the clock is immediately stopped. The peripheral clocks are automatically disabled after a reset.

In order to stop a peripheral, it is recommended that the system software wait until the peripheral has executed its last programmed operation before disabling the clock. This is to avoid data corruption or erroneous behavior of the system.

The value written in the PID field in PMC\_PCR is the Peripheral Identifier defined at the product level (refer to section "Peripheral Identifiers"). Generally, the field value corresponds to the interrupt source number assigned to the peripheral.

## 21.12 Programmable Clock Controller

The PMC controls two signals to be outputs on external pins PCKx. Each signal can be independently programmed via the PMC Programmable Clock Register (PMC\_PCKx).

PCKx can be independently selected between the Slow Clock (SLCK), the Master Clock (MAINCK), the PLLACK, the UTMI PLL output and the Main Clock by writing the CSS field in PMC\_PCKx. Each output signal can also be divided by a power of 2 between 1 and 64 by writing the PRES (Prescaler) field in PMC\_PCKx.

Each output signal can be enabled and disabled by writing a 1 in the corresponding bit, PCKx of PMC\_SCER and PMC\_SCDR, respectively. The status of the active programmable output clocks are given in the PCKx bits of PMC\_SCSR.

The status bit PCKRDYx in PMC\_SR indicates that the Programmable Clock programmed in PMC\_PCKx is ready.

As the Programmable Clock Controller does not implement glitch prevention when switching clocks, it is strongly recommended to disable the Programmable Clock before any configuration change and to re-enable it after the change is actually performed.

### 21.13 Main Clock Failure Detector

The clock failure detector monitors the 12 to 16 MHz crystal oscillator or ceramic resonator-based oscillator to identify a possible failure of this oscillator.

The clock failure detector can be enabled or disabled by bit CFDEN in CKGR\_MOR. After a VDDCORE reset, the detector is disabled. However, if the oscillator is disabled (MOSCXTEN = 0), the detector is also disabled.

The sequence to initialize the clock failure detector is the following:

- The RC oscillator must be selected as the source of MAINCK.
- MCK must select MAINCK.
- 3. Enable the clock failure detector by setting the bit CKGR\_MOR.CFDEN.
- 4. PMC\_SR must be read two slow clock cycles after enabling the clock failure detector. The value read is meaningless.

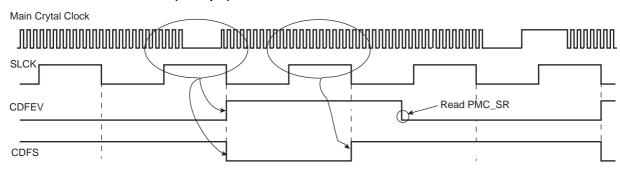

The clock failure detector is now initialized and MCK can select another clock source by programming field PMC MCKR.CSS.

A failure is detected by means of a counter incrementing on the main oscillator clock edge and detection logic is triggered by the 32 kHz generated by the 32 kHz (typical) RC oscillator. This oscillator is automatically enabled when CFDEN = 1.

The counter is cleared when the 32 kHz generated by the 32 kHz (typical) RC oscillator clock signal is low, and enabled when the signal is high. Thus, the failure detection time is one RC oscillator period. If, during the high level period of the 32 kHz generated by the 32 kHz (typical) RC oscillator clock signal, less than eight 12 to 16 MHz crystal oscillator clock periods have been counted, then a failure is reported.

If a failure of the main clock is detected, bit PMC\_SR.CFDEV indicates a failure event and generates an interrupt if the corresponding interrupt source is enabled. The interrupt remains active until a read occurs in PMC\_SR. The user can know the status of the clock failure detection at any time by reading bit PMC\_SR.CFDS.

Figure 21-5. Clock Failure Detection (Example)

Note: Ratio of clock periods is for illustration purposes only.

If the 12 to 16 MHz crystal oscillator or ceramic resonator-based oscillator is selected as the source clock of MAINCK (CKGR\_MOR.MOSCSEL = 1), and if MCK source is PLLACK or UPLLCK (PMC\_MCKR.CSS = 2 or 3), a clock failure detection automatically forces MAINCK to be the source clock for the master clock (MCK). Then, regardless of the PMC configuration, a clock failure detection automatically forces the 12 MHz RC oscillator to be the source clock for MAINCK. If this oscillator is disabled when a clock failure detection occurs, it is automatically re-enabled by the clock failure detection mechanism.

It takes two 32 kHz (typical) clock cycles to detect and switch from the 12 to 16 MHz crystal oscillator to the 12 MHz RC oscillator if the source master clock (MCK) is main clock (MAINCK), or three 32 kHz (typical) cycles if the source of MCK is PLLACK or UPLLCK.

A clock failure detection activates a fault output that is connected to the Pulse Width Modulator (PWM) Controller. With this connection, the PWM controller is able to force its outputs and to protect the driven device, if a clock failure is detected.

The user can know the status of the clock failure detector at any time by reading bit PMC\_SR.FOS.

This fault output remains active until the defect is detected and until it is cleared by the bit FOCLR in the PMC Fault Output Clear Register (PMC\_FOCR).

## 21.14 Programming Sequence

- 1. If the 12 to 16 MHz crystal oscillator is not required, PLL can be directly configured (begin with Step 6. or Step 7.) else this oscillator must be started (begin with Step 2.).
- 2. Enable the 12 to 16 MHz crystal oscillator by setting the MOSCXTEN bit in the CKGR\_MOR. The user can define a start-up time. This can be achieved by writing a value in the MOSCXTST field in CKGR\_MOR. Once this register has been correctly configured, the user must wait for MOSCXTS field in the PMC\_SR to be set. This can be done either by polling MOSCXTS in the PMC\_SR or by waiting for the interrupt line to be raised if the associated interrupt source (MOSCXTS) has been enabled in the PMC\_IER.
- 3. Switch the MAINCK to the 12 to 16 MHz crystal oscillator by setting MOSCSEL in CKGR\_MOR.
- 4. Wait for the MOSCSELS to be set in PMC\_SR to ensure the switchover is complete.
- 5. Check the main clock frequency:

The main clock frequency can be measured via the Main Clock Frequency Register (CKGR\_MCFR).

Read the CKGR\_MCFR until the MAINFRDY field is set, after which the user can read the field CKGR\_MCFR.MAINF by performing an additional read. This provides the number of main clock cycles that have been counted during a period of 16 slow clock cycles.

If MAINF = 0, switch the MAINCK to the 12 MHz RC oscillator by clearing CKGR\_MOR.MOSCSEL. If MAINF  $\neq$  0, proceed to Step 6.

6. Setting PLLA and divider (if not required, proceed to Step 7.)

All parameters needed to configure PLLA and the divider are located in the CKGR\_PLLAR.

The DIVA field is used to control divider itself. A value between 0 and 255 can be programmed. Divider output is divider input divided by DIVA parameter. By default, the DIVA field is cleared, which means that divider and PLLA are turned off.

The MULA field is the PLLA multiplier factor. This parameter can be programmed between 0 and 127. If MULA is cleared, PLLA is turned off, otherwise the PLLA output frequency is PLLA input frequency multiplied by (MULA + 1).

The PLLACOUNT field specifies the number of slow clock cycles before LOCKA bit is set in the PMC\_SR after the CKGR PLLAR has been written.

Once the CKGR\_PLLAR has been written, the user must wait for the LOCKA bit to be set in the PMC\_SR. This can be done either by polling LOCKA in the PMC\_SR or by waiting for the interrupt line to be raised if the associated interrupt source (LOCKA) has been enabled in the PMC\_IER. All parameters in CKGR\_PLLAR can be programmed in a single write operation. If at some stage parameter MULA or DIVA is modified, LOCKA bit goes low to indicate that PLLA is not yet ready. When PLLA is locked, LOCKA is set again.

The user must wait for the LOCKA bit to be set before using the PLLA output clock.

7. Setting Bias and High-speed PLL (UPLL) for UTMI

The UTMI PLL is enabled by setting the UPLLEN field in the CKGR\_UCKR. The UTMI Bias must is enabled by setting the BIASEN field in the CKGR\_UCKR in the same time. In some cases it may be advantageous to define a start-up time. This can be achieved by writing a value in the PLLCOUNT field in the CKGR\_UCKR.

Once this register has been correctly configured, the user must wait for LOCKU field in the PMC\_SR to be set. This can be done either by polling LOCKU in the PMC SR or by waiting for the interrupt line to be raised if the associated interrupt source (LOCKU) has been enabled in the PMC\_IER.

Selecting Master Clock and Processor Clock

The Master Clock and the Processor Clock are configurable via the PMC MCKR.

The CSS field is used to select the clock source of the Master Clock and Processor Clock dividers. By default, the selected clock source is the main clock.

The PRES field is used to define the Processor Clock and Master Clock prescaler. The user can choose between different values (1, 2, 4, 8, 16, 32, 64). Prescaler output is the selected clock source frequency divided by the PRES value.

The MDIV field is used to define the Master Clock divider. It is possible to choose between different values (0, 1, 2, 3). The Master Clock output is Processor Clock frequency divided by 1, 2, 3 or 4, depending on the value programmed in MDIV.

The PMC PLLA Clock input can be divided by 2 by writing the PLLADIV2 bit.

By default, MDIV and PLLLADIV2 are cleared, which indicates that Processor Clock is equal to the Master Clock.

Once the PMC\_MCKR has been written, the user must wait for the MCKRDY bit to be set in the PMC\_SR. This can be done either by polling MCKRDY in the PMC\_SR or by waiting for the interrupt line to be raised if the associated interrupt source (MCKRDY) has been enabled in the PMC\_IER.

The PMC\_MCKR must not be programmed in a single write operation. The programming sequence for PMC\_MCKR is the following:

If a new value for CSS field corresponds to PLL Clock,

- 1. Program PMC MCKR.PRES field
- 2. Wait for PMC\_SR.MCKRDY bit to be set
- 3. Program PMC\_MCKR.CSS field
- 4. Wait for PMC\_SR.MCKRDY bit to be set

If a new value for CSS field corresponds to main clock or slow clock,

- 1. Program PMC MCKR.CSS field
- 2. Wait for PMC\_SR.MCKRDY bit to be set
- 3. Program PMC\_MCKR.PRES field
- 4. Wait for PMC\_SR.MCKRDY bit to be set

If at some stage parameter CSS or PRES is modified, the MCKRDY bit goes low to indicate that the Master Clock and the Processor Clock are not yet ready. The user must wait for the MCKRDY bit to be set again before using the Master and Processor Clocks.

Note:

If PLLA clock was selected as the Master Clock and the user decides to modify it by writing in CKGR PLLR, the MCKRDY flag goes low while PLL is unlocked. Once PLL is locked again, LOCKA goes high and MCKRDY is set. While PLL is unlocked, the Master Clock selection is automatically changed to slow clock. For further information, see Section 21.15.2 "Clock Switching Waveforms".

### Code Example:

```
write_register(PMC_MCKR,0x0000001)
wait (MCKRDY=1)
write_register(PMC_MCKR,0x00000011)
wait (MCKRDY=1)
```

The Master Clock is main clock divided by 2.

The Processor Clock is the Master Clock.

### 9. Selecting Programmable Clocks

Programmable clocks can be enabled and/or disabled via the PMC\_SCER and PMC\_SCDR. 2 programmable clocks can be used. The PMC\_SCSR indicates which programmable clock is enabled. By default all programmable clocks are disabled.

PMC\_PCKx registers are used to configure programmable clocks.

The PMC\_PCKx.CSSfield selects the programmable clock divider source. Five clock options are available: main clock, slow clock, master clock, PLLACK, UPLLCK. The slow clock is the default clock source.

The PRES field is used to control the programmable clock prescaler. It is possible to choose among different values (1, 2, 4, 8, 16, 32, 64). Programmable clock output is prescaler input divided by PRES parameter. By default, the PRES value is cleared which means that PCKx is equal to slow clock.

Once the PMC\_PCKx register has been configured, The corresponding programmable clock must be enabled and the user is constrained to wait for the PCKRDYx bit to be set in the PMC\_SR. This can be done either by polling PCKRDYx in the PMC\_SR or by waiting for the interrupt line to be raised if the associated interrupt source (PCKRDYx) has been enabled in the PMC\_IER. All parameters in PMC\_PCKx can be programmed in a single write operation.

If the CSS and PRES parameters are to be modified, the corresponding programmable clock must be disabled first. The parameters can then be modified. Once this has been done, the user must re-enable the programmable clock and wait for the PCKRDYx bit to be set.

### 10. Enabling Peripheral Clocks

Once all of the previous steps have been completed, the peripheral clocks can be enabled and/or disabled via PMC\_PCER and PMC\_PCDR.

# 21.15 Clock Switching Details

## 21.15.1 Master Clock Switching Timings

Table 21-1 and Table 21-2 give the worst case timings required for the Master Clock to switch from one selected clock to another one. This is in the event that the prescaler is deactivated. When the prescaler is activated, an additional time of 64 clock cycles of the new selected clock has to be added.

Table 21-1. Clock Switching Timings (Worst Case)

|            | From   |  |  |  |  |  |
|------------|--|--|--|--|--|--|
| То         | Main Clock   | Main Clock SLCK                                    |  |  |  |  |
| Main Clock | -  | 4 × SLCK +<br>2.5 × Main Clock                     | 3 × PLL Clock +<br>4 × SLCK +<br>1 × Main Clock    |  |  |  |
| SLCK       | 0.5 × Main Clock +<br>4.5 × SLCK   | -  | 3× PLL Clock +<br>5× SLCK                          |  |  |  |
| PLL Clock  | 0.5 × Main Clock +<br>4 × SLCK +<br>PLLCOUNT × SLCK +<br>2.5 × PLL Clock | 2.5 × PLL Clock +<br>5 × SLCK +<br>PLLCOUNT × SLCK | 2.5 × PLL Clock +<br>4 × SLCK +<br>PLLCOUNT × SLCK |  |  |  |

Notes: 1. PLL designates either the PLLA or the UPLL Clock.

2. PLLCOUNT designates either PLLACOUNT or UPLLCOUNT.

Table 21-2. Clock Switching Timings Between Two PLLs (Worst Case)

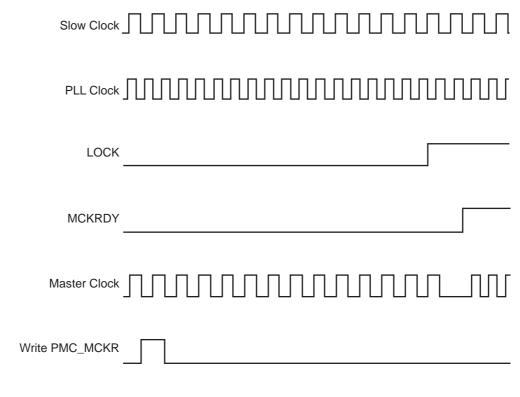

Figure 21-7. Switch Master Clock from Main Clock to Slow Clock

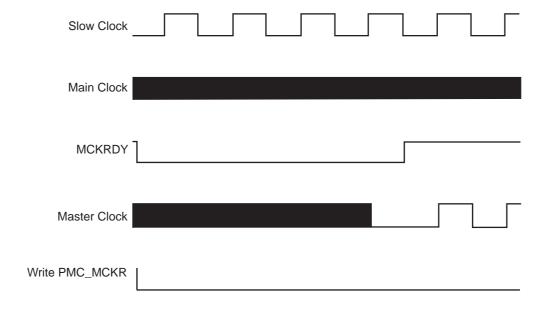

Figure 21-8. Change PLLA Programming

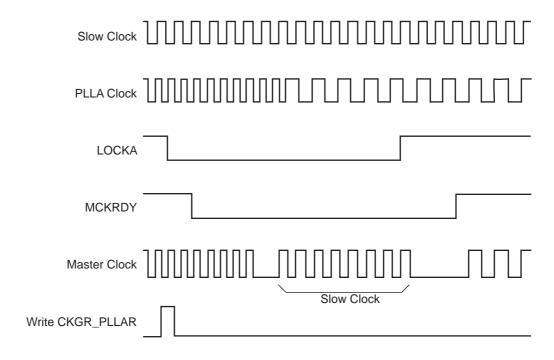

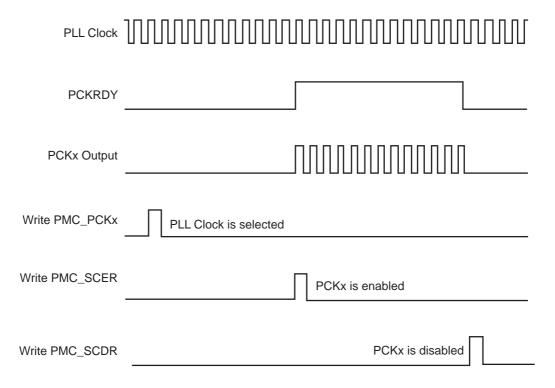

Figure 21-9. Programmable Clock Output Programming

# 21.16 Register Write Protection

To prevent any single software error from corrupting PMC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the PMC Write Protection Mode Register (PMC\_WPMR).

If a write access to a write-protected register is detected, the WPVS bit in the PMC Write Protection Status Register (PMC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the PMC\_WPSR.

The following registers can be write-protected:

- PMC System Clock Enable Register
- PMC System Clock Disable Register
- PMC Clock Generator Main Clock Frequency Register
- PMC Clock Generator PLLA Register
- PMC Master Clock Register
- PMC USB Clock Register
- PMC Programmable Clock Register
- PLL Charge Pump Current Register

# 21.17 Power Management Controller (PMC) User Interface

Table 21-3. Register Mapping

| Offset        | Register                          | Name        | Access     | Reset       |

| UDP     | UHP        | _  | SMDCK | LCDCK | DDRCK | _    | _    |

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

### • DDRCK: DDR Clock Enable

0: No effect.

1: Enables the DDR clock.

### • LCDCK: MCK2x Clock Enable

0: No effect.

1: Enables the MCK2x clock.

Note: MCK2x is selected as LCD Pixel source clock if LCDC\_LCDCFG0.CLKSEL = 1.

#### • SMDCK: SMD Clock Enable

0: No effect.

1: Enables the soft modem clock.

### • UHP: USB Host OHCI Clocks Enable

0: No effect.

1: Enables the UHP48M and UHP12M OHCI clocks.

## • UDP: USB Device Clock Enable

0: No effect.

1: Enables the USB Device clock.

## • PCKx: Programmable Clock x Output Enable

0: No effect.

1: Enables the corresponding Programmable Clock output.

# 21.17.2 PMC System Clock Disable Register

Name: PMC\_SCDR
Address: 0xFFFFC04
Access: Write only

| Access: | Write-only |    |       |       |       |      |      |
|---------|------------|----|-------|-------|-------|------|------|
| 31      | 30         | 29 | 28    | 27    | 26    | 25   | 24   |

| UDP     | UHP        | _  | SMDCK | LCDCK | DDRCK | _    | PCK  |

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

#### • PCK: Processor Clock Disable

0: No effect.

1: Disables the Processor clock. This is used to enter the processor in Idle mode.

#### DDRCK: DDR Clock Disable

0: No effect.

1: Disables the DDR clock.

#### LCDCK: MCK2x Clock Disable

0: No effect.

1: Disables the MCK2x clock.

## • SMDCK: SMD Clock Disable

0: No effect.

1: Disables the soft modem clock.

#### . UHP: USB Host OHCI Clock Disable

0: No effect.

1: Disables the UHP48M and UHP12M OHCI clocks.

## • UDP: USB Device Clock Enable

0: No effect.

1: Disables the USB Device clock.

### • PCKx: Programmable Clock x Output Disable

0: No effect.

1: Disables the corresponding Programmable Clock output.

# 21.17.3 PMC System Clock Status Register

3

PID3

2

PID2

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

4

PID4

## • PIDx: Peripheral Clock x Enable

0: No effect.

7

PID7

1: Enables the corresponding peripheral clock.

6

PID6

Note: PID2 to PID31 refer to identifiers as defined in the section "Peripheral Identifiers".

5

PID5

Note: Programming the control bits of the Peripheral ID that are not implemented has no effect on the behavior of the PMC.

0

#### • UPLLEN: UTMI PLL Enable

0: The UTMI PLL is disabled.

1: The UTMI PLL is enabled.

When UPLLEN is set, the LOCKU flag is set once the UTMI PLL startup time is achieved.

### • UPLLCOUNT: UTMI PLL Start-up Time

Specifies the number of slow clock cycles multiplied by 8 for the UTMI PLL start-up time.

#### • BIASEN: UTMI BIAS Enable

0: The UTMI BIAS is disabled.

1: The UTMI BIAS is enabled.

## • BIASCOUNT: UTMI BIAS Start-up Time

Specifies the number of slow clock cycles for the UTMI BIAS startup time.

## 21.17.8 PMC Clock Generator Main Oscillator Register

Name: CKGR\_MOR
Address: 0xFFFFC20
Access: Read/Write

| Access: | Read/Write |    |     |          |    |          |          |
|---------|------------|----|-----|----------|----|----------|----------|
| 31      | 30         | 29 | 28  | 27       | 26 | 25       | 24       |
| _       | -          | _  | _   | _        |    | CFDEN    | MOSCSEL  |
| 23      | 22         | 21 | 20  | 19       | 18 | 17       | 16       |
|         |            |    | ŀ   | (EY      |    |          |          |
| 15      | 14         | 13 | 12  | 11       | 10 | 9        | 8        |
|         |            |    | MOS | CXTST    |    |          |          |
| 7       | 6          | 5  | 4   | 3        | 2  | 1        | 0        |
| _       |            | 0  |     | MOSCRCEN |    | MOSCXTBY | MOSCXTEN |
|         |            | •  | •   |          |    | •        |          |

WARNING: Bits 6:4 must always be configured to 0 when programming the CKGR\_MOR.

## • MOSCXTEN: 12 to 16 MHz Crystal Oscillator Enable

A crystal must be connected between XIN and XOUT.

0: The 12 to 16 MHz crystal oscillator is disabled.

1: The 12 to 16 MHz crystal oscillator is enabled. MOSCXTBY must be cleared.

When MOSCXTEN is set, the MOSCXTS flag is set once the crystal oscillator startup time is achieved.

#### MOSCXTBY: 12 to 16 MHz Crystal Oscillator Bypass

0: No effect.

1: The 12 to 16 MHz crystal oscillator is bypassed. MOSCXTEN must be cleared. An external clock must be connected on XIN.

When MOSCXTBY is set, the MOSCXTS flag in PMC\_SR is automatically set.

Clearing MOSCXTEN and MOSCXTBY bits allows resetting the MOSCXTS flag.

Note: When Main Oscillator Bypass is disabled (MOSCXTBY = 0), the MOSCXTS flag must be read as 0 in PMC\_SR prior to enabling the main crystal oscillator (MOSCXTEN = 1).

### MOSCRCEN: 12 MHz RC Oscillator Enable

0: The 12 MHz RC oscillator is disabled.

1: The 12 MHz RC oscillator is enabled.

When MOSCRCEN is set, the MOSCRCS flag is set once the RC oscillator startup time is achieved.

## MOSCXTST: 12 to 16 MHz Crystal Oscillator Startup Time

Specifies the number of slow clock cycles multiplied by 8 for the crystal oscillator start-up time.

## KEY: Password

| Value | Name   | Description   |
|-------|--------|---|
| 0x37  | PASSWD | Writing any other value in this field aborts the write operation. |

## • MOSCSEL: Main Clock Oscillator Selection

0: The 12 MHz oscillator is selected.

1: The 12 to 16 MHz crystal oscillator is selected.

## • CFDEN: Clock Failure Detector Enable

0: The clock failure detector is disabled.

1: The clock failure detector is enabled.

## 21.17.9 PMC Clock Generator Main Clock Frequency Register

Name: CKGR MCFR Address: 0xFFFFFC24 Access: Read/Write MAINFRDY MAINE 

MAINE

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

## • MAINF: Main Clock Frequency

Gives the number of main clock cycles within 16 slow clock periods. To calculate the frequency of the measured clock:

$$f_{MAINCK} = (MAINF \times f_{SLCK}) / 16$$

where frequency is in MHz.

## MAINFRDY: Main Clock Frequency Measure Ready

0: MAINF value is not valid or the measured oscillator is disabled.

1: The measured oscillator has been enabled previously and MAINF value is available.

Note: To ensure that a correct value is read on the MAINF field, the MAINFRDY flag must be read at 1 then another read access must be performed on the register to get a stable value on the MAINF field.

## 21.17.10 PMC Clock Generator PLLA Register

Name: CKGR\_PLLAR
Address: 0xFFFFFC28
Access: Read/Write

| Access: | Read/Write |     |    |       |      |    |    |
|---------|------------|-----|----|-------|------|----|----|
| 31      | 30         | 29  | 28 | 27    | 26   | 25 | 24 |
| _       | _          | ONE | -  | -     | -    | -  | _  |
| 23      | 22         | 21  | 20 | 19    | 18   | 17 | 16 |
|         |            |     | MU | ILA   |      |    |    |
| 15      | 14         | 13  | 12 | 11    | 10   | 9  | 8  |
|         | OUTA       |     |    | PLLAC | OUNT |    |    |
| 7       | 6          | 5   | 4  | 3     | 2    | 1  | 0  |
|         |            |     | DI | VA    |      |    |    |
|         |            |     |    |       |      |    |    |

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

Possible limitations on PLL input frequencies and multiplier factors should be checked before using the PMC.

### • DIVA: Divider A

| Value | Name   | Description   |
|-------|--------|---|
| 0     | 0      | Divider output is 0                                   |
| 1     | BYPASS | Divider is bypassed                                   |
| 2–255 | -      | Divider output is the selected clock divided by DIVA. |

### • PLLACOUNT: PLLA Counter

Specifies the number of slow clock cycles before the LOCKA bit is set in PMC\_SR after CKGR\_PLLAR is written.

### OUTA: PLLA Clock Frequency Range

To optimize clock performance, this field must be programmed as specified in "PLL Characteristics" in the Electrical Characteristics section of the product datasheet.

#### • MULA: PLLA Multiplier

0: The PLLA is deactivated.

1–254: The PLLA Clock frequency is the PLLA input frequency multiplied by MULA + 1.

#### ONE: Must Be Set to 1

Bit 29 must always be set to 1 when programming the CKGR\_PLLAR.

# 21.17.11 PMC Master Clock Register

Name: PMC\_MCKR
Address: 0xFFFFC30
Access: Read/Write

| ACCESS. | Reau/wille |      |          |    |    |      |    |

# 21.17.19 PLL Charge Pump Current Register

PMC PLLICPR Name: Address: 0xFFFFC80 Access: Read/Write \_ ICPLLA

This register can only be written if the WPEN bit is cleared in the PMC Write Protection Mode Register.

## • ICPLLA: Charge Pump Current

To optimize clock performance, this field must be programmed as specified in "PLL A Characteristics" in the Electrical Characteristics section of the product datasheet.

# 21.17.20 PMC Write Protection Mode Register

Name: PMC\_WPMR
Address: 0xFFFFCE4
Access: Read/Write

| Access: | Read/Write |    |    |     |    |    |      |
|---------|------------|----|----|-----|----|----|------|
| 31      | 30         | 29 | 28 | 27  | 26 | 25 | 24   |
|         |            |    | WP | KEY |    |    |      |
| 23      | 22         | 21 | 20 | 19  | 18 | 17 | 16   |
|         |            |    | WP | KEY |    |    |      |
| 15      | 14         | 13 | 12 | 11  | 10 | 9  | 8    |
|         |            |    | WP | KEY |    |    |      |

| _       | _          | _  | _  | _   | _  | _  | WPEN |

### • WPEN: Write Protection Enable

0: Disables the write protection if WPKEY corresponds to 0x504D43 ("PMC" in ASCII).

See Section 21.16 "Register Write Protection" for the list of registers that can be write-protected.

## • WPKEY: Write Protection Key

| Value    | Name    | Description   |  |  |
|----------|---------|---|--|--|
| 0x504D43 | PASSWD  | Writing any other value in this field aborts the write operation of the WPEN bit. |  |  |
| 0x304D43 | FASSVID | Always reads as 0.  |  |  |

<sup>1:</sup> Enables the write protection if WPKEY corresponds to 0x504D43 ("PMC" in ASCII).

## 21.17.21 PMC Write Protection Status Register

Name: PMC\_WPSR Address: 0xFFFFCE8 Access: Read-only WPVSRC WPVSRC \_ **WPVS** 

#### . WPVS: Write Protection Violation Status

0: No write protection violation has occurred since the last read of the PMC\_WPSR.

#### • WPVSRC: Write Protection Violation Source

When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

<sup>1:</sup> A write protection violation has occurred since the last read of the PMC\_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

7

Peripheral ID selection from PID2 to the maximum PID number. This refers to identifiers as defined in the section "Peripheral Identifiers".

3

PID

2

1

0

4

Only the following peripherals can have a DIV value greater than 0: PID2, PID3, PID5 to PID11, PID13 to PID19, PID28 to PID30.

#### • CMD: Command

0: Read mode

1: Write mode

#### . DIV: Divisor Value

Only the following peripherals can be configured with divided clock (DIV > 0): PID2, PID3, PID5 to PID11, PID13 to PID19, PID28 to PID30.

Among the PIDs supporting the divided clock, some require a DIV value configuration matching the maximum peripheral frequency. Refer to section "Power Consumption versus Modes" in the "Electrical Characteristics".

| Value | Name            | Description               |
|-------|-----------------|---------------------------|
| 0     | PERIPH_DIV_MCK  | Peripheral clock is MCK   |
| 1     | PERIPH_DIV2_MCK | Peripheral clock is MCK/2 |
| 2     | PERIPH_DIV4_MCK | Peripheral clock is MCK/4 |
| 3     | PERIPH_DIV8_MCK | Peripheral clock is MCK/8 |

DIV must not be changed while peripheral is in use or when the peripheral clock is enabled.

#### • EN: Enable

0: Selected Peripheral clock is disabled

1: Selected Peripheral clock is enabled

# 22. Parallel Input/Output Controller (PIO)

## 22.1 Description

The Parallel Input/Output Controller (PIO) manages up to 32 fully programmable input/output lines. Each I/O line may be dedicated as a general-purpose I/O or be assigned to a function of an embedded peripheral. This ensures effective optimization of the pins of the product.

Each I/O line is associated with a bit number in all of the 32-bit registers of the 32-bit wide user interface.

Each I/O line of the PIO Controller features:

- An input change interrupt enabling level change detection on any I/O line.
- Additional Interrupt modes enabling rising edge, falling edge, low-level or high-level detection on any I/O line.
- A glitch filter providing rejection of glitches lower than one-half of peripheral clock cycle.
- A debouncing filter providing rejection of unwanted pulses from key or push button operations.
- Multi-drive capability similar to an open drain I/O line.
- Control of the pull-up and pull-down of the I/O line.
- Input visibility and output control.

The PIO Controller also features a synchronous output providing up to 32 bits of data output in a single write operation.

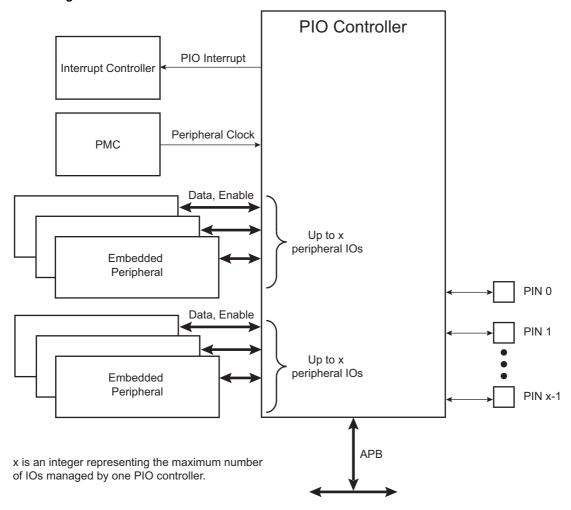

#### 22.2 Embedded Characteristics

- Up to 32 Programmable I/O Lines
- Fully Programmable through Set/Clear Registers
- Multiplexing of Four Peripheral Functions per I/O Line
- For each I/O Line (Whether Assigned to a Peripheral or Used as General Purpose I/O)
  - Input Change Interrupt
  - Programmable Glitch Filter
  - Programmable Debouncing Filter
  - Multi-drive Option Enables Driving in Open Drain
  - Programmable Pull-Up on Each I/O Line
  - Pin Data Status Register, Supplies Visibility of the Level on the Pin at Any Time
  - Additional Interrupt Modes on a Programmable Event: Rising Edge, Falling Edge, Low-Level or High-Level
- Synchronous Output, Provides Set and Clear of Several I/O Lines in a Single Write
- Register Write Protection
- Programmable Schmitt Trigger Inputs
- Programmable I/O Delay
- Programmable I/O Drive

## 22.3 Block Diagram

Figure 22-1. Block Diagram

## 22.4 Product Dependencies

### 22.4.1 Pin Multiplexing

Each pin is configurable, depending on the product, as either a general-purpose I/O line only, or as an I/O line multiplexed with one or two peripheral I/Os. As the multiplexing is hardware defined and thus product-dependent, the hardware designer and programmer must carefully determine the configuration of the PIO Controllers required by their application. When an I/O line is general-purpose only, i.e., not multiplexed with any peripheral I/O, programming of the PIO Controller regarding the assignment to a peripheral has no effect and only the PIO Controller can control how the pin is driven by the product.

### 22.4.2 External Interrupt Lines

The interrupt signals FIQ and IRQ0 to IRQn are generally multiplexed through the PIO Controllers. However, it is not necessary to assign the I/O line to the interrupt function as the PIO Controller has no effect on inputs and the external interrupt lines are used only as inputs.

When the WKUPx input pins must be used as external interrupt lines, the PIO Controller must be configured to disable the peripheral control on these IOs, and the corresponding IO lines must be set to Input mode.

## 22.4.3 Power Management

The Power Management Controller controls the peripheral clock in order to save power. Writing any of the registers of the user interface does not require the peripheral clock to be enabled. This means that the configuration of the I/O lines does not require the peripheral clock to be enabled.

However, when the clock is disabled, not all of the features of the PIO Controller are available, including glitch filtering. Note that the input change interrupt, the interrupt modes on a programmable event and the read of the pin level require the clock to be validated.

After a hardware reset, the peripheral clock is disabled by default.

The user must configure the Power Management Controller before any access to the input line information.

#### 22.4.4 Interrupt Sources

For interrupt handling, the PIO Controllers are considered as user peripherals. This means that the PIO Controller interrupt lines are connected among the interrupt sources. Refer to the PIO Controller peripheral identifier in the Peripheral Identifiers table to identify the interrupt sources dedicated to the PIO Controllers. Using the PIO Controller requires the Interrupt Controller to be programmed first.

The PIO Controller interrupt can be generated only if the peripheral clock is enabled.

Table 22-1. Peripheral IDs

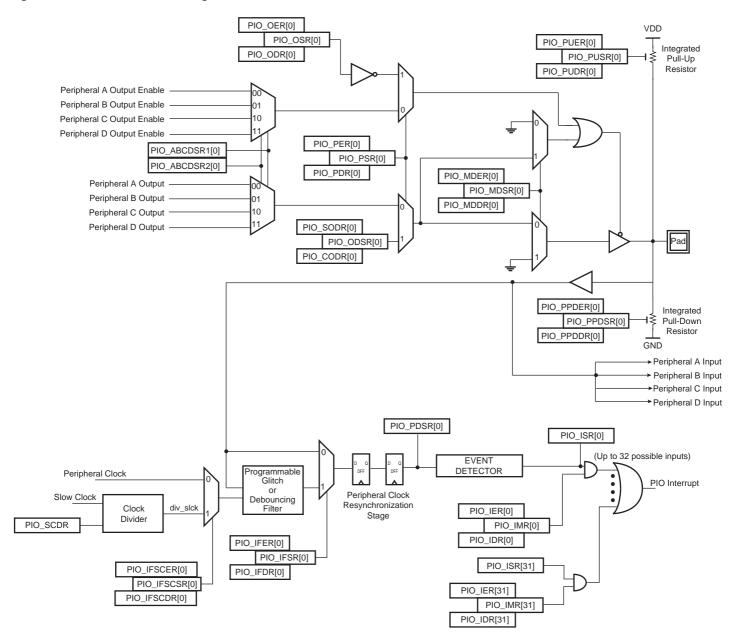

| Instance | ID |
|----------|----|
| PIOA     | 2  |
| PIOB     | 2  |
| PIOC     | 3  |
| PIOD     | 3  |

## 22.5 Functional Description

The PIO Controller features up to 32 fully-programmable I/O lines. Most of the control logic associated to each I/O is represented in Figure 22-2. In this description each signal shown represents one of up to 32 possible indexes.

Figure 22-2. I/O Line Control Logic

#### 22.5.1 Pull-up and Pull-down Resistor Control

Each I/O line is designed with an embedded pull-up resistor and an embedded pull-down resistor. The pull-up resistor can be enabled or disabled by writing to the Pull-up Enable Register (PIO\_PUER) or Pull-up Disable Register (PIO\_PUDR), respectively. Writing to these registers results in setting or clearing the corresponding bit in the Pull-up Status Register (PIO\_PUSR). Reading a one in PIO\_PUSR means the pull-up is disabled and reading a zero means the pull-up is enabled. The pull-down resistor can be enabled or disabled by writing the Pull-down Enable Register (PIO\_PPDER) or the Pull-down Disable Register (PIO\_PPDDR), respectively. Writing in these

registers results in setting or clearing the corresponding bit in the Pull-down Status Register (PIO\_PPDSR). Reading a one in PIO\_PPDSR means the pull-up is disabled and reading a zero means the pull-down is enabled.

Enabling the pull-down resistor while the pull-up resistor is still enabled is not possible. In this case, the write of PIO\_PPDER for the relevant I/O line is discarded. Likewise, enabling the pull-up resistor while the pull-down resistor is still enabled is not possible. In this case, the write of PIO\_PUER for the relevant I/O line is discarded.

Control of the pull-up resistor is possible regardless of the configuration of the I/O line.

After reset, depending on the I/O, pull-up or pull-down can be set.

### 22.5.2 I/O Line or Peripheral Function Selection

When a pin is multiplexed with one or two peripheral functions, the selection is controlled with the Enable Register (PIO\_PER) and the Disable Register (PIO\_PDR). The Status Register (PIO\_PSR) is the result of the set and clear registers and indicates whether the pin is controlled by the corresponding peripheral or by the PIO Controller. A value of zero indicates that the pin is controlled by the corresponding on-chip peripheral selected in the ABCD Select registers (PIO\_ABCDSR1 and PIO\_ABCDSR2). A value of one indicates the pin is controlled by the PIO Controller.

If a pin is used as a general-purpose I/O line (not multiplexed with an on-chip peripheral), PIO\_PER and PIO\_PDR have no effect and PIO\_PSR returns a one for the corresponding bit.

After reset, the I/O lines are controlled by the PIO Controller, i.e., PIO\_PSR resets at one. However, in some events, it is important that PIO lines are controlled by the peripheral (as in the case of memory chip select lines that must be driven inactive after reset, or for address lines that must be driven low for booting out of an external memory). Thus, the reset value of PIO\_PSR is defined at the product level and depends on the multiplexing of the device.

#### 22.5.3 Peripheral A or B or C or D Selection

The PIO Controller provides multiplexing of up to four peripheral functions on a single pin. The selection is performed by writing PIO\_ABCDSR1 and PIO\_ABCDSR2.

For each pin:

- The corresponding bit at level zero in PIO\_ABCDSR1 and the corresponding bit at level zero in PIO\_ABCDSR2 means peripheral A is selected.
- The corresponding bit at level one in PIO\_ABCDSR1 and the corresponding bit at level zero in PIO\_ABCDSR2 means peripheral B is selected.
- The corresponding bit at level zero in PIO\_ABCDSR1 and the corresponding bit at level one in PIO\_ABCDSR2 means peripheral C is selected.
- The corresponding bit at level one in PIO\_ABCDSR1 and the corresponding bit at level one in PIO\_ABCDSR2 means peripheral D is selected.

Note that multiplexing of peripheral lines A, B, C and D only affects the output line. The peripheral input lines are always connected to the pin input (see Figure 22-2).

Writing in PIO\_ABCDSR1 and PIO\_ABCDSR2 manages the multiplexing regardless of the configuration of the pin. However, assignment of a pin to a peripheral function requires a write in PIO\_ABCDSR1 and PIO\_ABCDSR2 in addition to a write in PIO\_PDR.

After reset, PIO\_ABCDSR1 and PIO\_ABCDSR2 are zero, thus indicating that all the PIO lines are configured on peripheral A. However, peripheral A generally does not drive the pin as the PIO Controller resets in I/O line mode.

If the software selects a peripheral A, B, C or D which does not exist for a pin, no alternate functions are enabled for this pin and the selection is taken into account. The PIO Controller does not carry out checks to prevent selection of a peripheral which does not exist.

### 22.5.4 Output Control

When the I/O line is assigned to a peripheral function, i.e., the corresponding bit in PIO\_PSR is at zero, the drive of the I/O line is controlled by the peripheral. Peripheral A or B or C or D depending on the value in PIO\_ABCDSR1 and PIO\_ABCDSR2 determines whether the pin is driven or not.

When the I/O line is controlled by the PIO Controller, the pin can be configured to be driven. This is done by writing the Output Enable Register (PIO\_OER) and Output Disable Register (PIO\_ODR). The results of these write operations are detected in the Output Status Register (PIO\_OSR). When a bit in this register is at zero, the corresponding I/O line is used as an input only. When the bit is at one, the corresponding I/O line is driven by the PIO Controller.

The level driven on an I/O line can be determined by writing in the Set Output Data Register (PIO\_SODR) and the Clear Output Data Register (PIO\_CODR). These write operations, respectively, set and clear the Output Data Status Register (PIO\_ODSR), which represents the data driven on the I/O lines. Writing in PIO\_OER and PIO\_ODR manages PIO\_OSR whether the pin is configured to be controlled by the PIO Controller or assigned to a peripheral function. This enables configuration of the I/O line prior to setting it to be managed by the PIO Controller.

Similarly, writing in PIO\_SODR and PIO\_CODR affects PIO\_ODSR. This is important as it defines the first level driven on the I/O line.

#### 22.5.5 Synchronous Data Output

Clearing one or more PIO line(s) and setting another one or more PIO line(s) synchronously cannot be done by using PIO\_SODR and PIO\_CODR. It requires two successive write operations into two different registers. To overcome this, the PIO Controller offers a direct control of PIO outputs by single write access to PIO\_ODSR. Only bits unmasked by the Output Write Status Register (PIO\_OWSR) are written. The mask bits in PIO\_OWSR are set by writing to the Output Write Enable Register (PIO\_OWER) and cleared by writing to the Output Write Disable Register (PIO\_OWDR).

After reset, the synchronous data output is disabled on all the I/O lines as PIO\_OWSR resets at 0x0.

#### 22.5.6 Multi-Drive Control (Open Drain)

Each I/O can be independently programmed in open drain by using the multi-drive feature. This feature permits several drivers to be connected on the I/O line which is driven low only by each device. An external pull-up resistor (or enabling of the internal one) is generally required to guarantee a high level on the line.

The multi-drive feature is controlled by the Multi-driver Enable Register (PIO\_MDER) and the Multi-driver Disable Register (PIO\_MDDR). The multi-drive can be selected whether the I/O line is controlled by the PIO Controller or assigned to a peripheral function. The Multi-driver Status Register (PIO\_MDSR) indicates the pins that are configured to support external drivers.

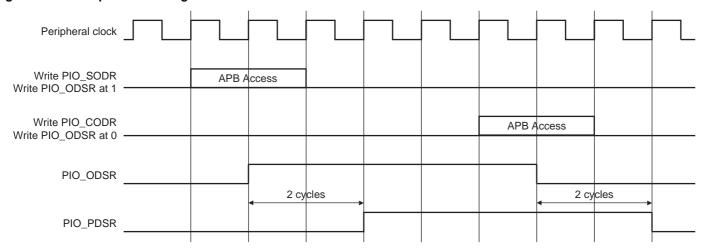

After reset, the multi-drive feature is disabled on all pins, i.e., PIO\_MDSR resets at value 0x0.

## 22.5.7 Output Line Timings

Figure 22-3 shows how the outputs are driven either by writing PIO\_SODR or PIO\_CODR, or by directly writing PIO\_ODSR. This last case is valid only if the corresponding bit in PIO\_OWSR is set. Figure 22-3 also shows when the feedback in the Pin Data Status Register (PIO\_PDSR) is available.

Figure 22-3. Output Line Timings

#### 22.5.8 Inputs

The level on each I/O line can be read through PIO\_PDSR. This register indicates the level of the I/O lines regardless of their configuration, whether uniquely as an input, or driven by the PIO Controller, or driven by a peripheral.

Reading the I/O line levels requires the clock of the PIO Controller to be enabled, otherwise PIO\_PDSR reads the levels present on the I/O line at the time the clock was disabled.

#### 22.5.9 Input Glitch and Debouncing Filters

Optional input glitch and debouncing filters are independently programmable on each I/O line.

The glitch filter can filter a glitch with a duration of less than 1/2 peripheral clock and the debouncing filter can filter a pulse of less than 1/2 period of a programmable divided slow clock.

The selection between glitch filtering or debounce filtering is done by writing in the PIO Input Filter Slow Clock Disable Register (PIO\_IFSCDR) and the PIO Input Filter Slow Clock Enable Register (PIO\_IFSCER). Writing PIO\_IFSCDR and PIO\_IFSCER, respectively, sets and clears bits in the Input Filter Slow Clock Status Register (PIO\_IFSCSR).

The current selection status can be checked by reading the PIO IFSCSR.

- If PIO IFSCSR[i] = 0: The glitch filter can filter a glitch with a duration of less than 1/2 master clock period.
- If PIO\_IFSCSR[i] = 1: The debouncing filter can filter a pulse with a duration of less than 1/2 programmable divided slow clock period.

For the debouncing filter, the period of the divided slow clock is defined by writing in the DIV field of the Slow Clock Divider Debouncing Register (PIO\_SCDR):

$$t_{\text{div slck}} = ((\text{DIV} + 1) \times 2) \times t_{\text{slck}}$$

When the glitch or debouncing filter is enabled, a glitch or pulse with a duration of less than 1/2 selected clock cycle (selected clock represents peripheral clock or divided slow clock depending on PIO\_IFSCDR and PIO\_IFSCER programming) is automatically rejected, while a pulse with a duration of one selected clock (peripheral clock or divided slow clock) cycle or more is accepted. For pulse durations between 1/2 selected clock cycle and one selected clock cycle, the pulse may or may not be taken into account, depending on the precise timing of its occurrence. Thus for a pulse to be visible, it must exceed one selected clock cycle, whereas for a glitch to be reliably filtered out, its duration must not exceed 1/2 selected clock cycle.

The filters also introduce some latencies, illustrated in Figure 22-4 and Figure 22-5.

The glitch filters are controlled by the Input Filter Enable Register (PIO\_IFER), the Input Filter Disable Register (PIO\_IFDR) and the Input Filter Status Register (PIO\_IFSR). Writing PIO\_IFER and PIO\_IFDR respectively sets and clears bits in PIO\_IFSR. This last register enables the glitch filter on the I/O lines.

When the glitch and/or debouncing filter is enabled, it does not modify the behavior of the inputs on the peripherals. It acts only on the value read in PIO\_PDSR and on the input change interrupt detection. The glitch and debouncing filters require that the peripheral clock is enabled.

Figure 22-4. Input Glitch Filter Timing

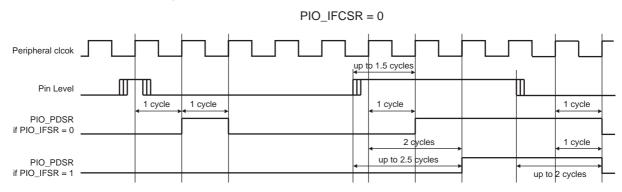

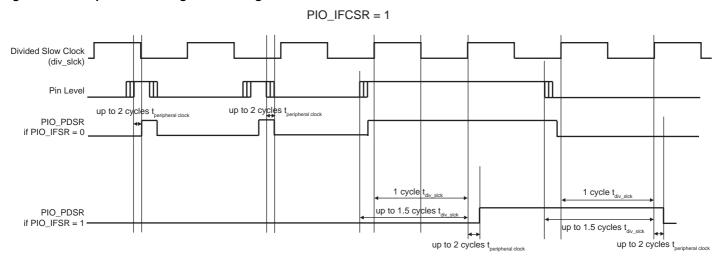

Figure 22-5. Input Debouncing Filter Timing

#### 22.5.10 Input Edge/Level Interrupt

The PIO Controller can be programmed to generate an interrupt when it detects an edge or a level on an I/O line. The Input Edge/Level interrupt is controlled by writing the Interrupt Enable Register (PIO\_IER) and the Interrupt Disable Register (PIO\_IDR), which enable and disable the input change interrupt respectively by setting and clearing the corresponding bit in the Interrupt Mask Register (PIO\_IMR). As input change detection is possible only by comparing two successive samplings of the input of the I/O line, the peripheral clock must be enabled. The Input Change interrupt is available regardless of the configuration of the I/O line, i.e., configured as an input only, controlled by the PIO Controller or assigned to a peripheral function.

By default, the interrupt can be generated at any time an edge is detected on the input.

Some additional interrupt modes can be enabled/disabled by writing in the Additional Interrupt Modes Enable Register (PIO\_AIMER) and Additional Interrupt Modes Disable Register (PIO\_AIMDR). The current state of this selection can be read through the Additional Interrupt Modes Mask Register (PIO\_AIMMR).

#### These additional modes are:

- Rising edge detection
- Falling edge detection
- Low-level detection
- High-level detection

In order to select an additional interrupt mode:

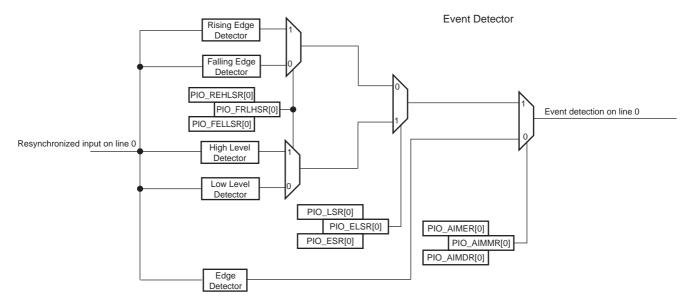

- The type of event detection (edge or level) must be selected by writing in the Edge Select Register (PIO\_ESR) and Level Select Register (PIO\_LSR) which select, respectively, the edge and level detection. The current status of this selection is accessible through the Edge/Level Status Register (PIO\_ELSR).
- The polarity of the event detection (rising/falling edge or high/low-level) must be selected by writing in the Falling Edge/Low-Level Select Register (PIO\_FELLSR) and Rising Edge/High-Level Select Register (PIO\_REHLSR) which allow to select falling or rising edge (if edge is selected in PIO\_ELSR) edge or highor low-level detection (if level is selected in PIO\_ELSR). The current status of this selection is accessible through the Fall/Rise - Low/High Status Register (PIO\_FRLHSR).

When an input edge or level is detected on an I/O line, the corresponding bit in the Interrupt Status Register (PIO\_ISR) is set. If the corresponding bit in PIO\_IMR is set, the PIO Controller interrupt line is asserted. The interrupt signals of the 32 channels are ORed-wired together to generate a single interrupt signal to the interrupt controller.

When the software reads PIO\_ISR, all the interrupts are automatically cleared. This signifies that all the interrupts that are pending when PIO\_ISR is read must be handled. When an Interrupt is enabled on a "level", the interrupt is generated as long as the interrupt source is not cleared, even if some read accesses in PIO\_ISR are performed.

Figure 22-6. Event Detector on Input Lines (Figure Represents Line 0)

Example of interrupt generation on following lines:

- Rising edge on PIO line 0
- Falling edge on PIO line 1
- Rising edge on PIO line 2
- Low-level on PIO line 3
- High-level on PIO line 4
- High-level on PIO line 5
- Falling edge on PIO line 6
- Rising edge on PIO line 7
- Any edge on the other lines

Table 22-2 provides the required configuration for this example.

Table 22-2. Configuration for Example Interrupt Generation

| Configuration                                   | Description  |
|---|--|
|   | All the interrupt sources are enabled by writing 32'hFFFF_FFFF in PIO_IER.   |
| Interrupt Mode                                  | Then the additional interrupt mode is enabled for lines 0 to 7 by writing 32'h0000_00FF in PIO_AIMER.  |
|   | Lines 3, 4 and 5 are configured in level detection by writing 32'h0000_0038 in PIO_LSR.  |
| Edge or Level Detection                         | The other lines are configured in edge detection by default, if they have not been previously configured. Otherwise, lines 0, 1, 2, 6 and 7 must be configured in edge detection by writing 32'h0000_00C7 in PIO_ESR.                                    |
| Falling/Picing Edge or Low/High Lovel           | Lines 0, 2, 4, 5 and 7 are configured in rising edge or high-level detection by writing 32'h0000_00B5 in PIO_REHLSR.   |
| Falling/Rising Edge or Low/High-Level Detection | The other lines are configured in falling edge or low-level detection by default if they have not been previously configured. Otherwise, lines 1, 3 and 6 must be configured in falling edge/low-level detection by writing 32'h0000_004A in PIO_FELLSR. |

Figure 22-7. Input Change Interrupt Timings When No Additional Interrupt Modes

#### 22.5.11 Programmable I/O Delays

The PIO interface consists of a series of signals driven by peripherals or directly by software. The simultaneous switching outputs on these busses may lead to a peak of current in the internal and external power supply lines.

In order to reduce the current peak in such cases, additional propagation delays can be adjusted independently for pad buffers by means of configuration registers, PIO\_DELAYR.

For each I/O supporting the additional programmable delay, the delay ranges from 0 to 4 ns (worst case process, voltage, temperature). The delay can differ between I/Os supporting this feature. Delay can be modified per programming for each I/O. The minimal additional delay that can be programmed on a PAD supporting this feature is 1/16 of the maximum programmable delay.

Only pads PA[20:15], PA[13:11] and PA[4:2] can be configured.

When programming 0x0 in fields, no delay is added (reset value) and the propagation delay of the pad buffers is the inherent delay of the pad buffer. When programming 0xF in fields, the propagation delay of the corresponding pad is maximal.

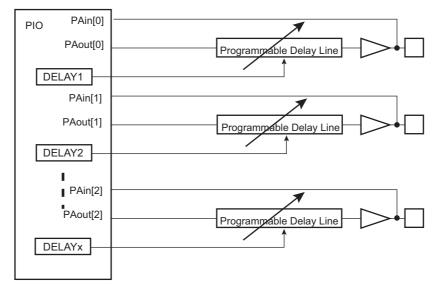

Figure 22-8. Programmable I/O Delays

#### 22.5.12 Programmable I/O Drive

It is possible to configure the I/O drive for pads PA[20:15], PA[13:11] and PA[4:2]. Refer to the section "Electrical Characteristics".

#### 22.5.13 Programmable Schmitt Trigger

It is possible to configure each input for the Schmitt trigger. By default the Schmitt trigger is active. Disabling the Schmitt trigger is requested when using the QTouch<sup>®</sup> Library.

#### 22.5.14 I/O Lines Programming Example

The programming example shown in Table 22-3 is used to obtain the following configuration:

- 4-bit output port on I/O lines 0 to 3 (should be written in a single write operation), open-drain, with pull-up resistor
- Four output signals on I/O lines 4 to 7 (to drive LEDs for example), driven high and low, no pull-up resistor, no pull-down resistor
- Four input signals on I/O lines 8 to 11 (to read push-button states for example), with pull-up resistors, glitch filters and input change interrupts
- Four input signals on I/O line 12 to 15 to read an external device status (polled, thus no input change interrupt), no pull-up resistor, no glitch filter
- I/O lines 16 to 19 assigned to peripheral A functions with pull-up resistor
- I/O lines 20 to 23 assigned to peripheral B functions with pull-down resistor
- I/O lines 24 to 27 assigned to peripheral C with input change interrupt, no pull-up resistor and no pull-down resistor
- I/O lines 28 to 31 assigned to peripheral D, no pull-up resistor and no pull-down resistor

Table 22-3. Programming Example

| Register    | Value to be Written |
|-------------|---------------------|
| PIO_PER     | 0x0000_FFFF         |
| PIO_PDR     | 0xFFFF_0000         |
| PIO_OER     | 0x0000_00FF         |
| PIO_ODR     | 0xFFFF_FF00         |
| PIO_IFER    | 0x0000_0F00         |

#### 22.5.15 Register Write Protection

To prevent any single software error from corrupting PIO behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the PIO Write Protection Mode Register (PIO\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the PIO Write Protection Status Register (PIO\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the PIO\_WPSR.

The following registers can be write-protected:

- PIO Enable Register
- PIO Disable Register
- PIO Output Enable Register
- PIO Output Disable Register
- PIO Input Filter Enable Register
- PIO Input Filter Disable Register
- PIO Multi-driver Enable Register
- PIO Multi-driver Disable Register
- PIO Pull-Up Disable Register
- PIO Pull-Up Enable Register
- PIO Peripheral ABCD Select Register 1
- PIO Peripheral ABCD Select Register 2
- PIO Output Write Enable Register
- PIO Output Write Disable Register
- PIO Pad Pull-Down Disable Register
- PIO Pad Pull-Down Enable Register

# 22.6 Parallel Input/Output Controller (PIO) User Interface

Each I/O line controlled by the PIO Controller is associated with a bit in each of the PIO Controller User Interface registers. Each register is 32-bit wide. If a parallel I/O line is not defined, writing to the corresponding bits has no effect. Undefined bits read zero. If the I/O line is not multiplexed with any peripheral, the I/O line is controlled by the PIO Controller and PIO\_PSR returns one systematically.

Table 22-4. Register Mapping

| Offset | Register                                 | Name     | Access                                       | Reset      |
|--------|--|----------|--|------------|
| 0x0000 | PIO Enable Register                      | PIO_PER  | Write-only                                   | _          |
| 0x0004 | PIO Disable Register                     | PIO_PDR  | Write-only                                   | _          |

| 0x0114        | I/O Drive Register 1                        | PIO_DRIVER1 | Read/Write | 0x00000000 |
| 0x0118        | I/O Drive Register 2                        | PIO_DRIVER2 | Read/Write | 0x00000000 |
| 0x011C        | Reserved                                    | _           | _          | _          |

Table 22-4. Register Mapping (Continued)

| Offset        | Register | Name | Access | Reset |
|---------------|----------|------|--------|-------|
| 0x0120-0x014C | Reserved | _    | _      | _     |

Notes: 1. Reset value depends on the product implementation.

- 2. PIO\_ODSR is Read-only or Read/Write depending on PIO\_OWSR I/O lines.
- 3. Reset value of PIO\_PDSR depends on the level of the I/O lines. Reading the I/O line levels requires the clock of the PIO Controller to be enabled, otherwise PIO\_PDSR reads the levels present on the I/O line at the time the clock was disabled.
- 4. PIO\_ISR is reset at 0x0. However, the first read of the register may read a different value as input changes may have occurred.
- 5. If an offset is not listed in the table it must be considered as reserved.

## 22.6.1 PIO Enable Register

Name: PIO\_PER

Address: 0xFFFFF400 (PIOA), 0xFFFFF600 (PIOB), 0xFFFFF800 (PIOC), 0xFFFFFA00 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

#### • P0-P31: PIO Enable

0: No effect.

1: Enables the PIO to control the corresponding pin (disables peripheral control of the pin).

## 22.6.2 PIO Disable Register

Name: PIO\_PDR

Address: 0xFFFFF404 (PIOA), 0xFFFFF604 (PIOB), 0xFFFFF804 (PIOC), 0xFFFFFA04 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

#### • P0-P31: PIO Disable

0: No effect.

1: Disables the PIO from controlling the corresponding pin (enables peripheral control of the pin).

## 22.6.3 PIO Status Register

Name: PIO\_PSR

Address: 0xFFFFF408 (PIOA), 0xFFFFF608 (PIOB), 0xFFFFF808 (PIOC), 0xFFFFFA08 (PIOD)

Access: Read-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

#### • P0-P31: PIO Status

0: PIO is inactive on the corresponding I/O line (peripheral is active).

1: PIO is active on the corresponding I/O line (peripheral is inactive).

# 22.6.4 PIO Output Enable Register

Name: PIO\_OER

Address: 0xFFFFF410 (PIOA), 0xFFFFF610 (PIOB), 0xFFFFF810 (PIOC), 0xFFFFFA10 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

# • P0-P31: Output Enable

0: No effect.

1: Enables the output on the I/O line.

## 22.6.5 PIO Output Disable Register

Name: PIO\_ODR

Address: 0xFFFFF414 (PIOA), 0xFFFFF614 (PIOB), 0xFFFFF814 (PIOC), 0xFFFFFA14 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |

| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

# • P0-P31: Output Disable

0: No effect.

1: Disables the output on the I/O line.

# 22.6.6 PIO Output Status Register

Name: PIO\_OSR

Address: 0xFFFFF418 (PIOA), 0xFFFFF618 (PIOB), 0xFFFFF818 (PIOC), 0xFFFFFA18 (PIOD)

Access: Read-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |

| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

# • P0-P31: Output Status

0: The I/O line is a pure input.

1: The I/O line is enabled in output.

## 22.6.7 PIO Input Filter Enable Register

Name: PIO\_IFER

Address: 0xFFFFF420 (PIOA), 0xFFFFF620 (PIOB), 0xFFFFF820 (PIOC), 0xFFFFFA20 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

## • P0-P31: Input Filter Enable

0: No effect.

1: Enables the input glitch filter on the I/O line.

## 22.6.8 PIO Input Filter Disable Register

Name: PIO\_IFDR

Address: 0xFFFFF424 (PIOA), 0xFFFFF624 (PIOB), 0xFFFFF824 (PIOC), 0xFFFFFA24 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

## • P0-P31: Input Filter Disable

0: No effect.

1: Disables the input glitch filter on the I/O line.

## 22.6.9 PIO Input Filter Status Register

Name: PIO\_IFSR

Address: 0xFFFFF428 (PIOA), 0xFFFFF628 (PIOB), 0xFFFFF828 (PIOC), 0xFFFFFA28 (PIOD)

Access: Read-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |

| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

## • P0-P31: Input Change Interrupt Disable

0: No effect.

1: Disables the input change interrupt on the I/O line.

## 22.6.16 PIO Interrupt Mask Register

Name: PIO\_IMR

Address: 0xFFFFF448 (PIOA), 0xFFFFF648 (PIOB), 0xFFFFF848 (PIOC), 0xFFFFFA48 (PIOD)

Access: Read-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

## • P0-P31: Input Change Interrupt Mask

0: Input change interrupt is disabled on the I/O line.

1: Input change interrupt is enabled on the I/O line.

## 22.6.17 PIO Interrupt Status Register

Name: PIO\_ISR

Address: 0xFFFFF44C (PIOA), 0xFFFFF64C (PIOB), 0xFFFFF84C (PIOC), 0xFFFFFA4C (PIOD)

Access: Read-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

## • P0-P31: Input Change Interrupt Status

0: No input change has been detected on the I/O line since PIO\_ISR was last read or since reset.

1: At least one input change has been detected on the I/O line since PIO\_ISR was last read or since reset.

## 22.6.18 PIO Multi-driver Enable Register

Name: PIO\_MDER

Address: 0xFFFFF450 (PIOA), 0xFFFFF650 (PIOB), 0xFFFFF850 (PIOC), 0xFFFFFA50 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

#### • P0-P31: Multi-drive Enable

0: No effect.

1: Enables multi-drive on the I/O line.

## 22.6.19 PIO Multi-driver Disable Register

Name: PIO\_MDDR

Address: 0xFFFFF454 (PIOA), 0xFFFFF654 (PIOB), 0xFFFFF854 (PIOC), 0xFFFFFA54 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

#### • P0-P31: Multi-drive Disable

0: No effect.

1: Disables multi-drive on the I/O line.

# 22.6.20 PIO Multi-driver Status Register

Name: PIO\_MDSR

Address: 0xFFFFF458 (PIOA), 0xFFFFF658 (PIOB), 0xFFFFF858 (PIOC), 0xFFFFFA58 (PIOD)

Access: Read-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

#### • P0-P31: Multi-drive Status

0: The multi-drive is disabled on the I/O line. The pin is driven at high- and low-level.

1: The multi-drive is enabled on the I/O line. The pin is driven at low-level only.

## 22.6.21 PIO Pull-Up Disable Register

Name: PIO\_PUDR

Address: 0xFFFFF460 (PIOA), 0xFFFFF660 (PIOB), 0xFFFFF860 (PIOC), 0xFFFFFA60 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

## • P0-P31: Pull-Up Disable

0: No effect.

1: Disables the pull-up resistor on the I/O line.

## 22.6.22 PIO Pull-Up Enable Register

Name: PIO\_PUER

Address: 0xFFFFF464 (PIOA), 0xFFFFF664 (PIOB), 0xFFFFF864 (PIOC), 0xFFFFFA64 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

## • P0-P31: Pull-Up Enable

0: No effect.

1: Enables the pull-up resistor on the I/O line.

## 22.6.23 PIO Pull-Up Status Register

Name: PIO\_PUSR

Address: 0xFFFFF468 (PIOA), 0xFFFFF668 (PIOB), 0xFFFFF868 (PIOC), 0xFFFFFA68 (PIOD)

Access: Read-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

## • P0-P31: Pull-Up Status

0: Pull-up resistor is enabled on the I/O line.

1: Pull-up resistor is disabled on the I/O line.

## 22.6.24 PIO Peripheral ABCD Select Register 1

Name: PIO\_ABCDSR1

Access: Read/Write

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

#### • P0-P31: Peripheral Select

If the same bit is set to 0 in PIO\_ABCDSR2:

- 0: Assigns the I/O line to the Peripheral A function.
- 1: Assigns the I/O line to the Peripheral B function.

If the same bit is set to 1 in PIO\_ABCDSR2:

- 0: Assigns the I/O line to the Peripheral C function.
- 1: Assigns the I/O line to the Peripheral D function.

## 22.6.25 PIO Peripheral ABCD Select Register 2

Name: PIO\_ABCDSR2

Address: 0xFFFFF470 (PIOA), 0xFFFFF670 (PIOB), 0xFFFFF870 (PIOC), 0xFFFFFA70 (PIOD)

Access: Read/Write

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

#### • P0-P31: Peripheral Select

If the same bit is set to 0 in PIO\_ABCDSR1:

0: Assigns the I/O line to the Peripheral A function.

1: Assigns the I/O line to the Peripheral C function.

If the same bit is set to 1 in PIO\_ABCDSR1:

0: Assigns the I/O line to the Peripheral B function.

1: Assigns the I/O line to the Peripheral D function.

# 22.6.26 PIO Input Filter Slow Clock Disable Register

Name: PIO\_IFSCDR

Address: 0xFFFFF480 (PIOA), 0xFFFFF680 (PIOB), 0xFFFFF880 (PIOC), 0xFFFFFA80 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

## • P0-P31: Peripheral Clock Glitch Filtering Select

0: No effect.

<sup>1:</sup> The glitch filter is able to filter glitches with a duration  $< t_{peripheral clock}/2$ .

## 22.6.27 PIO Input Filter Slow Clock Enable Register

Name: PIO\_IFSCER

Address: 0xFFFFF484 (PIOA), 0xFFFFF684 (PIOB), 0xFFFFF884 (PIOC), 0xFFFFFA84 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

## • P0-P31: Slow Clock Debouncing Filtering Select

0: No effect.

<sup>1:</sup> The debouncing filter is able to filter pulses with a duration <  $t_{\rm div\_slck}/2$ .

## 22.6.28 PIO Input Filter Slow Clock Status Register

Name: PIO\_IFSCSR

Address: 0xFFFFF488 (PIOA), 0xFFFFF688 (PIOB), 0xFFFFF888 (PIOC), 0xFFFFFA88 (PIOD)

Access: Read-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

## • P0-P31: Glitch or Debouncing Filter Selection Status

0: The glitch filter is able to filter glitches with a duration  $< t_{peripheral clock}/2$ .

1: The debouncing filter is able to filter pulses with a duration  $< t_{\text{div slck}}/2$ .

## 22.6.29 PIO Slow Clock Divider Debouncing Register

Name: PIO\_SCDR

Address: 0xFFFFF48C (PIOA), 0xFFFFF68C (PIOB), 0xFFFFF88C (PIOC), 0xFFFFFA8C (PIOD)

Access: Read/Write

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|----|----|----|----|----|----|----|----|
| _  | _  | ı  | _  | _  | _  | ı  | _  |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| _  | _  | ı  | _  | _  | -  | ı  | _  |
| 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
| _  | _  |    |    | D  | IV |    |    |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|    |    |    | D  | IV |    |    |    |

# • DIV: Slow Clock Divider Selection for Debouncing

 $t_{\text{div\_slck}} = ((\text{DIV} + 1) \times 2) \times t_{\text{slck}}$ 

## 22.6.30 PIO Pad Pull-Down Disable Register

Name: PIO\_PPDDR

Address: 0xFFFFF490 (PIOA), 0xFFFFF690 (PIOB), 0xFFFFF890 (PIOC), 0xFFFFFA90 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

### • P0-P31: Pull-Down Disable

0: No effect.

1: Disables the pull-down resistor on the I/O line.

## 22.6.31 PIO Pad Pull-Down Enable Register

Name: PIO\_PPDER

Address: 0xFFFFF494 (PIOA), 0xFFFFF694 (PIOB), 0xFFFFF894 (PIOC), 0xFFFFFA94 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

### • P0-P31: Pull-Down Enable

0: No effect.

1: Enables the pull-down resistor on the I/O line.

## 22.6.32 PIO Pad Pull-Down Status Register

Name: PIO\_PPDSR

Address: 0xFFFFF498 (PIOA), 0xFFFFF698 (PIOB), 0xFFFFF898 (PIOC), 0xFFFFFA98 (PIOD)

Access: Read-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

### • P0-P31: Pull-Down Status

0: Pull-down resistor is enabled on the I/O line.

1: Pull-down resistor is disabled on the I/O line.

## 22.6.33 PIO Output Write Enable Register

Name: PIO\_OWER

Address: 0xFFFFF4A0 (PIOA), 0xFFFFF6A0 (PIOB), 0xFFFFF8A0 (PIOC), 0xFFFFFAA0 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

## • P0-P31: Output Write Enable

0: No effect.

1: Enables writing PIO\_ODSR for the I/O line.

## 22.6.34 PIO Output Write Disable Register

Name: PIO\_OWDR

Address: 0xFFFFF4A4 (PIOA), 0xFFFFF6A4 (PIOB), 0xFFFFF8A4 (PIOC), 0xFFFFFAA4 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

This register can only be written if the WPEN bit is cleared in the PIO Write Protection Mode Register.

## • P0-P31: Output Write Disable

0: No effect.

1: Disables writing PIO\_ODSR for the I/O line.

## 22.6.35 PIO Output Write Status Register

Name: PIO\_OWSR

Address: 0xFFFFF4A8 (PIOA), 0xFFFFF6A8 (PIOB), 0xFFFFF8A8 (PIOC), 0xFFFFFAA8 (PIOD)

Access: Read-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

## • P0-P31: Output Write Status

0: Writing PIO\_ODSR does not affect the I/O line.

1: Writing PIO\_ODSR affects the I/O line.

## 22.6.36 PIO Additional Interrupt Modes Enable Register

Name: PIO\_AIMER

Address: 0xFFFFF4B0 (PIOA), 0xFFFFF6B0 (PIOB), 0xFFFFF8B0 (PIOC), 0xFFFFFAB0 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

## • P0-P31: Additional Interrupt Modes Enable

0: No effect.

<sup>1:</sup> The interrupt source is the event described in PIO\_ELSR and PIO\_FRLHSR.

## 22.6.37 PIO Additional Interrupt Modes Disable Register

Name: PIO\_AIMDR

Address: 0xFFFFF4B4 (PIOA), 0xFFFFF6B4 (PIOB), 0xFFFFF8B4 (PIOC), 0xFFFFFAB4 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

## • P0-P31: Additional Interrupt Modes Disable

0: No effect.

1: The interrupt mode is set to the default interrupt mode (both-edge detection).

## 22.6.38 PIO Additional Interrupt Modes Mask Register

Name: PIO\_AIMMR

Address: 0xFFFFF4B8 (PIOA), 0xFFFFF6B8 (PIOB), 0xFFFFF8B8 (PIOC), 0xFFFFFAB8 (PIOD)

Access: Read-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

### • P0-P31: IO Line Index

Selects the IO event type triggering an interrupt.

0: The interrupt source is a both-edge detection event.

1: The interrupt source is described by the registers PIO\_ELSR and PIO\_FRLHSR.

## 22.6.39 PIO Edge Select Register

Name: PIO\_ESR

Address: 0xFFFFF4C0 (PIOA), 0xFFFFF6C0 (PIOB), 0xFFFFF8C0 (PIOC), 0xFFFFFAC0 (PIOD)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

## • P0-P31: Edge Interrupt Selection

0: No effect.

1: The interrupt source is an edge-detection event.

## 22.6.40 PIO Level Select Register

Name: PIO\_LSR

Address: 0xFFFFF4C4 (PIOA), 0xFFFFF6C4 (PIOB), 0xFFFFF8C4 (PIOC), 0xFFFFFAC4 (PIOD)

Access: Write-only

## • P0-P31: Edge/Level Interrupt Source Selection

0: The interrupt source is a falling edge detection (if PIO\_ELSR = 0) or low-level detection event (if PIO\_ELSR = 1).

1: The interrupt source is a rising edge detection (if PIO\_ELSR = 0) or high-level detection event (if PIO\_ELSR = 1).

## 22.6.45 PIO Write Protection Mode Register

Name: PIO\_WPMR

Address: 0xFFFFF4E4 (PIOA), 0xFFFFF6E4 (PIOB), 0xFFFFF8E4 (PIOC), 0xFFFFFAE4 (PIOD)

Access: Read/Write

| 31 | 30    | 29 | 28 | 27  | 26 | 25 | 24   |  |  |  |  |
|----|-------|----|----|-----|----|----|------|--|--|--|--|
|    | WPKEY |    |    |     |    |    |      |  |  |  |  |
| 23 | 22    | 21 | 20 | 19  | 18 | 17 | 16   |  |  |  |  |
|    |       |    | WP | KEY |    |    |      |  |  |  |  |
| 15 | 14    | 13 | 12 | 11  | 10 | 9  | 8    |  |  |  |  |
|    |       |    | WP | KEY |    |    |      |  |  |  |  |
| 7  | 6     | 5  | 4  | 3   | 2  | 1  | 0    |  |  |  |  |
| _  | _     | -  | _  | _   | -  | _  | WPEN |  |  |  |  |

### • WPEN: Write Protection Enable

0: Disables the write protection if WPKEY corresponds to 0x50494F ("PIO" in ASCII).

1: Enables the write protection if WPKEY corresponds to 0x50494F ("PIO" in ASCII).

See Section 22.5.15 "Register Write Protection" for the list of registers that can be protected.

### • WPKEY: Write Protection Key

| Value    | Name   | Description  |
|----------|--------|--|
| 0x50494F | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

## 22.6.46 PIO Write Protection Status Register

Name: PIO\_WPSR

Address: 0xFFFFF4E8 (PIOA), 0xFFFFF6E8 (PIOB), 0xFFFFF8E8 (PIOC), 0xFFFFFAE8 (PIOD)

Access: Read-only

| 31 | 30 | 29 | 28  | 27   | 26 | 25 | 24   |
|----|----|----|-----|------|----|----|------|
| _  | _  | -  | _   | -    | _  | -  | _    |
| 23 | 22 | 21 | 20  | 19   | 18 | 17 | 16   |
|    |    |    | WPV | 'SRC |    |    |      |
| 15 | 14 | 13 | 12  | 11   | 10 | 9  | 8    |
|    |    |    | WPV | 'SRC |    |    |      |
| 7  | 6  | 5  | 4   | 3    | 2  | 1  | 0    |
| _  | _  | -  | -   | -    | _  | -  | WPVS |

### • WPVS: Write Protection Violation Status

0: No write protection violation has occurred since the last read of the PIO\_WPSR.

### WPVSRC: Write Protection Violation Source

When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

<sup>1:</sup> A write protection violation has occurred since the last read of the PIO\_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

## 22.6.47 PIO Schmitt Trigger Register

Name: PIO\_SCHMITT

Address: 0xFFFFF500 (PIOA), 0xFFFFF700 (PIOB), 0xFFFFF900 (PIOC), 0xFFFFFB00 (PIOD)

Access: Read/Write

# 23. Debug Unit (DBGU)

### 23.1 Description

The Debug Unit (DBGU) provides a single entry point from the processor for access to all the debug capabilities of Atmel's ARM-based systems.

The Debug Unit features a two-pin UART that can be used for several debug and trace purposes and offers an ideal medium for in-situ programming solutions and debug monitor communications. The Debug Unit two-pin UART can be used stand-alone for general purpose serial communication. Moreover, the association with DMA controller channels permits packet handling for these tasks with processor time reduced to a minimum.

The Debug Unit also makes the Debug Communication Channel (DCC) signals provided by the In-circuit Emulator of the ARM processor visible to the software. These signals indicate the status of the DCC read and write registers and generate an interrupt to the ARM processor, making possible the handling of the DCC under interrupt control.

Chip Identifier registers permit recognition of the device and its revision. These registers indicate the sizes and types of the on-chip memories, as well as the set of embedded peripherals.

Finally, the Debug Unit features a Force NTRST capability that enables the software to decide whether to prevent access to the system via the In-circuit Emulator. This permits protection of the code, stored in ROM.

## 23.2 Embedded Characteristics

- System Peripheral to Facilitate Debug of Atmel<sup>®</sup> ARM<sup>®</sup>-based Systems
- Composed of Four Functions
  - Two-pin UART
  - Debug Communication Channel (DCC) Support
  - Chip ID Registers
  - ICE Access Prevention
- Two-pin UART
  - Implemented Features are USART Compatible
  - Independent Receiver and Transmitter with a Common Programmable Baud Rate Generator
  - Even, Odd, Mark or Space Parity Generation
  - Parity, Framing and Overrun Error Detection
  - Automatic Echo, Local Loopback and Remote Loopback Channel Modes
  - Interrupt Generation
  - Support for Two DMA Channels with Connection to Receiver and Transmitter
- Debug Communication Channel Support
  - Offers Visibility of COMMRX and COMMTX Signals from the ARM Processor
  - Interrupt Generation
- Chip ID Registers
  - Identification of the Device Revision, Sizes of the Embedded Memories, Set of Peripherals
- ICE Access Prevention
  - Enables Software to Prevent System Access Through the ARM Processor's ICE
  - Prevention is Made by Asserting the NTRST Line of the ARM Processor's ICE

# 23.3 Block Diagram

Figure 23-1. Debug Unit Functional Block Diagram

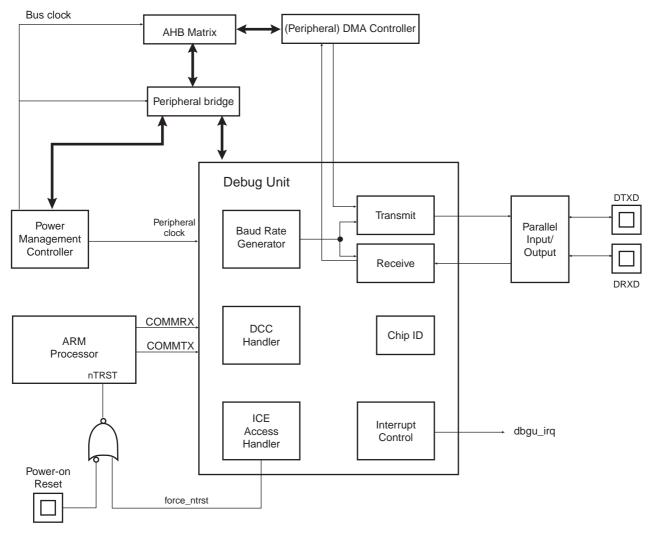

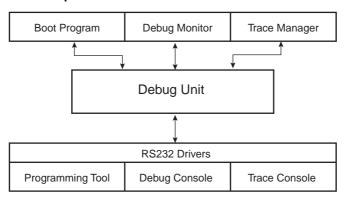

Table 23-1. Debug Unit Pin Description

| Pin Name | Description         | Туре   |
|----------|---------------------|--------|
| DRXD     | Debug Receive Data  | Input  |
| DTXD     | Debug Transmit Data | Output |

Figure 23-2. Debug Unit Application Example

### 23.4 Product Dependencies

#### 23.4.1 I/O Lines

Depending on product integration, the Debug Unit pins may be multiplexed with PIO lines. In this case, the programmer must first configure the corresponding PIO Controller to enable I/O lines operations of the Debug Unit.

Table 23-2. I/O Lines

| Instance | Signal | I/O Line | Peripheral |
|----------|--------|----------|------------|
| DBGU     | DRXD   | PA9      | Α          |
| DBGU     | DTXD   | PA10     | Α          |

#### 23.4.2 Power Management

Depending on product integration, the Debug Unit clock may be controllable through the Power Management Controller. In this case, the programmer must first configure the PMC to enable the Debug Unit clock. Usually, the peripheral identifier used for this purpose is 1.

### 23.4.3 Interrupt Source

Depending on product integration, the Debug Unit interrupt line is connected to one of the interrupt sources of the Advanced Interrupt Controller. Interrupt handling requires programming of the AIC before configuring the Debug Unit. Usually, the Debug Unit interrupt line connects to the interrupt source 1 of the AIC, which may be shared with the real-time clock, the system timer interrupt lines and other system peripheral interrupts, as shown in Figure 23-1. This sharing requires the programmer to determine the source of the interrupt when the source 1 is triggered.

### 23.5 UART Operations

The Debug Unit operates as a UART, (asynchronous mode only) and supports only 8-bit character handling (with parity). It has no clock pin.

The Debug Unit's UART is made up of a receiver and a transmitter that operate independently, and a common baud rate generator. Receiver timeout and transmitter time guard are not implemented. However, all the implemented features are compatible with those of a standard USART.

#### 23.5.1 Baud Rate Generator

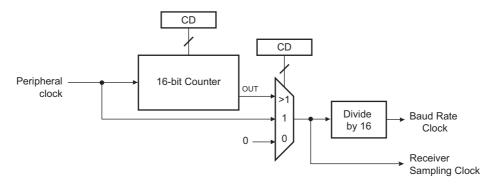

The baud rate generator provides the bit period clock named baud rate clock to both the receiver and the transmitter.

The baud rate clock is the peripheral clock divided by 16 times the value (CD) written in the Debug Unit Baud Rate Generator register (DBGU\_BRGR). If DBGU\_BRGR is set to 0, the baud rate clock is disabled and the Debug Unit's UART remains inactive. The maximum allowable baud rate is peripheral clock divided by 16. The minimum allowable baud rate is peripheral clock divided by (16 x 65536).

Baud Rate = 
$$\frac{f_{peripheral clock}}{16 \times CD}$$

Figure 23-3. Baud Rate Generator

#### 23.5.2 Receiver

#### 23.5.2.1 Receiver Reset, Enable and Disable

After device reset, the Debug Unit receiver is disabled and must be enabled before being used. The receiver can be enabled by writing one to the RXEN bit in the Debug Unit Control register (DBGU\_CR). At this command, the receiver starts looking for a start bit.

The programmer can disable the receiver by writing a one to the RXDIS bit in the DBGU\_CR. If the receiver is waiting for a start bit, it is immediately stopped. However, if the receiver has already detected a start bit and is receiving the data, it waits for the stop bit before actually stopping its operation.

The programmer can also put the receiver in its reset state by writing a one to the RSTRX bit in the DBGU\_CR. In doing so, the receiver immediately stops its current operations and is disabled, whatever its current state. If RSTRX is applied when data is being processed, this data is lost.

### 23.5.2.2 Start Detection and Data Sampling

The Debug Unit only supports asynchronous operations, and this affects only its receiver. The Debug Unit receiver detects the start of a received character by sampling the DRXD signal until it detects a valid start bit. A low level (space) on DRXD is interpreted as a valid start bit if it is detected for more than 7 cycles of the sampling clock, which is 16 times the baud rate. Hence, a space that is longer than 7/16 of the bit period is detected as a valid start bit. A space which is 7/16 of a bit period or shorter is ignored and the receiver continues to wait for a valid start bit.

When a valid start bit has been detected, the receiver samples the DRXD at the theoretical midpoint of each bit. It is assumed that each bit lasts 16 cycles of the sampling clock (1-bit period) so the bit sampling point is eight cycles (0.5-bit period) after the start of the bit. The first sampling point is therefore 24 cycles (1.5-bit periods) after the falling edge of the start bit was detected.

Each subsequent bit is sampled 16 cycles (1-bit period) after the previous one.

### Figure 23-4. Start Bit Detection

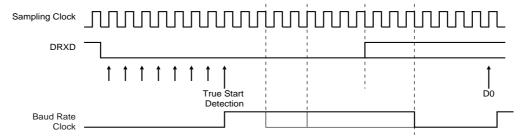

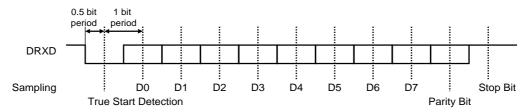

Figure 23-5. Character Reception

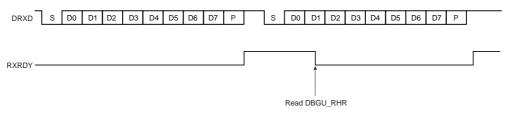

Example: 8-bit, parity enabled 1 stop

### 23.5.2.3 Receiver Ready

When a complete character is received, it is transferred to the Debug Unit Receive Holding register (DBGU\_RHR) and the RXRDY status bit in the Debug Unit Status register (DBGU\_SR) is set. The bit RXRDY is automatically cleared when the receive holding register DBGU\_RHR is read.

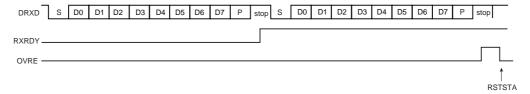

Figure 23-6. Receiver Ready

### 23.5.2.4 Receiver Overrun

If DBGU\_RHR has not been read by the software (or the Peripheral Data Controller or DMA Controller) since the last transfer, the RXRDY bit is still set and a new character is received, the OVRE status bit in DBGU\_SR is set. OVRE is cleared when the software writes a one to the bit RSTSTA (Reset Status) in the DBGU\_CR.

Figure 23-7. Receiver Overrun

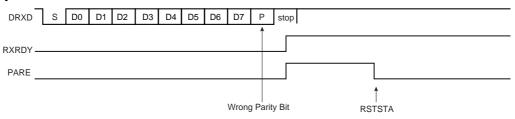

### 23.5.2.5 Parity Error

Each time a character is received, the receiver calculates the parity of the received data bits, in accordance with the field PAR in the Debug Unit Mode register (DBGU\_MR). It then compares the result with the received parity bit. If different, the parity error bit PARE in DBGU\_SR is set at the same time as the RXRDY is set. The parity bit is

cleared when a one is written to the bit RSTSTA (Reset Status) in the DBGU\_CR. If a new character is received before the reset status command is written, the PARE bit remains at 1.

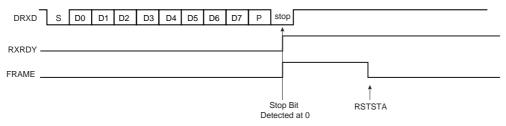

Figure 23-8. Parity Error

### 23.5.2.6 Receiver Framing Error

When a start bit is detected, it generates a character reception when all the data bits have been sampled. The stop bit is also sampled and when it is detected at 0, the FRAME (Framing Error) bit in DBGU\_SR is set at the same time as the RXRDY bit is set. The bit FRAME remains high until a one is written to the RSTSTA bit in the DBGU\_CR.

Figure 23-9. Receiver Framing Error

#### 23.5.3 Transmitter

### 23.5.3.1 Transmitter Reset, Enable and Disable

After device reset, the Debug Unit transmitter is disabled and it must be enabled before being used. The transmitter is enabled by writing a one to the TXEN bit in DBGU\_CR. From this command, the transmitter waits for a character to be written in the Transmit Holding register (DBGU\_THR) before actually starting the transmission.

The programmer can disable the transmitter by writing a one to the TXDIS bit in the DBGU\_CR. If the transmitter is not operating, it is immediately stopped. However, if a character is being processed into the Shift Register and/or a character has been written in the Transmit Holding Register, the characters are completed before the transmitter is actually stopped.

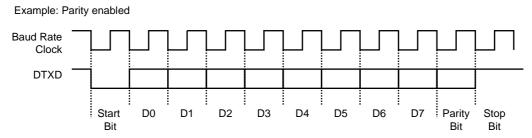

The programmer can also put the transmitter in its reset state by writing a one to the RSTTX bit in the DBGU\_CR. This immediately stops the transmitter, whether or not it is processing characters.

### 23.5.3.2 Transmit Format

The Debug Unit transmitter drives the pin DTXD at the baud rate clock speed. The line is driven depending on the format defined in DBGU\_MR and the data stored in the Shift Register. One start bit at level 0, then the 8 data bits, from the lowest to the highest bit, one optional parity bit and one stop bit at 1 are consecutively shifted out as shown on the following figure. The field PARE in DBGU\_MR defines whether or not a parity bit is shifted out. When a parity bit is enabled, it can be selected between an odd parity, an even parity, or a fixed space or mark bit.

Figure 23-10. Character Transmission

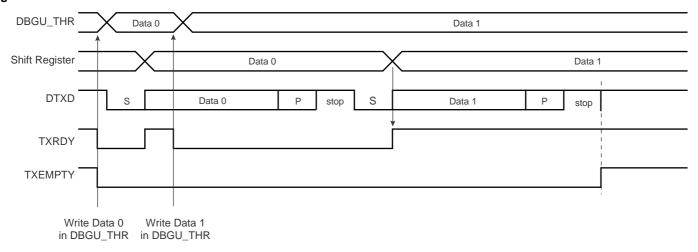

### 23.5.3.3 Transmitter Control

When the transmitter is enabled, the bit TXRDY (Transmitter Ready) is set in DBGU\_SR. The transmission starts when the programmer writes in DBGU\_THR, and after the written character is transferred from DBGU\_THR to the Shift Register. The bit TXRDY remains high until a second character is written in DBGU\_THR. As soon as the first character is completed, the last character written in DBGU\_THR is transferred into the shift register and TXRDY rises again, showing that the holding register is empty.

When both the Shift Register and the DBGU\_THR are empty, i.e., all the characters written in DBGU\_THR have been processed, the bit TXEMPTY rises after the last stop bit has been completed.

Figure 23-11. Transmitter Control

#### 23.5.4 DMA Support

Both the receiver and the transmitter of the Debug Unit's UART are connected to a DMA Controller (DMAC) channel.

The DMA Controller channels are programmed via registers that are mapped within the DMAC user interface.

### 23.5.5 Test Modes

The Debug Unit supports three tests modes. These modes of operation are programmed by using the field CHMODE (Channel Mode) in DBGU\_MR.

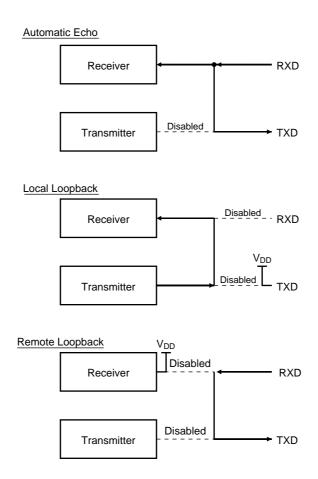

The Automatic Echo mode allows bit-by-bit retransmission. When a bit is received on the DRXD line, it is sent to the DTXD line. The transmitter operates normally, but has no effect on the DTXD line.

The Local Loopback mode allows the transmitted characters to be received. DTXD and DRXD pins are not used and the output of the transmitter is internally connected to the input of the receiver. The DRXD pin level has no effect and the DTXD line is held high, as in idle state.

The Remote Loopback mode directly connects the DRXD pin to the DTXD line. The transmitter and the receiver are disabled and have no effect. This mode allows a bit-by-bit retransmission.

Figure 23-12. Test Modes

### 23.5.6 Debug Communication Channel Support

The Debug Unit handles the signals COMMRX and COMMTX that come from the Debug Communication Channel of the ARM Processor and are driven by the In-circuit Emulator.

The Debug Communication Channel contains two registers that are accessible through the ICE Breaker on the JTAG side and through the coprocessor 0 on the ARM Processor side.

As a reminder, the following instructions are used to read and write the Debug Communication Channel:

Returns the debug communication data read register into Rd

Writes the value in Rd to the debug communication data write register.

The bits COMMRX and COMMTX, which indicate, respectively, that the read register has been written by the debugger but not yet read by the processor, and that the write register has been written by the processor and not yet read by the debugger, are wired on the two highest bits of DBGU\_SR. These bits can generate an interrupt. This feature permits handling under interrupt a debug link between a debug monitor running on the target system and a debugger.

### 23.5.7 Chip Identifier

The Debug Unit features two chip identifier registers, Debug Unit Chip ID register (DBGU\_CIDR) and Debug Unit Extension ID register (DBGU\_EXID). Both registers contain a hard-wired value that is read-only.

The first register (DBGU\_CIDR) contains the following fields:

- EXT: shows the use of the extension identifier register
- NVPTYP and NVPSIZ: identifies the type of embedded non-volatile memory and its size
- ARCH: identifies the set of embedded peripherals
- SRAMSIZ: indicates the size of the embedded SRAM
- EPROC: indicates the embedded ARM processor
- VERSION: gives the revision of the silicon

The second register (DBGU\_EXID) is device-dependent and is read as 0 if the bit EXT is 0 in DBGU\_CIDR.

### 23.5.8 ICE Access Prevention

The Debug Unit allows blockage of access to the system through the ARM processor's ICE interface. This feature is implemented via the Debug Unit Force NTRST register (DBGU\_FNR), that allows assertion of the NTRST signal of the ICE Interface. Writing the bit FNTRST (Force NTRST) to 1 in this register prevents any activity on the TAP controller.

On standard devices, the bit FNTRST resets to 0 and thus does not prevent ICE access.

This feature is especially useful on custom ROM devices for customers who do not want their on-chip code to be visible.

# 23.6 Debug Unit (DBGU) User Interface

Table 23-3. Register Mapping

| Offset          | Register                     | Name      | Access     | Reset |

| TXDIS | TXEN | RXDIS | RXEN | RSTTX | RSTRX | _  | _      |

### • RSTRX: Reset Receiver

0: No effect.

1: The receiver logic is reset and disabled. If a character is being received, the reception is aborted.

#### RSTTX: Reset Transmitter

0: No effect.

1: The transmitter logic is reset and disabled. If a character is being transmitted, the transmission is aborted.

### • RXEN: Receiver Enable

0: No effect.

1: The receiver is enabled if RXDIS is 0.

#### RXDIS: Receiver Disable

0: No effect.

1: The receiver is disabled. If a character is being processed and RSTRX is not set, the character is completed before the receiver is stopped.

### • TXEN: Transmitter Enable

0: No effect.

1: The transmitter is enabled if TXDIS is 0.

### • TXDIS: Transmitter Disable

0: No effect.

1: The transmitter is disabled. If a character is being processed and a character has been written in the DBGU\_THR and RSTTX is not set, both characters are completed before the transmitter is stopped.

### RSTSTA: Reset Status Bits

0: No effect.

1: Resets the status bits PARE, FRAME and OVRE in DBGU\_SR.

## • RXRDY: Receiver Ready

0: No character has been received since the last read of the DBGU\_RHR, or the receiver is disabled.

1: At least one complete character has been received, transferred to DBGU\_RHR and not yet read.

#### TXRDY: Transmitter Ready

0: A character has been written to DBGU\_THR and not yet transferred to the Shift Register, or the transmitter is disabled.

1: There is no character written to DBGU\_THR not yet transferred to the Shift Register.

#### • OVRE: Overrun Error

0: No overrun error has occurred since the last RSTSTA.

1: At least one overrun error has occurred since the last RSTSTA.

#### FRAME: Framing Error

0: No framing error has occurred since the last RSTSTA.

1: At least one framing error has occurred since the last RSTSTA.

#### • PARE: Parity Error

0: No parity error has occurred since the last RSTSTA.

1: At least one parity error has occurred since the last RSTSTA.

### • TXEMPTY: Transmitter Empty

0: There are characters in DBGU\_THR, or characters being processed by the transmitter, or the transmitter is disabled.

1: There are no characters in DBGU\_THR and there are no characters being processed by the transmitter.

#### COMMTX: Debug Communication Channel Write Status

0: COMMTX from the ARM processor is inactive.

1: COMMTX from the ARM processor is active.

## COMMRX: Debug Communication Channel Read Status

0: COMMRX from the ARM processor is inactive.

1: COMMRX from the ARM processor is active.

## • FNTRST: Force NTRST

0: NTRST of the ARM processor's TAP controller is driven by the power\_on\_reset signal.

1: NTRST of the ARM processor's TAP controller is held low.

# 24. Bus Matrix (MATRIX)

## 24.1 Description

The Bus Matrix implements a multi-layer AHB, based on the AHB-Lite protocol, that enables parallel access paths between multiple AHB masters and slaves in a system, thus increasing the overall bandwidth. The Bus Matrix interconnects up to 16 AHB masters to up to 16 AHB slaves. The normal latency to connect a master to a slave is one cycle except for the default master of the accessed slave which is connected directly (zero cycle latency).

The Bus Matrix user interface is compliant with ARM Advanced Peripheral Bus and provides a Chip Configuration User Interface with Registers that allow the Bus Matrix to support application specific features.

#### 24.2 Embedded Characteristics

- 12-layer Matrix, handling requests from 11 masters
- Programmable Arbitration strategy
  - Fixed-priority Arbitration
  - Round-Robin Arbitration, either with no default master, last accessed default master or fixed default master
- Burst Management
  - Breaking with Slot Cycle Limit Support
  - Undefined Burst Length Support
- One Address Decoder provided per Master
  - Three different slaves may be assigned to each decoded memory area: one for internal ROM boot, one for internal flash boot, one after remap
- Boot Mode Select
  - Non-volatile Boot Memory can be internal ROM or external memory on EBI\_NCS0
  - Selection is made by General purpose NVM bit sampled at reset
- Remap Command
  - Allows Remapping of an Internal SRAM in Place of the Boot Non-Volatile Memory (ROM or External Flash)
  - Allows Handling of Dynamic Exception Vectors

### 24.2.1 Matrix Masters

The Bus Matrix manages 12 masters, which means that each master can perform an access concurrently with others, depending on whether the slave it accesses is available.

Each master has its own decoder, which can be defined specifically for each master. In order to simplify the addressing, all the masters have the same decodings.

Table 24-1. List of Bus Matrix Masters

| Master 0     | ARM926 Instruction |
|--------------|--------------------|
| Master 1     | ARM926 Data        |
| Master 2 & 3 | DMA Controller 0   |
| Master 4 & 5 | DMA Controller 1   |
| Master 6     | UDP HS DMA         |
| Master 7     | UHP EHCI DMA       |
| Master 8     | UHP OHCI DMA       |
| Master 9     | LCD DMA            |
| Master 10    | EMAC DMA           |
| Master 11    | Reserved           |

# 24.2.2 Matrix Slaves

The Bus Matrix manages 10 slaves. Each slave has its own arbiter, thus allowing a different arbitration per slave to be programmed.

Table 24-2. List of Bus Matrix Slaves

| Slave 0 | Internal SRAM                             |  |  |  |
|---------|---|--|--|--|
| Slave 0 | IIILEITIAI SKAWI                          |  |  |  |
| Slave 1 | Internal ROM                              |  |  |  |
| Slave 2 | Soft Modem (SMD)                          |  |  |  |
|         | USB Device High Speed Dual Port RAM (DPR) |  |  |  |
| Slave 3 | USB Host EHCI registers                   |  |  |  |
|         | USB Host OHCI registers                   |  |  |  |
| Slave 4 | External Bus Interface                    |  |  |  |
| Slave 5 | DDR2 port 1                               |  |  |  |
| Slave 6 | DDR2 port 2                               |  |  |  |
| Slave 7 | DDR2 port 3                               |  |  |  |
| Slave 8 | Peripheral Bridge 0                       |  |  |  |
| Slave 9 | Peripheral Bridge 1                       |  |  |  |

#### 24.2.3 Master to Slave Access

All the Masters can normally access all the Slaves. However, some paths do not make sense, such as allowing access from the USB Device High speed DMA to the Internal Peripherals. Thus, these paths are forbidden or simply not wired, and shown as "—" in the following table.

Table 24-3. Master to Slave Access

|      | Masters  | 0                | 1              | 2 & 3 | 4 & 5 | 6                       | 7                   | 8                   | 9       | 10          | 11       |

# 24.3 Memory Mapping

The Bus Matrix provides one decoder for every AHB master interface. The decoder offers each AHB master several memory mappings. Each memory area may be assigned to several slaves. Booting at the same address while using different AHB slaves (i.e., external RAM, internal ROM or internal Flash, etc.) becomes possible.

The Bus Matrix user interface provides the Master Remap Control Register (MATRIX\_MRCR), that performs remap action for every master independently.

## 24.4 Special Bus Granting Mechanism

The Bus Matrix provides some speculative bus granting techniques in order to anticipate access requests from masters. This mechanism reduces latency at first access of a burst, or single transfer, as long as the slave is free from any other master access, but does not provide any benefit as soon as the slave is continuously accessed by more than one master, since arbitration is pipelined and has no negative effect on the slave bandwidth or access latency.

This bus granting mechanism sets a different default master for every slave.

At the end of the current access, if no other request is pending, the slave remains connected to its associated default master. A slave can be associated with three kinds of default masters:

- No default master
- Last access master
- Fixed default master

To change from one type of default master to another, the Bus Matrix user interface provides the Slave Configuration Registers, one for every slave, that set a default master for each slave. The Slave Configuration Register contains two fields: DEFMSTR\_TYPE and FIXED\_DEFMSTR. The 2-bit DEFMSTR\_TYPE field selects the default master type (no default, last access master, fixed default master), whereas the 4-bit FIXED\_DEFMSTR field selects a fixed default master provided that DEFMSTR\_TYPE is set to fixed default master. Refer to Section 24.7.2 "Bus Matrix Slave Configuration Registers".

### 24.4.1 No Default Master

After the end of the current access, if no other request is pending, the slave is disconnected from all masters.

This configuration incurs one latency clock cycle for the first access of a burst after bus Idle. Arbitration without default master may be used for masters that perform significant bursts or several transfers with no Idle in between, or if the slave bus bandwidth is widely used by one or more masters.

This configuration provides no benefit on access latency or bandwidth when reaching maximum slave bus throughput, irregardless of the number of requesting masters.

#### 24.4.2 Last Access Master

After the end of the current access, if no other request is pending, the slave remains connected to the last master that performed an access request.

This allows the Bus Matrix to remove the one latency cycle for the last master that accessed the slave. Other non-privileged masters still get one latency clock cycle if they want to access the same slave. This technique is useful for masters that mainly perform single accesses or short bursts with some Idle cycles in between.

This configuration provides no benefit on access latency or bandwidth when reaching maximum slave bus throughput irregardless of the number of requesting masters.

#### 24.4.3 Fixed Default Master

After the end of the current access, if no other request is pending, the slave connects to its fixed default master. Unlike the last access master, the fixed default master does not change unless the user modifies it by software (FIXED\_DEFMSTR field of the related MATRIX\_SCFG).

This allows the Bus Matrix arbiters to remove the one latency clock cycle for the fixed default master of the slave. All requests attempted by the fixed default master do not cause any arbitration latency, whereas other non-privileged masters will get one latency cycle. This technique is useful for a master that mainly performs single accesses or short bursts with Idle cycles in between.

This configuration provides no benefit on access latency or bandwidth when reaching maximum slave bus throughput, irregardless of the number of requesting masters.

## 24.5 Arbitration

The Bus Matrix provides an arbitration mechanism that reduces latency when conflict cases occur, i.e., when two or more masters try to access the same slave at the same time. One arbiter per AHB slave is provided, thus arbitrating each slave specifically.

The Bus Matrix provides the user with the possibility of choosing between two arbitration types or mixing them for each slave:

- 1. Round-robin Arbitration (default)
- 2. Fixed Priority Arbitration

The resulting algorithm may be complemented by selecting a default master configuration for each slave.

When re-arbitration is required, specific conditions apply. See Section 24.5.1 "Arbitration Scheduling".

#### 24.5.1 Arbitration Scheduling

Each arbiter has the ability to arbitrate between two or more different master requests. In order to avoid burst breaking and also to provide the maximum throughput for slave interfaces, arbitration may only take place during the following cycles:

- 1. Idle Cycles: When a slave is not connected to any master or is connected to a master which is not currently accessing it.
- 2. Single Cycles: When a slave is currently doing a single access.
- 3. End of Burst Cycles: When the current cycle is the last cycle of a burst transfer. For defined length burst, predicted end of burst matches the size of the transfer but is managed differently for undefined length burst. See Section 24.5.1.1 "Undefined Length Burst Arbitration"
- 4. Slot Cycle Limit: When the slot cycle counter has reached the limit value indicating that the current master access is too long and must be broken. See Section 24.5.1.2 "Slot Cycle Limit Arbitration"

#### 24.5.1.1 Undefined Length Burst Arbitration

In order to prevent long AHB burst lengths that can lock the access to the slave for an excessive period of time, the user can trigger the re-arbitration before the end of the incremental bursts. The re-arbitration period can be selected from the following Undefined Length Burst Type (ULBT) possibilities:

- 1. Unlimited: no predetermined end of burst is generated. This value enables 1-kbyte burst lengths.
- 2. 1-beat bursts: predetermined end of burst is generated at each single transfer during the INCR transfer.
- 3. 4-beat bursts: predetermined end of burst is generated at the end of each 4-beat boundary during INCR transfer.
- 4. 8-beat bursts: predetermined end of burst is generated at the end of each 8-beat boundary during INCR transfer.
- 5. 16-beat bursts: predetermined end of burst is generated at the end of each 16-beat boundary during INCR transfer.
- 6. 32-beat bursts: predetermined end of burst is generated at the end of each 32-beat boundary during INCR transfer.
- 7. 64-beat bursts: predetermined end of burst is generated at the end of each 64-beat boundary during INCR transfer.
- 8. 128-beat bursts: predetermined end of burst is generated at the end of each 128-beat boundary during INCR transfer.

Use of undefined length16-beat bursts, or less, is discouraged since this generally decreases significantly overall bus bandwidth due to arbitration and slave latencies at each first access of a burst.

If the master does not permanently and continuously request the same slave or has an intrinsically limited average throughput, the ULBT should be left at its default unlimited value, knowing that the AHB specification natively limits all word bursts to 256 beats and double-word bursts to 128 beats because of its 1 Kbyte address boundaries.

Unless duly needed, the ULBT should be left at its default value of 0 for power saving.

This selection can be done through the ULBT field of the Master Configuration Registers (MATRIX\_MCFG).

#### 24.5.1.2 Slot Cycle Limit Arbitration

The Bus Matrix contains specific logic to break long accesses, such as back-to-back undefined length bursts or very long bursts on a very slow slave (e.g., an external low speed memory). At each arbitration time a counter is loaded with the value previously written in the SLOT\_CYCLE field of the related Slave Configuration Register (MATRIX\_SCFG) and decreased at each clock cycle. When the counter elapses, the arbiter has the ability to rearbitrate at the end of the current AHB bus access cycle.

Unless a master has a very tight access latency constraint, which could lead to data overflow or underflow due to a badly undersized internal FIFO with respect to its throughput, the Slot Cycle Limit should be disabled

(SLOT\_CYCLE = 0) or set to its default maximum value in order not to inefficiently break long bursts performed by some Atmel masters.

However, the Slot Cycle Limit should not be disabled in the particular case of a master capable of accessing the slave by performing back-to-back undefined length bursts shorter than the number of ULBT beats with no Idle cycle in between, since in this case the arbitration could be frozen all along the burst sequence.

In most cases this feature is not needed and should be disabled for power saving.

Warning: This feature cannot prevent any slave from locking its access indefinitely.

### 24.5.2 Arbitration Priority Scheme

The bus Matrix arbitration scheme is organized in priority pools.

Round-robin priority is used in the highest and lowest priority pools, whereas fixed level priority is used between priority pools and in the intermediate priority pools.

For each slave, each master is assigned to one of the slave priority pools through the priority registers for slaves (MxPR fields of MATRIX\_PRAS and MATRIX\_PRBS). When evaluating master requests, this programmed priority level always takes precedence.

After reset, all the masters belong to the lowest priority pool (MxPR = 0) and are therefore granted bus access in a true round-robin order.

The highest priority pool must be specifically reserved for masters requiring very low access latency. If more than one master belongs to this pool, they will be granted bus access in a biased round-robin manner which allows tight and deterministic maximum access latency from AHB bus requests. At worst, any currently occurring high-priority master request will be granted after the current bus master access has ended and other high priority pool master requests, if any, have been granted once each.

The lowest priority pool shares the remaining bus bandwidth between AHB Masters.

Intermediate priority pools allow fine priority tuning. Typically, a moderately latency-critical master or a bandwidth-only critical master will use such a priority level. The higher the priority level (MxPR value), the higher the master priority.

All combinations of MxPR values are allowed for all masters and slaves. For example some masters might be assigned to the highest priority pool (round-robin) and the remaining masters to the lowest priority pool (round-robin), with no master for intermediate fix priority levels.

If more than one master requests the slave bus, irregardless of the respective masters priorities, no master will be granted the slave bus for two consecutive runs. A master can only get back-to-back grants so long as it is the only requesting master.

## 24.5.2.1 Fixed Priority Arbitration

Fixed priority arbitration algorithm is the first and only arbitration algorithm applied between masters from distinct priority pools. It is also used in priority pools other than the highest and lowest priority pools (intermediate priority pools).

Fixed priority arbitration allows the Bus Matrix arbiters to dispatch the requests from different masters to the same slave by using the fixed priority defined by the user in the MxPR field for each master in the Priority Registers, MATRIX\_PRAS and MATRIX\_PRBS. If two or more master requests are active at the same time, the master with the highest priority MxPR number is serviced first.

In intermediate priority pools, if two or more master requests with the same priority are active at the same time, the master with the highest number is serviced first.

### 24.5.2.2 Round-Robin Arbitration

This algorithm is only used in the highest and lowest priority pools. It allows the Bus Matrix arbiters to properly dispatch requests from different masters to the same slave. If two or more master requests are active at the same time in the priority pool, they are serviced in a round-robin increasing master number order.

# 24.6 Register Write Protection

To prevent any single software error from corrupting MATRIX behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the "Write Protection Mode Register" (MATRIX\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the "Write Protection Status Register" (MATRIX\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the MATRIX\_WPSR.

The following registers can be write-protected:

- "Bus Matrix Master Configuration Registers"
- "Bus Matrix Slave Configuration Registers"
- "Bus Matrix Priority Registers A For Slaves"
- "Bus Matrix Priority Registers B For Slaves"
- "Bus Matrix Master Remap Control Register"

## 24.7.1 Bus Matrix Master Configuration Registers

Name: MATRIX\_MCFG0...MATRIX\_MCFG10

Address: 0xFFFFDE00 [0], 0xFFFFDE04 [1], 0xFFFFDE08 [2], 0xFFFFDDEC [3], 0xFFFFDE10 [4], 0xFFFFDE14 [5],

0xFFFFDE18 [6], 0xFFFFDE1C [7], 0xFFFFDE20 [8], 0xFFFFDE24 [9]

Access: Read/Write

| 31 | 30 | 29 | 28 | 27 | 26   | 25 | 24  |  |
|----|----|----|----|----|------|----|-----|--|
| _  | _  | _  | _  | _  | _    | _  | _   |  |
| 23 | 22 | 21 | 20 | 19 | 18   | 17 | 16  |  |
| _  | _  | -  | -  | -  | _    | 1  | _   |  |
|    |    |    |    |    |      |    |     |  |
| 15 | 14 | 13 | 12 | 11 | 10   | 9  | . 8 |  |
| _  | _  | ı  | 1  | 1  | _    | 1  | _   |  |
|    |    |    |    |    |      |    |     |  |
| 7  | 6  | 5  | 4  | 3  | 2    | 1  | 0   |  |
| _  | -  | _  | _  | _  | ULBT |    |     |  |

This register can only be written if the WPEN bit is cleared in the "Write Protection Mode Register".

## ULBT: Undefined Length Burst Type

#### 0: Unlimited Length Burst

No predicted end of burst is generated, therefore INCR bursts coming from this master can only be broken if the Slave Slot Cycle Limit is reached. If the Slot Cycle Limit is not reached, the burst is normally completed by the master, at the latest, on the next AHB 1 Kbyte address boundary, allowing up to 256-beat word bursts or 128-beat double-word bursts.

#### 1: Single Access

The undefined length burst is treated as a succession of single accesses, allowing re-arbitration at each beat of the INCR burst.

#### 2: 4-beat Burst

The undefined length burst is split into 4-beat bursts, allowing re-arbitration at each 4-beat burst end.

#### 3: 8-beat Burst

The undefined length burst is split into 8-beat bursts, allowing re-arbitration at each 8-beat burst end.

#### 4: 16-beat Burst

The undefined length burst is split into 16-beat bursts, allowing re-arbitration at each 16-beat burst end.

#### 5: 32-beat Burst

The undefined length burst is split into 32-beat bursts, allowing re-arbitration at each 32-beat burst end.

### 6: 64-beat Burst

The undefined length burst is split into 64-beat bursts, allowing re-arbitration at each 64-beat burst end.

#### 7: 128-beat Burst

The undefined length burst is split into 128-beat bursts, allowing re-arbitration at each 128-beat burst end.

Unless duly needed, the ULBT should be left at its default 0 value for power saving.

## 24.7.2 Bus Matrix Slave Configuration Registers

Name: MATRIX SCFG0...MATRIX SCFG9

**Address:** 0xFFFFDE40 [0], 0xFFFFDE44 [1], 0xFFFFDE48 [2], 0xFFFFDE4C [3], 0xFFFFDE50 [4], 0xFFFFDE54 [5],

0xFFFFDE58 [6], 0xFFFFDE5C [7], 0xFFFFDE60 [8], 0xFFFFDE64 [9]

Access: Read/Write

| 31 | 30         | 29 | 28      | 27     | 26 | 25           | 24         |  |
|----|------------|----|---------|--------|----|--------------|------------|--|
| _  | _          | _  | _       | _      | -  | ı            | _          |  |
| 23 | 22         | 21 | 20      | 19     | 18 | 17           | 16         |  |
| _  | _          |    | FIXED_D | EFMSTR |    | DEFMSTR_TYPE |            |  |
|    |            |    |         |        |    |              | _          |  |
| 15 | 14         | 13 | 12      | 11     | 10 | 9            | 8          |  |
| _  | _          | _  | _       | _      | -  | ı            | SLOT_CYCLE |  |
| 7  | 6          | 5  | 4       | 3      | 2  | 1            | 0          |  |
|    | SLOT_CYCLE |    |         |        |    |              |            |  |

This register can only be written if the WPEN bit is cleared in the "Write Protection Mode Register".

#### SLOT\_CYCLE: Maximum Bus Grant Duration for Masters

When SLOT\_CYCLE AHB clock cycles have elapsed since the last arbitration, a new arbitration takes place so as to let another master access this slave. If another master is requesting the slave bus, then the current master burst is broken.

If SLOT\_CYCLE = 0, the Slot Cycle Limit feature is disabled and bursts always complete unless broken according to the ULBT.

This limit has been placed in order to enforce arbitration so as to meet potential latency constraints of masters waiting for slave access or in the particular case of a master performing back-to-back undefined length bursts indefinitely freezing the arbitration.

This limit must not be too small. Unreasonably small values break every burst and the Bus Matrix arbitrates without performing any data transfer. The default maximum value is usually an optimal conservative choice.

In most cases this feature is not needed and should be disabled for power saving. See Section 24.5.1.2 on page 306.

### DEFMSTR\_TYPE: Default Master Type

#### 0: No Default Master

At the end of the current slave access, if no other master request is pending, the slave is disconnected from all masters.

This results in a one-clock cycle latency for the first access of a burst transfer or for a single access.

#### 1: Last Default Master

At the end of the current slave access, if no other master request is pending, the slave stays connected to the last master having accessed it.

This results in not having a one-clock cycle latency when the last master tries to access the slave again.

#### 2: Fixed Default Master

At the end of the current slave access, if no other master request is pending, the slave connects to the fixed master the number that has been written in the FIXED\_DEFMSTR field.

This results in not having a one-clock cycle latency when the fixed master tries to access the slave again.

# • FIXED\_DEFMSTR: Fixed Default Master

This is the number of the Default Master for this slave. Only used if DEFMSTR\_TYPE is 2. Specifying the number of a master which is not connected to the selected slave is equivalent to setting DEFMSTR\_TYPE to 0.

## 24.7.3 Bus Matrix Priority Registers A For Slaves

This register can only be written if the WPEN bit is cleared in the "Write Protection Mode Register".

## . MxPR: Master x Priority

Fixed priority of Master x for accessing the selected slave. The higher the number, the higher the priority.

All the masters programmed with the same MxPR value for the slave make up a priority pool.

Round-robin arbitration is used in the lowest (MxPR = 0) and highest (MxPR = 3) priority pools.

Fixed priority is used in intermediate priority pools (MxPR = 1) and (MxPR = 2).

See "Arbitration Priority Scheme" on page 307 for details.

## 24.7.4 Bus Matrix Priority Registers B For Slaves

Name: MATRIX PRBS0...MATRIX PRBS9

Address: 0xFFFFDE84 [0], 0xFFFFDE8C [1], 0xFFFFDE94 [2], 0xFFFFDE9C [3], 0xFFFFDEA4 [4], 0xFFFFDEAC

[5], 0xFFFFDEB4 [6], 0xFFFFDEBC [7], 0xFFFFDEC4 [8], 0xFFFFDECC [9]

| Access: Read/Write |
|--------------------|
|--------------------|

|    |            |    |    |          |    |           |             |
| 7  | 6          | 5  | 4  | 3        | 2  | 1         | 0           |
| _  | _          | _  | _  | EBI_CS3A | _  | EBI_CS1A  | _           |
|    |            | ·  | ·  |          |    |           | <u> </u>    |

#### • EBI\_CS1A: EBI Chip Select 1 Assignment

0: EBI Chip Select 1 is assigned to the Static Memory Controller.

1: EBI Chip Select 1 is assigned to the DDR2SDR Controller.

## • EBI\_CS3A: EBI Chip Select 3 Assignment

0: EBI Chip Select 3 is only assigned to the Static Memory Controller and EBI\_NCS3 behaves as defined by the SMC.

1: EBI Chip Select 3 is assigned to the Static Memory Controller and the NAND Flash Logic is activated.

### • EBI\_DBPUC: EBI Data Bus Pull-Up Configuration

0: EBI D0-D15 Data Bus bits are internally pulled-up to the VDDIOM power supply.

1: EBI D0-D15 Data Bus bits are not internally pulled-up.

### • EBI\_DBPDC: EBI Data Bus Pull-Down Configuration

0: EBI D0-D15 Data Bus bits are internally pulled-down to the ground.

1: EBI D0-D15 Data Bus bits are not internally pulled-down.

## • EBI\_DRIVE: EBI I/O Drive Configuration

This allows to avoid overshoots and gives the best performance according to the bus load and external memories.

0: Low drive (default).

1: High drive.

## • NFD0\_ON\_D16: NAND Flash Databus Selection

0: NAND Flash I/O are connected to D0-D15 (default).

1: NAND Flash I/O are connected to D16-D31.

| NFD0_ON_D16 | Signals                  | VDDIOM | VDDNF | External Memory                           |
|-------------|--------------------------|--------|-------|---|
| 0           | NFD0 = D0,, NFD15 = D15  | 1.8V   | 1.8V  | DDR2 or LP-DDR or LPSDR + NAND Flash 1.8V |
| 0           | NFD0 = D0,, NFD15 = D15  | 3.3V   | 3.3V  | 32-bit SDRAM + NAND Flash 3.3V            |
| 1           | NFD0 = D16,, NFD15 = D31 | 1.8V   | 1.8V  | DDR2 or LP-DDR or LPSDR + NAND Flash 1.8V |
| 1           | NFD0 = D16,, NFD15 = D31 | 1.8V   | 3.3V  | DDR2 or LP-DDR or LPSDR + NAND Flash 3.3V |
| 1           | NFD0 = D16,, NFD15 = D31 | 3.3V   | 1.8V  | 16-bit SDR + NAND Flash 1.8V              |

## • DDR\_MP\_EN: DDR Multi-port Enable

0: DDR Multi-port is disabled (default).

1: DDR Multi-port is enabled, performance is increased. **Warning:** Use only with NFDO0\_ON\_D16 = 0. The system behavior is unpredictable if ND0\_ON\_D16 is set to 1 at the same time.

Note: EBI Chip Select 1 is to be assigned to the DDR2SDR Controller.

# 24.7.7 Write Protection Mode Register

Name: MATRIX\_WPMR
Address: 0xFFFDFE4
Access: Read/Write

| 31 | 30    | 29 | 28 | 27  | 26 | 25 | 24   |  |
|----|-------|----|----|-----|----|----|------|--|
|    |       |    | WP | KEY |    |    |      |  |
| 23 | 22    | 21 | 20 | 19  | 18 | 17 | 16   |  |
|    |       |    | WP | KEY |    |    |      |  |
| 15 | 14    | 13 | 12 | 11  | 10 | 9  | 8    |  |
|    | WPKEY |    |    |     |    |    |      |  |
| 7  | 6     | 5  | 4  | 3   | 2  | 1  | 0    |  |
| _  | _     | _  | _  | _   | _  | -  | WPEN |  |

### • WPEN: Write Protection Enable

0: Disables the write protection if WPKEY corresponds to 0x4D4154 ("MAT" in ASCII).

See Section 24.6 "Register Write Protection" for the list of registers that can be write-protected.

# • WPKEY: Write Protection Key

| Value    | Name   | Description  |
|----------|--------|--|
| 0x4D4154 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

<sup>1:</sup> Enables the write protection if WPKEY corresponds to 0x4D4154 ("MAT" in ASCII).

# 24.7.8 Write Protection Status Register

Name: MATRIX\_WPSR
Address: 0xFFFFDFE8

| Access: | Read-only |    |     |      |    |    |      |  |
|---------|-----------|----|-----|------|----|----|------|--|
| 31      | 30        | 29 | 28  | 27   | 26 | 25 | 24   |  |
| _       | _         | _  | -   | _    | _  | _  | _    |  |
| 23      | 22        | 21 | 20  | 19   | 18 | 17 | 16   |  |
|         |           |    | WP\ | /SRC |    |    |      |  |
| 15      | 14        | 13 | 12  | 11   | 10 | 9  | 8    |  |
| WPVSRC  |           |    |     |      |    |    |      |  |
| 7       | 6         | 5  | 4   | 3    | 2  | 1  | 0    |  |
| _       | _         | _  | _   | _    | _  | _  | WPVS |  |

# • WPVS: Write Protection Violation Status

0: No write protection violation has occurred since the last read of the MATRIX\_WPSR.

### • WPVSRC: Write Protection Violation Source

When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

<sup>1:</sup> A write protection violation has occurred since the last read of the MATRIX\_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

# 25. External Bus Interface (EBI)

## 25.1 Description

The External Bus Interface (EBI) is designed to ensure the successful data transfer between several external devices and the embedded memory controller of an ARM-based device.

The Static Memory, DDR, SDRAM and ECC controllers are all featured external memory controllers on the EBI. These external memory controllers are capable of handling several types of external memory and peripheral devices, such as SRAM, PROM, EPROM, EEPROM, Flash, DDR2 and SDRAM. The EBI operates with a 1.8V or 3.3V power supply (VDDIOM).

The EBI also supports the NAND Flash protocols via integrated circuitry that greatly reduces the requirements for external components. Furthermore, the EBI handles data transfers with up to six external devices, each assigned to six address spaces defined by the embedded memory controller. Data transfers are performed through a 16-bit or 32-bit data bus, an address bus of up to 26 bits, up to six chip select lines (NCS[5:0]) and several control pins that are generally multiplexed between the different external memory controllers.

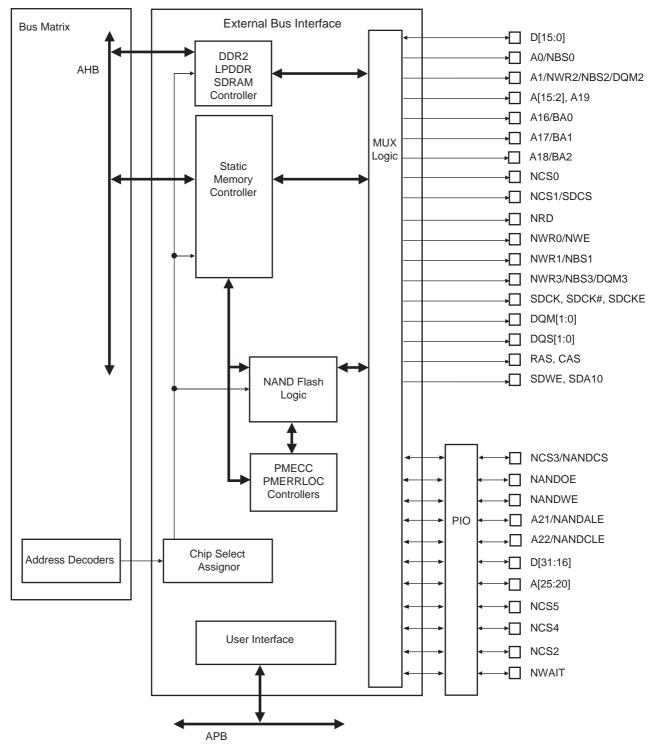

#### 25.2 Embedded Characteristics

- Integrates three External Memory Controllers:
  - Static Memory Controller
  - DDR2/SDRAM Controller
  - 8-bit NAND Flash ECC Controller
- Up to 26-bit Address Bus (up to 64 Mbytes linear per chip select)
- Up to 6 chip selects, Configurable Assignment:
  - Static Memory Controller on NCS0, NCS1, NCS2, NCS3, NCS4, NCS5
  - DDR2/SDRAM Controller (SDCS) or Static Memory Controller on NCS1
  - NAND Flash support on NCS3

# 25.3 EBI Block Diagram

Figure 25-1. Organization of the External Bus Interface

# 25.4 I/O Lines Description

Table 25-1. EBI I/O Lines Description

| Name                | Function                               | Туре     | Active Level |  |  |  |  |  |  |
|---------------------|--|----------|--------------|--|--|--|--|--|--|

Notes: 1. NWR1 enables upper byte writes. NWR0 enables lower byte writes.

- 2. NWRx enables corresponding byte x writes. (x = 0,1,2 or 3)
- 3. NBS0 and NBS1 enable respectively lower and upper bytes of the lower 16-bit word.
- 4. NBS2 and NBS3 enable respectively lower and upper bytes of the upper 16-bit word.
- 5. D24-31 and A20, A23-A25, NCS2, NCS4, NCS5 are multiplexed on PD15-PD31.

| Pxx        | VDDNF        | _                             | -         | CE         |  |
| Pxx        | VDDNF        | -                             | _         | RDY        |  |

Note: 1. The switch NFD0\_ON\_D16 is used to select NAND Flash path on D0-D7 or D16-D23 depending on memory power supplies. This switch is located in the CCFG\_EBICSA register in the Bus Matrix.

### 25.5.2 Product Dependencies

#### 25.5.2.1 I/O Lines

The pins used for interfacing the External Bus Interface may be multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the External Bus Interface pins to their peripheral function. If I/O lines of the External Bus Interface are not used by the application, they can be used for other purposes by the PIO Controller.

### 25.5.3 Functional Description

The EBI transfers data between the internal AHB Bus (handled by the Bus Matrix) and the external memories or peripheral devices. It controls the waveforms and the parameters of the external address, data and control buses and is composed of the following elements:

- Static Memory Controller (SMC)
- DDR2/SDRAM Controller (DDR2SDRC)
- Programmable Multibit ECC Controller (PMECC)
- A chip select assignment feature that assigns an AHB address space to the external devices
- A multiplex controller circuit that shares the pins between the different Memory Controllers
- Programmable NAND Flash support logic

### 25.5.3.1 Bus Multiplexing

The EBI offers a complete set of control signals that share the 32-bit data lines, the address lines of up to 26 bits and the control signals through a multiplex logic operating in function of the memory area requests.

Multiplexing is specifically organized in order to guarantee the maintenance of the address and output control lines at a stable state while no external access is being performed. Multiplexing is also designed to respect the data float times defined in the Memory Controllers. Furthermore, refresh cycles of the DDR2 and SDRAM are executed independently by the DDR2SDR Controller without delaying the other external Memory Controller accesses.

### 25.5.3.2 Pull-up and Pull-down Control

The EBI\_CSA registers in the Chip Configuration User Interface enable on-chip pull-up and pull-down resistors on data bus lines not multiplexed with the PIO Controller lines. The pull-down resistors are enabled after reset. The bits, EBIx\_DBPUC and EBI\_DBPDC, control the pull-up and pull-down resistors on the D0–D15 lines. Pull-up or pull-down resistors on the D16–D31 lines can be performed by programming the appropriate PIO controller.

### 25.5.3.3 Drive Level and Delay Control

The EBI I/Os accept two drive levels, HIGH and LOW. This allows to avoid overshoots and give the best performance according to the bus load and external memories.

The slew rates are determined by programming EBI\_DRIVE bit in the EBI Chip Select Assignment Register (CCFG\_EBICSA) in the Bus Matrix.

At reset the selected current drive is LOW.

To reduce EMI, programmable delay has been inserted on high-speed lines. The control of these delays is as follows:

EBI (DDR2SDRC\SMC\NAND Flash)

D[15:0] controlled by 2 registers DELAY1 and DELAY2 located in the SMC user interface.

- D[0] <=> DELAY1[3:0],
- D[1] <=> DELAY1[7:4],...,
- D[6] <=> DELAY1[27:24],
- D[7] <=> DELAY1[31:28]
- D[8] <=> DELAY2[3:0],
- D[9] <=> DELAY2[7:4],...,
- D[14] <=> DELAY2[27:24],
- D[15] <=> DELAY2[31:28]

**D[31:16] on PIOD[21:6]** controlled by 2 registers, DELAY3 and DELAY4 located in the SMC user interface.

- A22 <=> PD[3] <=> DELAY7[27:24]

### 25.5.3.4 Power supplies

The product embeds a dual power supply for EBI: VDDNF for NAND Flash signals and VDDIOM for others. This makes it possible to use a 1.8V or 3.3V NAND Flash independently of the SDRAM power supply.

The switch NFD0\_ON\_D16 is used to select the NAND Flash path on D0-D15 or D16-D31 depending on memory power supplies. This switch is located in the CCFG\_EBICSA register in the Bus Matrix.

Figure 25-2 illustrates an example of the NAND Flash and the external RAM (DDR2 or LP-DDR or 16-bit LP-SDR) in the same power supply range (NFD0 ON D16 = default).

Figure 25-2. NAND Flash and External RAM in Same Power Supply Range (NFD0\_ON\_D16 = default)

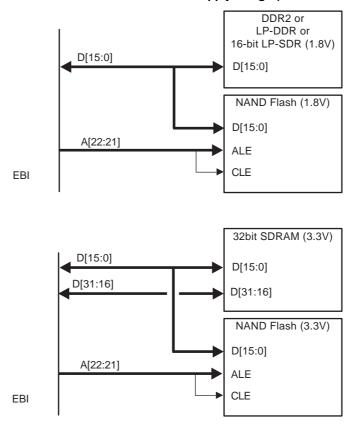

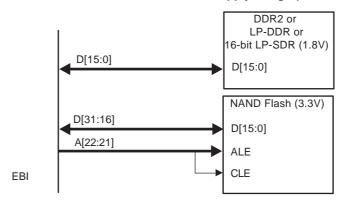

Figure 25-3 illustrates an example of the NAND Flash and the external RAM (DDR2 or LP-DDR or 16-bit LP-SDR) **not** in the same power supply range (NFD0\_ON\_D16 = 1).

This can be used if the SMC connects to the NAND Flash only. Using this function with another device on the SMC will lead to an unpredictable behavior of that device. In that case, the default value must be selected.

Figure 25-3. NAND Flash and External RAM Not in Same Power Supply Range (NFD0\_ON\_D16 = 1)

At reset NFD0\_ON\_D16 = 0 and the NAND Flash bus is connected to D0-D15.

### 25.5.3.5 Static Memory Controller

For information on the Static Memory Controller, refer to the Static Memory Controller section of this datasheet.

### 25.5.3.6 DDR2SDRAM Controller

The product embeds a multi-port DDR2SDR Controller. This allows to use three additional ports on DDR2SDRC to lessen the EBI load from a part of DDR2 or LP-DDR accesses. This increases the bandwidth when DDR2 and NAND Flash devices are used. This feature is NOT compatible with SDR or LP-SDR Memory.

It is controlled by DDR\_MP\_EN bit in EBI Chip Select Assignment Register.

Figure 25-4. DDR2SDRC Multi-port Enabled (DDR\_MP\_EN = 1)

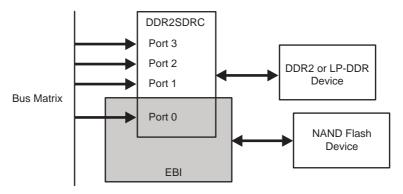

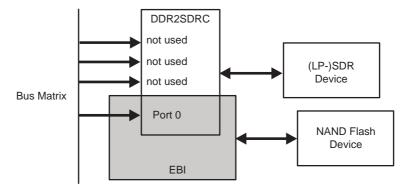

Figure 25-5. DDR2SDRC Multi-port Disabled (DDR\_MP\_EN = 0)

### 25.5.3.7 Programmable Multibit ECC Controller

For information on the PMECC Controller, refer to PMECC and PMERRLOC sections; also refer to Boot Strategies Section, NAND Flash Boot: PMECC Error Detection and Correction.

### 25.5.3.8 NAND Flash Support

External Bus Interfaces integrate circuitry that interfaces to NAND Flash devices.

#### **External Bus Interface**

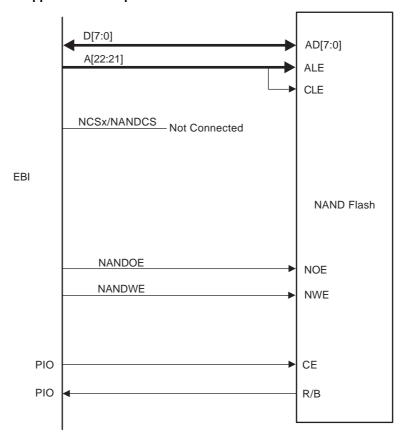

The NAND Flash logic is driven by the Static Memory Controller on the NCS3 address space. Programming the EBI\_CSA field in the EBI\_CSA Register in the Chip Configuration User Interface to the appropriate value enables the NAND Flash logic. For details on this register, refer to the Bus Matrix section. Access to an external NAND Flash device is then made by accessing the address space reserved to NCS3 (i.e., between 0x4000 0000 and 0x4FFF FFFF).

The NAND Flash Logic drives the read and write command signals of the SMC on the NANDOE and NANDWE signals when the NCS3 signal is active. NANDOE and NANDWE are invalidated as soon as the transfer address fails to lie in the NCS3 address space. See Figure 25-6 for more information. For details on these waveforms, refer to the Static Memory Controller section.

## **NAND Flash Signals**

The address latch enable and command latch enable signals on the NAND Flash device are driven by address bits A22 and A21 of the EBI address bus. The command, address or data words on the data bus of the NAND Flash device are distinguished by using their address within the NCSx address space. The chip enable (CE) signal of the device and the ready/busy (R/B) signals are connected to PIO lines. The CE signal then remains asserted even when NCSx is not selected, preventing the device from returning to standby mode.

Figure 25-6. NAND Flash Application Example

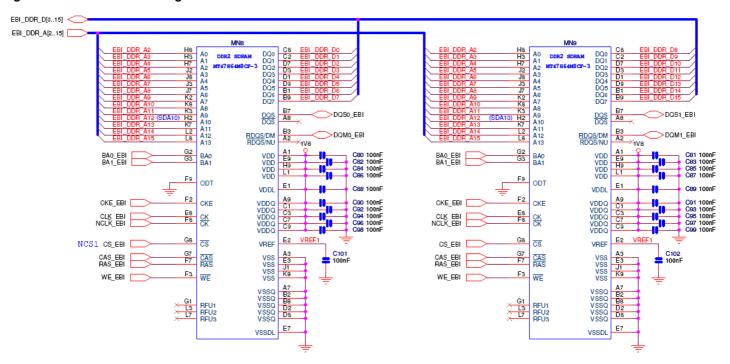

## 25.5.4 Implementation Examples

The following hardware configurations are given for illustration only. The user should refer to the memory manufacturer web site to check current device availability.

### 25.5.4.1 2x8-bit DDR2 on EBI

Figure 25-7. Hardware Configuration - 2x8-bit DDR2 on EBI

### Software Configuration - 2x8-bit DDR2 on EBI

- Assign EBI\_CS1 to the DDR2 controller by setting the EBI\_CS1A bit in the EBI Chip Select Assignment Register (CCFG\_EBICSA) in the Bus Matrix.
- Initialize the DDR2 Controller depending on the DDR2 device and system bus frequency.

The DDR2 initialization sequence is described in the subsection "DDR2 Device Initialization" of the DDRSDRC section.

In this case VDDNF can be different from VDDIOM. NAND Flash device can be 3.3V or 1.8V and wired on D16–D31 data bus. NFD0\_ON\_D16 is to be set to 1.

### 25.5.4.2 16-bit LPDDR on EBI

D[0..15] A[1..21] LPDDR MN1 A0 A1 A2 A3 D00 D01 D02 D03 D04 D05 D06 D07 D08 D09 D010 D011 J9 K7 800 A4 A5 A6 A7 A8 A9 A10 J1 J2 J3 DB H1 D3 H2 H3 A12 DQ12 DQ13 DQ14 DQ15 148 R3 BAO 149 -VDDIOM FR C2 C4 C6 LDM VDD 100nF F2 UDM 100nF 100nF GI G2 G3 CKE C8 100nF VDDQ VDDQ VDDQ 딿 C10 100nF C12 100nF C14 100nF C16 100nF Ri VDDIOM LDQS UDQS VDDQ VDDQ RI CAS VSS 470K VSS VSS VSSQ VSSQ WE WE B9 C1 D9 H7 VSSQ VSSQ F7 VSSQ

Figure 25-8. Hardware Configuration - 16-bit LPDDR on EBI

### **Software Configuration - 16-bit LPDDR on EBI**

The following configuration has to be performed:

- Assign EBI\_CS1 to the DDR2 controller by setting the bit EBI\_CS1A bit in the EBI Chip Select Assignment Register (CCFG\_EBICSA) in the Bus Matrix.
- Initialize the DDR2 Controller depending on the LP-DDR device and system bus frequency.

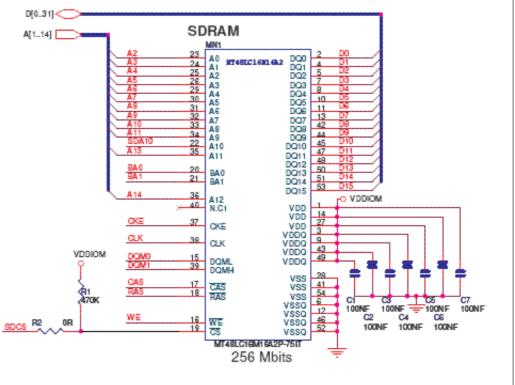

The LP-DDR initialization sequence is described in the section "Low-power DDR1-SDRAM Initialization" in "DDR/SDR SDRAM Controller (DDRSDRC)".

In this case VDDNF can be different from VDDIOM. NAND Flash device can be 3.3V or 1.8V and wired on D16–D31 data bus. NFD0\_ON\_D16 is to be set to 1.

### 25.5.4.3 16-bit SDRAM on EBI

Figure 25-9. Hardware Configuration - 16-bit SDRAM on EBI

### **Software Configuration - 16-bit SDRAM on EBI**

The following configuration has to be performed:

- Assign the EBI CS1 to the SDRAM controller by setting the bit EBI\_CS1A bit in the EBI Chip Select Assignment Register (CCFG\_EBICSA) in the Bus Matrix.
- Initialize the SDRAM Controller depending on the SDRAM device and system bus frequency.

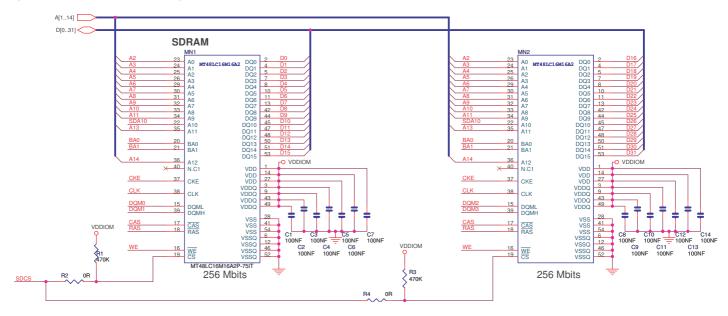

The Data Bus Width is to be programmed to 16 bits.

The SDRAM initialization sequence is described in the section "SDRAM Device Initialization" in "SDRAM Controller (SDRAMC)".

In this case VDDNF can be different from VDDIOM. NAND Flash device can be 3.3V or 1.8V and wired on D16–D31 data bus. NFD0 ON D16 is to be set to 1.

### 25.5.4.4 2x16-bit SDRAM on EBI

Figure 25-10. Hardware Configuration - 2x16-bit SDRAM on EBI

# Software Configuration - 2x16-bit SDRAM on EBI

The following configuration has to be performed:

- Assign the EBI CS1 to the SDRAM controller by setting the bit EBI\_CS1A bit in the EBI Chip Select Assignment Register (CCFG\_EBICSA) in the Bus Matrix.
- Initialize the SDRAM Controller depending on the SDRAM device and system bus frequency.

The Data Bus Width is to be programmed to 32 bits. The data lines D[16..31] are multiplexed with PIO lines and thus the dedicated PIOs must be programmed in peripheral mode in the PIO controller.

The SDRAM initialization sequence is described in the section "SDRAM Device Initialization" in "SDRAM Controller (SDRAMC)".

In this case VDDNF must to be equal to VDDIOM. The NAND Flash device must be 3.3V and wired on D0–D15 data bus. NFD0\_ON\_D16 is to be set to 0.

# 26. Programmable Multibit ECC Controller (PMECC)

# 26.1 Description

The Programmable Multibit ECC Controller (PMECC) is a programmable binary BCH (Bose, Chaudhuri and Hocquenghem) encoder/decoder. This controller can be used to generate redundancy information for both Single-Level Cell (SLC) and Multi-level Cell (MLC) NAND Flash devices. It supports redundancy for correction of 2, 4, 8, 12 or 24 bits of error per sector of data.

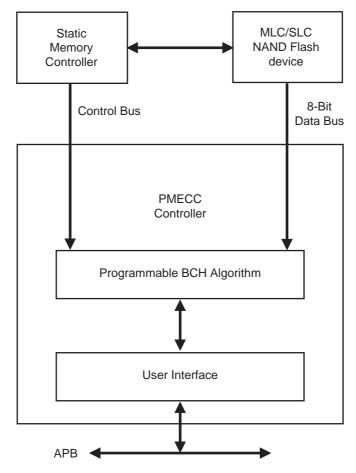

### 26.2 Embedded Characteristics

- 8-bit Nand Flash Data Bus Support
- Multibit Error Correcting Code.
- Algorithm based on binary shortened Bose, Chaudhuri and Hocquenghem (BCH) codes.
- Programmable Error Correcting Capability: 2, 4, 8, 12 and 24 bit of errors per sector.
- Programmable Sector Size: 512 bytes or 1024 bytes.
- Programmable Number of Sectors per page: 1, 2, 4 or 8 sectors of data per page.
- Programmable Spare Area Size.
- Supports Spare Area ECC Protection.
- Supports 8 Kbytes page size using 1024 bytes per sector and 4 kbytes page size using 512 bytes per sector.
- Configurable through APB interface
- Multibit Error Detection is Interrupt Driven.

# 26.3 Block Diagram

Figure 26-1. Block Diagram

## 26.4 Functional Description

The NAND Flash sector size is programmable and can be set to 512 bytes or 1024 bytes. The PMECC module generates redundancy at encoding time, when a NAND write page operation is performed. The redundancy is appended to the page and written in the spare area. This operation is performed by the processor. It moves the content of the PMECCx registers into the NAND Flash memory. The number of registers depends on the selected error correction capability, refer to Table 26-1 on page 345. This operation is executed for each sector. At decoding time, the PMECC module generates the remainder of the received codeword by minimal polynomials. When all polynomial remainders for a given sector are set to zero, no error occurred. When the polynomial remainders are other than zero, the codeword is corrupted and further processing is required.

The PMECC module generates an interrupt indicating that an error occurred. The processor must read the PMECCISR register. This register indicates which sector is corrupted.

To find the error location within a sector, the processor must execute the decoding steps as follows:

- 1. Syndrome computation
- 2. Find the error locator polynomials
- 3. Find the roots of the error locator polynomial

All decoding steps involve finite field computation. It means that a library of finite field arithmetic must be available to perform addition, multiplication and inversion. The finite field arithmetic operations can be performed through the use of a memory mapped lookup table, or direct software implementation. The software implementation presented is based on lookup tables. Two tables named  $g_{\log}$  and  $g_{\min}$  are used. If alpha is the primitive element of the field, then a power of alpha is in the field. Assume beta = alpha  $^{\circ}$  index, then beta belongs to the field, and  $g_{\log}$  (beta) =  $g_{\log}$  (alpha  $^{\circ}$  index) = index. The  $g_{\min}$  antilog tables provide exponent inverse of the element, if beta = alpha  $^{\circ}$  index, then  $g_{\min}$  antilog(index) = beta.

The first step consists of the syndrome computation. The PMECC module computes the remainders and software must substitute the power of the primitive element.

The procedure implementation is given in Section 26.5.1 "Remainder Substitution Procedure" on page 348.

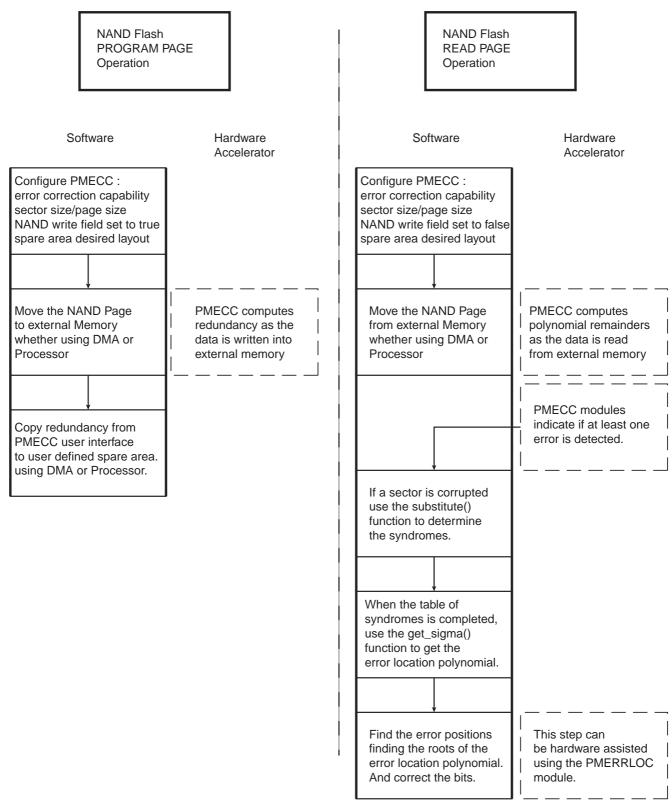

The second step is the most software intensive. It is the Berlekamp's iterative algorithm for finding the error-location polynomial.

The procedure implementation is given in Section 26.5.2 "Find the Error Location Polynomial Sigma(x)" on page 349.

The Last step is finding the root of the error location polynomial. This step can be very software intensive. Indeed, there is no straightforward method of finding the roots, except by evaluating each element of the field in the error location polynomial. However a hardware accelerator can be used to find the roots of the polynomial. The Programmable Multibit Error Correction Code Location (PMERRLOC) module provides this kind of hardware acceleration.

Figure 26-2. Software/Hardware Multibit Error Correction Dataflow

## 26.4.1 MLC/SLC Write Page Operation using PMECC

When an MLC write page operation is performed, the PMECC controller is configured with the NANDWR field of the PMECCFG register set to one. When the NAND spare area contains file system information and redundancy (PMECCx), the spare area is error protected, then the SPAREEN bit of the PMECCFG register is set to one. When the NAND spare area contains only redundancy information, the SPAREEN bit is set to zero.

When the write page operation is terminated, the user writes the redundancy in the NAND spare area. This operation can be done with DMA assistance.

Table 26-1. Relevant Redundancy Registers

| BCH_ERR field | Sector size set to 512 bytes   | Sector size set to 1024 bytes   |
|---------------|--|---|
| 0             | PMECC_ECC0   | PMECC_ECC0  |

### 26.4.1.1 SLC/MLC Write Operation with Spare Enable Bit Set

When the SPAREEN field of the PMECC\_CFG register is set to one, the spare area of the page is encoded with the stream of data of the last sector of the page. This mode is entered by writing one in the DATA field of the PMECC\_CTRL register. When the encoding process is over, the redundancy is written to the spare area in user mode, USER field of the PMECC\_CTRL must be set to one.

Figure 26-3. NAND Write Operation with Spare Encoding

Write NAND operation with SPAREEN set to one

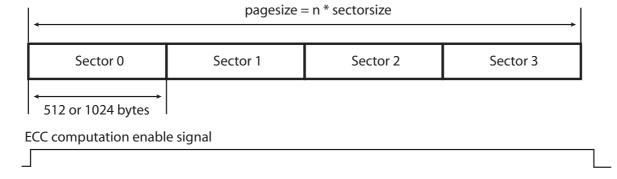

### 26.4.1.2 MLC/SLC Write Operation with Spare Area Disabled

When the SPAREEN field of PMECC\_CFG is set to zero the spare area is not encoded with the stream of data. This mode is entered by writing one to the DATA field of the PMECC\_CTRL register.

Figure 26-4. NAND Write Operation

Write NAND operation with SPAREEN set to zero

# 26.4.2 MLC/SLC Read Page Operation using PMECC

Table 26-3. Relevant Remainders Registers

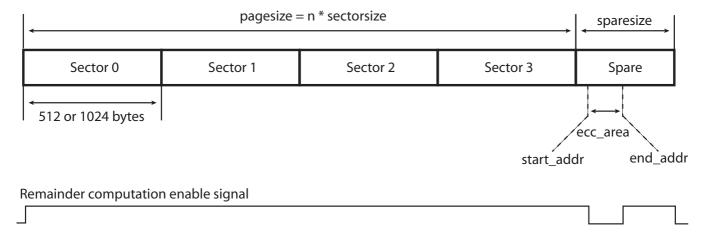

| BCH_ERR field | Sector size set to 512 bytes   | Sector size set to 1024 bytes  |
|---------------|--|--|

### 26.4.2.1 MLC/SLC Read Operation with Spare Decoding

When the spare area is protected, the spare area contains valid data. As the redundancy may be included in the middle of the information stream, the user programs the start address and the end address of the ECC area. The controller will automatically skip the ECC area. This mode is entered by writing one in the DATA field of the PMECC\_CTRL register. When the page has been fully retrieved from NAND, the ECC area is read using the user mode by writing one to the USER field of the PMECC\_CTRL register.

Figure 26-5. Read Operation with Spare Decoding

Read NAND operation with SPAREEN set to One and AUTO set to Zero

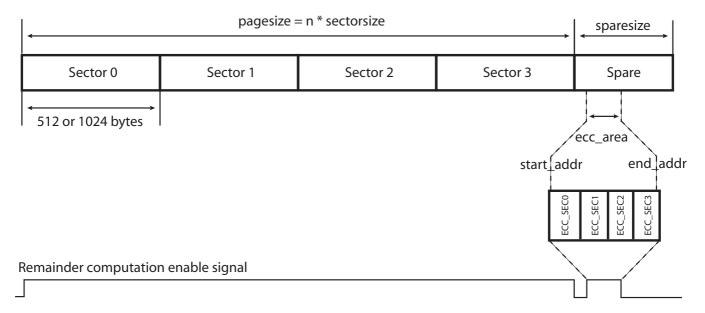

### 26.4.2.2 MLC/SLC Read Operation

If the spare area is not protected with the error correcting code, the redundancy area is retrieved directly. This mode is entered by writing one in the DATA field of the PMECC\_CTRL register. When AUTO field is set to one the ECC is retrieved automatically, otherwise the ECC must be read using user mode.

### Figure 26-6. Read Operation

Read NAND operation with SPAREEN set to Zero and AUTO set to One

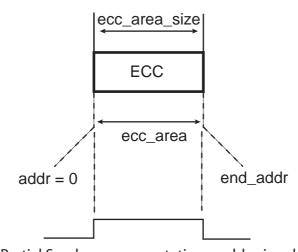

### 26.4.2.3 MLC/SLC User Read ECC Area

This mode allows a manual retrieve of the ECC.

This mode is entered writing one in the USER field of the PMECC\_CTRL register.

Figure 26-7. User Read Mode

Partial Syndrome computation enable signal

# 26.5 Software Implementation

### 26.5.1 Remainder Substitution Procedure

The substitute function evaluates the polynomial remainder, with different values of the field primitive elements. The finite field arithmetic addition operation is performed with the Exclusive or. The finite field arithmetic multiplication operation is performed through the gf\_log, gf\_antilog lookup tables.

The REM2NP1 and REMN2NP3 fields of the PMECC\_REMx registers contain only odd remainders. Each bit indicates whether the coefficient of the polynomial remainder is set to zero or not.

NB ERROR MAX defines the maximum value of the error correcting capability.

NB\_ERROR defines the error correcting capability selected at encoding/decoding time.

NB\_FIELD\_ELEMENTS defines the number of elements in the field.

si[] is a table that holds the current syndrome value, an element of that table belongs to the field. This is also a shared variable for the next step of the decoding operation.

oo[] is a table that contains the degree of the remainders.

```
int substitute()
{
  int i;
  int j;
  for (i = 1; i < 2 * NB_ERROR_MAX; i++)
  {
      si[i] = 0;
}
  for (i = 1; i < 2*NB_ERROR; i++)
  {
      for (j = 0; j < oo[i]; j++)
      {
           if (REM2NPX[i][j])
           {
                si[i] = gf_antilog[(i * j)*NB_FIELD_ELEMENTS] ^ si[i];
           }
      }
}
return 0;
}</pre>
```

### 26.5.2 Find the Error Location Polynomial Sigma(x)

The sample code below gives a Berlekamp iterative procedure for finding the value of the error location polynomial.

The input of the procedure is the si[] table defined in the remainder substitution procedure.

The output of the procedure is the error location polynomial named smu (sigma mu). The polynomial coefficients belong to the field. The smu[NB\_ERROR+1][] is a table that contains all these coefficients.

NB\_ERROR\_MAX defines the maximum value of the error correcting capability.

NB ERROR defines the error correcting capability selected at encoding/decoding time.

NB FIELD ELEMENTS defines the number of elements in the field.

```
int delta[NB_ERROR_MAX+2];
/* index of largest delta */
int ro;
int largest;
int diff;
/*
                      * /
/*
      First Row
                     * /
/*
                      * /
/* Mu */
mu[0] = -1; /* Actually -1/2 */
/* Sigma(x) set to 1 */
for (i = 0; i < (2*NB_ERROR_MAX+1); i++)
      smu[0][i] = 0;
smu[0][0] = 1;
/* discrepancy set to 1 */
dmu[0] = 1;
/* polynom order set to 0 */
lmu[0] = 0;
/* delta set to -1 */
delta[0] = (mu[0] * 2 - lmu[0]) >> 1;
/*
                       * /
/*
                       * /
     Second Row
/*
                       * /
/* Mu */
mu[1] = 0;
/* Sigma(x) set to 1 */
for (i = 0; i < (2*NB_ERROR_MAX+1); i++)
      smu[1][i] = 0;
smu[1][0] = 1;
/* discrepancy set to Syndrome 1 */
dmu[1] = si[1];
/* polynom order set to 0 */
lmu[1] = 0;
/* delta set to 0 */
delta[1] = (mu[1] * 2 - lmu[1]) >> 1;
for (i=1; i <= NB_ERROR; i++)</pre>
      mu[i+1] = i << 1;
      /***********************************
                                                        * /
      /*
                                                        * /
      /*
                                                        * /
                  Compute Sigma (Mu+1)
                  And L(mu)
      /* check if discrepancy is set to 0 */
      if (dmu[i] == 0)
      /* copy polynom */
      for (j=0; j<2*NB_ERROR_MAX+1; j++)</pre>
            smu[i+1][j] = smu[i][j];
      /* copy previous polynom order to the next */
      lmu[i+1] = lmu[i];
      }
      else
```

```
{
         = 0;
      ro
      largest = -1;
      /* find largest delta with dmu != 0 */
      for (j=0; j<i; j++)
            if (dmu[j])
                  if (delta[j] > largest)
                        largest = delta[j];
                        ro = ji
                  }
      /* initialize signal ro */
      for (k = 0; k < 2*NB\_ERROR\_MAX+1; k ++)
            sro[k] = 0;
      /* compute difference */
      diff = (mu[i] - mu[ro]);
      /* compute X ^ (2(mu-ro)) */
      for (k = 0; k < (2*NB\_ERROR\_MAX+1); k ++)
            sro[k+diff] = smu[ro][k];
      /* multiply by dmu * dmu[ro]^-1 */
      for (k = 0; k < 2*NB ERROR MAX+1; k ++)
            /* dmu[ro] is not equal to zero by definition */
            /* check that operand are different from 0
            if (sro[k] && dmu[i])
                  /* galois inverse */
                  sro[k] = gf_antilog[(gf_log[dmu[i]] + (NB_FIELD_ELEMENTS-
gf_log[dmu[ro]]) + gf_log[sro[k]]) % NB_FIELD_ELEMENTS];
      /* multiply by dmu * dmu[ro]^-1 */
      for (k = 0; k < 2*NB_ERROR_MAX+1; k++)

/* In either case compute the discrepancy */
for (k = 0 ; k <= (lmu[i+1]>>1); k++)
{
      if (k == 0)
      dmu[i+1] = si[2*(i-1)+3];
      /* check if one operand of the multiplier is null, its index is -1 */
      else if (smu[i+1][k] && si[2*(i-1)+3-k])
      dmu[i+1] = gf_antilog[(gf_log[smu[i+1][k]] + gf_log[si[2*(i-1)+3-k]])%nn] ^ dmu[i+1];
}
}
return 0;
}
```

### 26.5.3 Find the Error Position

The output of the get\_sigma() procedure is a polynomial stored in the smu[NB\_ERROR+1][] table. The error position is the roots of that polynomial. The degree of this polynomial is very important information, as it gives the number of errors. The PMERRLOC module provides a hardware accelerator for this step.

### • BCH\_ERR: Error Correct Capability

| Value | Name      | Description |
|-------|-----------|-------------|
| 0     | BCH_ERR2  | 2 errors    |
| 1     | BCH_ERR4  | 4 errors    |
| 2     | BCH_ERR8  | 8 errors    |
| 3     | BCH_ERR12 | 12 errors   |
| 4     | BCH_ERR24 | 24 errors   |

### • SECTORSZ: Sector Size

0: The ECC computation is based on a sector of 512 bytes.

1: The ECC computation is based on a sector of 1024 bytes.

## • PAGESIZE: Number of Sectors in the Page

| Value | Name          | Description                                  |
|-------|---------------|--|
| 0     | PAGESIZE_1SEC | 1 sector for main area (512 or 1024 bytes)   |
| 1     | PAGESIZE_2SEC | 2 sectors for main area (1024 or 2048 bytes) |
| 2     | PAGESIZE_4SEC | 4 sectors for main area (2048 or 4096 bytes) |
| 3     | PAGESIZE_8SEC | 8 errors for main area (4096 or 8192 bytes)  |

### • NANDWR: NAND Write Access

:0: NAND read access

1: NAND write access

# • SPAREEN: Spare Enable

- for NAND write access:

0: The spare area is skipped

1: The spare area is protected with the last sector of data.

- for NAND read access:

0: The spare area is skipped.

1: The spare area contains protected data or only redundancy information.

## • AUTO: Automatic Mode Enable

This bit is only relevant in NAND Read Mode, when spare enable is activated.

0: Indicates that the spare area is not protected. In that case the ECC computation takes into account the ECC area located in the spare area. (within the start address and the end address).

1: Indicates that the spare is error protected. In this case, the ECC computation takes into account the whole spare area minus the ECC area in the ECC computation operation.

# 26.6.2 PMECC Spare Area Size Register

|    |    |    | E  | CC |    |    |    |

## • ECC: BCH Redundancy

This register contains the remainder of the division of the codeword by the generator polynomial.

### 26.6.13 PMECC Remainder x Register

Name: PMECC\_REMx [x=0..11] [sec\_num=0..7]

**Address:** 0xFFFFE240 [0][0] .. 0xFFFFE26C [11][0]

OxFFFFE280 [0][1] .. OxFFFFE2AC [11][1]
OxFFFFE2C0 [0][2] .. OxFFFFE2EC [11][2]
OxFFFFE300 [0][3] .. OxFFFFE32C [11][3]
OxFFFFE340 [0][4] .. OxFFFFE36C [11][4]
OxFFFFE380 [0][5] .. OxFFFFE3AC [11][5]
OxFFFFE3C0 [0][6] .. OxFFFFE3EC [11][6]
OxFFFFE400 [0][7] .. OxFFFFE42C [11][7]

Access: Read-only
Reset: 0x00000000

| 31 | 30      | 29 | 28 | 27  | 26   | 25 | 24 |  |  |  |
|----|---------|----|----|-----|------|----|----|--|--|--|
| _  | _       |    |    | REM | 2NP3 |    |    |  |  |  |
| 23 | 22      | 21 | 20 | 19  | 18   | 17 | 16 |  |  |  |
|    | REM2NP3 |    |    |     |      |    |    |  |  |  |
| 15 | 14      | 13 | 12 | 11  | 10   | 9  | 8  |  |  |  |
| _  | -       |    |    | REM | 2NP1 |    |    |  |  |  |
| 7  | 6       | 5  | 4  | 3   | 2    | 1  | 0  |  |  |  |
|    | REM2NP1 |    |    |     |      |    |    |  |  |  |

### • REM2NP1: BCH Remainder 2 \* N + 1

When sector size is set to 512 bytes, bit REM2NP1[13] is not used and read as zero.

If bit i of the REM2NP1 field is set to one then the coefficient of the X ^ i is set to one, otherwise the coefficient is zero.

#### REM2NP3: BCH Remainder 2 \* N + 3

When sector size is set to 512 bytes, bit REM2NP3[29] is not used and read as zero.

If bit i of the REM2NP3 field is set to one then the coefficient of the X ^ i is set to one, otherwise the coefficient is zero.

# 27. Programmable Multibit ECC Error Location Controller (PMERRLOC)

## 27.1 Description

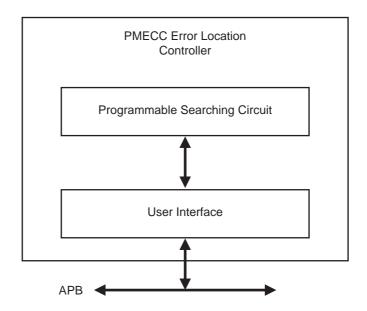

The PMECC Error Location Controller provides hardware acceleration for determining roots of polynomials over two finite fields: GF(2^13) and GF(2^14). It integrates 24 fully programmable coefficients. These coefficients belong to GF(2^13) or GF(2^14). The coefficient programmed in the PMERRLOC\_SIGMAx register is the coefficient of degree x in the polynomial.

### 27.2 Embedded Characteristics

- Provides Hardware Acceleration for determining roots of polynomials defined over a finite field
- Programmable Finite Field GF(2^13) or GF(2^14)
- Finds Roots of Error Locator Polynomial
- Programmable Number of Roots

## 27.3 Block Diagram

Figure 27-1. Block Diagram

# 27.4 Functional Description

The PMERRLOC search operation is started as soon as a write access is detected in the ELEN register and can be disabled by writing to the ELDIS register. The ENINIT field of the ELEN register shall be initialized with the number of Galois field elements to test. The set of the roots can be limited to a valid range.

Table 27-1. ENINIT field value for a sector size of 512 bytes

| Error Correcting Capability | ENINIT Value |
|-----------------------------|--------------|
| 2                           | 4122         |
| 4                           | 4148         |
| 8                           | 4200         |
| 12                          | 4252         |
| 24                          | 4408         |

Table 27-2. ENINIT field value for a sector size of 1024 bytes

| Error Correcting Capability | ENINIT Value |  |  |  |
|-----------------------------|--------------|--|--|--|
| 2                           | 8220         |  |  |  |
| 4                           | 8248         |  |  |  |
| 8                           | 8304         |  |  |  |
| 12                          | 8360         |  |  |  |
| 24                          | 8528         |  |  |  |

When the PMEERRLOC engine is searching for roots the BUSY field of the ELSR remains asserted. An interrupt is asserted at the end of the computation, and the DONE bit of the ELSIR register is set. The ERR\_CNT field of the ELISR indicates the number of errors. The error position can be read in the PMERRLOCx registers.

# 27.5 Programmable Multibit ECC Error Location Controller (PMERRLOC) User Interface

### • ERRLOCN: Error Position within the Set {sector area, spare area}.

ERRLOCN points to 0 when the first bit of the main area is corrupted.

If the sector size is set to 512 bytes, the ERRLOCN points to 4096 when the last bit of the sector area is corrupted. If the sector size is set to 1024 bytes, the ERRLOCN points to 8192 when the last bit of the sector area is corrupted.

If the sector size is set to 512 bytes, the ERRLOCN points to 4097 when the first bit of the spare area is corrupted.

If the sector size is set to 1024 bytes, the ERRLOCN points to 8193 when the first bit of the spare area is corrupted.

# 28. Static Memory Controller (SMC)

## 28.1 Description

The Static Memory Controller (SMC) generates the signals that control the access to the external memory devices or peripheral devices. It has 6 Chip Selects and a 26-bit address bus. The 32-bit data bus can be configured to interface with 8-, 16-, or 32-bit external devices. Separate read and write control signals allow for direct memory and peripheral interfacing. Read and write signal waveforms are fully parametrizable.

The SMC can manage wait requests from external devices to extend the current access. The SMC is provided with an automatic slow clock mode. In slow clock mode, it switches from user-programmed waveforms to slow-rate specific waveforms on read and write signals. The SMC supports asynchronous burst read in page mode access for page size up to 32 bytes.

### 28.2 Embedded Characteristics

- 6 Chip Selects Available
- 64-Mbyte Address Space per Chip Select
- 8-, 16- or 32-bit Data Bus
- Word, Halfword, Byte Transfers
- Byte Write or Byte Select Lines
- Programmable Setup, Pulse And Hold Time for Read Signals per Chip Select
- Programmable Setup, Pulse And Hold Time for Write Signals per Chip Select
- Programmable Data Float Time per Chip Select
- Compliant with LCD Module
- External Wait Request
- Automatic Switch to Slow Clock Mode
- Asynchronous Read in Page Mode Supported: Page Size Ranges from 4 to 32 Bytes

## 28.3 I/O Lines Description

Table 28-1. I/O Line Description

| Name         | Description                                | Туре   | Active Level |

# 28.5 Application Example

### 28.5.1 Hardware Interface

Figure 28-1. SMC Connections to Static Memory Devices

# 28.6 Product Dependencies

### 28.6.1 I/O Lines

The pins used for interfacing the Static Memory Controller may be multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the Static Memory Controller pins to their peripheral function. If I/O Lines of the SMC are not used by the application, they can be used for other purposes by the PIO Controller.

Table 28-3. I/O Lines

| Instance | Signal      | I/O Line | Peripheral |  |
|----------|-------------|----------|------------|--|
| SMC      | A20         | PD15     | В          |  |
| SMC      | A21/NANDALE | PD2      | PD2 A      |  |
| SMC      | A22/NANDCLE | PD3      | Α          |  |
| SMC      | A23         | PD16     | В          |  |
| SMC      | A24         | PD17     | В          |  |

| SMC      | NCS4        | PD20     | В          |  |
| SMC      | NCS5        | PD21     | В          |  |
| SMC      | NWAIT       | PD5      | А          |  |

## 28.7 External Memory Mapping

The SMC provides up to 26 address lines, A[25:0]. This allows each chip select line to address up to 64 Mbytes of memory.

If the physical memory device connected on one chip select is smaller than 64 Mbytes, it wraps around and appears to be repeated within this space. The SMC correctly handles any valid access to the memory device within the page (see Figure 28-2).

A[25:0] is only significant for 8-bit memory, A[25:1] is used for 16-bit memory, A[25:2] is used for 32-bit memory.

NCS[0] - NCS[7] NCS7 Memory Enable NRD NCS6 Memory Enable **SMC NWE** NCS5 Memory Enable A[25:0] NCS4 Memory Enable D[31:0] NCS3 Memory Enable NCS2 Memory Enable NCS1 Memory Enable NCS0 Memory Enable Output Enable Write Enable A[25:0] 8 or 16 or 32 D[31:0] or D[15:0] o D[7:0]

Figure 28-2. Memory Connections for Eight External Devices

### 28.8 Connection to External Devices

### 28.8.1 Data Bus Width

A data bus width of 8, 16, or 32 bits can be selected for each chip select. This option is controlled by the field DBW in SMC\_MODE (Mode Register) for the corresponding chip select.

Figure 28-3 shows how to connect a 512K x 8-bit memory on NCS2. Figure 28-4 shows how to connect a 512K x 16-bit memory on NCS2. Figure 28-5 shows two 16-bit memories connected as a single 32-bit memory

### 28.8.2 Byte Write or Byte Select Access

Each chip select with a 16-bit or 32-bit data bus can operate with one of two different types of write access: byte write or byte select access. This is controlled by the BAT field of the SMC\_MODE register for the corresponding chip select.

Figure 28-3. Memory Connection for an 8-bit Data Bus

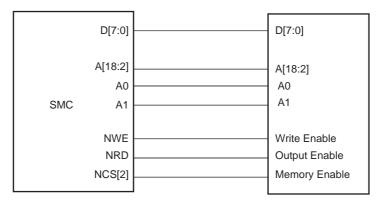

Figure 28-4. Memory Connection for a 16-bit Data Bus

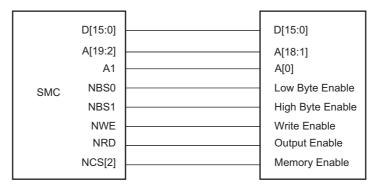

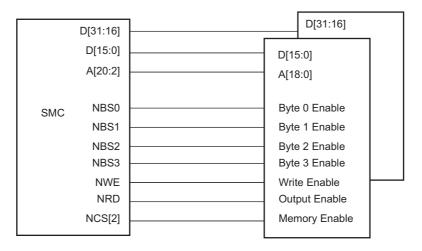

Figure 28-5. Memory Connection for a 32-bit Data Bus

### 28.8.2.1 Byte Write Access

Byte write access supports one byte write signal per byte of the data bus and a single read signal.

Note that the SMC does not allow boot in Byte Write Access mode.

 For 16-bit devices: the SMC provides NWR0 and NWR1 write signals for respectively byte0 (lower byte) and byte1 (upper byte) of a 16-bit bus. One single read signal (NRD) is provided.

Byte Write Access is used to connect 2 x 8-bit devices as a 16-bit memory.

• For 32-bit devices: NWR0, NWR1, NWR2 and NWR3, are the write signals of byte0 (lower byte), byte1, byte2 and byte 3 (upper byte) respectively. One single read signal (NRD) is provided.

Byte Write Access is used to connect 4 x 8-bit devices as a 32-bit memory.

Byte Write option is illustrated on Figure 28-6.

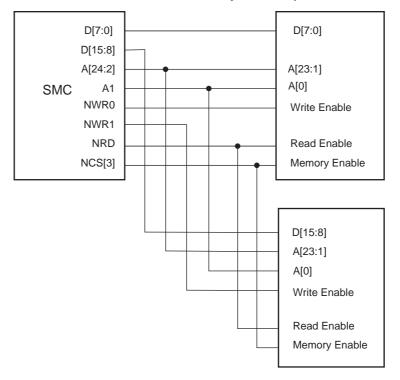

### 28.8.2.2 Byte Select Access

In this mode, read/write operations can be enabled/disabled at a byte level. One byte-select line per byte of the data bus is provided. One NRD and one NWE signal control read and write.

- For 16-bit devices: the SMC provides NBS0 and NBS1 selection signals for respectively byte0 (lower byte) and byte1 (upper byte) of a 16-bit bus.
  - Byte Select Access is used to connect one 16-bit device.
- For 32-bit devices: NBS0, NBS1, NBS2 and NBS3, are the selection signals of byte0 (lower byte), byte1, byte2 and byte 3 (upper byte) respectively. Byte Select Access is used to connect two 16-bit devices.

Figure 28-7 shows how to connect two 16-bit devices on a 32-bit data bus in Byte Select Access mode, on NCS3 (BAT = Byte Select Access).

Figure 28-6. Connection of 2 x 8-bit Devices on a 16-bit Bus: Byte Write Option

#### 28.8.2.3 Signal Multiplexing

Depending on the byte access type (BAT), only the write signals or the byte select signals are used. To save IOs at the external bus interface, control signals at the SMC interface are multiplexed. Table 28-4 shows signal multiplexing depending on the data bus width and the byte access type.

For 32-bit devices, bits A0 and A1 are unused. For 16-bit devices, bit A0 of address is unused. When the Byte Select option is selected, NWR1 to NWR3 are unused. When teh Byte Write option is selected, NBS0 to NBS3 are unused.

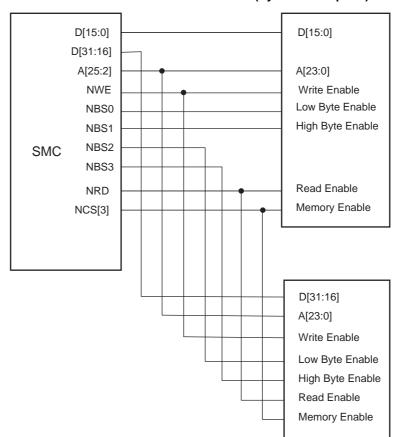

Figure 28-7. Connection of 2x16-bit Data Bus on a 32-bit Data Bus (Byte Select Option)

Table 28-4. SMC Multiplexed Signal Translation

| Signal Name            |             | 32-bit Bus  |            |             | 16-bit Bus |           |
|------------------------|-------------|-------------|------------|-------------|------------|-----------|
| Device Type            | 1 x 32-bit  | 2 x 16-bit  | 4 x 8-bit  | 1 x 16-bit  | 2 x 8-bit  | 1 x 8-bit |
| Byte Access Type (BAT) | Byte Select | Byte Select | Byte Write | Byte Select | Byte Write | _         |
| NBS0_A0                | NBS0        | NBS0        | _          | NBS0        | _          | A0        |
| NWE_NWR0               | NWE         | NWE         | NWR0       | NWE         | NWR0       | NWE       |
| NBS1_NWR1              | NBS1        | NBS1        | NWR1       | NBS1        | NWR1       | _         |
| NBS2_NWR2_A1           | NBS2        | NBS2        | NWR2       | A1          | A1         | A1        |
| NBS3_NWR3              | NBS3        | NBS3        | NWR3       | _           | _          | -         |

### 28.9 Standard Read and Write Protocols

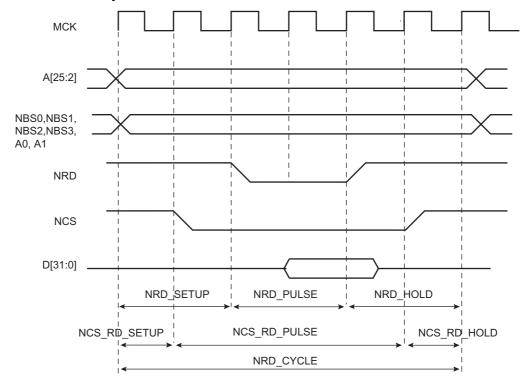

In the following sections, the byte access type is not considered. Byte select lines (NBS0 to NBS3) always have the same timing as the A address bus. NWE represents either the NWE signal in byte select access type or one of the byte write lines (NWR0 to NWR3) in byte write access type. NWR0 to NWR3 have the same timings and protocol as NWE. In the same way, NCS represents one of the NCS[0..5] chip select lines.

### 28.9.1 Read Waveforms

The read cycle is shown on Figure 28-8. The read cycle starts with the address setting on the memory address bus:

{A[25:2], A1, A0} for 8-bit devices {A[25:2], A1} for 16-bit devices A[25:2] for 32-bit devices

Figure 28-8. Standard Read Cycle

### 28.9.1.1 NRD Waveform

The NRD signal is characterized by a setup timing, a pulse width and a hold timing:

- NRD SETUP—NRD setup time is defined as the setup of address before the NRD falling edge.
- NRD\_PULSE—NRD pulse length is the time between NRD falling edge and NRD rising edge.
- NRD\_HOLD—NRD hold time is defined as the hold time of address after the NRD rising edge.

#### 28.9.1.2 NCS Waveform

Similar to the NRD signal, the NCS signal can be divided into a setup time, pulse length and hold time:

- NCS\_RD\_SETUP—NCS setup time is defined as the setup time of address before the NCS falling edge.
- NCS\_RD\_PULSE—NCS pulse length is the time between NCS falling edge and NCS rising edge;
- NCS\_RD\_HOLD—NCS hold time is defined as the hold time of address after the NCS rising edge.

### 28.9.1.3 Read Cycle

The NRD\_CYCLE time is defined as the total duration of the read cycle, that is, from the time where address is set on the address bus to the point where address may change. The total read cycle time is defined as:

NRD\_CYCLE = NRD\_SETUP + NRD\_PULSE + NRD\_HOLD, as well as

NRD\_CYCLE = NCS\_RD\_SETUP + NCS\_RD\_PULSE + NCS\_RD\_HOLD

All NRD and NCS timings are defined separately for each chip select as an integer number of Master Clock cycles. The NRD\_CYCLE field is common to both the NRD and NCS signals, thus the timing period is of the same duration.

NRD\_CYCLE, NRD\_SETUP, and NRD\_PULSE implicitly define the NRD\_HOLD value as:

NRD\_HOLD = NRD\_CYCLE - NRD SETUP - NRD PULSE

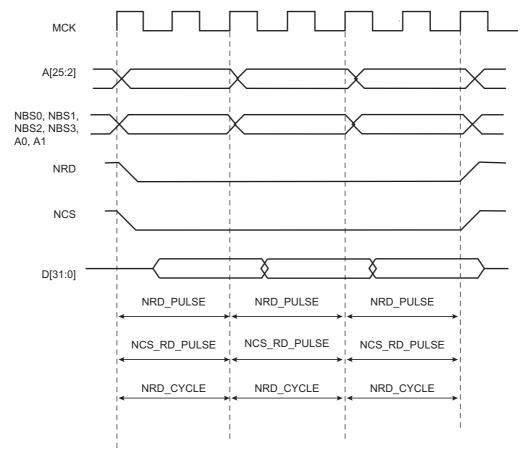

NRD\_CYCLE, NCS\_RD\_SETUP, and NCS\_RD\_PULSE implicitly define the NCS\_RD\_HOLD value as:

NCS\_RD\_HOLD = NRD\_CYCLE - NCS\_RD\_SETUP - NCS\_RD\_PULSE

#### 28.9.1.4 Null Delay Setup and Hold

If null setup and hold parameters are programmed for NRD and/or NCS, NRD and NCS remain active continuously in case of consecutive read cycles in the same memory (see Figure 28-9).

Figure 28-9. No Setup, No Hold On NRD and NCS Read Signals

#### 28.9.1.5 Null Pulse

Programming null pulse is not permitted. Pulse must be at least set to 1. A null value leads to unpredictable behavior.

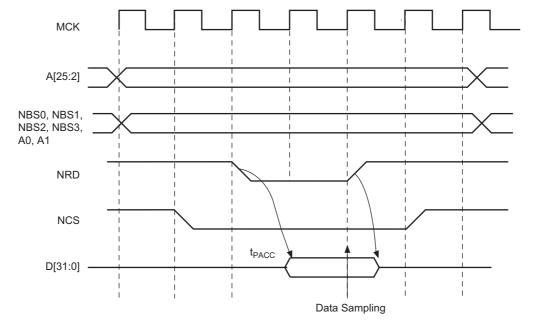

#### 28.9.2 Read Mode

As NCS and NRD waveforms are defined independently of one other, the SMC needs to know when the read data is available on the data bus. The SMC does not compare NCS and NRD timings to know which signal rises first. The READ\_MODE parameter in the SMC\_MODE register of the corresponding chip select indicates which signal of NRD and NCS controls the read operation.

### 28.9.2.1 Read is Controlled by NRD (READ\_MODE = 1)

Figure 28-10 shows the waveforms of a read operation of a typical asynchronous RAM. The read data is available  $t_{PACC}$  after the falling edge of NRD, and turns to 'Z' after the rising edge of NRD. In this case, the READ\_MODE must be set to 1 (read is controlled by NRD), to indicate that data is available with the rising edge of NRD. The SMC samples the read data internally on the rising edge of Master Clock that generates the rising edge of NRD, whatever the programmed waveform of NCS may be.

Figure 28-10. READ\_MODE = 1 (Data sampled by SMC before rising edge of NRD)

## 28.9.2.2 Read is Controlled by NCS (READ\_MODE = 0)

Figure 28-11 shows the typical read cycle of an LCD module. The read data is valid t<sub>PACC</sub> after the falling edge of the NCS signal and remains valid until the rising edge of NCS. Data must be sampled when NCS is raised. In that case, the READ\_MODE must be set to 0 (read is controlled by NCS): the SMC internally samples the data on the rising edge of Master Clock that generates the rising edge of NCS, whatever the programmed waveform of NRD may be.

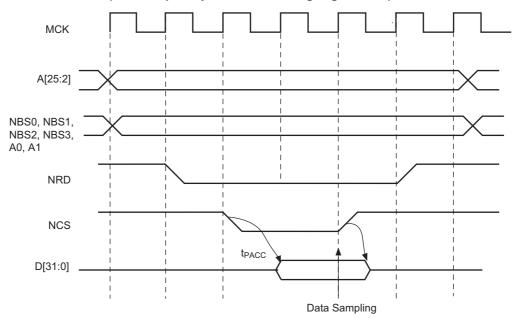

Figure 28-11. READ\_MODE = 0 (Data sampled by SMC before rising edge of NCS)

#### 28.9.3 Write Waveforms

The write protocol (depicted in Figure 28-12) is similar to the read protocol. The write cycle starts with the address setting on the memory address bus.

#### 28.9.3.1 NWE Waveforms

The NWE signal is characterized by a setup timing, a pulse width and a hold timing.

- NWE SETUP—NWE setup time is defined as the setup of address and data before the NWE falling edge.
- NWE\_PULSE—NWE pulse length is the time between NWE falling edge and NWE rising edge.
- NWE\_HOLD—NWE hold time is defined as the hold time of address and data after the NWE rising edge.

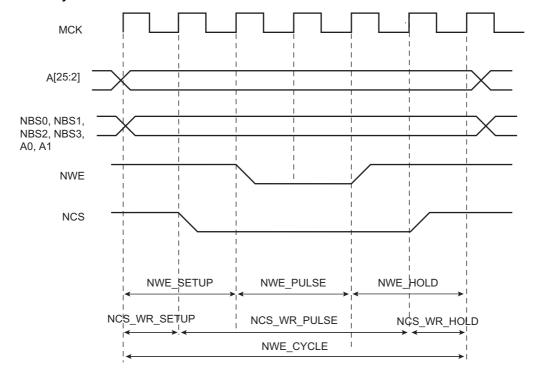

The NWE waveforms apply to all byte-write lines in Byte Write access mode: NWR0 to NWR3.

#### 28.9.3.2 NCS Waveforms

The NCS signal waveforms in write operation are not the same that those applied in read operations, but are separately defined:

- NCS\_WR\_SETUP—NCS setup time is defined as the setup time of address before the NCS falling edge.
- NCS\_WR\_PULSE—NCS pulse length is the time between NCS falling edge and NCS rising edge.
- NCS\_WR\_HOLD—NCS hold time is defined as the hold time of address after the NCS rising edge.

Figure 28-12. Write Cycle

## 28.9.3.3 Write Cycle

The write\_cycle time is defined as the total duration of the write cycle, that is, from the time where address is set on the address bus to the point where address may change. The total write cycle time is defined as:

NWE\_CYCLE = NWE\_SETUP + NWE\_PULSE + NWE\_HOLD,
as well as

NWE\_CYCLE = NCS\_WR\_SETUP + NCS\_WR\_PULSE + NCS\_WR\_HOLD

All NWE and NCS (write) timings are defined separately for each chip select as an integer number of Master Clock cycles. The NWE\_CYCLE field is common to both the NWE and NCS signals, thus the timing period is of the same duration.

NWE\_CYCLE, NWE\_SETUP, and NWE\_PULSE implicitly define the NWE\_HOLD value as:

NWE HOLD = NWE CYCLE - NWE SETUP - NWE PULSE

NWE\_CYCLE, NCS\_WR\_SETUP, and NCS\_WR\_PULSE implicitly define the NCS\_WR\_HOLD value as:

NCS\_WR\_HOLD = NWE\_CYCLE - NCS\_WR\_SETUP - NCS\_WR\_PULSE

#### 28.9.3.4 Null Delay Setup and Hold

If null setup parameters are programmed for NWE and/or NCS, NWE and/or NCS remain active continuously in case of consecutive write cycles in the same memory (see Figure 28-13). However, for devices that perform write operations on the rising edge of NWE or NCS, such as SRAM, either a setup or a hold must be programmed.

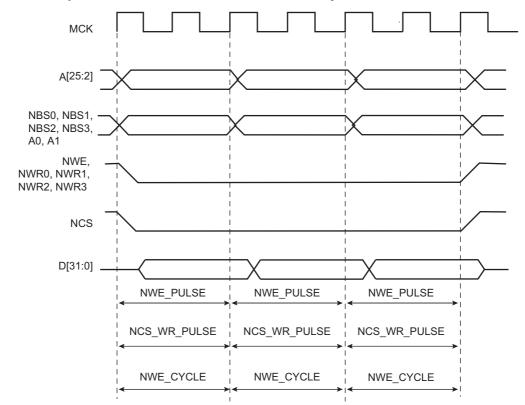

Figure 28-13. Null Setup and Hold Values of NCS and NWE in Write Cycle

### 28.9.3.5 Null Pulse

Programming null pulse is not permitted. Pulse must be at least set to 1. A null value leads to unpredictable behavior.

### 28.9.4 Write Mode

396

The WRITE\_MODE parameter in the SMC\_MODE register of the corresponding chip select indicates which signal controls the write operation.

### 28.9.4.1 Write is Controlled by NWE (WRITE\_MODE = 1):

Figure 28-14 shows the waveforms of a write operation with WRITE\_MODE set to 1. The data is put on the bus during the pulse and hold steps of the NWE signal. The internal data buffers are switched to output mode after the NWE\_SETUP time, and until the end of the write cycle, regardless of the programmed waveform on NCS.

### 28.9.5 Coding Timing Parameters

All timing parameters are defined for one chip select and are grouped together in one SMC\_REGISTER according to their type.

The SMC\_SETUP register groups the definition of all setup parameters:

NRD\_SETUP, NCS\_RD\_SETUP, NWE\_SETUP, NCS\_WR\_SETUP

The SMC\_PULSE register groups the definition of all pulse parameters:

NRD\_PULSE, NCS\_RD\_PULSE, NWE\_PULSE, NCS\_WR\_PULSE

The SMC\_CYCLE register groups the definition of all cycle parameters:

NRD\_CYCLE, NWE\_CYCLE

Table 28-5 shows how the timing parameters are coded and their permitted range.

Table 28-5. Coding and Range of Timing Parameters

|             |                |                               | Permitted Ran | ge              |

### 28.9.6 Reset Values of Timing Parameters

Table 28-9, "Register Mapping," on page 418 gives the default value of timing parameters at reset.

### 28.9.7 Usage Restriction

The SMC does not check the validity of the user-programmed parameters. If the sum of SETUP and PULSE parameters is larger than the corresponding CYCLE parameter, this leads to unpredictable behavior of the SMC.

For read operations:

Null but positive setup and hold of address and NRD and/or NCS can not be guaranteed at the memory interface because of the propagation delay of theses signals through external logic and pads. If positive setup and hold values must be verified, then it is strictly recommended to program non-null values so as to cover possible skews between address, NCS and NRD signals.

For write operations:

If a null hold value is programmed on NWE, the SMC can guarantee a positive hold of address, byte select lines, and NCS signal after the rising edge of NWE. This is true for WRITE\_MODE = 1 only. See "Early Read Wait State" on page 399.

For read and write operations:

A null value for pulse parameters is forbidden and may lead to unpredictable behavior.

In read and write cycles, the setup and hold time parameters are defined in reference to the address bus. For external devices that require setup and hold time between NCS and NRD signals (read), or between NCS and NWE signals (write), these setup and hold times must be converted into setup and hold times in reference to the address bus.

## 28.10 Automatic Wait States

Under certain circumstances, the SMC automatically inserts idle cycles between accesses to avoid bus contention or operation conflict.

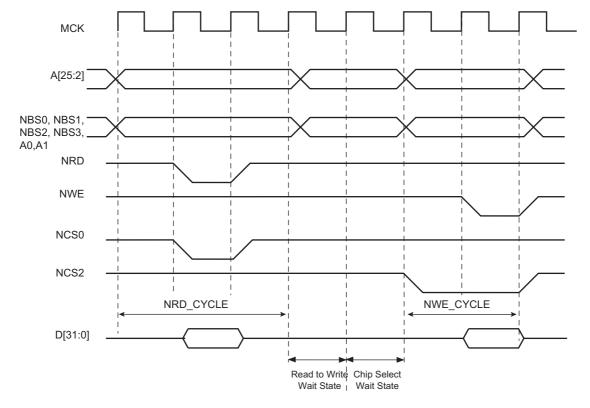

### 28.10.1 Chip Select Wait States

The SMC always inserts an idle cycle between 2 transfers on separate chip selects. This idle cycle ensures that there is no bus contention between the de-activation of one device and the activation of the next one.

During chip select wait state, all control lines are turned inactive: NBS0 to NBS3, NWR0 to NWR3, NCS[0..5], NRD lines are all set to 1.

Figure 28-16 illustrates a chip select wait state between access on Chip Select 0 and Chip Select 2.

Figure 28-16. Chip Select Wait State between a Read Access on NCS0 and a Write Access on NCS2

### 28.10.2 Early Read Wait State

In some cases, the SMC inserts a wait state cycle between a write access and a read access to allow time for the write cycle to end before the subsequent read cycle begins. This wait state is not generated in addition to a chip select wait state. The early read cycle thus only occurs between a write and read access to the same memory device (same chip select).

An early read wait state is automatically inserted if at least one of the following conditions is valid:

- the write controlling signal has no hold time and the read controlling signal has no setup time (Figure 28-17).
- in NCS write controlled mode (WRITE\_MODE = 0), there is no hold timing on the NCS signal and the NCS\_RD\_SETUP parameter is set to 0, regardless of the read mode (Figure 28-18). The write operation must end with a NCS rising edge. Without an Early Read Wait State, the write operation could not complete properly.
- in NWE controlled mode (WRITE\_MODE = 1) and if there is no hold timing (NWE\_HOLD = 0), the feedback of the write control signal is used to control address, data, chip select and byte select lines. If the external write control signal is not inactivated as expected due to load capacitances, an Early Read Wait State is inserted and address, data and control signals are maintained one more cycle. See Figure 28-19.

### 28.10.3 Reload User Configuration Wait State

The user may change any of the configuration parameters by writing the SMC user interface.

When detecting that a new user configuration has been written in the user interface, the SMC inserts a wait state before starting the next access. The so called "Reload User Configuration Wait State" is used by the SMC to load the new set of parameters to apply to next accesses.

The Reload Configuration Wait State is not applied in addition to the Chip Select Wait State. If accesses before and after re-programming the user interface are made to different devices (Chip Selects), then one single Chip Select Wait State is applied.

On the other hand, if accesses before and after writing the user interface are made to the same device, a Reload Configuration Wait State is inserted, even if the change does not concern the current Chip Select.

#### 28.10.3.1 User Procedure

To insert a Reload Configuration Wait State, the SMC detects a write access to any SMC\_MODE register of the user interface. If the user only modifies timing registers (SMC\_SETUP, SMC\_PULSE, SMC\_CYCLE registers) in the user interface, he must validate the modification by writing the SMC\_MODE, even if no change was made on the mode parameters.

The user must not change the configuration parameters of an SMC Chip Select (Setup, Pulse, Cycle, Mode) if accesses are performed on this CS during the modification. Any change of the Chip Select parameters, while fetching the code from a memory connected on this CS, may lead to unpredictable behavior. The instructions used to modify the parameters of an SMC Chip Select can be executed from the internal RAM or from a memory connected to another CS.

#### 28.10.3.2 Slow Clock Mode Transition

A Reload Configuration Wait State is also inserted when the Slow Clock Mode is entered or exited, after the end of the current transfer (see "Slow Clock Mode" on page 412).

#### 28.10.4 Read to Write Wait State

Due to an internal mechanism, a wait cycle is always inserted between consecutive read and write SMC accesses.

This wait cycle is referred to as a read to write wait state in this document.

This wait cycle is applied in addition to chip select and reload user configuration wait states when they are to be inserted. See Figure 28-16 on page 398.

#### 28.11 Data Float Wait States

Some memory devices are slow to release the external bus. For such devices, it is necessary to add wait states (data float wait states) after a read access:

- before starting a read access to a different external memory
- before starting a write access to the same device or to a different external one.

The Data Float Output Time (t<sub>DF</sub>) for each external memory device is programmed in the TDF\_CYCLES field of the SMC\_MODE register for the corresponding chip select. The value of TDF\_CYCLES indicates the number of data float wait cycles (between 0 and 15) before the external device releases the bus, and represents the time allowed for the data output to go to high impedance after the memory is disabled.

Data float wait states do not delay internal memory accesses. Hence, a single access to an external memory with long  $t_{DF}$  will not slow down the execution of a program from internal memory.

The data float wait states management depends on the READ\_MODE and the TDF\_MODE fields of the SMC\_MODE register for the corresponding chip select.

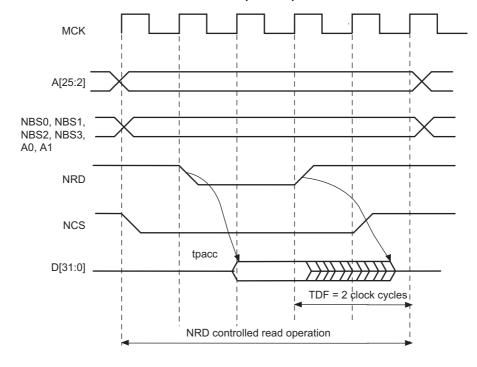

## 28.11.1 **READ\_MODE**

Setting the READ\_MODE to 1 indicates to the SMC that the NRD signal is responsible for turning off the tri-state buffers of the external memory device. The Data Float Period then begins after the rising edge of the NRD signal and lasts TDF\_CYCLES MCK cycles.

When the read operation is controlled by the NCS signal (READ\_MODE = 0), the TDF field gives the number of MCK cycles during which the data bus remains busy after the rising edge of NCS.

Figure 28-20 illustrates the Data Float Period in NRD-controlled mode (READ\_MODE =1), assuming a data float period of 2 cycles (TDF\_CYCLES = 2). Figure 28-21 shows the read operation when controlled by NCS (READ\_MODE = 0) and the TDF\_CYCLES parameter equals 3.

### 28.11.2 TDF Optimization Enabled (TDF\_MODE = 1)

When the TDF\_MODE of the SMC\_MODE register is set to 1 (TDF optimization is enabled), the SMC takes advantage of the setup period of the next access to optimize the number of wait states cycle to insert.

Figure 28-22 shows a read access controlled by NRD, followed by a write access controlled by NWE, on Chip Select 0. Chip Select 0 has been programmed with:

NRD\_HOLD = 4; READ\_MODE = 1 (NRD controlled)

NWE\_SETUP = 3; WRITE\_MODE = 1 (NWE controlled)

TDF\_CYCLES = 6; TDF\_MODE = 1 (optimization enabled).

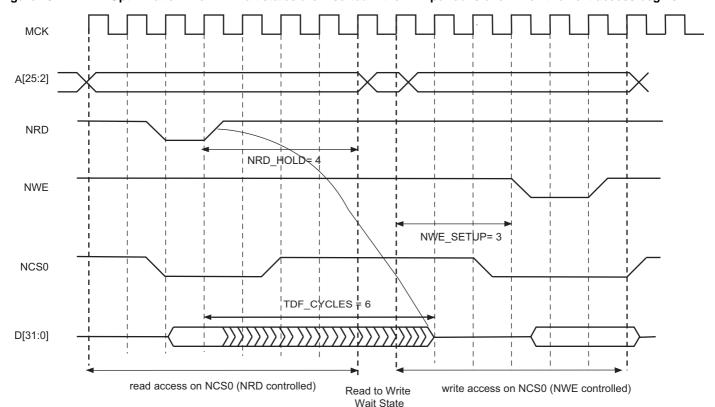

Figure 28-22. TDF Optimization: No TDF wait states are inserted if the TDF period is over when the next access begins

### 28.11.3 TDF Optimization Disabled (TDF\_MODE = 0)

When optimization is disabled, tdf wait states are inserted at the end of the read transfer, so that the data float period is ended when the second access begins. If the hold period of the read1 controlling signal overlaps the data float period, no additional tdf wait states will be inserted.

Figure 28-23, Figure 28-24 and Figure 28-25 illustrate the cases:

- read access followed by a read access on another chip select,
- read access followed by a write access on another chip select,
- · read access followed by a write access on the same chip select,

with no TDF optimization.

Figure 28-23. TDF Optimization Disabled (TDF Mode = 0). TDF wait states between 2 read accesses on different chip selects

Figure 28-25. TDF Mode = 0: TDF wait states between read and write accesses on the same chip select

#### 28.12 External Wait

Any access can be extended by an external device using the NWAIT input signal of the SMC. The EXNW\_MODE field of the SMC\_MODE register on the corresponding chip select must be set to either to "10" (frozen mode) or "11" (ready mode). When the EXNW\_MODE is set to "00" (disabled), the NWAIT signal is simply ignored on the corresponding chip select. The NWAIT signal delays the read or write operation in regards to the read or write controlling signal, depending on the read and write modes of the corresponding chip select.

#### 28.12.1 Restriction

When one of the EXNW\_MODE is enabled, it is mandatory to program at least one hold cycle for the read/write controlling signal. For that reason, the NWAIT signal cannot be used in Page Mode ("Asynchronous Page Mode" on page 414), or in Slow Clock Mode ("Slow Clock Mode" on page 412).

The NWAIT signal is assumed to be a response of the external device to the read/write request of the SMC. Then NWAIT is examined by the SMC only in the pulse state of the read or write controlling signal. The assertion of the NWAIT signal outside the expected period has no impact on SMC behavior.

### 28.12.2 Frozen Mode

When the external device asserts the NWAIT signal (active low), and after internal synchronization of this signal, the SMC state is frozen, i.e., SMC internal counters are frozen, and all control signals remain unchanged. When the resynchronized NWAIT signal is deasserted, the SMC completes the access, resuming the access from the point where it was stopped. See Figure 28-26. This mode must be selected when the external device uses the NWAIT signal to delay the access and to freeze the SMC.

The assertion of the NWAIT signal outside the expected period is ignored as illustrated in Figure 28-27.

Figure 28-26. Write Access with NWAIT Assertion in Frozen Mode (EXNW\_MODE = 10)

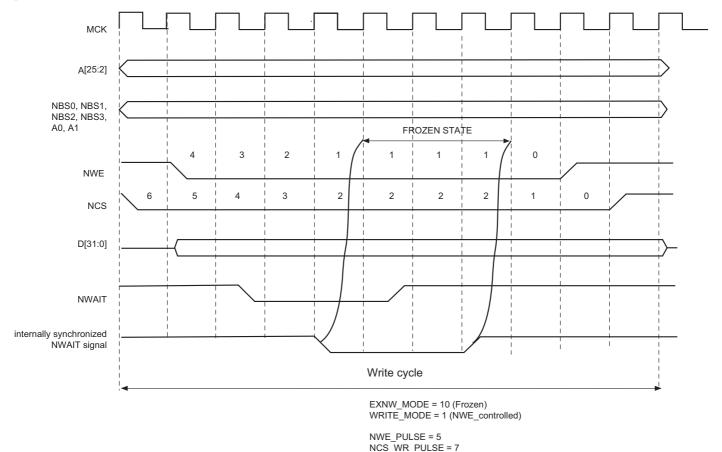

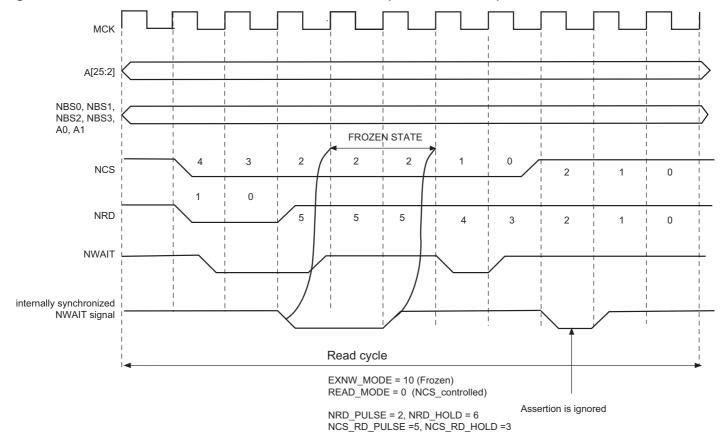

Figure 28-27. Read Access with NWAIT Assertion in Frozen Mode (EXNW\_MODE = 10)

**Atmel** 

## 28.12.3 Ready Mode

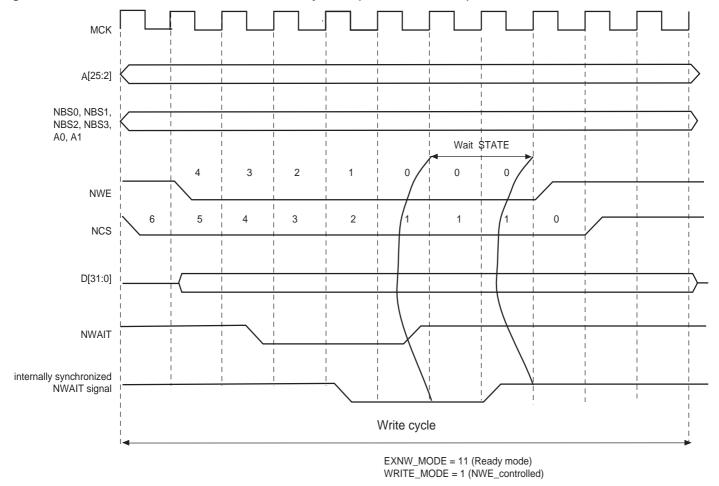

In Ready mode (EXNW\_MODE = 11), the SMC behaves differently. Normally, the SMC begins the access by down counting the setup and pulse counters of the read/write controlling signal. In the last cycle of the pulse phase, the resynchronized NWAIT signal is examined.

If asserted, the SMC suspends the access as shown in Figure 28-28 and Figure 28-29. After deassertion, the access is completed: the hold step of the access is performed.

This mode must be selected when the external device uses deassertion of the NWAIT signal to indicate its ability to complete the read or write operation.

If the NWAIT signal is deasserted before the end of the pulse, or asserted after the end of the pulse of the controlling read/write signal, it has no impact on the access length as shown in Figure 28-29.

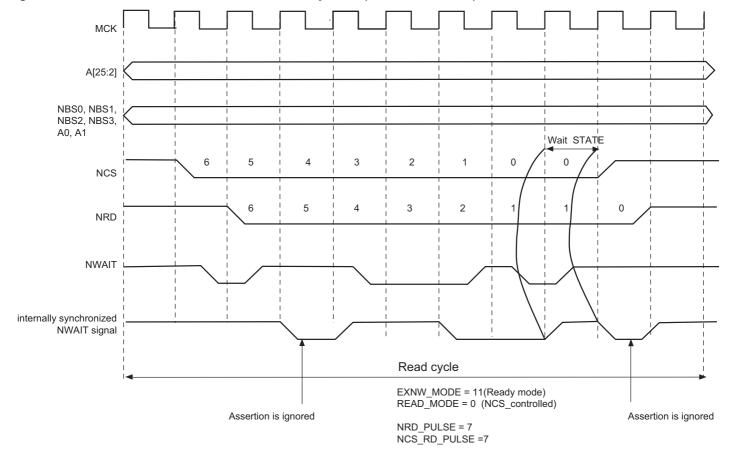

Figure 28-28. NWAIT Assertion in Write Access: Ready Mode (EXNW\_MODE = 11)

NWE\_PULSE = 5 NCS\_WR\_PULSE = 7

Figure 28-29. NWAIT Assertion in Read Access: Ready Mode (EXNW\_MODE = 11)

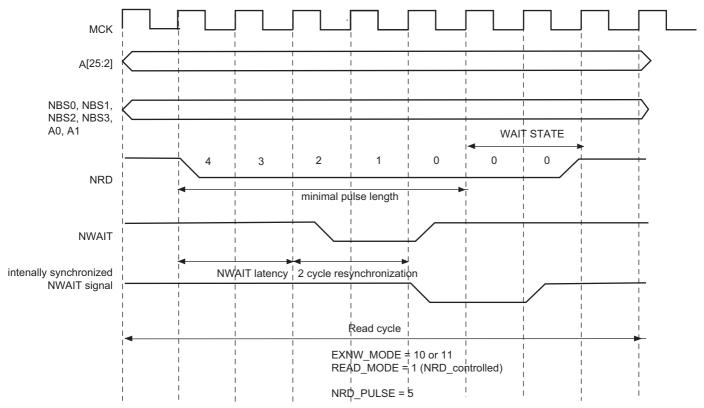

## 28.12.4 NWAIT Latency and Read/Write Timings

There may be a latency between the assertion of the read/write controlling signal and the assertion of the NWAIT signal by the device. The programmed pulse length of the read/write controlling signal must be at least equal to this latency plus the 2 cycles of resynchronization + 1 cycle. Otherwise, the SMC may enter the hold state of the access without detecting the NWAIT signal assertion. This is true in frozen mode as well as in ready mode. This is illustrated on Figure 28-30.

When EXNW\_MODE is enabled (ready or frozen), the user must program a pulse length of the read and write controlling signal of at least:

minimal pulse length = NWAIT latency + 2 resynchronization cycles + 1 cycle

Figure 28-30. NWAIT Latency

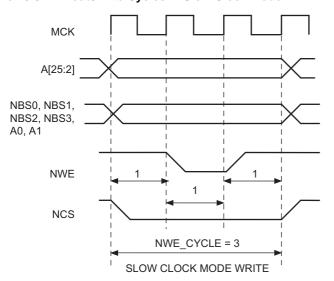

## 28.13 Slow Clock Mode

The SMC is able to automatically apply a set of "slow clock mode" read/write waveforms when an internal signal driven by the Power Management Controller is asserted because MCK has been turned to a very slow clock rate (typically 32kHz clock rate). In this mode, the user-programmed waveforms are ignored and the slow clock mode waveforms are applied. This mode is provided so as to avoid reprogramming the User Interface with appropriate waveforms at very slow clock rate. When activated, the slow mode is active on all chip selects.

#### 28.13.1 Slow Clock Mode Waveforms

Figure 28-31 illustrates the read and write operations in slow clock mode. They are valid on all chip selects. Table 28-6 indicates the value of read and write parameters in slow clock mode.

Figure 28-31. Read/write Cycles in Slow Clock Mode

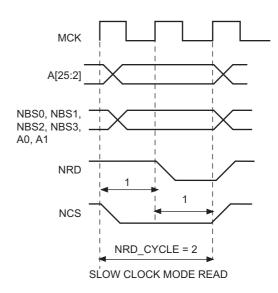

Table 28-6. Read and Write Timing Parameters in Slow Clock Mode

| Read Parameters | Duration (cycles) | Write Parameters | Duration (cycles) |
|-----------------|-------------------|------------------|-------------------|
| NRD_SETUP       | 1                 | NWE_SETUP        | 1                 |
| NRD_PULSE       | 1                 | NWE_PULSE        | 1                 |
| NCS_RD_SETUP    | 0                 | NCS_WR_SETUP     | 0                 |
| NCS_RD_PULSE    | 2                 | NCS_WR_PULSE     | 3                 |
| NRD_CYCLE       | 2                 | NWE_CYCLE        | 3                 |

### 28.13.2 Switching from (to) Slow Clock Mode to (from) Normal Mode

When switching from slow clock mode to the normal mode, the current slow clock mode transfer is completed at high clock rate, with the set of slow clock mode parameters. See Figure 28-32 on page 413. The external device may not be fast enough to support such timings.

Figure 28-33 illustrates the recommended procedure to properly switch from one mode to the other.

Figure 28-32. Clock Rate Transition Occurs while the SMC is Performing a Write Operation

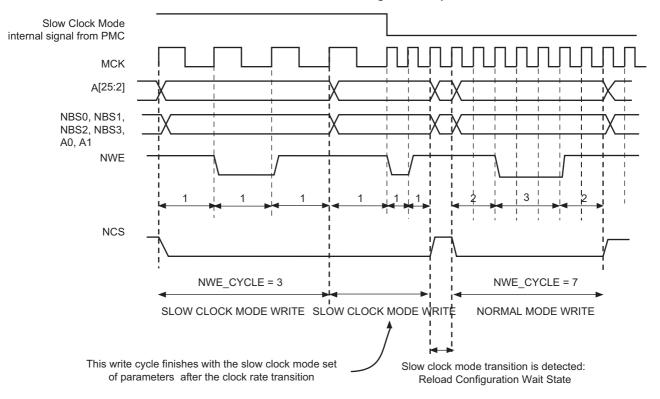

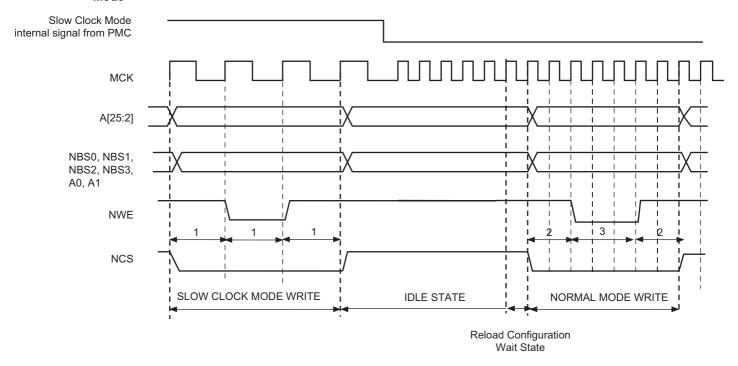

Figure 28-33. Recommended Procedure to Switch from Slow Clock Mode to Normal Mode or from Normal Mode to Slow Clock Mode

# 28.14 Asynchronous Page Mode

The SMC supports asynchronous burst reads in page mode, providing that the page mode is enabled in the SMC\_MODE register (PMEN field). The page size must be configured in the SMC\_MODE register (PS field) to 4, 8, 16 or 32 bytes.

The page defines a set of consecutive bytes into memory. A 4-byte page (resp. 8-, 16-, 32-byte page) is always aligned to 4-byte boundaries (resp. 8-, 16-, 32-byte boundaries) of memory. The MSB of data address defines the address of the page in memory, the LSB of address define the address of the data in the page as detailed in Table 28-7.

With page mode memory devices, the first access to one page ( $t_{pa}$ ) takes longer than the subsequent accesses to the page ( $t_{sa}$ ) as shown in Figure 28-34. When in page mode, the SMC enables the user to define different read timings for the first access within one page, and next accesses within the page.

Table 28-7. Page Address and Data Address within a Page

| Page Size | Page Address (1) | Data Address in the Page <sup>(2)</sup> |
|-----------|------------------|---|
| 4 bytes   | A[25:2]          | A[1:0]                                  |
| 8 bytes   | A[25:3]          | A[2:0]                                  |
| 16 bytes  | A[25:4]          | A[3:0]                                  |
| 32 bytes  | A[25:5]          | A[4:0]                                  |

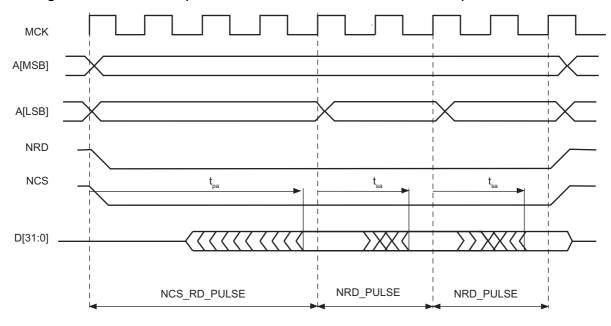

Notes: 1. 'A' denotes the address bus of the memory device

2. For 16-bit devices, the bit 0 of address is ignored. For 32-bit devices, bits [1:0] are ignored.

### 28.14.1 Protocol and Timings in Page Mode

Figure 28-34 shows the NRD and NCS timings in page mode access.

Figure 28-34. Page Mode Read Protocol (Address MSB and LSB are defined in Table 28-7)

The NRD and NCS signals are held low during all read transfers, whatever the programmed values of the setup and hold timings in the User Interface may be. Moreover, the NRD and NCS timings are identical. The pulse length of the first access to the page is defined with the NCS\_RD\_PULSE field of the SMC\_PULSE register. The pulse length of subsequent accesses within the page are defined using the NRD\_PULSE parameter.

The programming of the read timings in page mode is described in Table 28-8.

Table 28-8. Programming of Read Timings in Page Mode

| Parameter    | Value           | Definition                                     |
|--------------|-----------------|--|
| READ_MODE    | ʻx'             | No impact                                      |
| NCS_RD_SETUP | ʻx'             | No impact                                      |
| NCS_RD_PULSE | t <sub>pa</sub> | Access time of first access to the page        |
| NRD_SETUP    | ʻx'             | No impact                                      |
| NRD_PULSE    | t <sub>sa</sub> | Access time of subsequent accesses in the page |
| NRD_CYCLE    | ʻx'             | No impact                                      |

The SMC does not check the coherency of timings. It will always apply the NCS\_RD\_PULSE timings as page access timing ( $t_{pa}$ ) and the NRD\_PULSE for accesses to the page ( $t_{sa}$ ), even if the programmed value for  $t_{pa}$  is shorter than the programmed value for  $t_{sa}$ .

#### 28.14.2 Byte Access Type in Page Mode

The byte access type (BAT) configuration remains active in page mode. For 16-bit or 32-bit page mode devices that require byte selection signals, write a 0 to the BAT bit in the SMC Mode Register (SMC\_MODE) to select the byte select access type.

#### 28.14.3 Page Mode Restriction

The page mode is not compatible with the use of the NWAIT signal. Using the page mode and the NWAIT signal may lead to unpredictable behavior.

#### 28.14.4 Sequential and Non-sequential Accesses

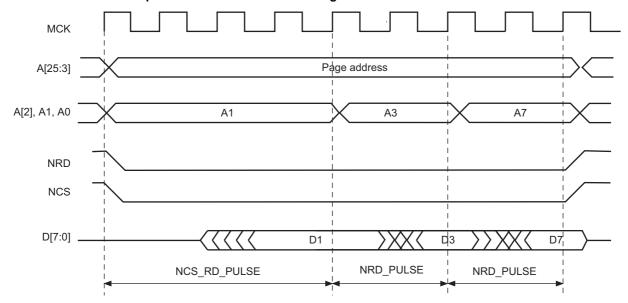

If the chip select and the MSB of addresses as defined in Table 28-7 are identical, then the current access lies in the same page as the previous one, and no page break occurs.

Using this information, all data within the same page, sequential or not sequential, are accessed with a minimum access time ( $t_{sa}$ ). Figure 28-35 illustrates access to an 8-bit memory device in page mode, with 8-byte pages. Access to D1 causes a page access with a long access time ( $t_{pa}$ ). Accesses to D3 and D7, though they are not sequential accesses, only require a short access time ( $t_{sa}$ ).

If the MSB of addresses are different, the SMC performs the access of a new page. In the same way, if the chip select is different from the previous access, a page break occurs. If two sequential accesses are made to the page mode memory, but separated by an other internal or external peripheral access, a page break occurs on the second access because the chip select of the device was deasserted between both accesses.

Figure 28-35. Access to Non-sequential Data within the Same Page

# 28.15 Register Write Protection

To prevent any single software error from corrupting SMC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the SMC Write Protection Mode Register (SMC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the SMC Write Protection Status Register (SMC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the SMC\_WPSR.

The following registers can be write-protected:

- SMC Setup Register
- SMC Pulse Register
- SMC Cycle Register
- SMC Mode Register

# 28.16 Static Memory Controller (SMC) User Interface

The SMC is programmed using the registers listed in Table 28-9. For each chip select, a set of four registers is used to program the parameters of the external device connected on it. In Table 28-9, "CS\_number" denotes the chip select number. Sixteen bytes (0x10) are required per chip select.

Note: The user must confirm the SMC configuration by writing any one of the SMC\_MODE registers.

Table 28-9. Register Mapping

| Offset                  | Register                             | Name      | Access     | Reset      |
|-------------------------|--------------------------------------|-----------|------------|------------|
| 0x10 x CS_number + 0x00 | SMC Setup Register                   | SMC_SETUP | Read/Write | 0x01010101 |
| 0x10 x CS_number + 0x04 | SMC Pulse Register                   | SMC_PULSE | Read/Write | 0x01010101 |
| 0x10 x CS_number + 0x08 | SMC Cycle Register                   | SMC_CYCLE | Read/Write | 0x00030003 |
| 0x10 x CS_number + 0x0C | SMC Mode Register                    | SMC_MODE  | Read/Write | 0x10001000 |
| 0xC0-0xDC               | Reserved                             | -         | _          | -          |
| 0xE4                    | SMC Write Protection Mode Register   | SMC_WPMR  | Read/Write | 0x00000000 |
| 0xE8                    | SMC Write Protection Status Register | SMC_WPSR  | Read-only  | 0x0000000  |
| 0xEC-0xFC               | Reserved                             | _         | _          | _          |

### 28.16.1 SMC Setup Register

Name: SMC\_SETUP[0..5]

Address: 0xFFFFEA00 [0], 0xFFFFEA10 [1], 0xFFFFEA20 [2], 0xFFFFEA30 [3], 0xFFFFEA40 [4], 0xFFFFEA50 [5]

Access: Read/Write

| 31 | 30 | 29 | 28 | 27     | 26      | 25 | 24 |
|----|----|----|----|--------|---------|----|----|
| _  | _  |    |    | NCS_RD | _SETUP  |    |    |
| 23 | 22 | 21 | 20 | 19     | 18      | 17 | 16 |
| _  | _  |    |    | NRD_   | SETUP   |    |    |
| 15 | 14 | 13 | 12 | 11     | 10      | 9  | 8  |
| _  | _  |    |    | NCS_WF | R_SETUP |    |    |
| 7  | 6  | 5  | 4  | 3      | 2       | 1  | 0  |
| _  | _  |    |    | NWE_   | SETUP   |    |    |

This register can only be written if the WPEN bit is cleared in the SMC Write Protection Mode Register.

### • NWE\_SETUP: NWE Setup Length

The NWE signal setup length is defined as:

NWE setup length = (128\* NWE\_SETUP[5] + NWE\_SETUP[4:0]) clock cycles

### NCS\_WR\_SETUP: NCS Setup Length in WRITE Access

In write access, the NCS signal setup length is defined as:

NCS setup length = (128\* NCS\_WR\_SETUP[5] + NCS\_WR\_SETUP[4:0]) clock cycles

### • NRD\_SETUP: NRD Setup Length

The NRD signal setup length is defined in clock cycles as:

NRD setup length = (128\* NRD\_SETUP[5] + NRD\_SETUP[4:0]) clock cycles

### NCS\_RD\_SETUP: NCS Setup Length in READ Access

In read access, the NCS signal setup length is defined as:

NCS setup length = (128\* NCS\_RD\_SETUP[5] + NCS\_RD\_SETUP[4:0]) clock cycles

### 28.16.2 SMC Pulse Register

Name: SMC\_PULSE[0..5]

Address: 0xFFFFEA04 [0], 0xFFFFEA14 [1], 0xFFFFEA24 [2], 0xFFFFEA34 [3], 0xFFFFEA44 [4], 0xFFFFEA54 [5]

Access: Read/Write

| 31 | 30 | 29 | 28 | 27           | 26 | 25 | 24 |
|----|----|----|----|--------------|----|----|----|
| _  |    |    |    | NCS_RD_PULSE |    |    |    |
| 23 | 22 | 21 | 20 | 19           | 18 | 17 | 16 |
| _  |    |    |    | NRD_PULSE    |    |    |    |
| 15 | 14 | 13 | 12 | 11           | 10 | 9  | 8  |
| _  |    |    |    | NCS_WR_PULSE |    |    |    |
| 7  | 6  | 5  | 4  | 3            | 2  | 1  | 0  |
| _  |    |    |    | NWE_PULSE    |    |    |    |

This register can only be written if the WPEN bit is cleared in the SMC Write Protection Mode Register.

#### • NWE PULSE: NWE Pulse Length

The NWE signal pulse length is defined as:

NWE pulse length = (256\* NWE PULSE[6] + NWE PULSE[5:0]) clock cycles

The NWE pulse length must be at least 1 clock cycle.

### • NCS\_WR\_PULSE: NCS Pulse Length in WRITE Access

In write access, the NCS signal pulse length is defined as:

NCS pulse length = (256\* NCS\_WR\_PULSE[6] + NCS\_WR\_PULSE[5:0]) clock cycles

The NCS pulse length must be at least 1 clock cycle.

#### NRD\_PULSE: NRD Pulse Length

In standard read access, the NRD signal pulse length is defined in clock cycles as:

NRD pulse length = (256\* NRD\_PULSE[6] + NRD\_PULSE[5:0]) clock cycles

The NRD pulse length must be at least 1 clock cycle.

In page mode read access, the NRD\_PULSE parameter defines the duration of the subsequent accesses in the page.

#### • NCS RD PULSE: NCS Pulse Length in READ Access

In standard read access, the NCS signal pulse length is defined as:

NCS pulse length = (256\* NCS\_RD\_PULSE[6] + NCS\_RD\_PULSE[5:0]) clock cycles

The NCS pulse length must be at least 1 clock cycle.

In page mode read access, the NCS\_RD\_PULSE parameter defines the duration of the first access to one page.

## 28.16.3 SMC Cycle Register

Name: SMC\_CYCLE[0..5]

Address: 0xFFFFEA08 [0], 0xFFFFEA18 [1], 0xFFFFEA28 [2], 0xFFFFEA38 [3], 0xFFFFEA48 [4], 0xFFFFEA58 [5]

Access: Read/Write

| 31 | 30        | 29 | 28    | 27    | 26 | 25 | 24        |
|----|-----------|----|-------|-------|----|----|-----------|
| _  | -         | _  | -     | -     | _  | -  | NRD_CYCLE |
| 23 | 22        | 21 | 20    | 19    | 18 | 17 | 16        |
|    |           |    | NRD_0 | CYCLE |    |    |           |
|    |           |    |       |       |    |    |           |
| 15 | 14        | 13 | 12    | 11    | 10 | 9  | 8         |
| _  | _         | _  | -     | _     | _  | -  | NWE_CYCLE |
| _  | _         | _  | _     | _     | _  | _  | _         |
| 7  | 6         | 5  | 4     | 3     | 2  | 1  | 0         |
|    | NWE_CYCLE |    |       |       |    |    |           |

This register can only be written if the WPEN bit is cleared in the SMC Write Protection Mode Register.

### • NWE\_CYCLE: Total Write Cycle Length

The total write cycle length is the total duration in clock cycles of the write cycle. It is equal to the sum of the setup, pulse and hold steps of the NWE and NCS signals. It is defined as:

Write cycle length = (NWE\_CYCLE[8:7]\*256 + NWE\_CYCLE[6:0]) clock cycles

# NRD\_CYCLE: Total Read Cycle Length

The total read cycle length is the total duration in clock cycles of the read cycle. It is equal to the sum of the setup, pulse and hold steps of the NRD and NCS signals. It is defined as:

Read cycle length = (NRD\_CYCLE[8:7]\*256 + NRD\_CYCLE[6:0]) clock cycles

## 28.16.4 SMC Mode Register

Name: SMC\_MODE[0..5]

Address: 0xFFFFEA0C [0], 0xFFFFEA1C [1], 0xFFFFEA2C [2], 0xFFFFEA3C [3], 0xFFFFEA4C [4], 0xFFFFEA5C [5]

Access: Read/Write

This register can only be written if the WPEN bit is cleared in the SMC Write Protection Mode Register.

The user must confirm the SMC configuration by writing any one of the SMC\_MODE registers.

## • READ\_MODE: Selection of the Control Signal for Read Operation

| Value | Name       | Description  |
|-------|------------|--|
|       |            | Read operation controlled by NCS signal  |
| 0     | 0 NCS_CTRL | <ul> <li>If TDF cycles are programmed, the external bus is marked busy after the rising edge of NCS.</li> <li>If TDF optimization is enabled (TDF_MODE = 1), TDF wait states are inserted after the setup of NCS.</li> </ul> |
|       |            | Read operation controlled by NRD signal  |
| 1     | 1 NRD_CTRL | <ul> <li>If TDF cycles are programmed, the external bus is marked busy after the rising edge of NRD.</li> <li>If TDF optimization is enabled (TDF_MODE = 1), TDF wait states are inserted after the setup of NRD.</li> </ul> |

### WRITE\_MODE: Selection of the Control Signal for Write Operation

| Value | Name     | Description  |
|-------|----------|--|
| 0     | NCS_CTRL | Write operation controlled by NCS signal—If TDF optimization is enabled (TDF_MODE = 1), TDF wait states will be inserted after the setup of NCS. |
| 1     | NWE_CTRL | Write operation controlled by NWE signal—If TDF optimization is enabled (TDF_MODE = 1), TDF wait states will be inserted after the setup of NWE. |

### • EXNW\_MODE: NWAIT Mode

The NWAIT signal is used to extend the current read or write signal. It is only taken into account during the pulse phase of the read and write controlling signal. When the use of NWAIT is enabled, at least one cycle hold duration must be programmed for the read and write controlling signal.

| Value | Name     | Description   |
|-------|----------|---|
| 00    | DISABLED | Disabled Mode—The NWAIT input signal is ignored on the corresponding Chip Select.   |
| 01    | _        | Reserved  |
| 10    | FROZEN   | Frozen Mode—If asserted, the NWAIT signal freezes the current read or write cycle. After deassertion, the read/write cycle is resumed from the point where it was stopped.  |
| 11    | READY    | Ready Mode—The NWAIT signal indicates the availability of the external device at the end of the pulse of the controlling read or write signal, to complete the access. If high, the access normally completes. If low, the access is extended until NWAIT returns high. |

## • BAT: Byte Access Type

This field is used only if DBW defines a 16- or 32-bit data bus.

| Value | Name        | Description   |
|-------|-------------|---|
|       | BYTE_SELECT | Byte select access type:  |
| 0     |             | - Write operation is controlled using NCS, NWE, NBS0, NBS1, NBS2 and NBS3 |
|       |             | - Read operation is controlled using NCS, NRD, NBS0, NBS1, NBS2 and NBS3  |
|       | BYTE_WRITE  | Byte write access type:   |
| 1     |             | - Write operation is controlled using NCS, NWR0, NWR1, NWR2, NWR3         |
|       |             | - Read operation is controlled using NCS and NRD                          |

#### · DBW: Data Bus Width

| Value | Name   | Description |
|-------|--------|-------------|
| 00    | BIT_8  | 8-bit bus   |
| 01    | BIT_16 | 16-bit bus  |
| 10    | BIT_32 | 32-bit bus  |
| 11    | _      | Reserved    |

### • TDF\_CYCLES: Data Float Time

This field gives the integer number of clock cycles required by the external device to release the data after the rising edge of the read controlling signal. The SMC always provides one full cycle of bus turnaround after the TDF\_CYCLES period. The external bus cannot be used by another chip select during TDF\_CYCLES + 1 cycles. From 0 up to 15 TDF\_CYCLES can be set.

### • TDF\_MODE: TDF Optimization

1: TDF optimization enabled—The number of TDF wait states is optimized using the setup period of the next read/write access.

0: TDF optimization disabled—The number of TDF wait states is inserted before the next access begins.

### PMEN: Page Mode Enabled

1: Asynchronous burst read in page mode is applied on the corresponding chip select.

0: Standard read is applied.

### PS: Page Size

If page mode is enabled, this field indicates the size of the page in bytes.

| Value | Name    | Description  |
|-------|---------|--------------|
| 00    | BYTE_4  | 4-byte page  |
| 01    | BYTE_8  | 8-byte page  |
| 10    | BYTE_16 | 16-byte page |
| 11    | BYTE_32 | 32-byte page |

# 28.16.5 SMC Write Protection Mode Register

Name: SMC\_WPMR
Address: 0xFFFFEAE4
Access: Read//Write

| Access: | Read//write |    |    |    |    |    |      |  |  |
|---------|-------------|----|----|----|----|----|------|--|--|

| WPKEY   |             |    |    |    |    |    |      |  |  |
| 23      | 22          | 21 | 20 | 19 | 18 | 17 | 16   |  |  |
|         | WPKEY       |    |    |    |    |    |      |  |  |
| 15      | 14          | 13 | 12 | 11 | 10 | 9  | 8    |  |  |
| WPKEY   |             |    |    |    |    |    |      |  |  |
| 7       | 6           | 5  | 4  | 3  | 2  | 1  | 0    |  |  |
| _       | _           | _  | _  | _  | _  |    | WPEN |  |  |
|         |             |    |    |    |    |    |      |  |  |

### • WPEN: Write Protection Enable

0: Disables write protection if WPKEY value corresponds to 0x534D43 ("SMC" in ASCII).

1: Enables write protection if WPKEY value corresponds to 0x534D43 ("SMC" in ASCII).

See Section 28.9.5 "Coding Timing Parameters" for list of write-protected registers.

# • WPKEY: Write Protection Key

| Value    | Name   | Description   |
|----------|--------|---|
| 0x534D43 | PASSWD | Writing any other value in this field aborts the write operation of bit WPEN.  Always reads as 0. |

# 28.16.6 SMC Write Protection Status Register

Name: SMC\_WPSR Address: 0xFFFFEAE8

### • WPVS: Write Protection Violation Status

0: No write protection violation has occurred since the last read of the SMC\_WPSR.

### • WPVSRC: Write Protection Violation Source

When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

<sup>1:</sup> A write protection violation occurred since the last read of the SMC\_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

# 29. DDR SDR SDRAM Controller (DDRSDRC)

# 29.1 Description

The DDR SDR SDRAM Controller (DDRSDRC) is a multiport memory controller. It comprises four slave AHB interfaces. All simultaneous accesses (four independent AHB ports) are interleaved to maximize memory bandwidth and minimize transaction latency due to SDRAM protocol.

The DDRSDRC extends the memory capabilities of a chip by providing the interface to an external 16-bit or 32-bit SDR-SDRAM device and external 16-bit DDR-SDRAM device. The page size supports ranges from 2048 to 16384 rows and from 256 to 4096 columns. It supports byte (8-bit), half-word (16-bit) and word (32-bit) accesses.

The DDRSDRC supports a read or write burst length (BL) of eight locations. This enables the command and address bus to anticipate the next command, thus reducing latency imposed by the SDRAM protocol and improving the SDRAM bandwidth. Moreover, the DDRSDRC keeps track of the active row in each bank, thus maximizing SDRAM performance, e.g., the application may be placed in one bank and data in the other banks. To optimize performance, it is advisable to avoid accessing different rows in the same bank. The DDRSDRC supports a CAS latency of 2 or 3 and optimizes the read access depending on the frequency.

The features of Self refresh, Power-down, and Deep Power-down modes minimize the consumption of the SDRAM device.

The DDRSDRC user interface is compliant with ARM Advanced Peripheral Bus (APB rev2).

Note: The term "SDRAM device" regroups SDR-SDRAM, Low-power SDR-SDRAM, Low-power DDR1-SDRAM and DDR2-SDRAM devices.

### 29.2 Embedded Characteristics

- AMBA compliant interface, interfaces directly to the ARM advanced high performance bus (AHB)
  - Four AHB interfaces, management of all accesses maximizes memory bandwidth and minimizes transaction latency
  - AHB transfer: Word, Half-Word, Byte access
- Supports DDR2-SDRAM, Low-power DDR1-SDRAM, SDR-SDRAM and Low-power SDR-SDRAM
- Numerous configurations supported
  - 2K, 4K, 8K, 16K row address memory parts
  - SDRAM with four and eight internal banks
  - SDR-SDRAM with 16- or 32-bit data path
  - DDR-SDRAM with 16-bit data path
  - One Chip Select for SDRAM device (256 Mbyte address space)
- Programming facilities
  - Multibank ping-pong access (up to or 4 banks or 8 banks opened at same time = reduces average latency of transactions)
  - Timing parameters specified by software
  - Automatic refresh operation, refresh rate is programmable
  - Automatic update of DS and PASR parameters (Low-power SDRAM Devices)
- Energy-saving capabilities
  - Self refresh, Power-down, Active Power-down and Deep Power-down modes supported
- SDRAM power-up initialization by software
- CAS Latency of 2, 3 supported
- Reset function supported (DDR2-SDRAM)
- ODT (On-die Termination) not supported
- Auto Precharge command not used
- SDR-SDRAM with 16-bit datapath and eight columns not supported
- DDR2-SDRAM with eight internal banks supported
- Linear and interleaved decoding supported
- SDR-SDRAM or Low-power DDR1-SDRAM with 2 internal banks not supported
- Clock frequency change in Precharge Power-down mode not supported
- OCD (Off-chip Driver) mode not supported

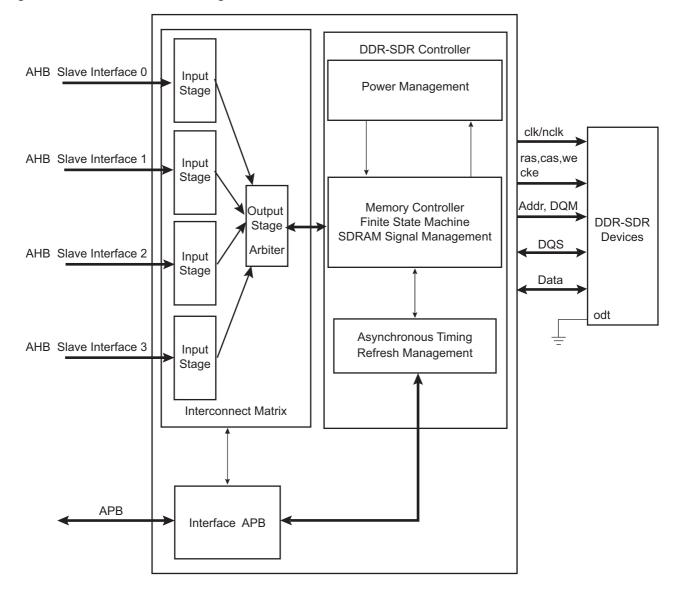

# 29.3 DDRSDRC Module Diagram

The DDRSDRC is partitioned in two blocks (see Figure 29-1):

- An Interconnect-Matrix that manages concurrent accesses on the AHB bus between four AHB masters and integrates an arbiter.
- A controller that translates AHB requests (Read/Write) in the SDRAM protocol.

Figure 29-1. DDRSDRC Module Diagram

## 29.4 Initialization Sequence

The addresses given are for example purposes only. The real address depends on implementation in the product.

#### 29.4.1 SDR-SDRAM Initialization

The initialization sequence is generated by software. The following sequence initializes SDR-SDRAM devices:

- 1. Program the memory device type in the Memory Device Register (see Section 29.7.8 on page 465).
- 2. Program the features of the SDR-SDRAM device in the Timing Register (asynchronous timing (trc, tras, etc.)), and in the Configuration Register (number of columns, rows, banks, CAS latency) (see Section 29.7.3 on page 456, Section 29.7.4 on page 459 and Section 29.7.5 on page 461).
- 3. For low-power SDRAM, drive strength (DS) and partial array self refresh (PASR) must be set in the Low-power Register (see Section 29.7.7 on page 463).

A minimum pause of 200 µs is provided to precede any signal toggle.

- 4. A NOP command is issued to the SDR-SDRAM. To program the NOP command, the application must configure the MODE field value to 1 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to any SDR-SDRAM address to acknowledge this command. Now the clock which drives SDR-SDRAM device is enabled.
- An All Banks Precharge command is issued to the SDR-SDRAM. To program All Banks Precharge command, the application must configure the MODE field value to 2 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to any SDR-SDRAM address to acknowledge this command.
- 6. Eight CAS before RAS (CBR) auto-refresh cycles are provided. To program the auto refresh command (CBR), the application must configure the MODE field value to 4 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to any SDR-SDRAM location eight times to acknowledge these commands.
- 7. A Mode Register set (MRS) cycle is issued to program the parameters of the SDR-SDRAM devices, in particular CAS latency and burst length. The application must configure the MODE field value to 3 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to the SDR-SDRAM to acknowledge this command. The write address must be chosen so that BA[1:0] are set to 0. For example, with a 16-bit 128 MB SDR-SDRAM (12 rows, 9 columns, 4 banks) bank address, the SDRAM write access should be performed at the address 0x20000000.

Note: This address is for example purposes only. The real address is dependent on implementation in the product.

- 8. For low-power SDR-SDRAM initialization, an Extended Mode Register set (EMRS) cycle is issued to program the SDR-SDRAM parameters (PASR, DS acronyms in JEDEC datasheet). The application must configure the MODE field value to 5 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to the SDR-SDRAM to acknowledge this command. The write address must be chosen so that BA[1] is set to 1 and BA[0] is set to 0. For example, with a 16-bit 128 MB SDRAM, (12 rows, 9 columns, 4 banks) bank address, the SDRAM write access should be performed at the address 0x20800000.
- 9. The application must go into Normal mode by configuring the MODE field value to 0 in the Mode Register (see Section 29.7.1 on page 454) and performing a write access at any location in the SDRAM to acknowledge this command.
- 10. Write the refresh rate into the COUNT field in the DDRSDRC Refresh Timer Register (DDRSDRC\_RTR). (Refresh rate = delay between refresh cycles). The SDR-SDRAM device requires a refresh every 15.625  $\mu$ s or 7.81  $\mu$ s. With a 100 MHz frequency, DDRSDRC\_RTR.COUNT must be configured to 15.625  $\times$  100 MHz = 1562 (0x061A) or 7.81  $\times$  100 MHz = 781 (0x030D).

After initialization, the SDR-SDRAM device is fully functional.

### 29.4.2 Low-power DDR1-SDRAM Initialization

The initialization sequence is generated by software. The following sequence initializes low-power DDR1-SDRAM devices:

- 1. Program the memory device type in the Memory Device Register (see Section 29.7.8 on page 465).
- 2. Program the features of the low-power DDR1-SDRAM device in the Configuration Register: asynchronous timing (TRC, TRAS, etc.), number of columns, rows, banks, CAS latency. See Section 29.7.3 on page 456, Section 29.7.4 on page 459 and Section 29.7.5 on page 461.
- 3. Program Partial array self refresh (PASR) and Drive strength (DS) in the Low-power Register. See Section 29.7.7 on page 463.
- 4. An NOP command will be issued to the low-power DDR1-SDRAM. To program the NOP command, the application must configure the MODE field value to 1 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to any DDR1-SDRAM address to acknowledge this command. Now clocks which drive DDR1-SDRAM device are enabled.

A minimum pause of 200 µs will be provided to precede any signal toggle.

- 5. An All Banks Precharge command is issued to the low-power DDR1-SDRAM. To program the All Banks Precharge command, the application must configure the MODE field value to 2 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to any low-power DDR1-SDRAM address to acknowledge this command.
- 6. Two CAS before RAS (CBR) auto-refresh cycles are provided. To program the auto refresh command (CBR), the application must configure the MODE field value to 4 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to any low-power DDR1-SDRAM location twice to acknowledge these commands.
- 7. An Extended Mode Register set (EMRS) cycle is issued to program the low-power DDR1-SDRAM parameters (carried on PASR, DS fields in DDRSDRC Low-power Register (DDRSDRC\_LPR). The application must configure the MODE field value to 5 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to the SDRAM to acknowledge this command. The write address must be chosen so that BA[1] is set to 1 BA[0] is set to 0. For example, with a 16-bit 128 MB SDRAM (12 rows, 9 columns, 4 banks) bank address, the low-power DDR1-SDRAM write access should be performed at address 0x20800000.

Note: This address is for example purposes only. The real address is dependent on implementation in the product.

- 8. A Mode Register set (MRS) cycle is issued to program the parameters of the low-power DDR1-SDRAM devices, in particular CAS latency, burst length. The application must configure the MODE field value to 3 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to the low-power DDR1-SDRAM to acknowledge this command. The write address must be chosen so that BA[1:0] bits are set to 0. For example, with a 16-bit 128 MB low-power DDR1-SDRAM (12 rows, 9 columns, 4 banks) bank address, the SDRAM write access should be performed at the address 0x20000000. The application must go into Normal mode by configuring the MODE field value to 0 in the Mode Register (see Section 29.7.1 on page 454) and performing a write access at any location in the low-power DDR1-SDRAM to acknowledge this command.
- 9. Perform a write access to any low-power DDR1-SDRAM address.
- 10. Write the refresh rate into the COUNT field in the DDRSDRC Refresh Timer Register (DDRSDRC\_RTR). (Refresh rate = delay between refresh cycles). The low-power DDR1-SDRAM device requires a refresh every 15.625  $\mu$ s or 7.81  $\mu$ s. With a 100 MHz frequency, DDRSDRC\_RTR.COUNT must be configured to 15.625  $\times$  100 MHz = 1562 (0x061A) or 7.81  $\times$  100 MHz = 781 (0x030D).
- 11. After initialization, the low-power DDR1-SDRAM device is fully functional.

### 29.4.3 DDR2-SDRAM Initialization

The initialization sequence is generated by software. The following sequence initializes DDR2-SDRAM devices:

- 1. Program the memory device type in the Memory Device Register (see Section 29.7.8 on page 465).
- 2. Program the features of DDR2-SDRAM device in the Timing Register (asynchronous timing (trc, tras, etc.)), and in the Configuration Register (number of columns, rows, banks, CAS latency and output drive strength) (see Section 29.7.3 on page 456, Section 29.7.4 on page 459 and Section 29.7.5 on page 461).
- An NOP command is issued to the DDR2-SDRAM. To program the NOP command, the application must configure the MODE field value to 1 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to any DDR2-SDRAM address to acknowledge this command. Now clocks which drive DDR2-SDRAM device are enabled.

A minimum pause of 200 µs is provided to precede any signal toggle.

- 4. An NOP command is issued to the DDR2-SDRAM. To program the NOP command, the application must configure the MODE field value to 1 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to any DDR2-SDRAM address to acknowledge this command. Now CKE is driven high.
- 5. An All Banks Precharge command is issued to the DDR2-SDRAM. To program the All Banks Precharge command, the application must configure the MODE field value to 2 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to any DDR2-SDRAM address to acknowledge this command.
- 6. An Extended Mode Register set (EMRS2) cycle is issued to choose between commercial or high temperature operations. The application must configure the MODE field value to 5 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that BA[1] is set to 1 and BA[0] is set to 0. For example, with a 16-bit 128 MB DDR2-SDRAM (12 rows, 9 columns, 4 banks) bank address, the DDR2-SDRAM write access should be performed at the address 0x20800000.

Note: This address is for example purposes only. The real address is dependent on implementation in the product.

- 7. An Extended Mode Register set (EMRS3) cycle is issued to set the Extended Mode Register to 0. The application must configure the MODE field value to 5 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that BA[1] is set to 1 and BA[0] is set to 1. For example, with a 16-bit 128 MB DDR2-SDRAM (12 rows, 9 columns, 4 banks) bank address, the DDR2-SDRAM write access should be performed at the address 0x20C00000.
- 8. An Extended Mode Register set (EMRS1) cycle is issued to enable DLL. The application must configure the MODE field value to 5 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that BA[1] is set to 0 and BA[0] is set to 1. For example, with a 16-bit 128 MB DDR2-SDRAM (12 rows, 9 columns, 4 banks) bank address, the DDR2-SDRAM write access should be performed at the address 0x20400000.

An additional 200 cycles of clock are required for locking DLL.

- 9. Program "Enable DLL reset" by setting the DLL bit in the Configuration Register (see Section 29.7.3 on page 456).
- 10. A Mode Register set (MRS) cycle is issued to reset DLL. The application must configure the MODE field value to 3 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that BA[1:0] bits are set to 0. For example, with a 16-bit 128 MB DDR2-SDRAM (12 rows, 9 columns, 4 banks) bank address, the SDRAM write access should be performed at the address 0x20000000.
- 11. An All Banks Precharge command is issued to the DDR2-SDRAM. To program the All Banks Precharge command, the application must configure the MODE field value to 2 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to any DDR2-SDRAM address to acknowledge this command.

- 12. Two CAS before RAS (CBR) auto-refresh cycles are provided. To program the auto refresh command (CBR), the application must configure the MODE field value to 4 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to any DDR2-SDRAM location twice to acknowledge these commands.
- 13. Program "Disable DLL reset" by clearing DLL bit in the Configuration Register (see Section 29.7.3 on page 456).
- 14. A Mode Register set (MRS) cycle is issued to program the parameters of the DDR2-SDRAM devices, in particular CAS latency, burst length and to disable DLL reset. The application must configure the MODE field value to 3 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that BA[1:0] are set to 0. For example, with a 16-bit 128 MB SDRAM (12 rows, 9 columns, 4 banks) bank address, the SDRAM write access should be performed at the address 0x20000000.
- 15. Program "OCD calibration default" by configuring the OCD field value to 7 in the Configuration Register (see Section 29.7.3 on page 456).
- 16. An Extended Mode Register set (EMRS1) cycle is issued to OCD default value. The application must configure the MODE field value to 5 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that BA[1] is set to 0 and BA[0] is set to 1. For example, with a 16-bit 128 MB DDR2-SDRAM (12 rows, 9 columns, 4 banks) bank address, the DDR2-SDRAM write access should be performed at the address 0x20400000.
- 17. Program "Exit from OCD calibration mode" by configuring the OCD field value to 0 in the Configuration Register (see Section 29.7.3 on page 456).
- 18. An Extended Mode Register set (EMRS1) cycle is issued to enable OCD exit. The application must configure the MODE field value to 5 in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that BA[1] is set to 0 and BA[0] is set to 1. For example, with a 16-bit 128 MB DDR2-SDRAM (12 rows, 9 columns, 4 banks) bank address, the DDR2-SDRAM write access should be performed at the address 0x20400000.
- 19. Program the Normal mode in the Mode Register (see Section 29.7.1 on page 454) and perform a write access to any DDR2-SDRAM address to acknowledge this command.
- Perform a write access to any DDR2-SDRAM address.
- 21. Write the refresh rate into the COUNT field in the DDRSDRC Refresh Timer Register (DDRSDRC\_RTR). (Refresh rate = delay between refresh cycles). The DDR2-SDRAM device requires a refresh every 15.625 μs or 7.81 μs. With a 133 MHz frequency, DDRSDRC\_RTR.COUNT must be configured to 15.625 × 133 MHz = 2079 (0x081F) or 7.81 × 133 MHz = 1039 (0x040F).

After initialization, the DDR2-SDRAM devices are fully functional.

## 29.5 Functional Description

## 29.5.1 SDRAM Controller Write Cycle

The DDRSDRC allows burst access or single access in Normal mode (DDRSDRC\_MR.MODE = 0). Whatever the access type, the DDRSDRC keeps track of the active row in each bank, thus maximizing performance.

The SDRAM device is programmed with a burst length equal to 8. This determines the length of a sequential data input by the write command that is set to 8. The latency from write command to data input is fixed to 1 in the case of DDR-SDRAM devices. In the case of SDR-SDRAM devices, there is no latency from write command to data input.

To initiate a single access, the DDRSDRC checks if the page access is already open. If row/bank addresses match with the previous row/bank addresses, the controller generates a write command. If the bank addresses are not identical or if bank addresses are identical but the row addresses are not identical, the controller generates a precharge command, activates the new row and initiates a write command. To comply with SDRAM timing parameters, additional clock cycles are inserted between precharge/active (T<sub>RP</sub>) commands and active/write (TRCD) command. As the burst length is fixed to 8, in the case of single access, it has to stop the burst, otherwise seven invalid values may be written. In the case of SDR-SDRAM devices, a Burst Stop command is generated to interrupt the write operation. In the case of DDR-SDRAM devices, Burst Stop command is not supported for the burst write operation. In order to then interrupt the write operation, DM must be set to 1 to mask invalid data (see Figure 29-2 on page 434 and Figure 29-5 on page 435) and DQS must continue to toggle.

To initiate a burst access, the DDRSDRC uses the transfer type signal provided by the master requesting the access. If the next access is a sequential write access, writing to the SDRAM device is carried out. If the next access is a write non-sequential access, then an automatic access break is inserted, the DDRSDRC generates a precharge command, activates the new row and initiates a write command. To comply with SDRAM timing parameters, additional clock cycles are inserted between precharge/active (TRP) commands and active/write (tRCD) commands.

For a definition of timing parameters, refer to Section 29.7.4 "DDRSDRC Timing Parameter 0 Register" on page 459.

Write accesses to the SDRAM devices are burst oriented and the burst length is programmed to 8. It determines the maximum number of column locations that can be accessed for a given write command. When the write command is issued, eight columns are selected. All accesses for that burst take place within these eight columns, thus the burst wraps within these eight columns if a boundary is reached. These eight columns are selected by addr[13:3]. addr[2:0] is used to select the starting location within the block.

In the case of incrementing burst (INCR/INCR4/INCR8/INCR16), the addresses can cross the 16-byte boundary of the SDRAM device. For example, in the case of DDR-SDRAM devices, when a transfer (INCR4) starts at address 0x0C, the next access is 0x10, but since the burst length is programmed to 8, the next access is at 0x00. Since the boundary is reached, the burst is wrapping. The DDRSDRC takes this feature of the SDRAM device into account. In the case of transfer starting at address 0x04/0x08/0x0C (DDR-SDRAM devices) or starting at address 0x10/0x14/0x18/0x1C, two write commands are issued to avoid to wrap when the boundary is reached. The last write command is subject to DM input logic level. If DM is registered high, the corresponding data input is ignored and write access is not performed. This avoids additional writing being done.

Figure 29-2. Single Write Access, Row Closed, Low-power DDR1-SDRAM Device

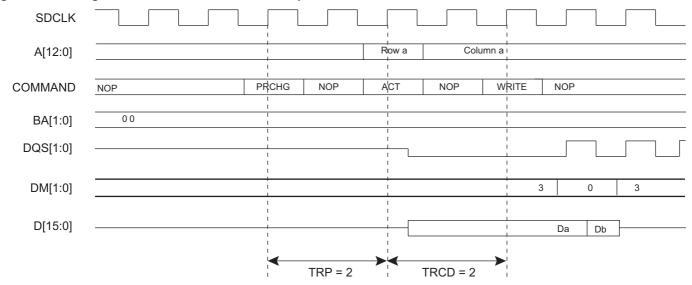

Figure 29-3. Single Write Access, Row Closed, DDR2-SDRAM Device

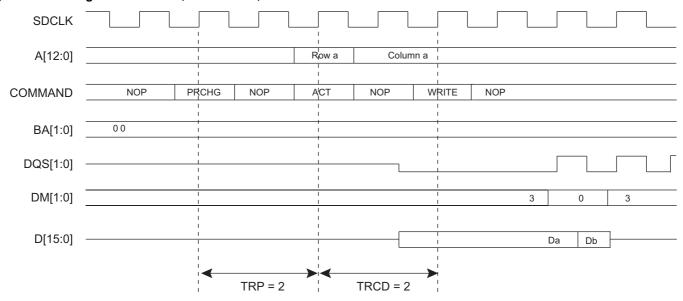

Figure 29-4. Single Write Access, Row Closed, SDR-SDRAM Device

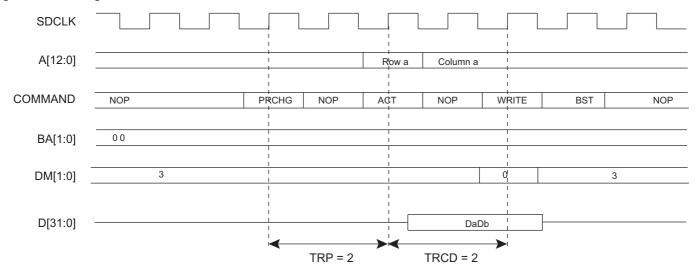

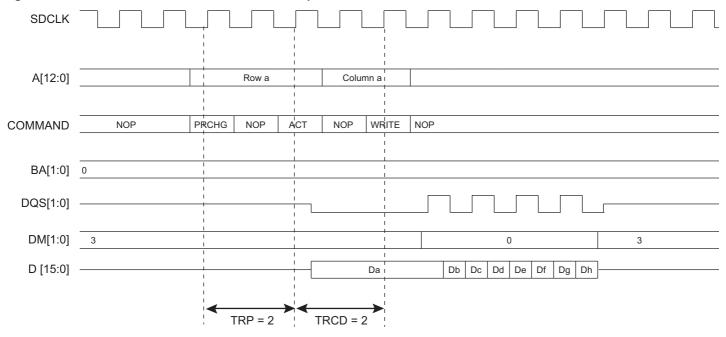

Figure 29-5. Burst Write Access, Row Closed, Low-power DDR1-SDRAM Device

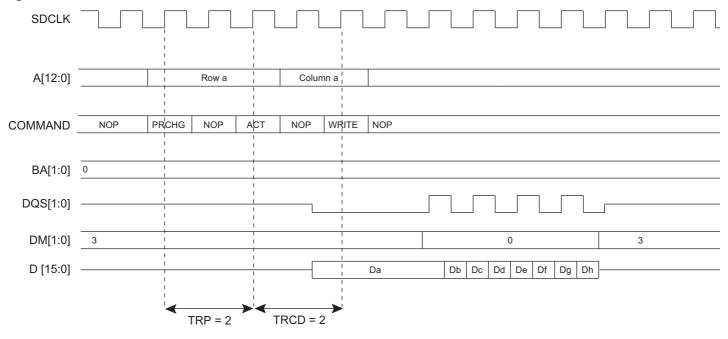

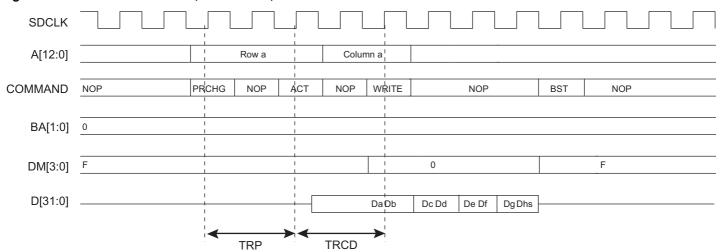

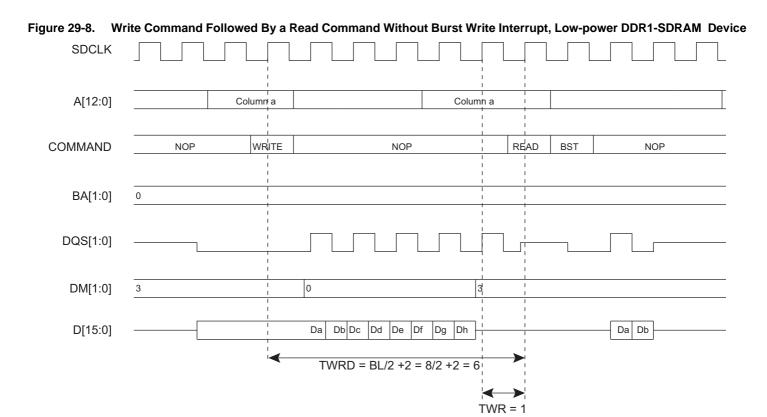

Figure 29-7. Burst Write Access, Row Closed, SDR-SDRAM Device

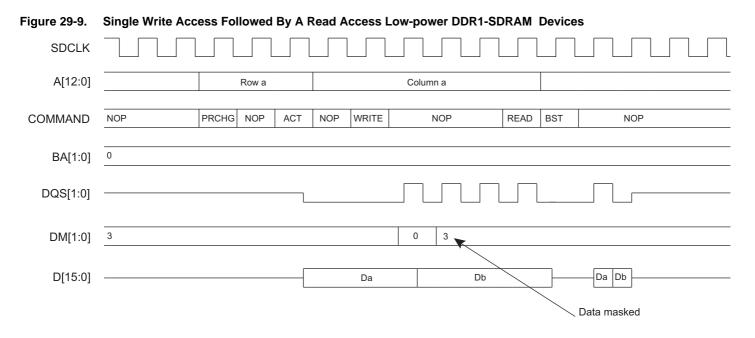

A write command can be followed by a read command. To avoid breaking the current write burst, TWTR/TWRD (BL/2 + 2 = 6 cycles) should be met. See Figure 29-8.

Note: TWRD = Write to read command delay (to input all data)

In the case of a single write access, write operation should be interrupted by a read access but DM must be input 1 cycle prior to the read command to avoid writing invalid data. (See Figure 29-9.)

**SDCLK** A[12:0] Row a Column a COMMAND NOPPRCHG NOP WRITE ACT NOP NOP RFAD NOP BA[1:0] DQS[1:0] DM[1:0] 0 Da Db Da Data masked **TWTR** 

Figure 29-10. Single Write Access Followed By A Read Access, DDR2-SDRAM Device

### 29.5.2 SDRAM Controller Read Cycle

The DDRSDRC allows burst access or single access in Normal mode (DDRSDRC\_MR.MODE = 0). Whatever access type, the DDRSDRC keeps track of the active row in each bank, thus maximizing performance of the DDRSDRC.

The SDRAM devices are programmed with a burst length equal to 8 which determines the length of a sequential data output by the read command that is set to 8. The latency from read command to data output is equal to 2 or 3. This value is programmed during the initialization phase (see Section 29.4.1 "SDR-SDRAM Initialization" on page 429).

To initiate a single access, the DDRSDRC checks if the page access is already open. If row/bank addresses match with the previous row/bank addresses, the controller generates a read command. If the bank addresses are not identical or if bank addresses are identical but the row addresses are not identical, the controller generates a precharge command, activates the new row and initiates a read command. To comply with SDRAM timing parameters, additional clock cycles are inserted between precharge/active (TRP) commands and active/read (TRCD) command. After a read command, additional wait states are generated to comply with CAS latency. The DDRSDRC supports a CAS latency of two, two and half, and three (2 or 3 clocks delay). As the burst length is fixed to 8, in the case of single access or burst access inferior to eight data requests, it has to stop the burst otherwise seven or X values could be read. Burst Stop (BST) command is used to stop output during a burst read.

To initiate a burst access, the DDRSDRC checks the transfer type signal. If the next accesses are sequential read accesses, reading to the SDRAM device is carried out. If the next access is a read non-sequential access, then an automatic page break can be inserted. If the bank addresses are not identical or if bank addresses are identical but the row addresses are not identical, the controller generates a precharge command, activates the new row and initiates a read command. In the case where the page access is already open, a read command is generated.

To comply with SDRAM timing parameters, additional clock cycles are inserted between precharge/active (TRP) commands and active/read (TRCD) commands. The DDRSDRC supports a CAS latency of two, two and half, and three (2 or 3 clocks delay). During this delay, the controller uses internal signals to anticipate the next access and improve the performance of the controller. Depending on the latency (2/3), the DDRSDRC anticipates 2 or 3 read accesses. In the case of burst of specified length, accesses are not anticipated, but if the burst is broken (border, busy mode, etc.), the next access is treated as an incrementing burst of unspecified length, and depending on the latency (2/3), the DDRSDRC anticipates 2 or 3 read accesses.

For a definition of timing parameters, refer to Section 29.7.3 "DDRSDRC Configuration Register" on page 456.

Read accesses to the SDRAM are burst oriented and the burst length is programmed to 8. It determines the maximum number of column locations that can be accessed for a given read command. When the read command is issued, eight columns are selected. All accesses for that burst take place within these eight columns, meaning that the burst wraps within these eight columns if the boundary is reached. These eight columns are selected by addr[13:3]; addr[2:0] is used to select the starting location within the block.

In the case of incrementing burst (INCR/INCR4/INCR8/INCR16), the addresses can cross the 16-byte boundary of the SDRAM device. For example, when a transfer (INCR4) starts at address 0x0C, the next access is 0x10, but since the burst length is programmed to 8, the next access is 0x00. Since the boundary is reached, the burst wraps. The DDRSDRC takes into account this feature of the SDRAM device. In the case of DDR-SDRAM devices, transfers start at address 0x04/0x08/0x0C. In the case of SDR-SDRAM devices, transfers start at address 0x14/0x18/0x1C. Two read commands are issued to avoid wrapping when the boundary is reached. The last read command may generate additional reading (1 read cmd = 4 DDR words or 1 read cmd = 8 SDR words).

To avoid additional reading, it is possible to use the burst stop command to truncate the read burst and to decrease power consumption.

## 29.5.3 Refresh (Auto-refresh Command)

An auto-refresh command is used to refresh the DDRSDRC. Refresh addresses are generated internally by the SDRAM device and incremented after each auto-refresh automatically. The DDRSDRC generates these auto-refresh commands periodically. A timer is loaded with the value in the register DDRSDRC\_TR that indicates the number of clock cycles between refresh cycles. When the DDRSDRC initiates a refresh of an SDRAM device, internal memory accesses are not delayed. However, if the CPU tries to access the SDRAM device, the slave indicates that the device is busy. A request of refresh does not interrupt a burst transfer in progress.

### 29.5.4 Power Management

#### 29.5.4.1 Self Refresh Mode

This mode is activated by configuring the Low-power Command Bits (LPCB) field value to 1 in the DDRSDRC Low-power Register (DDRSDRC\_LPR).

Self Refresh mode is used to reduce power consumption, i.e., when no access to the SDRAM device is possible. In this case, power consumption is very low. In Self Refresh mode, the SDRAM device retains data without external clocking and provides its own internal clocking, thus performing its own auto-refresh cycles. All the inputs to the SDRAM device become "don't care" except CKE, which remains low. As soon as the SDRAM device is selected, the DDRSDRC provides a sequence of commands and exits Self Refresh mode.

The DDRSDRC re-enables Self Refresh mode as soon as the SDRAM device is not selected. It is possible to define when Self Refresh mode will be enabled by configuring the TIMEOUT command field in the DDRSDRC Low-power Register (DDRSDRC\_LPR) (see Section 29.7.7 "DDRSDRC Low-power Register" on page 463):

- 0 = Self Refresh mode is enabled as soon as the SDRAM device is not selected
- 1 = Self Refresh mode is enabled 64 clock cycles after completion of the last access
- 2 = Self Refresh mode is enabled 128 clock cycles after completion of the last access

As soon as the SDRAM device is no longer selected, All Banks Precharge command is generated followed by a Self Refresh command. If, between these two commands an SDRAM access is detected, Self Refresh command will be replaced by an Auto-refresh command. According to the application, more Auto-refresh commands will be performed when the Self Refresh mode is enabled during the application.

This controller also interfaces low-power SDRAM. Compared to standard SDRAM, these devices add a feature: A single quarter, one half quarter or all banks of the SDRAM array can be enabled in Self Refresh mode. Disabled banks will be not refreshed in Self Refresh mode. This feature permits to reduce the Self Refresh current. The Extended Mode Register controls this feature, it includes Partial Array Self Refresh (PASR) parameters and Drive Strength (DS). These parameters are set during the initialization phase. After initialization, as soon as PASR/DS fields are modified, the Extended Mode Register in the memory of the external device is accessed automatically and PASR/DS fields are updated before entry into Self Refresh mode if DDRSDRC does not share an external bus with another controller or during a refresh command, and a pending read or write access, if DDRSDRC does share an external bus with another controller. The type of update is determined by the value of the DDRSDRC\_LPR.UPD\_MR field.

The low-power SDR-SDRAM must remain in Self Refresh mode for a minimum period of TRAS periods and may remain in Self Refresh mode for an indefinite period. (See Figure 29-17.)

The low-power DDR1-SDRAM must remain in Self Refresh mode for a minimum of TRFC periods and may remain in Self Refresh mode for an indefinite period.

The DDR2-SDRAM must remain in Self Refresh mode for a minimum of TCKE periods and may remain in Self Refresh mode for an indefinite period.

Note: Some SDRAM providers impose that 4K cycles of burst auto-refresh are required before Self Refresh entry and immediately after Self Refresh exit. This constraint is not supported.

Figure 29-21. Automatic Update During Auto-refresh Command and SDRAM Access

#### 29.5.4.2 Power-down Mode

This mode is activated by configuring the Low-power Command Bits (LPCB) field value to 2 in the DDRSDRC\_LPR.

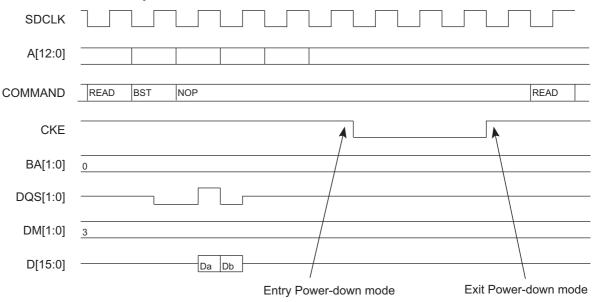

Power-down mode is used when no access to the SDRAM device is possible. In this mode, power consumption is greater than in Self Refresh mode. This state is similar to Normal mode (No low-power mode/No Self Refresh mode), but the CKE pin is low and the input and output buffers are deactivated as soon the SDRAM device is no longer accessible. In contrast to Self Refresh mode, the SDRAM device cannot remain in low-power mode longer than the refresh period (64 ms). As no auto-refresh operations are performed in this mode, the DDRSDRC carries out the refresh operation. In order to exit low-power mode, a NOP command is required in the case of Low-power SDR-SDRAM and SDR-SDRAM devices. In the case of Low-power DDR1-SDRAM devices, the controller generates a NOP command during a delay of at least TXP. In addition, Low-power DDR1-SDRAM and DDR2-SDRAM must remain in Power-down mode for a minimum period of TCKE periods.

The exit procedure is faster than in Self Refresh mode. (See Figure 29-22 on page 446.) The DDRSDRC returns to Power-down mode as soon as the SDRAM device is not selected. It is possible to define when Power-down mode is enabled by configuring the TIMEOUT command field in the DDRSDRC Low-power Register (DDRSDRC\_LPR) (see Section 29.7.7 "DDRSDRC Low-power Register" on page 463):

- 0 = Power-down mode is enabled as soon as the SDRAM device is not selected
- 1 = Power-down mode is enabled 64 clock cycles after completion of the last access
- 2 = Power-down mode is enabled 128 clock cycles after completion of the last access

Figure 29-22. Power-down Entry/Exit, DDRSDRC\_LPR.TIMEOUT = 0

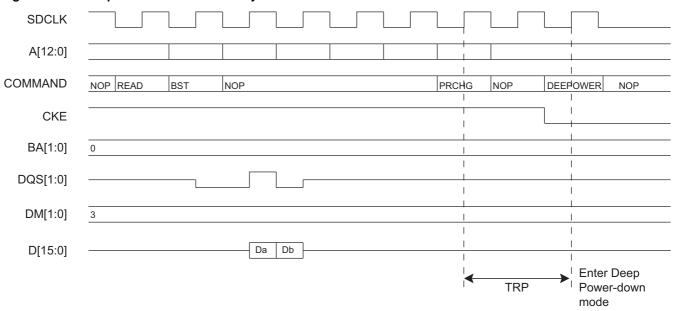

#### 29.5.4.3 Deep Power-down Mode

The Deep Power-down mode is a feature of the Low-power SDRAM. When this mode is activated, all internal voltage generators inside the device are stopped and all data is lost.

This mode is activated by configuring the Low-power Command Bits (LPCB) field value to 3 in the DDRSDRC\_LPR. When this mode is enabled, the DDRSDRC leaves Normal mode (DDRSDRC\_MR.MODE = 0) and the controller is frozen. To exit Deep Power-down mode, DDRSDRC\_LPR.LPCB must be configured to 0 and an initialization sequence must be generated by software. See Section 29.4.2 "Low-power DDR1-SDRAM Initialization" on page 430.

Figure 29-23. Deep Power-down Mode Entry

#### 29.5.4.4 Reset Mode

The reset mode is a feature of the DDR2-SDRAM. This mode is activated by configuring the Low-power Command Bits (LPCB) field value to 3 and the Clock Frozen Command Bit (CLK FR) to 1 in the DDRSDRC LPR.

When this mode is enabled, the DDRSDRC leaves Normal mode (DDRSDRC\_MR.MODE = 0) and the controller is frozen. Before enabling this mode, the end user must assume there is not an access in progress.

To exit reset mode, DDRSDRC\_LPR.LPCB must be configured to 0, DDRSDRC\_LPR.CLK\_FR to 0, and an initialization sequence must be generated by software. See Section 29.4.3 "DDR2-SDRAM Initialization" on page 431.

## 29.5.5 Multi-port Functionality

The SDRAM protocol imposes a check of timings prior to performing a read or a write access, thus decreasing the performance of systems. An access to SDRAM is performed if banks and rows are open (or active). To activate a row in a particular bank, it has to de-active the last open row and open the new row. Two SDRAM commands must be performed to open a bank: Precharge and Active command with respect to TRP timing. Before performing a read or write command, TRCD timing must be checked.

This operation represents a significative loss of performance. (See Figure 29-24.)

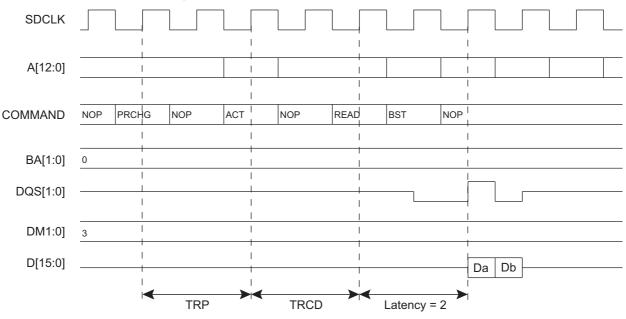

Figure 29-24. TRP and TRCD Timings

4 cycles before performing a read command

The multi-port controller has been designed to mask these timings and thus improve the bandwidth of the system.

DDRSDRC is a multi-port controller since four masters can simultaneously reach the controller. This feature improves the bandwidth of the system because it can detect four requests on the AHB slave inputs and thus anticipate the commands that follow, PRECHARGE and ACTIVE commands in bank X during current access in bank Y. This allows TRP and TRCD timings to be masked (see Figure 29-25). In the best case, all accesses are done as if the banks and rows were already open. The best condition is met when the four masters work in different banks. In the case of four simultaneous read accesses, when the four banks and associated rows are open, the controller reads with a continuous flow and masks the CAS latency for each different access. To allow a continuous flow, the read command must be set at 2 or 3 cycles (CAS latency) before the end of current access. This requires that the scheme of arbitration changes since the round-robin arbitration cannot be respected. If the

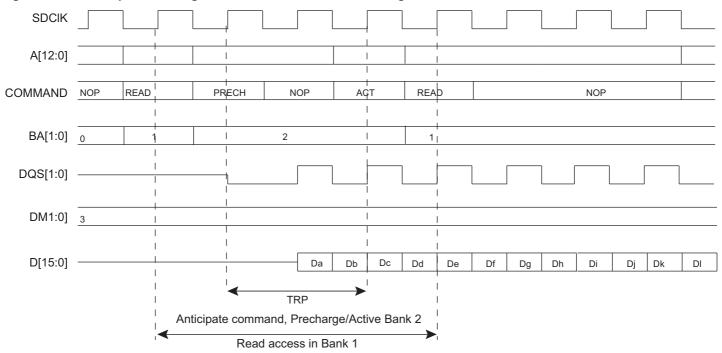

controller anticipates a read access, and thus before the end of current access a master with a high priority arises, then this master will not serviced.

The arbitration mechanism reduces latency when conflicts occur, i.e., when two or more masters try to access the SDRAM device at the same time.

The arbitration type is round-robin arbitration. This algorithm dispatches the requests from different masters to the SDRAM device in a round-robin manner. If two or more master requests arise at the same time, the master with the lowest number is serviced first, then the others are serviced in a round-robin manner. To avoid burst breaking and to provide the maximum throughput for the SDRAM device, arbitration may only take place during the following cycles:

- 1. Idle cycles: When no master is connected to the SDRAM device.
- 2. Single cycles: When a slave is currently doing a single access.
- 3. End of Burst cycles: When the current cycle is the last cycle of a burst transfer. For bursts of defined length, predicted end of burst matches the size of the transfer. For bursts of undefined length, predicted end of burst is generated at the end of each four beat boundary inside the INCR transfer.
- 4. Anticipated Access: When an anticipate read access is performed while current access is not complete, the arbitration scheme can be changed if the anticipated access is not the next access serviced by the arbitration scheme.

Figure 29-25. Anticipate Precharge/Active Command in Bank 2 During Read Access in Bank 1

## 29.5.6 Register Write Protection

To prevent any single software error from corrupting DDRSDRC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the DDRSDRC Write Protection Mode Register (DDRSDRC\_WPMR).

If a write access in a write-protected register is detected, the WPVS flag in the DDRSDRC Write Protection Status Register (DDRSDRC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS flag is automatically cleared after reading the DDRSDRC\_WPSR.

The following registers can be write-protected:

- DDRSDRC Mode Register
- DDRSDRC Refresh Timer Register
- DDRSDRC Configuration Register
- DDRSDRC Timing Parameter 0 Register
- DDRSDRC Timing Parameter 1 Register
- DDRSDRC Timing Parameter 2 Register
- DDRSDRC Memory Device Register
- DDRSDRC High Speed Register

## 29.6 Software Interface/SDRAM Organization, Address Mapping

The SDRAM address space is organized into banks, rows and columns. The DDRSDRC maps different memory types depending on the values set in the DDRSDRC Configuration Register (DDRSDRC\_CR). The following tables illustrate the relation between CPU addresses and columns, rows and banks addresses for 16-bit memory data bus widths and 32-bit memory data bus widths.

The DDRSDRC supports address mapping in linear mode and interleaved mode.

Linear mode is a method for address mapping where banks alternate at each last SDRAM page of current bank.

Interleaved mode is a method for address mapping where banks alternate at each SDRAM end page of current bank.

The DDRSDRC makes the SDRAM devices access protocol transparent to the user. Table 29-1 to Table 29-15 illustrate the SDRAM device memory mapping seen by the user in correlation with the device structure. Various configurations are illustrated.

|     |                  | Bk                     | [1:0]                 |                                 |   |  |  |  | R  | ow[12: | 0]   |      |  |   |   |  |  |  |  | Co | olumn[a | 8:0] |  |  |  | M[ | 1:0] |
|     | Bk[              | [1:0]                  | Row[12:0] Column[9:0] |                                 |   |  |  |  |    | M[     | 1:0] |      |  |   |   |  |  |  |  |    |         |      |  |  |  |    |      |
| Bk[ | 1:0]             | Row[12:0] Column[10:0] |                       |                                 |   |  |  |  | M[ | 1:0]   |      |      |  |   |   |  |  |  |  |    |         |      |  |  |  |    |      |

Notes: 1. M[1:0] is the byte address inside a 32-bit word.

2. Bk[2] = BA2, Bk[1] = BA1, Bk[0] = BA0

# 29.7 DDR SDR SDRAM Controller (DDRSDRC) User Interface

The User Interface is connected to the APB bus. The DDRSDRC is programmed using the registers listed in Table 29-16.

Table 29-16. Register Mapping

| Offset    | Register                                 | Name         | Access     | Reset      |
|-----------|--|--------------|------------|------------|
| 0x00      | DDRSDRC Mode Register                    | DDRSDRC_MR   | Read/Write | 0x00000000 |
| 0x04      | DDRSDRC Refresh Timer Register           | DDRSDRC_RTR  | Read/Write | 0x00000000 |
| 0x08      | DDRSDRC Configuration Register           | DDRSDRC_CR   | Read/Write | 0x7024     |

# 29.7.1 DDRSDRC Mode Register

Name: DDRSDRC\_MR
Address: 0xFFFFE800

Access: Read/Write

| 31 | 30 | 29 | 28 | 27 | 26 | 25   | 24 |
|----|----|----|----|----|----|------|----|
| _  | _  | 1  | -  | -  | _  | 1    | _  |
| 23 | 22 | 21 | 20 | 19 | 18 | 17   | 16 |
| _  | _  | 1  | -  | -  | _  | 1    | _  |
|    |    |    |    |    |    |      |    |
| 15 | 14 | 13 | 12 | 11 | 10 | 9    | 8  |
| _  | _  | 1  | -  | -  | _  | -    | _  |
|    |    |    |    |    |    |      |    |
| 7  | 6  | 5  | 4  | 3  | 2  | 1    | 0  |
| _  | _  | _  | -  | -  |    | MODE |    |

This register can only be written if the WPEN bit is cleared in the DDRSDRC Write Protection Mode Register.

## • MODE: DDRSDRC Command Mode

This field defines the command issued by the DDRSDRC when the SDRAM device is accessed. This register is used to initialize the SDRAM device and to activate Deep Power-down mode.

| Valu<br>e | Name          | Description  |
|-----------|---------------|--|
| 0         | NORMAL        | Normal mode: Any access to the DDRSDRC will be decoded normally. To activate this mode, command must be followed by a write to the SDRAM.  |
| 1         | NOP           | The DDRSDRC issues a NOP command when the SDRAM device is accessed regardless of the cycle. To activate this mode, command must be followed by a write to the SDRAM.   |
| 2         | ALLBKPRECH    | The DDRSDRC issues an "All Banks Precharge" command when the SDRAM device is accessed regardless of the cycle. To activate this mode, command must be followed by a write to the SDRAM.  |
| 3         | LOADMODREG    | The DDRSDRC issues a "Load Mode Register" command when the SDRAM device is accessed regardless of the cycle. To activate this mode, command must be followed by a write to the SDRAM.  |
| 4         | AUTOREFRESH   | The DDRSDRC issues an "Auto-refresh" command when the SDRAM device is accessed regardless of the cycle. Previously, an "All Banks Precharge" command must be issued. To activate this mode, command must be followed by a write to the SDRAM.  |
| 5         | EXTLOADMODREG | The DDRSDRC issues an "Extended Load Mode Register" command when the SDRAM device is accessed regardless of the cycle. To activate this mode, the "Extended Load Mode Register" command must be followed by a write to the SDRAM. The write in the SDRAM must be done in the appropriate bank. |
| 6         | DEEPPOWER     | Deep power mode: Access to Deep Power-down mode  |

## 29.7.2 DDRSDRC Refresh Timer Register

Name: DDRSDRC\_RTR
Address: 0xFFFFE804
Access: Read/Write

| 31 | 30 | 29 | 28 | 27  | 26  | 25  | 24 |
|----|----|----|----|-----|-----|-----|----|
| _  | -  | _  | _  | -   | _   | _   | _  |
| 23 | 22 | 21 | 20 | 19  | 18  | 17  | 16 |
| _  | _  | -  | _  | _   | _   | -   | _  |
| 15 | 14 | 13 | 12 | 11  | 10  | 9   | 8  |
| _  | _  | -  | _  |     | COL | JNT |    |
| 7  | 6  | 5  | 4  | 3   | 2   | 1   | 0  |
|    |    |    | CO | UNT |     |     |    |

This register can only be written if the WPEN bit is cleared in the DDRSDRC Write Protection Mode Register.

#### • COUNT: DDRSDRC Refresh Timer Count

This 12-bit field is loaded into a timer which generates the refresh pulse. Each time the refresh pulse is generated, a refresh sequence is initiated.

SDRAM devices require a refresh of all rows every 64 ms. The value to be loaded depends on the DDRSDRC clock frequency (MCK: Master Clock) and the number of rows in the device.

For example, for an SDRAM with 8192 rows and a 100 MHz Master clock, the value of Refresh Timer Count bit is programmed as  $((64 \times 10^{-3}) / 8192) \times 100 \times 10^{6} = 781 \text{ (0x030D)}$ .

# 29.7.3 DDRSDRC Configuration Register

Name: DDRSDRC\_CR
Address: 0xFFFFE808
Access: Read/Write

| Access: | Read/Write |     |    |    |        |         |          |
|---------|------------|-----|----|----|--------|---------|----------|
| 31      | 30         | 29  | 28 | 27 | 26     | 25      | 24       |
| _       | _          | _   | _  | _  | _      | _       | _        |
| 23      | 22         | 21  | 20 | 19 | 18     | 17      | 16       |
| _       | DECOD      | -   | NB | _  | ACTBST | _       | EBISHARE |
| 15      | 14         | 13  | 12 | 11 | 10     | 9       | 8        |
| _       |            | OCD |    | _  | -      | DIS_DLL | DIC      |
| 7       | 6          | 5   | 4  | 3  | 2      | 1       | 0        |
| DLL     |            | CAS |    |    | NR     | N       | IC       |

This register can only be written if the if the WPEN bit is cleared in the DDRSDRC Write Protection Mode Register.

## • NC: Number of Column Bits

Reset value is 9 column bits.

SDR-SDRAM devices with eight columns in 16-bit mode are not supported.

| Valu<br>e | Name        | Description                    |
|-----------|-------------|--------------------------------|
| 0         | DDR9_SDR8   | 9-bit for DDR, 8-bit for SDR   |
| 1         | DDR10_SDR9  | 10-bit for DDR, 9-bit for SDR  |
| 2         | DDR11_SDR10 | 11-bit for DDR, 10-bit for SDR |
| 3         | DDR12_SDR11 | 12-bit for DDR, 11-bit for SDR |

## • NR: Number of Row Bits

Reset value is 12 row bits.

| Valu |        |             |
|------|--------|-------------|
| е    | Name   | Description |
| 0    | 11_BIT | 11 row bit  |
| 1    | 12_BIT | 12 row bit  |
| 2    | 13_BIT | 13 row bit  |
| 3    | 14_BIT | 14 row bit  |

## · CAS: CAS Latency

Reset value is 2 cycles.

| Value | DDR2 CAS Latency | SDR CAS Latency |
|-------|------------------|-----------------|
| 0     | Reserved         | Reserved        |
| 1     | Reserved         | Reserved        |
| 2     | Reserved         | 2               |
| 3     | 3                | 3               |
| 4     | Reserved         | Reserved        |
| 5     | Reserved         | Reserved        |
| 6     | Reserved         | Reserved        |
| 7     | Reserved         | Reserved        |

#### • DLL: Reset DLL

Reset value is 0.

This field defines the value of Reset DLL.

0: Disable DLL reset.

1: Enable DLL reset.

This value is used during the power-up sequence.

Note: This field is found only in DDR2-SDRAM devices.

## • DIC: Output Driver Impedance Control

Reset value is 0. This field name may be described as "DS" in some memory datasheets and defines the output drive strength. This value is used during the power-up sequence.

| Valu |                       |                        |
|------|-----------------------|------------------------|
| е    | Name                  | Description            |
| 0    | DDR1_2_NORMALSTRENGTH | Normal driver strength |
| 1    | DDR1_2_WEAKSTRENGTH   | Weak driver strength   |

Note: This field is found only in DDR2-SDRAM devices.

### • DIS DLL: Disable DLL

Reset value is 0.

0: Enable DLL

1: Disable DLL

Note: This field is found only in DDR2-SDRAM devices.

## • OCD: Off-chip Driver

Reset value is 7.

Note: The SDRAM controller supports only two values for OCD: 7 (calibration default) and 0 (exit from calibration). These values MUST always be programmed during the initialization sequence. The "calibration default" must be programmed before programming "exit calibration and maintain settings."

Note: This field is found only in DDR2-SDRAM devices.

| Valu |                    |  |
|------|--------------------|--|
| е    | Name               | Description  |
| 0    | DDR2_EXITCALIB     | Exit from OCD calibration mode and maintain settings |
| 7    | DDR2_DEFAULT_CALIB | OCD calibration default                              |

#### EBISHARE: External Bus Interface is Shared

The DDR controller embedded in the EBI is used at the same time as another memory controller (SMC, ...)

Reset value is 0.

0: Only the DDR controller function is used.

1: The DDR controller shares the EBI with another memory controller (SMC, NAND, ...)

## ACTBST: Active Bank X to Burst Stop Read Access Bank Y

Reset value is 0.

0: After an Active command in Bank X, Burst Stop command can be issued to another bank to stop current read access.

1: After an Active command in Bank X, Burst Stop command cannot be issued to another bank to stop current read access.

This field is unique to SDR-SDRAM, Low-power SDR-SDRAM and Low-power DDR1-SDRAM devices.

#### . NB: Number of Banks

Reset value is four banks.

| Valu<br>e | Name    | Description |
|-----------|---------|-------------|
| 0         | 4_BANKS | 4 Banks     |
| 1         | 8_BANKS | 8 Banks     |

Note: Only DDR-SDRAM 2 devices support eight internal banks.

## . DECOD: Type of Decoding

Reset value is 0: sequential decoding.

| Valu |             |                      |
|------|-------------|----------------------|
| е    | Name        | Description          |
| 0    | SEQUENTIAL  | Sequential Decoding  |
| 1    | INTERLEAVED | Interleaved Decoding |

## 29.7.4 DDRSDRC Timing Parameter 0 Register

Name: DDRSDRC\_TPR0
Address: 0xFFFE80C
Access: Read/Write

| ,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,, |     |    |    |                 |    |      |    |
|---|-----|----|----|-----------------|----|------|----|
| 31                                      | 30  | 29 | 28 | 27              | 26 | 25   | 24 |
|   | TMF | RD |    | REDUCE_WRR<br>D |    | TWTR |    |
| 23                                      | 22  | 21 | 20 | 19              | 18 | 17   | 16 |
|   | TRR | RD |    |                 | Т  | RP   |    |
| 15                                      | 14  | 13 | 12 | 11              | 10 | 9    | 8  |
|   | TR  | 0  |    |                 | T\ | WR   |    |
| 7                                       | 6   | 5  | 4  | 3               | 2  | 1    | 0  |
|   | TRC | D  |    |                 | TF | RAS  |    |

This register can only be written if the WPEN bit is cleared in the DDRSDRC Write Protection Mode Register.

### • TRAS: Active to Precharge Delay

Reset value is 5 cycles.

This field defines the delay between an Activate command and a Precharge command in number of cycles. Number of cycles is between 0 and 15.

#### TRCD: Row to Column Delay

Reset value is 2 cycles.

This field defines the delay between an Activate command and a Read/Write command in number of cycles. Number of cycles is between 0 and 15.

### TWR: Write Recovery Delay

Reset value is 2 cycles.

This field defines the Write Recovery Time in number of cycles. Number of cycles is between 1 and 15.

## • TRC: Row Cycle Delay

Reset value is 7 cycles.

This field defines the delay between an Activate command and Refresh command in number of cycles. Number of cycles is between 0 and 15

## • TRP: Row Precharge Delay

Reset value is 2 cycles.

This field defines the delay between a Precharge command and another command in number of cycles. Number of cycles is between 0 and 15.

#### TRRD: Active BankA to Active BankB

Reset value is 2 cycles.

This field defines the delay between an Active command in BankA and an active command in BankB in number of cycles. Number of cycles is between 1 and 15.

## • TWTR: Internal Write to Read Delay

Reset value is 0.

This field is relevant only for Low-power DDR1-SDRAM devices and DDR2-SDRAM devices.

This field defines the internal write to read command Time in number of cycles. Number of cycles is between 1 and 7.

| Valu<br>e | Name  | Description              |
|-----------|-------|--------------------------|
|           | Name  | Description              |
| 1         | ONE   | 1 SDCK clock cycle delay |
| 2         | TWO   | 2 SDCK clock cycle delay |
| 3         | THREE | 3 SDCK clock cycle delay |
| 4         | FOUR  | 4 SDCK clock cycle delay |
| 5         | FIVE  | 5 SDCK clock cycle delay |
| 6         | SIX   | 6 SDCK clock cycle delay |
| 7         | SEVEN | 7 SDCK clock cycle delay |

In the case of low-power DDR1-SDRAM device the coding is different.

| Valu<br>e | Name | Description |
|-----------|------|-------------|
| 0         | ONE  | Does 1      |
| 1         | TWO  | Does 2      |

## • REDUCE\_WRRD: Reduce Write to Read Delay

Reset value is 0.

This field reduces the delay between write to read access for low-power DDR-SDRAM devices with a latency equal to 2. To use this feature, TWTR field must be equal to 0. Important to note is that some devices do not support this feature.

## • TMRD: Load Mode Register Command to Active or Refresh Command

Reset value is 2 cycles.

This field defines the delay between a Load Mode Register command and an active or refresh command in number of cycles. Number of cycles is between 0 and 15.

## 29.7.5 DDRSDRC Timing Parameter 1 Register

Name: DDRSDRC\_TPR1
Address: 0xFFFFE810
Access: Read/Write

| 31 | 30 | 29 | 28  | 27  | 26   | 25 | 24 |
|----|----|----|-----|-----|------|----|----|
| _  | _  | _  | _   |     | TX   | P  |    |
| 23 | 22 | 21 | 20  | 19  | 18   | 17 | 16 |
|    |    |    | TXS | SRD |      |    |    |
| 15 | 14 | 13 | 12  | 11  | 10   | 9  | 8  |
|    |    |    | TXS | SNR |      |    |    |
| 7  | 6  | 5  | 4   | 3   | 2    | 1  | 0  |
| _  | _  | -  |     |     | TRFC |    |    |

This register can only be written if the WPEN bit is cleared in the DDRSDRC Write Protection Mode Register.

## • TRFC: Row Cycle Delay

Reset value is 8 cycles.

This field defines the delay between a Refresh and an Activate command or Refresh command in number of cycles. Number of cycles is between 0 and 31.

### TXSNR: Exit Self Refresh Delay to Non-read Command

Reset value is 8 cycles.

This field defines the delay between CKE set high and a non Read command in number of cycles. Number of cycles is between 0 and 255. This field is used for SDR-SDRAM and DDR-SDRAM devices. In the case of SDR-SDRAM devices and Low-power DDR1-SDRAM, this field is equivalent to TXSR timing.

#### TXSRD: Exit Self Refresh Delay to Read Command

Reset value is 200 cycles.

This field defines the delay between CKE set high and a Read command in number of cycles. Number of cycles is between 0 and 255 cycles. This field is unique to DDR-SDRAM devices. In the case of a Low-power DDR1-SDRAM, this field must be written to 0.

## • TXP: Exit Power-down Delay to First Command

Reset value is 3 cycles.

This field defines the delay between CKE set high and a Valid command in number of cycles. Number of cycles is between 0 and 15 cycles. This field is unique to Low-power DDR1-SDRAM devices and DDR2-SDRAM devices.

## 29.7.6 DDRSDRC Timing Parameter 2 Register

Name: DDRSDRC\_TPR2
Address: 0xFFFE814
Access: Read/Write

| 31 | 30     | 29 | 28 | 27 | 26  | 25    | 24 |
|----|--------|----|----|----|-----|-------|----|
| _  | _      | _  | _  | 1  | _   | ı     | _  |
| 23 | 22     | 21 | 20 | 19 | 18  | 17    | 16 |
| _  | _      | _  | _  |    | TF/ | ΑW    |    |
|    |        |    |    |    |     |       |    |
| 15 | 14     | 13 | 12 | 11 | 10  | 9     | 8  |
| _  | - TRTP |    |    | TR | PA  |       |    |
|    |        | _  |    | _  | _   | _     |    |
| 7  | 6      | 5  | 4  | 3  | 2   | 1     | 0  |
|    | TXARDS |    |    |    | TXA | ARD . |    |

This register can only be written if the WPEN bit is cleared in the DDRSDRC Write Protection Mode Register.

### • TXARD: Exit Active Power Down Delay to Read Command in Mode "Fast Exit"

Reset value is 2 cycles.

This field defines the delay between CKE set high and a Read command in number of cycles. Number of cycles is between 0 and 15.

Note: This field is found only in DDR2-SDRAM devices.

## TXARDS: Exit Active Power Down Delay to Read Command in Mode "Slow Exit"

Reset value is 6 cycles.

This field defines the delay between CKE set high and a Read command in number of cycles. Number of cycles is between 0 and 15.

Note: This field is found only in DDR2-SDRAM devices.

## TRPA: Row Precharge All Delay

Reset value is 0 cycles.

This field defines the delay between an All Banks Precharge command and another command in number of cycles. Number of cycles is between 0 and 15.

Note: This field is found only in DDR2-SDRAM devices.

### • TRTP: Read to Precharge

Reset value is 2 cycles.

This field defines the delay between Read command and a Precharge command in number of cycle.

Number of cycles is between 0 and 7.

### • TFAW: Four Active Window

Reset value is 4 cycles.

DDR2 devices with 8-banks (1 GB or larger) have an additional requirement:  $t_{FAW}$ . This requires that no more than four ACTIVATE commands may be issued in any given  $t_{FAW}$  (MIN) period.

Number of cycles is between 0 and 15.

Note: This field is found only in DDR-SDRAM 2 devices with eight internal banks

## 29.7.7 DDRSDRC Low-power Register

Name: DDRSDRC\_LPR
Address: 0xFFFFE81C
Access: Read/Write

| A00033. | rtodd/ vviito |      |      |    |        |    |      |
|---------|---------------|------|------|----|--------|----|------|
| 31      | 30            | 29   | 28   | 27 | 26     | 25 | 24   |

|         |               |      |      |    |        |    |      |

### LPCB: Low-power Command Bits

Reset value is 0.

| Valu<br>e | Name          | Description   |  |  |  |
|-----------|---------------|---|--|--|--|
| 0         | NOLOWPOWER    | Low-power feature is inhibited: no power-down, Self Refresh and deep power mode are issued to the SDRAM device.   |  |  |  |
| 1         | SELFREFRESH   | The DDRSDRC issues a Self Refresh command to the SDRAM device, the clock(s) is/are deactivated and the CKE signal is set low. The SDRAM device leaves the Self Refresh mode when accessed and enters it after the access. |  |  |  |
| 2         | POWERDOWN     | The DDRSDRC issues a Power-down command to the SDRAM device after each access, the CKE signal is set low. The SDRAM device leaves the Power-down mode when accessed and enters it after the access.                       |  |  |  |
| 3         | DEEPPOWERDOWN | The DDRSDRC issues a Deep Power-down command to the Low-power SDRAM device.  Note: This mode is unique to Low-power SDRAM devices.  |  |  |  |

#### CLK FR: Clock Frozen Command Bit

Reset value is 0.

This field sets the clock low during Power-down mode or during Deep Power-down mode. Some SDRAM devices do not support freezing the clock during Power-down mode or during Deep Power-down mode. Refer to the SDRAM device data-sheet for details on this.

- 0: Clock(s) is/are not frozen.
- 1: Clock(s) is/are frozen.

## PASR: Partial Array Self Refresh

Reset value is 0.

This field is unique to Low-power SDRAM. It is used to specify whether only one quarter, one half or all banks of the SDRAM array are enabled. Disabled banks are not refreshed in Self Refresh mode.

The values of this field are dependant on Low-power SDRAM devices.

After the initialization sequence, as soon as PASR field is modified, Extended Mode Register in the external device memory is accessed automatically and PASR field is updated. Depending on the value of the the UPD\_MR field, the update is done before entering in Self Refresh mode or during a refresh command and a pending read or write access.

## • DS: Drive Strength

Reset value is 0.

Note: This field is unique to Low-power SDRAM.

It selects the driver strength of SDRAM output (see memory devices datasheet for details).

After the initialization sequence, as soon as DS field is modified, Extended Mode Register is accessed automatically and DS bits are updated. Depending on the value of the UPD\_MR field, the update is done before entering in Self Refresh mode or during a refresh command and a pending read or write access.

#### TIMEOUT: Time Between Last Transfer and Low Power Mode

Reset value is 0. This field defines when low-power mode is enabled.

| Valu<br>e | Name   | Description   |
|-----------|--------|---|
| 0         | NONE   | Self Refresh mode is enabled as soon as the SDRAM device is not selected          |
| 1         | CLK64  | Self Refresh mode is enabled 64 clock cycles after completion of the last access  |
| 2         | CLK128 | Self Refresh mode is enabled 128 clock cycles after completion of the last access |

#### APDE: Active Power Down Exit Time

Reset value is 1.

Note: This mode is unique to DDR2-SDRAM devices.

This mode allows to determine the active power-down mode, which determines performance versus power saving.

| Valu<br>e | Name           | Description   |
|-----------|----------------|---|
| 0         | DDR2_FAST_EXIT | Fast Exit from Power Down. DDR2-SDRAM devices only. |
| 1         | DDR2_SLOW_EXIT | Slow Exit from Power Down. DDR2-SDRAM devices only. |

After the initialization sequence, as soon as APDE bit is modified, Extended Mode Register (located in the memory of the external device) is accessed automatically and APDE bit is updated. Depending on the value of the UPD\_MR field, the update is done before entering in Self Refresh mode or during a refresh command and a pending read or write access.

## • UPD\_MR: Update Load Mode Register and Extended Mode Register

Reset value is 0.

This bit is used to enable or disable automatic update of the Load Mode Register and Extended Mode Register. This update depends on the DDRSDRC integration in a system. DDRSDRC can either share or not, an external bus with another controller.

| Value | Name               | Description  |
|-------|--------------------|--|
| 0     | NO_UPDATE          | Update is disabled.  |
| 1     | UPDATE_SHAREDBUS   | DDRSDRC shares external bus. Automatic update is done during a refresh command and a pending read or write access in SDRAM device. |
| 2     | UPDATE_NOSHAREDBUS | DDRSDRC does not share external bus. Automatic update is done before entering in Self Refresh mode.                                |

# 29.7.8 DDRSDRC Memory Device Register

Name: DDRSDRC\_MD
Address: 0xFFFE820
Access: Read/Write

| Access: | Read/write |    |     |    |    |    |    |
|---------|------------|----|-----|----|----|----|----|
| 31      | 30         | 29 | 28  | 27 | 26 | 25 | 24 |
| _       | -          | _  | _   | _  | -  | -  | _  |
| 23      | 22         | 21 | 20  | 19 | 18 | 17 | 16 |
| _       | _          | _  | _   | _  | _  | _  | _  |
|         |            |    |     |    |    |    |    |
| 15      | 14         | 13 | 12  | 11 | 10 | 9  | 8  |
| _       | _          | _  | _   | _  | -  | 1  | _  |
|         |            |    |     |    |    |    |    |
| 7       | 6          | 5  | 4   | 3  | 2  | 1  | 0  |
| _       | _          | _  | DBW | _  |    | MD |    |
| _       | _          | _  | DBW | _  |    | MD |    |

This register can only be written if the WPEN bit is cleared in the DDRSDRC Write Protection Mode Register.

# • MD: Memory Device

Indicates the type of memory used. Reset value is for SDR-SDRAM device.

| Valu |              |                         |
|------|--------------|-------------------------|
| е    | Name         | Description             |
| 0    | SDR_SDRAM    | SDR-SDRAM memory device |
| 1    | LPSDR_SDRAM  | Low-power SDR-SDRAM     |
| 2    | DDR1_SDRAM   | Reserved                |
| 3    | LPDDR1_SDRAM | Low-power DDR1-SDRAM    |
| 4    | DDR2_SDRAM   | DDR2-SDRAM              |

## • DBW: Data Bus Width

Reset value is 16 bits.

| Valu |           |   |
|------|-----------|---|
| е    | Name      | Description   |
| 0    | BUS_32BIT | Data bus width is 32 bits (reserved for SDR-SDRAM device) |
| 1    | BUS_16BIT | Data bus width is 16 bits                                 |

## 29.7.9 DDRSDRC DLL Register

Name: DDRSDRC\_DLL
Address: 0xFFFE824
Access: Read-only

| Access. | Reau-only |    |    |     |       |       |       |
|---------|-----------|----|----|-----|-------|-------|-------|
| 31      | 30        | 29 | 28 | 27  | 26    | 25    | 24    |
| _       | _         | _  | _  | _   | _     | _     | _     |
| 23      | 22        | 21 | 20 | 19  | 18    | 17    | 16    |
| _       | _         | _  | _  | _   | _     | -     | _     |
| 15      | 14        | 13 | 12 | 11  | 10    | 9     | 8     |
|         |           |    | MD | VAL |       |       |       |
| 7       | 6         | 5  | 4  | 3   | 2     | 1     | 0     |
| _       | _         | _  | _  | _   | MDOVF | MDDEC | MDINC |
| •       | -         | -  | 5  | •   | •     |       | 5     |

The DLL logic is internally used by the controller in order to delay DQS inputs. This is necessary to center the strobe time and the data valid window.

## MDINC: DLL Master Delay Increment

0: The DLL is not incrementing the Master delay counter.

1: The DLL is incrementing the Master delay counter.

## • MDDEC: DLL Master Delay Decrement

0: The DLL is not decrementing the Master delay counter.

1: The DLL is decrementing the Master delay counter.

## MDOVF: DLL Master Delay Overflow Flag

0: The Master delay counter has not reached its maximum value, or the Master is not locked yet.

1: The Master delay counter has reached its maximum value, the Master delay counter increment is stopped and the DLL forces the Master lock. If this flag is set, it means the DDRSDRC clock frequency is too low compared to Master delay line number of elements.

#### MDVAL: DLL Master Delay Value

Value of the Master delay counter.

# 29.7.10 DDRSDRC High Speed Register

Name: DDRSDRC\_HS
Address: 0xFFFFE82C
Access: Pood/Write

| Access: | Read/Write |    |    |    |                      |    |    |
|---------|------------|----|----|----|----------------------|----|----|
| 31      | 30         | 29 | 28 | 27 | 26                   | 25 | 24 |
| _       | _          | _  | -  | _  | _                    | _  | _  |
| 23      | 22         | 21 | 20 | 19 | 18                   | 17 | 16 |
| _       | _          | _  | _  | _  | _                    | ı  | _  |
| •       |            |    |    |    |                      |    | _  |
| 15      | 14         | 13 | 12 | 11 | 10                   | 9  | 8  |
| _       | -          | -  | -  | -  | -                    | _  | _  |
|         |            |    |    |    |                      |    |    |
| 7       | 6          | 5  | 4  | 3  | 2                    | 1  | 0  |
| _       | -          | -  | -  | -  | DIS_ANTICIP_R<br>EAD | -  | -  |

This register can only be written if the WPEN bit is cleared in the DDRSDRC Write Protection Mode Register.

## • DIS\_ANTICIP\_READ: Anticipated Read Access

0: Anticipated read access is enabled.

1: Anticipated read access is disabled (default).

DIS\_ANTICIP\_READ allows DDR2 read access optimization with multi-port.

This feature is based on the "bank open policy". Therefore, software must map different buffers in different DDR2 banks to use the feature.

# 29.7.11 DDRSDRC Write Protection Mode Register

Name: DDRSDRC\_WPMR

Address: 0xFFFFE8E4

Access: Read/Write

| 31 | 30 | 29    | 28       | 27        | 26 | 25 | 24   |
|----|----|-------|----------|-----------|----|----|------|
|    |    |       | WP       | KEY       |    |    |      |
| 23 | 22 | 21    | 20<br>WP | 19<br>KEY | 18 | 17 | 16   |

| 7       | 6         | 5  | 4        | 3    | 2  | 1        | 0    |
|         |           | -  | <u> </u> | -    |    | <u> </u> | WPVS |
| t-      | •         |    |          |      | U. |          |      |

#### . WPVS: Write Protection Violation Status

0: No write protection violation has occurred since the last read of the DDRSDRC\_WPSR.

1: A write protection violation has occurred since the last read of the DDRSDRC\_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

## • WPVSRC: Write Protection Violation Source

When WPVS is active, this field indicates the write-protected register (through address offset or code) in which a write access has been attempted.

Note: Reading DDRSDRC\_WPSR automatically clears all fields.

# 30. DMA Controller (DMAC)

## 30.1 Description

The DMA Controller (DMAC) is an AHB-central DMA controller core that transfers data from a source peripheral to a destination peripheral over one or more AMBA buses. One channel is required for each source/destination pair. In the most basic configuration, the DMAC has one master interface and one channel. The master interface reads the data from a source and writes it to a destination. Two AMBA transfers are required for each DMAC data transfer. This is also known as a dual-access transfer.

The DMAC is programmed via the APB interface.

#### 30.2 Embedded Characteristics

- 2 AHB-Lite Master Interfaces
- DMA Module Supports the Following Transfer Schemes: Peripheral-to-Memory, Memory-to-Peripheral, Peripheral-to-Peripheral and Memory-to-Memory
- Source and Destination Operate independently on BYTE (8-bit), HALF-WORD (16-bit) and WORD (32-bit)
- Supports Hardware and Software Initiated Transfers
- Supports Multiple Buffer Chaining Operations
- Supports Incrementing/decrementing/fixed Addressing Mode Independently for Source and Destination
- Supports Programmable Address Increment/decrement on User-defined Boundary Condition to Enable Picture-in-Picture Mode
- Programmable Arbitration Policy, Modified Round Robin and Fixed Priority are Available
- Supports Specified Length and Unspecified Length AMBA AHB Burst Access to Maximize Data Bandwidth
- AMBA APB Interface Used to Program the DMA Controller
- 8 DMA Channels on DMAC0
- 8 DMA Channels on DMAC1
- 12 External Request Lines on DMAC0
- 12 External Request Lines on DMAC1
- Embedded FIFO
- Channel Locking and Bus Locking Capability
- Register Write Protection

# 30.3 DMA Controller Peripheral Connections

The DMA Controller handles the transfer between peripherals and memory and receives triggers from the peripherals listed in the following tables.

#### 30.3.1 DMA Controller 0

- Two Masters
- Embeds 8 channels
- 64-byte FIFO for channel 0, 16-byte FIFO for channels 1 to 7
- Features:
  - Linked List support with Status Write Back operation at End of Transfer
  - Word, Half-word, Byte transfer support
  - Peripheral-to-memory transfers
  - Memory-to-peripheral transfers
  - Memory-to-memory transfers

The DMA Controller 0 handles the transfer between peripherals and memory and receives triggers from the peripherals connected on APB0 (see Table 30-1).

Table 30-1. DMAC 0 Channel Definition

| Instance Name | Transmit/Receive | DMA Channel Number |
|---------------|------------------|--------------------|
| HSMCI0        | RX/TX            | 0                  |
| SPI0          | TX               | 1                  |
| SPI0          | RX               | 2                  |
| USART0        | TX               | 3                  |
| USART0        | RX               | 4                  |
| USART1        | TX               | 5                  |
| USART1        | RX               | 6                  |
| TWI0          | TX               | 7                  |
| TWI0          | RX               | 8                  |

## 30.3.2 DMA Controller 1

- Two Masters
- Embeds 8 channels
- 16-byte FIFO per channel
- Features:
  - Linked List support with Status Write Back operation at End of Transfer
  - Word, Half-word, Byte transfer support
  - Peripheral-to-memory transfers
  - Memory-to-peripheral transfers

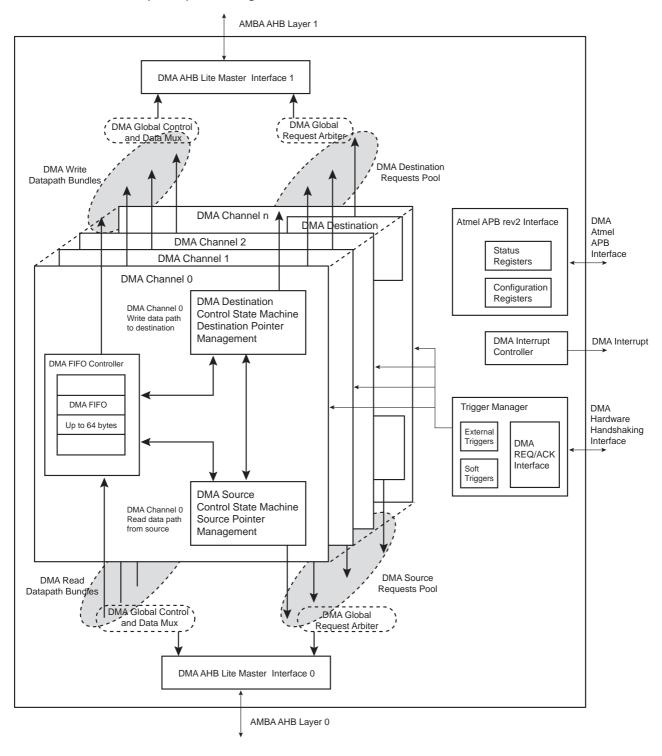

The DMA Controller 1 handles the transfer between peripherals and memory and receives triggers from the peripherals connected on APB1 (see Table 30-2).

Table 30-2. DMAC 1 Channel Definition

| Instance Name | Transmit/Receive | DMA Channel Number |
|---------------|------------------|--------------------|
| HSMCI1        | RX/TX            | 0                  |
| SPI1          | TX               | 1                  |
| SPI1          | RX               | 2                  |
| SMD           | TX               | 3                  |
| SMD           | RX               | 4                  |
| TWI1          | TX               | 5                  |
| TWI1          | RX               | 6                  |
| ADC           | RX               | 7                  |
| DBGU          | TX               | 8                  |
| DBGU          | RX               | 9                  |
| UART1         | TX               | 10                 |
| UART1         | RX               | 11                 |
| USART2        | TX               | 12                 |
| USART2        | RX               | 13                 |

## 30.5 Product Dependencies

#### 30.5.1 Interrupt Sources

The DMAC interrupt line is connected to one of the internal sources of the interrupt controller. Using the DMAC interrupt requires prior programming of the interrupt controller.

Table 30-3. Peripheral IDs

| Instance | ID |
|----------|----|
| DMAC0    | 20 |
| DMAC1    | 21 |

# 30.6 Functional Description

#### 30.6.1 Basic Definitions

**Source peripheral:** Device on an AMBA layer from where the DMAC reads data, which is then stored in the channel FIFO. The source peripheral teams up with a destination peripheral to form a channel.

**Destination peripheral:** Device to which the DMAC writes the stored data from the FIFO (previously read from the source peripheral).

**Memory:** Source or destination that is always "ready" for a DMAC transfer and does not require a handshaking interface to interact with the DMAC.

**Programmable Arbitration Policy:** Modified Round Robin and Fixed Priority are available by means of the ARB\_CFG bit in the Global Configuration Register (DMAC\_GCFG). The fixed priority is linked to the channel number. The highest DMAC channel number has the highest priority.

**Channel:** Read/write datapath between a source peripheral on one configured AMBA layer and a destination peripheral on the same or different AMBA layer that occurs through the channel FIFO. If the source peripheral is not memory, then a source handshaking interface is assigned to the channel. If the destination peripheral is not memory, then a destination handshaking interface is assigned to the channel. Source and destination handshaking interfaces can be assigned dynamically by programming the channel registers.

**Master interface:** DMAC is a master on the AHB bus reading data from the source and writing it to the destination over the AHB bus.

**Slave interface:** The APB interface over which the DMAC is programmed. The slave interface in practice could be on the same layer as any of the master interfaces or on a separate layer.

**Handshaking interface:** A set of signal registers that conform to a protocol and *handshake* between the DMAC and source or destination peripheral to control the transfer of a single or chunk transfer between them. This interface is used to request, acknowledge, and control a DMAC transaction. A channel can receive a request through one of two types of handshaking interface: hardware or software.

**Hardware handshaking interface:** Uses hardware signals to control the transfer of a single or chunk transfer between the DMAC and the source or destination peripheral.

**Software handshaking interface:** Uses software registers to control the transfer of a single or chunk transfer between the DMAC and the source or destination peripheral. No special DMAC handshaking signals are needed on the I/O of the peripheral. This mode is useful for interfacing an existing peripheral to the DMAC without modifying it.

**Transfer hierarchy:** Figure 30-2 illustrates the hierarchy between DMAC transfers, buffer transfers, chunk or single, and AMBA transfers (single or burst) for non-memory peripherals. Figure 30-3 shows the transfer hierarchy for memory.

Figure 30-2. DMAC Transfer Hierarchy for Non-Memory Peripheral

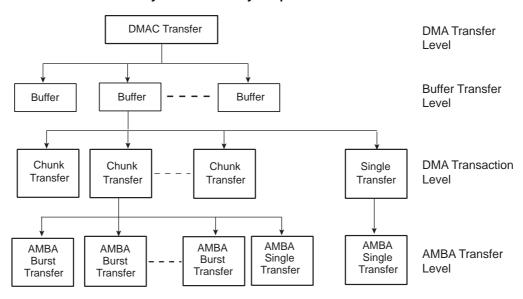

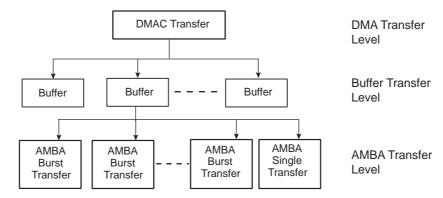

Figure 30-3. DMAC Transfer Hierarchy for Memory

**Buffer:** A buffer of DMAC data. The amount of data (length) is determined by the flow controller. For transfers between the DMAC and memory, a buffer is broken directly into a sequence of AMBA bursts and AMBA single transfers.

For transfers between the DMAC and a non-memory peripheral, a buffer is broken into a sequence of DMAC transactions (single and chunks). These are in turn broken into a sequence of AMBA transfers.

**Transaction:** A basic unit of a DMAC transfer as determined by either the hardware or software handshaking interface. A transaction is only relevant for transfers between the DMAC and a source or destination peripheral if the source or destination peripheral is a non-memory device. There are two types of transactions: single transfer and chunk transfer.

- Single transfer: The length of a single transaction is always 1 and is converted to a single AMBA access.
- Chunk transfer: The length of a chunk is programmed into the DMAC. The chunk is then converted
  into a sequence of AHB access.DMAC executes each AMBA burst transfer by performing incremental
  bursts that are no longer than 16 beats.

**DMAC** transfer: Software controls the number of buffers in a DMAC transfer. Once the DMAC transfer has completed, then hardware within the DMAC disables the channel and can generate an interrupt to signal the completion of the DMAC transfer. It is then possible to re-program the channel for a new DMAC transfer.

Single-buffer DMAC transfer: Consists of a single buffer.

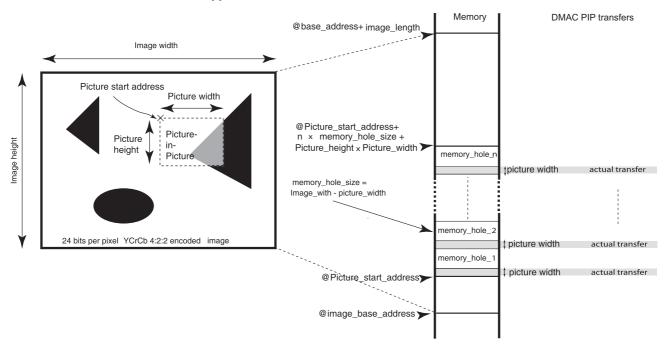

**Multi-buffer DMAC transfer:** A DMAC transfer may consist of multiple DMAC buffers. Multi-buffer DMAC transfers are supported through buffer chaining (linked list pointers), auto-reloading of channel registers, and contiguous buffers. The source and destination can independently select which method to use.

- Linked lists (buffer chaining) A descriptor pointer (DSCR) points to the location in system memory
  where the next linked list item (LLI) exists. The LLI is a set of registers that describe the next buffer
  (buffer descriptor) and a descriptor pointer register. The DMAC fetches the LLI at the beginning of
  every buffer when buffer chaining is enabled.
- Replay The DMAC automatically reloads the channel registers at the end of each buffers to the value when the channel was first enabled.
- Contiguous buffers Where the address of the next buffer is selected to be a continuation from the end of the previous buffer.

Picture-in-Picture Mode: DMAC contains a Picture-in-Picture mode support. When this mode is enabled, addresses are automatically incremented by a programmable value when the DMAC channel transfer count reaches a user defined boundary.

Figure 30-4 illustrates a memory mapped image 4:2:2 encoded located at image\_base\_address in memory. A user defined start address is defined at Picture\_start\_address. The incremented value is set to memory\_hole\_size = image\_width - picture\_width, and the boundary is set to picture\_width.

Figure 30-4. Picture-In-Picture Mode Support

**Channel locking:** Software can program a channel to keep the AHB master interface by locking the arbitration for the master bus interface for the duration of a DMAC transfer, buffer, or chunk.

**Bus locking:** Software can program a channel to maintain control of the AMBA bus by asserting hmastlock for the duration of a DMAC transfer, buffer, or transaction (single or chunk). Channel locking is asserted for the duration of bus locking at a minimum.

## 30.6.2 Memory Peripherals

Figure 30-3 on page 475 shows the DMAC transfer hierarchy of the DMAC for a memory peripheral. There is no handshaking interface with the DMAC, and therefore the memory peripheral can never be a flow controller. Once the channel is enabled, the transfer proceeds immediately without waiting for a transaction request. The alternative to not having a transaction-level handshaking interface is to allow the DMAC to attempt AMBA transfers to the peripheral once the channel is enabled. If the peripheral slave cannot accept these AMBA transfers, it inserts wait states onto the bus until it is ready; it is not recommended that more than 16 wait states be inserted onto the bus. By using the handshaking interface, the peripheral can signal to the DMAC that it is ready to transmit/receive data, and then the DMAC can access the peripheral without the peripheral inserting wait states onto the bus.

## 30.6.3 Handshaking Interface

Handshaking interfaces are used at the transaction level to control the flow of single or chunk transfers. The operation of the handshaking interface is different and depends on whether the peripheral or the DMAC is the flow controller.

The peripheral uses the handshaking interface to indicate to the DMAC that it is ready to transfer/accept data over the AMBA bus. A non-memory peripheral can request a DMAC transfer through the DMAC using one of two handshaking interfaces:

- Hardware handshaking
- Software handshaking

Software selects between the hardware or software handshaking interface on a per-channel basis. Software handshaking is accomplished through memory-mapped registers, while hardware handshaking is accomplished using a dedicated handshaking interface.

#### 30.6.3.1 Software Handshaking

When the slave peripheral requires the DMAC to perform a DMAC transaction, it communicates this request by sending an interrupt to the CPU or interrupt controller.

The interrupt service routine then uses the software registers to initiate and control a DMAC transaction. These software registers are used to implement the software handshaking interface.

The SRC\_H2SEL/DST\_H2SEL bit in the Channel Configuration Register (DMAC\_CFGx) must be cleared to enable software handshaking.

When the peripheral is not the flow controller, then the Software Last Transfer Flag Register (DMAC\_LAST) is not used, and the values in these registers are ignored.

## Chunk Transactions

Writing a '1' to the Software Chunk Transfer Request Register (DMAC\_CREQ[2x]) starts a source chunk transaction request, where x is the channel number. Writing a '1' to the DMAC\_CREQ[2x+1] register starts a destination chunk transfer request, where x is the channel number.

Upon completion of the chunk transaction, the hardware clears the DMAC CREQ[2x] or DMAC CREQ[2x+1].

#### Single Transactions

Writing a '1' to the Software Single Request Register (DMAC\_SREQ[2x]) starts a source single transaction request, where x is the channel number. Writing a '1' to the DMAC\_SREQ[2x+1] register starts a destination single transfer request, where x is the channel number.

Upon completion of the chunk transaction, the hardware clears the DMAC\_SREQ[x] or DMAC\_SREQ[2x+1].

The software can poll the relevant channel bit in the DMAC\_CREQ[2x]/DMAC\_CREQ[2x+1] and DMAC\_SREQ[x]/DMAC\_SREQ[2x+1] registers. When both are 0, then either the requested chunk or single transaction has completed.

## 30.6.4 DMAC Transfer Types

A DMAC transfer may consist of single or multi-buffer transfers. On successive buffers of a multi-buffer transfer, DMAC\_SADDRx/DMAC\_DADDRx in the DMAC are reprogrammed using either of the following methods:

- Buffer chaining using linked lists
- Replay mode
- Contiguous address between buffers

On successive buffers of a multi-buffer transfer, the DMAC\_CTRLAx and DMAC\_CTRLBx registers in the DMAC are re-programmed using either of the following methods:

- Buffer chaining using linked lists
- Replay mode

When buffer chaining using linked lists is the multi-buffer method of choice, and on successive buffers, DMAC\_DSCRx in the DMAC is reprogrammed using the following method:

Buffer chaining using linked lists

A buffer descriptor (LLI) consists of the following registers: DMAC\_SADDRx, DMAC\_DADDRx, DMAC\_DSCRx, DMAC\_CTRLAx, and DMAC\_CTRLBx. These registers, along with DMAC\_CFGx, are used by the DMAC to set up and describe the buffer transfer.

#### 30.6.4.1 Multi-buffer Transfers

Buffer Chaining Using Linked Lists

In this case, the DMAC re-programs the channel registers prior to the start of each buffer by fetching the buffer descriptor for that buffer from system memory. This is known as an LLI update.

DMAC buffer chaining is supported by using a descriptor pointer register (DMAC\_DSCRx) that stores the address in memory of the next buffer descriptor. Each buffer descriptor contains the corresponding buffer descriptor (DMAC\_SADDRx, DMAC\_DADDRx, DMAC\_DSCRx, DMAC\_CTRLAx DMAC\_CTRLBx).

To set up buffer chaining, a sequence of linked lists must be programmed in memory.

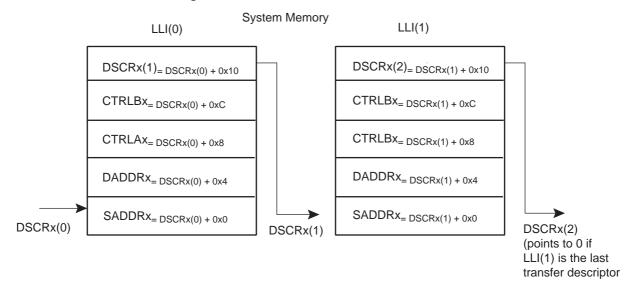

DMAC\_SADDRx, DMAC\_DADDRx, DMAC\_DSCRx, DMAC\_CTRLAx and DMAC\_CTRLBx are fetched from system memory on an LLI update. The updated content of DMAC\_CTRLAx is written back to memory on buffer completion. Figure 30-5 on page 479 shows how to use chained linked lists in memory to define multi-buffer transfers using buffer chaining.

The Linked List multi-buffer transfer is initiated by programming DMAC\_DSCRx with DSCRx(0) (LLI(0) base address) different from zero. Other fields and registers are ignored and overwritten when the descriptor is retrieved from memory.

The last transfer descriptor must be written to memory with its next descriptor address set to 0.

Figure 30-5. Multi-Buffer Transfer Using Linked List

## 30.6.4.2 Programming DMAC for Multiple Buffer Transfers

Table 30-4. **Multiple Buffers Transfer Management Table** 

| Transfer Type  | AUTO | SRC_REP | DST_REP | SRC_DSCR | DST_DSCR | BTSIZE | DSCR | SADDR | DADDR | Other<br>Fields |
|--|------|---------|---------|----------|----------|--------|------|-------|-------|-----------------|
| Single Buffer or Last Buffer of a multiple buffer transfer               | 0    | _       | _       | -        | -        | USR    | 0    | USR   | USR   | USR             |
| 2) Multi-buffer transfer with contiguous DADDR                           | 0    | _       | 0       | 0        | 1        | LLI    | USR  | LLI   | CONT  | LLI             |
| 3) Multi-buffer transfer with contiguous SADDR                           | 0    | 0       | _       | 1        | 0        | LLI    | USR  | CONT  | LLI   | LLI             |
| 4) Multi-buffer transfer with LLI support                                | 0    | _       | _       | 0        | 0        | LLI    | USR  | LLI   | LLI   | LLI             |
| 5) Multi-buffer transfer with DADDR reloaded                             | 0    | _       | 1       | 0        | 1        | LLI    | USR  | LLI   | REP   | LLI             |
| 6) Multi-buffer transfer with SADDR reloaded                             | 0    | 1       | _       | 1        | 0        | LLI    | USR  | REP   | LLI   | LLI             |
| 7) Multi-buffer transfer with BTSIZE reloaded and contiguous DADDR       | 1    | _       | 0       | 0        | 1        | REP    | USR  | LLI   | CONT  | LLI             |
| 8) Multi-buffer transfer<br>with BTSIZE reloaded<br>and contiguous SADDR | 1    | 0       | _       | 1        | 0        | REP    | USR  | CONT  | LLI   | LLI             |
| 9) Automatic mode channel is stalling BTsize is reloaded                 | 1    | 0       | 0       | 1        | 1        | REP    | USR  | CONT  | CONT  | REP             |
| 10) Automatic mode<br>BTSIZE, SADDR and<br>DADDR reloaded                | 1    | 1       | 1       | 1        | 1        | REP    | USR  | REP   | REP   | REP             |
| 11) Automatic mode<br>BTSIZE, SADDR<br>reloaded and DADDR<br>contiguous  | 1    | 1       | 0       | 1        | 1        | REP    | USR  | REP   | CONT  | REP             |

- Notes: 1. USR means that the register field is manually programmed by the user.
  - 2. CONT means that address are contiguous.
  - 3. REP means that the register field is updated with its previous value. If the transfer is the first one, then the user must manually program the value.
  - 4. Channel stalled is true if the relevant BTC interrupt is not masked.
  - 5. LLI means that the register field is updated with the content of the linked list item.

## Replay Mode of Channel Registers

During automatic replay mode, the channel registers are reloaded with their initial values at the completion of each buffer and the new values used for the new buffer. Depending on the row number in Table 30-4 on page 480, some or all of the DMAC\_SADDRx, DMAC\_DADDRx, DMAC\_CTRLAx and DMAC\_CTRLBx channel registers are reloaded from their initial value at the start of a buffer transfer.

## Contiguous Address Between Buffers

In this case, the address between successive buffers is selected to be a continuation from the end of the previous buffer. Enabling the source or destination address to be contiguous between buffers is a function of DMAC\_CTRLAx.SRC\_DSCR, DMAC\_CFGx.DST\_REP, DMAC\_CFGx.SRC\_REP and DMAC\_CTRLAx.DST\_DSCR registers.

#### Suspension of Transfers Between Buffers

At the end of every buffer transfer, an end of buffer interrupt is asserted if:

the channel buffer interrupt is unmasked, DMAC\_EBCIMR.BTCx = '1', where x is the channel number.

Note: The Buffer Transfer Completed Interrupt is generated at the completion of the buffer transfer to the destination.

At the end of a chain of multiple buffers, an end of linked list interrupt is asserted if:

• the channel end of the Chained Buffer Transfer Completed Interrupt is unmasked, DMAC\_EBCIMR.CBTCx = '1', when n is the channel number.

#### 30.6.4.3 Ending Multi-buffer Transfers

All multi-buffer transfers must end as shown in Row 1 of Table 30-4 on page 480. At the end of every buffer transfer, the DMAC samples the row number, and if the DMAC is in Row 1 state, then the previous buffer transferred was the last buffer and the DMAC transfer is terminated.

For rows 9, 10 and 11 of Table 30-4 on page 480, (DMAC\_DSCRx = 0 and DMAC\_CTRLBx.AUTO is set), multi-buffer DMAC transfers continue until the automatic mode is disabled by clearing the DMAC\_CTRLBx.AUTO bit. This bit should be programmed to zero in the end of buffer interrupt service routine that services the next-to-last buffer transfer. This puts the DMAC into Row 1 state.

For rows 2, 3, 4, 5, and 6 (DMAC\_CRTLBx.AUTO cleared), the user must set up the last buffer descriptor in memory so that LLI.DMAC\_DSCRx is set to 0.

#### 30.6.5 Programming a Channel

Four registers, DMAC\_DSCRx, DMAC\_CTRLAx, DMAC\_CTRLBx and DMAC\_CFGx, need to be programmed to set up whether single or multi-buffer transfers take place, and which type of multi-buffer transfer is used. The different transfer types are shown in Table 30-4 on page 480.

The "BTSIZE", "SADDR" and "DADDR" columns indicate where the values of DMAC\_SARx, DMAC\_DARx, DMAC\_CTLx, and DMAC\_LLPx are obtained for the next buffer transfer when multi-buffer DMAC transfers are enabled.

#### 30.6.5.1 Programming Examples

Single-buffer Transfer (Row 1)

- 1. Read the ENAx bit in the DMAC Channel Handler Status Register (DMAC\_CHSR) to choose a free (disabled) channel.
- 2. Clear any pending interrupts on the channel from the previous DMAC transfer by reading the DMAC Error, Buffer Transfer and Chained Buffer Transfer Status Register (DMAC EBCISR).
- 3. Program the following channel registers:
  - a. Write the starting source address in DMAC\_SADDRx for channel x.
  - b. Write the starting destination address in DMAC\_DADDRx for channel x.
  - c. Write the next descriptor address in DMA\_DSCRx for channel x with 0x0.
  - d. Program DMAC\_CTRLAx, DMAC\_CTRLBx and DMAC\_CFGx according to Row 1 as shown in Table 30-4 on page 480. Program DMAC\_CTRLBx with both AUTO bits cleared.
  - e. Write the control information for the DMAC transfer in DMAC\_CTRLAx and DMAC\_CTRLBx for channel x. For example, in the register, you can program the following:
    - i. Set up the transfer type (memory or non-memory peripheral for source and destination) and flow control device by programming the FC field in DMAC\_CTRLBx.
    - ii. Set up the transfer characteristics, such as:
    - Transfer width for the source in the SRC WIDTH field.
    - Transfer width for the destination in the DST WIDTH field.
    - Incrementing/decrementing or fixed address for source in SRC\_INCR field.
    - Incrementing/decrementing or fixed address for destination in DST\_INCR field.
  - f. Write the channel configuration information into DMAC\_CFGx for channel x.
    - i. Designate the handshaking interface type (hardware or software) for the source and destination peripherals. This is not required for memory. This step requires programming the SRC\_H2SEL/DST\_H2SEL bits, respectively. Writing a '1' activates the hardware handshaking interface to handle source/destination requests. Writing a '0' activates the software handshaking interface to handle source/destination requests.
    - ii. If the hardware handshaking interface is activated for the source or destination peripheral, assign a
      handshaking interface to the source and destination peripheral. This requires programming the
      SRC\_PER and DST\_PER bits, respectively.
  - g. If source Picture-in-Picture mode is enabled (DMAC\_CTRLBx.SRC\_PIP is enabled), program DMAC\_SPIPx for channel x.
  - h. If destination Picture-in-Picture mode is enabled (DMAC\_CTRLBx.DST\_PIP is enabled), program DMAC\_DPIPx for channel x.
- 4. After the DMAC selected channel has been programmed, enable the channel by setting the ENAx bit in the DMAC Channel Handler Enable Register (DMAC\_CHER), where x is the channel number. Make sure that the ENABLE bit (register bit 0) in DMAC\_EN is set.
- 5. Source and destination request single and chunk DMAC transactions to transfer the buffer of data (assuming non-memory peripherals). The DMAC acknowledges at the completion of every transaction (chunk and single) in the buffer and carries out the buffer transfer.
- 6. Once the transfer completes, the hardware sets the interrupts and disables the channel. At this time, you can either respond to the Buffer Transfer Completed Interrupt or Chained Buffer Transfer Completed Interrupt, or poll for the DMAC\_CHSR.ENAx bit until it is cleared by hardware, to detect when the transfer is complete.

Multi-buffer Transfer with Linked List for Source and Linked List for Destination (Row 4)

- 1. Read the DMAC\_CHSR to choose a free (disabled) channel.
- 2. Set up the chain of Linked List Items (otherwise known as buffer descriptors) in memory. Write the control information in the LLI.DMAC\_CTRLAx and LLI.DMAC\_CTRLBx registers location of the buffer descriptor for each LLI in memory (see Figure 30-6 on page 484) for channel x. For example, in the register, you can program the following:
  - a. Set up the transfer type (memory or non-memory peripheral for source and destination) and flow control device by programming the FC field in DMAC CTRLBx.
  - b. Set up the transfer characteristics, such as:
    - i. Transfer width for the source in the SRC\_WIDTH field.
    - ii. Transfer width for the destination in the DST\_WIDTH field.
    - v. Incrementing/decrementing or fixed address for source in SRC\_INCR field.
    - vi. Incrementing/decrementing or fixed address for destination DST\_INCR field.
- 3. Write the channel configuration information into DMAC\_CFGx for channel x.
  - a. Designate the handshaking interface type (hardware or software) for the source and destination peripherals. This is not required for memory. This step requires programming the SRC\_H2SEL/DST\_H2SEL bits, respectively. Writing a '1' activates the hardware handshaking interface to handle source/destination requests for the specific channel. Writing a '0' activates the software handshaking interface to handle source/destination requests.
  - b. If the hardware handshaking interface is activated for the source or destination peripheral, assign the handshaking interface to the source and destination peripheral. This requires programming the SRC\_PER and DST\_PER bits, respectively.
- 4. Make sure that the LLI.DMAC\_CTRLBx register locations of all LLI entries in memory (except the last) are set as shown in Row 4 of Table 30-4 on page 480. The LLI.DMAC\_CTRLBx register of the last Linked List Item must be set as described in Row 1 of Table 30-4. Figure 30-5 on page 479 shows a Linked List example with two list items.
- 5. Make sure that the LLI.DMAC\_DSCRx register locations of all LLI entries in memory (except the last) are non-zero and point to the base address of the next Linked List Item.
- 6. Make sure that the LLI.DMAC\_SADDRx/LLI.DMAC\_DADDRx register locations of all LLI entries in memory point to the start source/destination buffer address preceding that LLI fetch.
- 7. Make sure that the LLI.DMAC\_CTRLAx.DONE bit of the LLI.DMAC\_CTRLAx register locations of all LLI entries in memory are cleared.
- 8. If source Picture-in-Picture mode is enabled (DMAC\_CTRLBx.SRC\_PIP is enabled), program DMAC\_SPIPx for channel x.
- 9. If destination Picture-in-Picture is enabled (DMAC\_CTRLBx.DST\_PIP is enabled), program DMAC\_DPIPx for channel x.
- 10. Clear any pending interrupts on the channel from the previous DMAC transfer by reading DMAC EBCISR.
- 11. Program DMAC\_CTRLBx and DMAC\_CFGx according to Row 4 as shown in Table 30-4 on page 480.
- 12. Program DMAC\_DSCRx with DMAC\_DSCRx(0), the pointer to the first Linked List item.
- 13. Finally, enable the channel by setting the DMAC\_CHER.ENAx bit, where x is the channel number. The transfer is performed.
- 14. The DMAC fetches the first LLI from the location pointed to by DMAC\_DSCRx(0).
- Note: The LLI.DMAC\_SADDRx, LLI. DMAC\_DADDRx, LLI.DMAC\_DSCRx, LLI.DMAC\_CTRLAx and LLI.DMAC\_CTRLBx registers are fetched. The DMAC automatically reprograms the DMAC\_SADDRx, DMAC\_DADDRx, DMAC\_DSCRx, DMAC\_CTRLBx and DMAC\_CTRLAx channel registers from the DMAC\_DSCRx(0).
- 15. Source and destination request single and chunk DMAC transactions to transfer the buffer of data (assuming non-memory peripheral). The DMAC acknowledges at the completion of every transaction (chunk and single) in the buffer and carries out the buffer transfer.

- 16. Once the buffer of data is transferred, the DMAC\_CTRLAx register is written out to system memory at the same location and on the same layer where it was originally fetched, that is, the location of the DMAC\_CTRLAx register of the linked list item fetched prior to the start of the buffer transfer. Only DMAC\_CTRLAx register is written out because only the DMAC\_CTRLAx.BTSIZE and DMAC\_CTRLAX.DONE bits have been updated by DMAC hardware. Additionally, the DMAC\_CTRLAx.DONE bit is asserted when the buffer transfer has completed.
- Note: Do not poll the DMAC\_CTRLAx.DONE bit in the DMAC memory map. Instead, poll the LLI.DMAC\_CTRLAx.DONE bit in the LLI for that buffer. If the poll LLI.DMAC\_CTRLAx.DONE bit is asserted, then this buffer transfer has completed. This LLI.DMAC\_CTRLAx.DONE bit was cleared at the start of the transfer.
- 17. The DMAC does not wait for the buffer interrupt to be cleared, but continues fetching the next LLI from the memory location pointed to by current DMAC\_DSCRx and automatically reprograms the DMAC\_SADDRx, DMAC\_DADDRx, DMAC\_DSCRx, DMAC\_CTRLAx and DMAC\_CTRLBx channel registers. The DMAC transfer continues until the DMAC determines that the DMAC\_CTRLBx and DMAC\_DSCRx registers at the end of a buffer transfer match as described in Row 1 of Table 30-4 on page 480. The DMAC then knows that the previous buffer transferred was the last buffer in the DMAC transfer. The DMAC transfer might look like that shown in Figure 30-6 on page 484.

Buffer 2

Buffer 1

SADDR(1)

Buffer 1

DADDR(1)

Buffer 0

Buffer 0

Figure 30-6. Multi-buffer with Linked List Address for Source and Destination

SADDR(0)

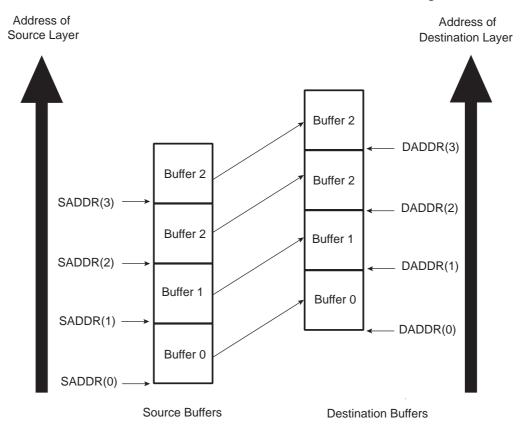

If the user needs to execute a DMAC transfer where the source and destination address are contiguous but the amount of data to be transferred is greater than the maximum buffer size DMAC\_CTRLAx.BTSIZE, then this can be achieved using the type of multi-buffer transfer as shown in Figure 30-7 on page 485.

Source Buffers

DADDR(0)

**Destination Buffers** 

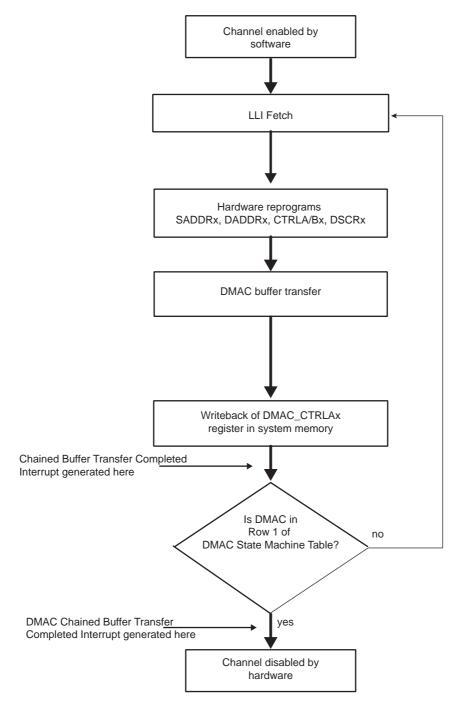

Figure 30-7. Multi-buffer with Linked Address for Source and Destination Buffers are Contiguous

The DMAC transfer flow is shown in Figure 30-8 on page 486.

Figure 30-8. DMAC Transfer Flow for Source and Destination Linked List Address

Multi-buffer Transfer with Source Address Auto-reloaded and Destination Address Auto-reloaded (Row 10)

- 1. Read the DMAC\_CHSR to choose an available (disabled) channel.
- 2. Clear any pending interrupts on the channel from the previous DMAC transfer by reading the interrupt status register. Program the following channel registers:
  - a. Write the starting source address in DMAC\_SADDRx for channel x.
  - b. Write the starting destination address in DMAC\_DADDRx for channel x.
  - c. Program DMAC\_CTRLAx, DMAC\_CTRLBx and DMAC\_CFGx according to Row 10 as shown in Table 30-4 on page 480. Program DMAC\_DSCRx with 0.
  - d. Write the control information for the DMAC transfer in DMAC\_CTRLAx and DMAC\_CTRLBx for channel x. For example, in the register, you can program the following:
    - i. Set up the transfer type (memory or non-memory peripheral for source and destination) and flow control device by programming the FC field in DMAC\_CTRLBx.
    - ii. Set up the transfer characteristics, such as:
    - Transfer width for the source in the SRC\_WIDTH field.
    - Transfer width for the destination in the DST WIDTH field.
    - Source AHB master interface layer in the SIF field where source resides.
    - Destination AHB master interface layer in the DIF field where destination resides.
    - Incrementing/decrementing or fixed address for source in SRC\_INCR field.
    - Incrementing/decrementing or fixed address for destination in DST\_INCR field.
  - e. If source Picture-in-Picture mode is enabled (DMAC\_CTRLBx.SPIP is enabled), program DMAC\_SPIPx for channel x.
  - If destination Picture-in-Picture is enabled (DMAC\_CTRLBx.DPIP), program DMAC\_DPIPx for channel x.
  - g. Write the channel configuration information into DMAC\_CFGx for channel x. Ensure that the reload bits, DMAC\_CFGx.SRC\_REP, DMAC\_CFGx.DST\_REP and DMAC\_CTRLBx.AUTO are enabled.
    - i. Designate the handshaking interface type (hardware or software) for the source and destination peripherals. This is not required for memory. This step requires programming the SRC\_H2SEL/DST\_h2SEL bits, respectively. Writing a '1' activates the hardware handshaking interface to handle source/destination requests for the specific channel. Writing a '0' activates the software handshaking interface to handle source/destination requests.
    - ii. If the hardware handshaking interface is activated for the source or destination peripheral, assign handshaking interface to the source and destination peripheral. This requires programming the SRC\_PER and DST\_PER bits, respectively.
- 3. After the DMAC selected channel has been programmed, enable the channel by setting the DMAC\_CHER.ENAx bit where x is the channel number. Make sure that the ENABLE bit (register bit 0) in DMAC\_EN is set.
- 4. Source and destination request single and chunk DMAC transactions to transfer the buffer of data (assuming non-memory peripherals). The DMAC acknowledges on completion of each chunk/single transaction and carries out the buffer transfer.
- 5. When the buffer transfer has completed, the DMAC reloads DMAC\_SADDRx, DMAC\_DADDRx and DMAC\_CTRLAx. The hardware sets the Buffer Transfer Completed Interrupt. The DMAC then samples the row number as shown in Table 30-4 on page 480. If the DMAC is in Row 1, then the DMAC transfer has completed. The hardware sets the Chained Buffer Transfer Completed Interrupt and disables the channel. You can either respond to the Buffer Transfer Completed Interrupt or Chained Buffer Transfer Completed Interrupt, or poll for the DMAC\_CHSR.ENAx until it is disabled, to detect when the transfer is complete. If the DMAC is not in Row 1, the next step is performed.
- 6. The DMAC transfer proceeds as follows:

- a. If the Buffer Transfer Completed Interrupt is unmasked (DMAC\_EBCIMR.BTCx = '1', where x is the channel number), the hardware sets the Buffer Transfer Completed Interrupt when the buffer transfer has completed. It then stalls until the STALx bit of DMAC\_CHSR is cleared by software, writing '1' to DMAC\_CHER.KEEPx bit, where x is the channel number. If the next buffer is to be the last buffer in the DMAC transfer, then the buffer complete ISR (interrupt service routine) should clear the automatic mode bit in the DMAC\_CTRLBx.AUTO bit. This puts the DMAC into Row 1 as shown in Table 30-4 on page 480. If the next buffer is not the last buffer in the DMAC transfer, then the reload bits should remain enabled to keep the DMAC in Row 4.
- b. If the Buffer Transfer Completed Interrupt is masked (DMAC\_EBCIMR.BTCx = '0', where x is the channel number), the hardware does not stall until it detects a write to the Buffer Transfer Completed Interrupt Enable register DMAC\_EBCIER register, but starts the next buffer transfer immediately. In this case, the software must clear the automatic mode bit in the DMAC\_CTRLB to put the DMAC into ROW 1 of Table 30-4 on page 480 before the last buffer of the DMAC transfer has completed. The transfer is similar to that shown in Figure 30-9 on page 488. The DMAC transfer flow is shown in Figure 30-10 on page 489.

Figure 30-9. Multi-buffer DMAC Transfer with Source and Destination Address Auto-reloaded

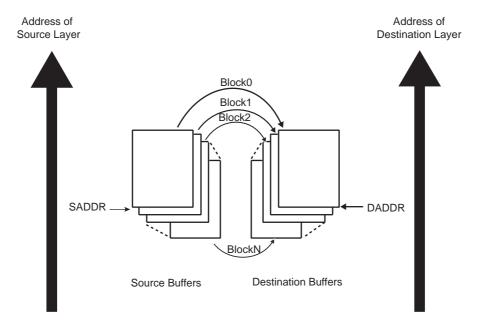

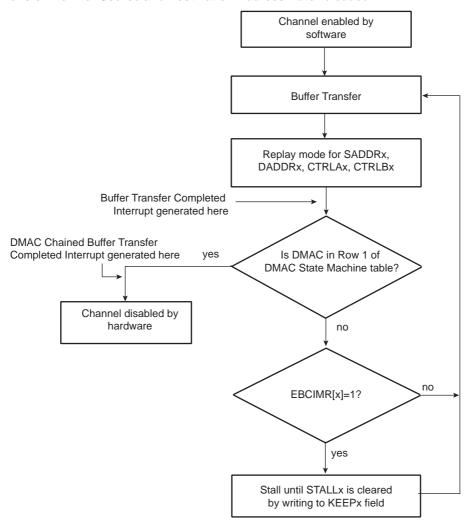

Figure 30-10. DMAC Transfer Flow for Source and Destination Address Auto-reloaded

Multi-buffer Transfer with Source Address Auto-reloaded and Linked List Destination Address (Row 6)

- 1. Read the DMAC\_CHSR to choose a free (disabled) channel.
- 2. Set up the chain of linked list items (otherwise known as buffer descriptors) in memory. Write the control information in the LLI.DMAC\_CTRLAx and DMAC\_CTRLBx registers location of the buffer descriptor for each LLI in memory for channel x. For example, in the register, you can program the following:
  - a. Set up the transfer type (memory or non-memory peripheral for source and destination) and flow control peripheral by programming the FC field in DMAC\_CTRLBx.
  - b. Set up the transfer characteristics, such as:
    - i. Transfer width for the source in the SRC\_WIDTH field.
    - ii. Transfer width for the destination in the DST WIDTH field.
    - iii. Source AHB master interface layer in the SIF field where source resides.
    - iv. Destination AHB master interface layer in the DIF field where destination resides.
    - v. Incrementing/decrementing or fixed address for source in SRC\_INCR field.
    - vi. Incrementing/decrementing or fixed address for destination DST INCR field.
- 3. Write the starting source address in DMAC\_SADDRx for channel x.

Note: The values in the LLI.DMAC\_SADDRx register locations of each of the Linked List Items (LLIs) set up in memory, although fetched during an LLI fetch, are not used.

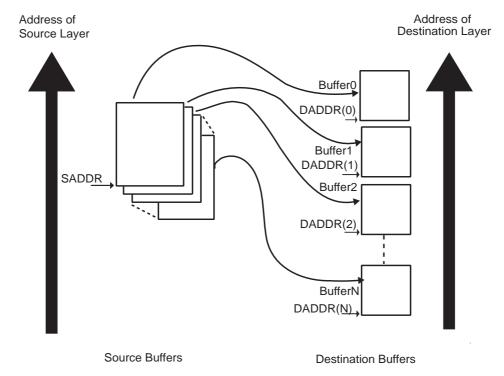

- 4. Write the channel configuration information into DMAC\_CFGx for channel x.
  - a. Designate the handshaking interface type (hardware or software) for the source and destination peripherals. This is not required for memory. This step requires programming the SRC\_H2SEL/DST\_H2SEL bits, respectively. Writing a '1' activates the hardware handshaking interface to handle source/destination requests for the specific channel. Writing a '0' activates the software handshaking interface source/destination requests.
  - b. If the hardware handshaking interface is activated for the source or destination peripheral, assign handshaking interface to the source and destination peripheral. This requires programming the SRC\_PER and DST\_PER bits, respectively.
- 5. Make sure that the LLI.DMAC\_CTRLBx register locations of all LLIs in memory (except the last one) are set as shown in Row 6 of Table 30-4 on page 480 while the LLI.DMAC\_CTRLBx register of the last Linked List item must be set as described in Row 1 of Table 30-4. Figure 30-5 on page 479 shows a Linked List example with two list items.
- 6. Make sure that the LLI.DMAC\_DSCRx register locations of all LLIs in memory (except the last one) are non-zero and point to the next Linked List Item.
- 7. Make sure that the LLI.DMAC\_DADDRx register locations of all LLIs in memory point to the start destination buffer address proceeding that LLI fetch.
- 8. Make sure that the LLI.DMAC\_CTLx.DONE bit of the LLI.DMAC\_CTRLA register locations of all LLIs in memory is cleared.
- 9. If source Picture-in-Picture is enabled (DMAC\_CTRLBx.SPIP is enabled), program DMAC\_SPIPx for channel x.
- 10. If destination Picture-in-Picture is enabled (DMAC\_CTRLBx.DPIP is enabled), program DMAC\_DPIPx for channel x.
- 11. Clear any pending interrupts on the channel from the previous DMAC transfer by reading DMAC\_EBCISR.
- 12. Program DMAC\_CTLx and DMAC\_CFGx according to Row 6 as shown in Table 30-4 on page 480.
- 13. Program DMAC\_DSCRx with DMAC\_DSCRx(0), the pointer to the first Linked List item.
- 14. Finally, enable the channel by setting the DMAC\_CHER.ENAx bit, where x is the channel number. The transfer is performed. Make sure that the ENABLE bit (register bit 0) in DMAC\_EN is set.
- 15. The DMAC fetches the first LLI from the location pointed to by DMAC\_DSCRx(0).

- Note: The LLI.DMAC\_SADDRx, LLI.DMAC\_DADDRx, LLI. DMAC\_LLPx LLI.DMAC\_CTRLAx and LLI.DMAC\_CTRLBx registers are fetched. The LLI.DMAC\_SADDRx register, although fetched, is not used.
  - 16. Source and destination request single and chunk DMAC transactions to transfer the buffer of data (assuming non-memory peripherals). DMAC acknowledges at the completion of every transaction (chunk and single) in the buffer and carries out the buffer transfer.
- 17. The DMAC\_CTRLAx register is written out to the system memory. The DMAC\_CTRLAx register is written out to the same location on the same layer (DMAC\_DSCRx.DSCR\_IF) where it was originally fetched, that is the location of the DMAC\_CTRLAx register of the linked list item fetched prior to the start of the buffer transfer. Only DMAC\_CTRLAx register is written out, because only the DMAC\_CTRLAx.BTSIZE and DMAC\_CTRLAx.DONE fields have been updated by hardware within the DMAC. The LLI.DMAC\_CTRLAx.DONE bit is asserted to indicate buffer completion. Therefore, the software can poll the LLI.DMAC\_CTRLAx.DONE bit of the DMAC\_CTRLAx register in the LLi to ascertain when a buffer transfer has completed.
- Note: Do not poll the DMAC\_CTRLAx.DONE bit in the DMAC memory map. Instead, poll the LLI.DMAC\_CTRLAx.DONE bit in the LLI for that buffer. If the polled LLI.DMAC\_CTRLAx.DONE bit is asserted, then this buffer transfer has completed. This LLI.DMAC\_CTRLA.DONE bit was cleared at the start of the transfer.
- 18. The DMAC reloads DMAC\_SADDRx from the initial value. The hardware sets the Buffer Transfer Completed Interrupt. The DMAC samples the row number as shown in Table 30-4 on page 480. If the DMAC is in Row 1, then the DMAC transfer has completed. The hardware sets the Chained Buffer Transfer Completed Interrupt and disables the channel. You can either respond to the Buffer Transfer Completed Interrupt or Chained Buffer Transfer Completed Interrupt, or poll for the DMAC\_CHSR.ENAx bit until it is cleared by hardware, to detect when the transfer is complete. If the DMAC is not in Row 1 as shown in Table 30-4 on page 480, the following step is performed.
- 19. The DMAC fetches the next LLI from the memory location pointed to by the current DMAC\_DSCRx register, and automatically reprograms the DMAC\_DADDRx, DMAC\_CTRLAx, DMAC\_CTRLBx and DMAC\_DSCRx channel registers. Note that the DMAC\_SADDRx is not re-programmed as the reloaded value is used for the next DMAC buffer transfer. If the next buffer is the last buffer of the DMAC transfer, then the DMAC\_CTRLBx and DMAC\_DSCRx registers just fetched from the LLI should match Row 1 of Table 30-4 on page 480. The DMAC transfer might look like that shown in Figure 30-11 on page 492.

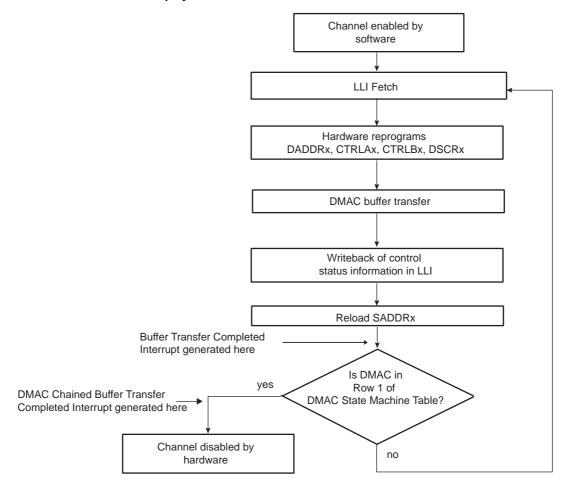

Figure 30-11. Multi-buffer DMAC Transfer with Source Address Auto-reloaded and Linked List Destination Address

The DMAC Transfer flow is shown in Figure 30-12.

Figure 30-12. DMAC Transfer Flow for Replay Mode at Source and Linked List Destination Address

Multi-buffer Transfer with Source Address Auto-reloaded and Contiguous Destination Address (Row 11)

- 1. Read the DMAC CHSR to choose a free (disabled) channel.
- 2. Clear any pending interrupts on the channel from the previous DMAC transfer by reading to the Interrupt Status Register.
- 3. Program the following channel registers:
  - a. Write the starting source address in DMAC\_SADDRx for channel x.
  - b. Write the starting destination address in DMAC\_DADDRx for channel x.
  - c. Program DMAC\_CTRLAx, DMAC\_CTRLBx and DMAC\_CFGx according to Row 11 as shown in Table 30-4 on page 480. Program DMAC\_DSCRx with '0'. DMAC\_CTRLBx.AUTO bit is set to '1' to enable automatic mode support.
  - d. Write the control information for the DMAC transfer in DMAC\_CTRLBx and DMAC\_CTRLAx for channel x. For example, in this register, you can program the following:
    - i. Set up the transfer type (memory or non-memory peripheral for source and destination) and flow control device by programming the FC field in DMAC\_CTRLBx.
    - ii. Set up the transfer characteristics, such as:
    - Transfer width for the source in the SRC\_WIDTH field.
    - Transfer width for the destination in the DST WIDTH field.

- Source AHB master interface layer in the SIF field where source resides.
- Destination AHB master interface master layer in the DIF field where destination resides.
- Incrementing/decrementing or fixed address for source in SRC\_INCR field.
- Incrementing/decrementing or fixed address for destination in DST\_INCR field.
- e. If source Picture-in-Picture is enabled (DMAC\_CTRLBx.SPIP is enabled), program DMAC\_SPIPx for channel x.
- If destination Picture-in-Picture is enabled (DMAC\_CTRLBx.DPIP), program DMAC\_DPIPx for channel x.
- g. Write the channel configuration information into DMAC\_CFGx for channel x.
  - i. Designate the handshaking interface type (hardware or software) for the source and destination peripherals. This is not required for memory. This step requires programming the SRC\_H2SEL/DST\_H2SEL bits, respectively. Writing a '1' activates the hardware handshaking interface to handle source/destination requests for the specific channel. Writing a '0' activates the software handshaking interface to handle source/destination requests.
  - ii. If the hardware handshaking interface is activated for the source or destination peripheral, assign
    the handshaking interface to the source and destination peripheral. This requires programming the
    SRC\_PER and DST\_PER bits, respectively.
- 4. After the DMAC channel has been programmed, enable the channel by setting the DMAC\_CHER.ENAx bit, where x is the channel number. Make sure that the ENABLE bit (register bit 0) in DMAC\_EN is set.
- 5. Source and destination request single and chunk DMAC transactions to transfer the buffer of data (assuming non-memory peripherals). The DMAC acknowledges at the completion of every transaction (chunk and single) in the buffer and carries out the buffer transfer.
- 6. When the buffer transfer has completed, the DMAC reloads DMAC\_SADDRx. DMAC\_DADDRx remains unchanged. The hardware sets the Buffer Transfer Completed Interrupt. The DMAC then samples the row number as shown in Table 30-4 on page 480. If the DMAC is in Row 1, then the DMAC transfer has completed. The hardware sets the Chained Buffer Transfer Completed Interrupt and disables the channel. You can either respond to the Buffer Transfer Completed Interrupt or Chained Buffer Transfer Completed Interrupt, or poll for the DMAC\_CHSR.ENAx bit until it is cleared by hardware, to detect when the transfer is complete. If the DMAC is not in Row 1, the next step is performed.
- 7. The DMAC transfer proceeds as follows:
  - a. If the Buffer Transfer Completed Interrupt is unmasked (DMAC\_EBCIMR.BTCx = '1', where x is the channel number), the hardware sets the Buffer Transfer Completed Interrupt when the buffer transfer has completed. It then stalls until STALx bit of DMAC\_CHSR is cleared by writing in the KEEPx bit of DMAC\_CHER, where x is the channel number. If the next buffer is to be the last buffer in the DMAC transfer, then the buffer complete ISR (interrupt service routine) should clear the automatic mode bit, DMAC\_CTRLBx.AUTO. This puts the DMAC into Row 1 as shown in Table 30-4 on page 480. If the next buffer is not the last buffer in the DMAC transfer, then the automatic transfer mode bit should remain enabled to keep the DMAC in Row 11 as shown in Table 30-4 on page 480.
  - b. If the Buffer Transfer Completed Interrupt is masked (DMAC\_EBCIMR.BTCx = '0', where x is the channel number), the hardware does not stall until it detects a write to the Buffer Transfer Completed Interrupt Enable register, but starts the next buffer transfer immediately. In this case, the software must clear the automatic mode bit, DMAC\_CTRLBx.AUTO, to put the device into ROW 1 of Table 30-4 on page 480 before the last buffer of the DMAC transfer has completed.

The transfer is similar to that shown in Figure 30-13.

The DMAC Transfer flow is shown in Figure 30-14.

Figure 30-13. Multi-buffer Transfer with Source Address Auto-reloaded and Contiguous Destination Address

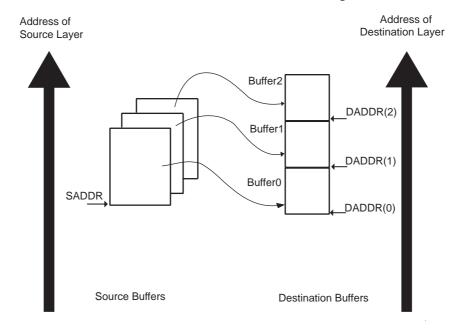

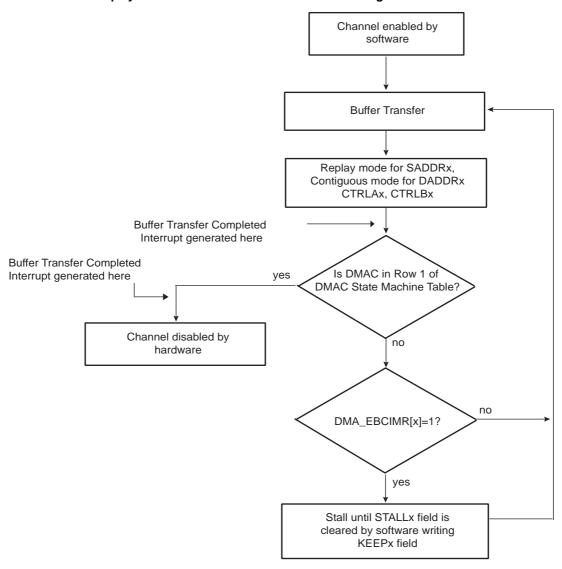

Figure 30-14. DMAC Transfer Replay Mode is Enabled for the Source and Contiguous Destination Address

Multi-buffer DMAC Transfer with Linked List for Source and Contiguous Destination Address (Row 2)

- 1. Read the DMAC\_CHSR to choose a free (disabled) channel.
- Set up the linked list in memory. Write the control information in the LLI.DMAC\_CTRLAx and LLI.DMAC\_CTRLBx register location of the buffer descriptor for each LLI in memory for channel x. For example, in the register, you can program the following:
  - a. Set up the transfer type (memory or non-memory peripheral for source and destination) and flow control device by programming the FC field in DMAC\_CTRLBx.
  - b. Set up the transfer characteristics, such as:
    - i. Transfer width for the source in the SRC\_WIDTH field.
    - ii. Transfer width for the destination in the DST\_WIDTH field.
    - v. Incrementing/decrementing or fixed address for source in SRC\_INCR field.
    - vi. Incrementing/decrementing or fixed address for destination DST\_INCR field.
- 3. Write the starting destination address in DMAC\_DADDRx for channel x.

Note: The values in the LLI.DMAC\_DADDRx register location of each Linked List Item (LLI) in memory, although fetched during an LLI fetch, are not used.

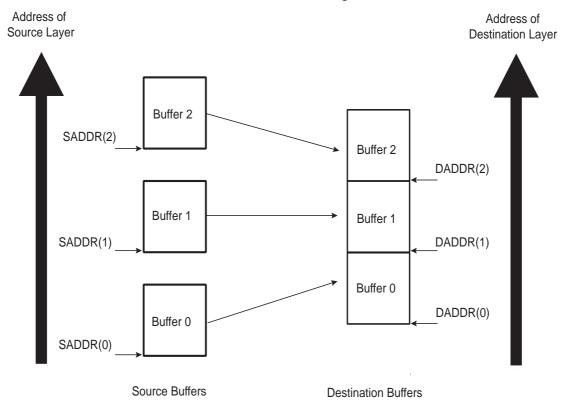

- 4. Write the channel configuration information into DMAC CFGx for channel x.
  - a. Designate the handshaking interface type (hardware or software) for the source and destination peripherals. This is not required for memory. This step requires programming the SRC\_H2SEL/DST\_H2SEL bits, respectively. Writing a '1' activates the hardware handshaking interface to handle source/destination requests for the specific channel. Writing a '0' activates the software handshaking interface to handle source/destination requests.
  - b. If the hardware handshaking interface is activated for the source or destination peripheral, assign the handshaking interface to the source and destination peripherals. This requires programming the SRC\_PER and DST\_PER bits, respectively.
- 5. Make sure that all LLI.DMAC\_CTRLBx register locations of the LLI (except the last) are set as shown in Row 2 of Table 30-4 on page 480, while the LLI.DMAC\_CTRLBx register of the last Linked List item must be set as described in Row 1 of Table 30-4. Figure 30-5 on page 479 shows a Linked List example with two list items.
- 6. Make sure that the LLI.DMAC\_DSCRx register locations of all LLIs in memory (except the last) are non-zero and point to the next Linked List Item.
- 7. Make sure that the LLI.DMAC\_SADDRx register locations of all LLIs in memory point to the start source buffer address proceeding that LLI fetch.
- 8. Make sure that the LLI.DMAC\_CTRLAx.DONE bit of the LLI.DMAC\_CTRLAx register locations of all LLIs in memory is cleared.
- 9. If source Picture-in-Picture is enabled (DMAC\_CTRLBx.SPIP is enabled), program DMAC\_SPIPx for channel x.
- 10. If destination Picture-in-Picture is enabled (DMAC\_CTRLBx.DPIP is enabled), program DMAC\_DPIPx for channel x.
- 11. Clear any pending interrupts on the channel from the previous DMAC transfer by reading the interrupt status register.
- 12. Program DMAC\_CTRLAx, DMAC\_CTRLBx and DMAC\_CFGx according to Row 2 as shown in Table 30-4 on page 480
- 13. Program DMAC\_DSCRx with DMAC\_DSCRx(0), the pointer to the first Linked List item.
- 14. Finally, enable the channel by setting the DMAC\_CHER.ENAx bit. The transfer is performed. Make sure that the ENABLE bit (register bit 0) in DMAC\_EN is set.
- 15. The DMAC fetches the first LLI from the location pointed to by DMAC DSCRx(0).
- Note: The LLI.DMAC\_SADDRx, LLI.DMAC\_DADDRx, LLI.DMAC\_DSCRx and LLI.DMAC\_CTRLA/Bx registers are fetched. The LLI.DMAC\_DADDRx register location of the LLI, although fetched, is not used. The DMAC\_DADDRx register in the DMAC remains unchanged.
  - 16. Source and destination requests single and chunk DMAC transactions to transfer the buffer of data (assuming non-memory peripherals). The DMAC acknowledges at the completion of every transaction (chunk and single) in the buffer and carries out the buffer transfer.
  - 17. Once the buffer of data is transferred, the DMAC\_CTRLAx register is written out to the system memory at the same location and on the same layer where it was originally fetched, that is, the location of the DMAC\_CTRLAx register of the linked list item fetched prior to the start of the buffer transfer. Only DMAC\_CTRLAx register is written out because only the DMAC\_CTRLAx.BTSIZE and DMAC\_CTRLAX.DONE fields have been updated by DMAC hardware. Additionally, the DMAC CTRLAx.DONE bit is asserted when the buffer transfer has completed.
- Note: Do not poll the DMAC\_CTRLAx.DONE bit in the DMAC memory map. Instead, poll the LLI.DMAC\_CTRLAx.DONE bit in the LLI for that buffer. If the poll LLI.DMAC\_CTRLAx.DONE bit is asserted, then this buffer transfer has completed. This LLI.DMAC\_CTRLAx.DONE bit was cleared at the start of the transfer.
  - 18. The DMAC does not wait for the buffer interrupt to be cleared, but continues and fetches the next LLI from the memory location pointed to by the current DMAC\_DSCRx register, then automatically reprograms the DMAC\_SADDRx, DMAC\_CTRLAx, DMAC\_CTRLBx and DMAC\_DSCRx channel registers.

DMAC\_DADDRx is left unchanged. The DMAC transfer continues until the DMAC samples the DMAC\_CTRLAx, DMAC\_CTRLBx and DMAC\_DSCRx registers at the end of a buffer transfer match that described in Row 1 of Table 30-4 on page 480. The DMAC then knows that the previous buffer transferred was the last buffer in the DMAC transfer.

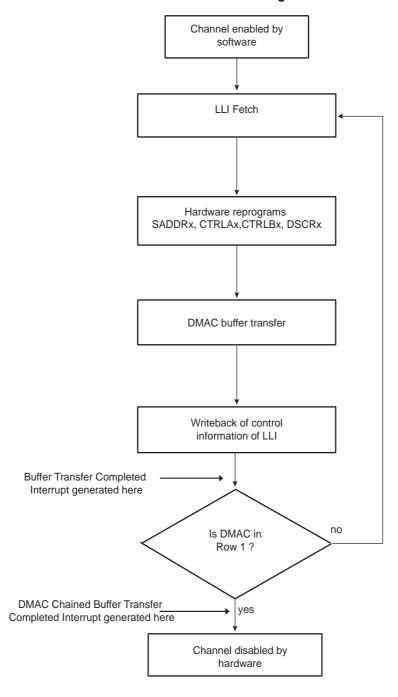

The DMAC transfer might look like that shown in Figure 30-15. Note that the destination address is decrementing.

Figure 30-15. DMAC Transfer with Linked List Source Address and Contiguous Destination Address

The DMAC transfer flow is shown in Figure 30-16 on page 499.

Figure 30-16. DMAC Transfer Flow for Linked List Source Address and Contiguous Destination Address

## 30.6.6 Disabling a Channel Prior to Transfer Completion

Under normal operation, the software enables a channel by setting the DMAC\_CHER.ENAx bit, and the hardware disables a channel on transfer completion by clearing the DMAC\_CHSR.ENAx bit.

The recommended way for software to disable a channel without losing data is to use the SUSPx bit in conjunction with the EMPTx bit in the DMAC\_CHSR.

- 1. If the software chooses to disable a channel n prior to the DMAC transfer completion, then it can set the DMAC\_CHER.SUSPx bit to instruct the DMAC to halt all transfers from the source peripheral. Therefore, the channel FIFO receives no new data.
- 2. The software can now poll the DMAC\_CHSR.EMPTx bit until it indicates that the channel n FIFO is empty, where n is the channel number.
- 3. The DMAC\_CHER.ENAx bit can then be cleared by software once the channel n FIFO is empty, where n is the channel number.

When DMAC\_CTRLAx.SRC\_WIDTH is less than DMAC\_CTRLAx.DST\_WIDTH and the DMAC\_CHSRx.SUSPx bit is high, the DMAC\_CHSRx.EMPTx is asserted once the contents of the FIFO does not permit a single word of DMAC\_CTRLAx.DST\_WIDTH to be formed. However, there may still be data in the channel FIFO but not enough to form a single transfer of DMAC\_CTLx.DST\_WIDTH width. In this configuration, once the channel is disabled, the remaining data in the channel FIFO are not transferred to the destination peripheral. It is permitted to remove the channel from the suspension state by by setting the DMAC\_CHDR.RESx bit. The DMAC transfer completes in the normal manner. n defines the channel number.

Note: If a channel is disabled by software, an active single or chunk transaction is not guaranteed to receive an acknowledgement.

#### 30.6.6.1 Abnormal Transfer Termination

A DMAC transfer may be terminated abruptly by software by clearing the channel enable bit, DMAC\_CHER.ENAX, where x is the channel number. This does not mean that the channel is disabled immediately after the DMAC\_CHSR.ENAX bit is cleared over the APB interface. Consider this as a request to disable the channel. The DMAC\_CHSR.ENAX must be polled and then it must be confirmed that the channel is disabled by reading back 0.

The software may terminate all channels abruptly by clearing the general enable bit in the DMAC Enable Register (DMAC\_EN.ENABLE). Again, this does not mean that all channels are disabled immediately after the DMAC\_EN.ENABLE bit is cleared over the APB slave interface. Consider this as a request to disable all channels. The DMAC\_CHSR.ENABLE must be polled and then it must be confirmed that all channels are disabled by reading back '0'.

Note: If the channel enable bit is cleared while there is data in the channel FIFO, this data is not sent to the destination peripheral and is not present when the channel is re-enabled. For read sensitive source peripherals, such as a source FIFO, this data is therefore lost. When the source is not a read sensitive device (i.e., memory), disabling a channel without waiting for the channel FIFO to empty may be acceptable as the data is available from the source peripheral upon request and is not lost.

Note: If a channel is disabled by software, an active single or chunk transaction is not guaranteed to receive an acknowledgement.

## 30.6.7 Register Write Protection

To prevent any single software error from corrupting DMAC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the "DMAC Write Protection Mode Register" (DMAC\_WPMR).

If a write access to a write-protected register is detected, the WPVS bit in the "DMAC Write Protection Status Register" (DMAC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the DMAC\_WPSR.

The following registers can be write-protected:

- "DMAC Global Configuration Register"
- "DMAC Enable Register"
- "DMAC Channel x [x = 0..7] Source Address Register"
- "DMAC Channel x [x = 0..7] Destination Address Register"
- "DMAC Channel x [x = 0..7] Descriptor Address Register"
- "DMAC Channel x [x = 0..7] Control A Register"
- "DMAC Channel x [x = 0..7] Control B Register"
- "DMAC Channel x [x = 0..7] Configuration Register"

## 30.7 DMAC Software Requirements

- There must not be any write operation to channel registers in an active channel after the channel enable is made HIGH. If any channel parameters must be reprogrammed, this can only be done after disabling the DMAC channel.
- The channel registers DMAC\_SADDRx and DMAC\_DADDRx must be programmed with a byte, half-word and word aligned address depending on the source width and destination width.
- After the software disables a channel by writing into the DMAC Channel Handler Disable Register, it must reenable the channel only after it has polled a '0' in the DMAC Channel Handler Status Register. This is
  because the current AHB Burst must terminate properly.
- If the value of field DMAC\_CTRLAx.BTSIZE is configured to zero and the DMAC has been defined as the flow controller, the channel is automatically disabled.
- Multiple transfers involving the same peripheral must not be programmed and enabled on different channels, unless this peripheral integrates several hardware handshaking interfaces.
- When a peripheral has been defined as the flow controller, the targeted DMAC channel must be enabled before the peripheral. If you do not ensure this and the first DMAC request is also the last transfer, the DMAC channel might miss a Last Transfer Flag.
- When the AUTO bit is set to TRUE, the BTSIZE field is automatically reloaded from its previous value.
   BTSIZE must be initialized to a non zero value if the first transfer is initiated with the AUTO bit set to TRUE, even if LLI mode is enabled, because the LLI fetch operation will not update this field.

# 30.8 DMA Controller (DMAC) User Interface

Table 30-5. Register Mapping

| Offset                     | Register   | Name        | Access     | Reset      |

# 30.8.1 DMAC Global Configuration Register

Name: DMAC\_GCFG

Address: 0xFFFFEC00 (0), 0xFFFFEE00 (1)

Access: Read/Write

| 31 | 30 | 29 | 28      | 27 | 26 | 25 | 24 |
|----|----|----|---------|----|----|----|----|
| _  | _  | _  | _       | _  | _  | _  | _  |
| 23 | 22 | 21 | 20      | 19 | 18 | 17 | 16 |
| _  | _  | _  | -       | -  | -  | 1  | _  |
| 15 | 14 | 13 | 12      | 11 | 10 | 9  | 8  |
| _  | _  | _  | -       | 1  | -  | ı  | _  |
| 7  | 6  | 5  | 4       | 3  | 2  | 1  | 0  |
| _  | _  | _  | ARB_CFG | -  | _  | _  | _  |

Note: Bit fields 0, 1, 2, and 3 have a default value of 0. This should not be changed.

This register can only be written if the WPEN bit is cleared in "DMAC Write Protection Mode Register" .

# • ARB\_CFG: Arbiter Configuration

| Value | Name        | Description                                      |
|-------|-------------|--|
| 0     | FIXED       | Fixed priority arbiter (see "Basic Definitions") |
| 1     | ROUND_ROBIN | Modified round robin arbiter.                    |

# 30.8.2 DMAC Enable Register

Name: DMAC\_EN

Address: 0xFFFFEC04 (0), 0xFFFFEE04 (1)

Access: Read/Write

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24     |
|----|----|----|----|----|----|----|--------|
| _  | _  | _  | _  | _  | _  | -  | _      |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16     |
| _  | _  | _  | _  | _  | _  | -  | _      |
| 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8      |
| _  | _  | _  | _  | _  | _  | ı  | _      |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0      |
| _  | _  | _  | _  | _  | -  | _  | ENABLE |

This register can only be written if the WPEN bit is cleared in "DMAC Write Protection Mode Register" .

#### • ENABLE: General Enable of DMA

0: DMA Controller is disabled.

1: DMA Controller is enabled.

# 30.8.3 DMAC Software Single Request Register

Name: DMAC\_SREQ

Address: 0xFFFFEC08 (0), 0xFFFFEE08 (1)

Access: Read/Write

| 31     | 30     | 29           | 28     | 27     | 26           | 25     | 24     |
|--------|--------|--------------|--------|--------|--------------|--------|--------|
| -      | ı      | _            | _      | _      | _            | -      | _      |
|        | •      | -            |        | -      | -            |        | -      |
| 23     | 22     | 21           | 20     | 19     | 18           | 17     | 16     |

| DSREQ7 | SSREQ7 | DSREQ6       | SSREQ6 | DSREQ5 | SSREQ5       | DSREQ4 | SSREQ4 |
|        |        |              |        |        |              |        | _      |
| 7      | 6      | 5            | 4      | 3      | 2            | 1      | 0      |
| DSREQ3 | SSREQ3 | DSREQ2       | SSREQ2 | DSREQ1 | SSREQ1       | DSREQ0 | SSREQ0 |

# • DSREQx: Destination Request

Request a destination single transfer on channel i.

# • SSREQx: Source Request

Request a source single transfer on channel i.

# 30.8.4 DMAC Software Chunk Transfer Request Register

Name: DMAC\_CREQ

Address: 0xFFFFEC0C (0), 0xFFFFEE0C (1)

Access: Read/Write

| 31     | 30     | 29     | 28     | 27     | 26     | 25     | 24     |
|--------|--------|--------|--------|--------|--------|--------|--------|
| _      | -      | _      | _      | _      | _      | -      | _      |
| 23     | 22     | 21     | 20     | 19     | 18     | 17     | 16     |
| _      | -      | _      | _      | _      | _      | -      | _      |
| 15     | 14     | 13     | 12     | 11     | 10     | 9      | 8      |
| DCREQ7 | SCREQ7 | DCREQ6 | SCREQ6 | DCREQ5 | SCREQ5 | DCREQ4 | SCREQ4 |
| 7      | 6      | 5      | 4      | 3      | 2      | 1      | 0      |
| DCREQ3 | SCREQ3 | DCREQ2 | SCREQ2 | DCREQ1 | SCREQ1 | DCREQ0 | SCREQ0 |

# • DCREQx: Destination Chunk Request

Request a destination chunk transfer on channel i.

# • SCREQx: Source Chunk Request

Request a source chunk transfer on channel i.

# 30.8.5 DMAC Software Last Transfer Flag Register

Name: DMAC\_LAST

Address: 0xFFFFEC10 (0), 0xFFFFEE10 (1)

Access: Read/Write

| 31     | 30     | 29     | 28     | 27     | 26     | 25     | 24     |
|--------|--------|--------|--------|--------|--------|--------|--------|
| _      | _      | _      | -      | -      | _      | -      | _      |
| 23     | 22     | 21     | 20     | 19     | 18     | 17     | 16     |
| _      | -      | _      | _      | _      | _      | _      | _      |
| 15     | 14     | 13     | 12     | 11     | 10     | 9      | 8      |
| DLAST7 | SLAST7 | DLAST6 | SLAST6 | DLAST5 | SLAST5 | DLAST4 | SLAST4 |
| 7      | 6      | 5      | 4      | 3      | 2      | 1      | 0      |
| DLAST3 | SLAST3 | DLAST2 | SLAST2 | DLAST1 | SLAST1 | DLAST0 | SLAST0 |

#### • DLASTx: Destination Last

Writing one to DLASTx prior to writing one to DSREQx or DCREQx indicates that this destination request is the last transfer of the buffer.

#### • SLASTx: Source Last

Writing one to SLASTx prior to writing one to SSREQx or SCREQx indicates that this source request is the last transfer of the buffer.

## 30.8.6 DMAC Error, Buffer Transfer and Chained Buffer Transfer Interrupt Enable Register

Name: DMAC\_EBCIER

Address: 0xFFFFEC18 (0), 0xFFFFEE18 (1)

Access: Write-only

| 31    | 30    | 29    | 28    | 27    | 26    | 25    | 24    |

|    |    | DS | CR |    |    | DSC | R_IF |

This register can only be written if the WPEN bit is cleared in "DMAC Write Protection Mode Register".

## • DSCR\_IF: Descriptor Interface Selection

| Value | Name    | Description  |
|-------|---------|--|
| 0     | AHB_IF0 | The buffer transfer descriptor is fetched via AHB-Lite Interface 0 (first DMA Master Interface)  |
| 1     | AHB_IF1 | The buffer transfer descriptor is fetched via AHB-Lite Interface 1 (second DMA Master Interface) |

#### • DSCR: Buffer Transfer Descriptor Address

This address is word aligned.

## 30.8.16 DMAC Channel x [x = 0..7] Control A Register

Name: DMAC\_CTRLAx [x = 0..7]

Address: 0xFFFFEC48 (0)[0], 0xFFFFEC70 (0)[1], 0xFFFFEC98 (0)[2], 0xFFFFECC0 (0)[3], 0xFFFFECE8 (0)[4],

0xFFFFED10 (0)[5], 0xFFFFED38 (0)[6], 0xFFFFED60 (0)[7], 0xFFFFEE48 (1)[0], 0xFFFFEE70 (1)[1], 0xFFFFEE98 (1)[2], 0xFFFFEEC0 (1)[3], 0xFFFFEE88 (1)[4], 0xFFFFEF10 (1)[5], 0xFFFFEF38 (1)[6],

0xFFFFEF60 (1)[7]

Access: Read/Write

| 31   | 30     | 29    | 28    | 27 | 26     | 25   | 24    |
|------|--------|-------|-------|----|--------|------|-------|
| DONE | -      | DST_\ | WIDTH | _  | -      | SRC_ | WIDTH |
| 23   | 22     | 21    | 20    | 19 | 18     | 17   | 16    |
| _    | DCSIZE |       |       | _  | SCSIZE |      |       |
| 15   | 14     | 13    | 12    | 11 | 10     | 9    | 8     |
|      | BTSIZE |       |       |    |        |      |       |
| 7    | 6      | 5     | 4     | 3  | 2      | 1    | 0     |
|      | BTSIZE |       |       |    |        |      |       |

This register can only be written if the WPEN bit is cleared in "DMAC Write Protection Mode Register" on page 527.

#### • BTSIZE: Buffer Transfer Size

The transfer size relates to the number of transfers to be performed, that is, for writes it refers to the number of source width transfers to perform when DMAC is flow controller. For reads, BTSIZE refers to the number of transfers completed on the Source Interface. When this field is cleared, the DMAC module is automatically disabled when the relevant channel is enabled.

#### SCSIZE: Source Chunk Transfer Size

| Value | Name   | Description         |
|-------|--------|---------------------|
| 000   | CHK_1  | 1 data transferred  |
| 001   | CHK_4  | 4 data transferred  |
| 010   | CHK_8  | 8 data transferred  |
| 011   | CHK_16 | 16 data transferred |

#### DCSIZE: Destination Chunk Transfer Size

| Value | Name   | Description         |
|-------|--------|---------------------|
| 000   | CHK_1  | 1 data transferred  |
| 001   | CHK_4  | 4 data transferred  |
| 010   | CHK_8  | 8 data transferred  |
| 011   | CHK_16 | 16 data transferred |

# • SRC\_WIDTH: Transfer Width for the Source

| Value | Name      | Description                              |  |
|-------|-----------|--|--|
| 00    | BYTE      | The transfer size is set to 8-bit width  |  |
| 01    | HALF_WORD | The transfer size is set to 16-bit width |  |
| 1X    | WORD      | The transfer size is set to 32-bit width |  |

## • DST\_WIDTH: Transfer Width for the Destination

| Value | Name      | Description                              |
|-------|-----------|--|
| 00    | BYTE      | The transfer size is set to 8-bit width  |
| 01    | HALF_WORD | The transfer size is set to 16-bit width |
| 1X    | WORD      | The transfer size is set to 32-bit width |

## • DONE: Current Descriptor Stop Command and Transfer Completed Memory Indicator

0: The transfer is performed.

1: If SOD bit in DMAC\_CFG is set to true, then the DMAC is automatically disabled when an LLI updates the content of this register.

The DONE bit is written back to memory at the end of the current descriptor transfer.

#### 30.8.17 DMAC Channel x [x = 0..7] Control B Register

Name: DMAC\_CTRLBx [x = 0..7]

**Address:** 0xFFFFEC4C (0)[0], 0xFFFFEC74 (0)[1], 0xFFFFEC9C (0)[2], 0xFFFFECC4 (0)[3], 0xFFFFECEC (0)[4],

0xFFFFED14 (0)[5], 0xFFFFED3C (0)[6], 0xFFFFED64 (0)[7], 0xFFFFEE4C (1)[0], 0xFFFFEE74 (1)[1], 0xFFFFEE9C (1)[2], 0xFFFFEEC4 (1)[3], 0xFFFFEECC (1)[4], 0xFFFFEF14 (1)[5], 0xFFFFEF3C (1)[6],

0xFFFFEF64 (1)[7]

Access: Read/Write

| 31   | 30  | 29  | 28       | 27 | 26 | 25  | 24       |
|------|-----|-----|----------|----|----|-----|----------|

| _    | -   | -   | DST_PIP  | -  | -  | _   | SRC_PIP  |
|      |     |     |          |    |    |     | _        |
| 7    | 6   | 5   | 4        | 3  | 2  | 1   | 0        |
| _    | _   |     | DIF      | _  | _  | S   | SIF      |

This register can only be written if the WPEN bit is cleared in "DMAC Write Protection Mode Register".

#### • SIF: Source Interface Selection Field

| Value | Name    | Description  |
|-------|---------|--|
| 0     | AHB_IF0 | The source transfer is done via AHB_Lite Interface 0 (first DMA Master Interface)  |
| 1     | AHB_IF1 | The source transfer is done via AHB_Lite Interface 1 (second DMA Master Interface) |

#### DIF: Destination Interface Selection Field

| 1                      | V-1 | <b>N</b> 1 | Description of the second of t |
|------------------------|-----|------------|--|
| Value Name Description |     |            |  |
|                        | 0   | AHB_IF0    | The destination transfer is done via AHB_Lite Interface 0 (first DMA Master Interface)   |
|                        | 1   | AHB_IF1    | The destination transfer is done via AHB_Lite Interface 1 (second DMA Master Interface)  |

#### • SRC PIP: Source Picture-in-Picture Mode

0 (DISABLE): Picture-in-Picture mode is disabled. The source data area is contiguous.

1 (ENABLE): Picture-in-Picture mode is enabled. When the source PIP counter reaches the programmable boundary, the address is automatically incremented by a user defined amount.

#### • DST\_PIP: Destination Picture-in-Picture Mode

0 (DISABLE): Picture-in-Picture mode is disabled. The Destination data area is contiguous.

1 (ENABLE): Picture-in-Picture mode is enabled. When the Destination PIP counter reaches the programmable boundary the address is automatically incremented by a user-defined amount.

#### • SRC DSCR: Source Address Descriptor

0 (FETCH\_FROM\_MEM): Source address is updated when the descriptor is fetched from the memory.

1 (FETCH\_DISABLE): Buffer Descriptor Fetch operation is disabled for the source.

## • DST\_DSCR: Destination Address Descriptor

0 (FETCH\_FROM\_MEM): Destination address is updated when the descriptor is fetched from the memory.

1 (FETCH\_DISABLE): Buffer Descriptor Fetch operation is disabled for the destination.

#### • FC: Flow Control

This field defines which device controls the size of the buffer transfer, also referred to as the Flow Controller.

| Value Name |                | Description   |  |  |  |
|------------|----------------|---|--|--|--|
| 00         | MEM2MEM_DMA_FC | Memory-to-Memory Transfer DMAC is flow controller         |  |  |  |
| 01         | MEM2PER_DMA_FC | Memory-to-Peripheral Transfer DMAC is flow controller     |  |  |  |
| 10         | PER2MEM_DMA_FC | Peripheral-to-Memory Transfer DMAC is flow controller     |  |  |  |
| 11         | PER2PER_DMA_FC | Peripheral-to-Peripheral Transfer DMAC is flow controller |  |  |  |

SRC\_INCR: Incrementing, Decrementing or Fixed Address for the Source

| Value | Name         | Description                          |  |  |
|-------|--------------|--------------------------------------|--|--|
| 00    | INCREMENTING | The source address is incremented    |  |  |
| 01    | DECREMENTING | The source address is decremented    |  |  |
| 10    | FIXED        | The source address remains unchanged |  |  |

DST INCR: Incrementing, Decrementing or Fixed Address for the Destination

| Value | Name         | Description                               |  |  |  |  |  |
|-------|--------------|---|--|--|--|--|--|
| 00    | INCREMENTING | The destination address is incremented    |  |  |  |  |  |
| 01    | DECREMENTING | The destination address is decremented    |  |  |  |  |  |
| 10    | FIXED        | The destination address remains unchanged |  |  |  |  |  |

#### • IEN: Interrupt Enable Not

0: When the buffer transfer is completed, the BTCx flag is set in the DMAC\_EBCISR. This bit is active low.

1: When the buffer transfer is completed, the BTCx flag is not set.

If this bit is cleared, when the buffer transfer is completed, the BTCx flag is set in the DMAC\_EBCISR.

#### • AUTO: Automatic Multiple Buffer Transfer

0 (DISABLE): Automatic multiple buffer transfer is disabled.

1 (ENABLE): Automatic multiple buffer transfer is enabled. This bit enables replay mode or contiguous mode when several buffers are transferred.

#### 30.8.18 DMAC Channel x [x = 0..7] Configuration Register

Name: DMAC\_CFGx [x = 0..7]

Address: 0xFFFFEC50 (0)[0], 0xFFFFEC78 (0)[1], 0xFFFFECA0 (0)[2], 0xFFFFECC8 (0)[3], 0xFFFFECF0 (0)[4],

| _  | _         | FIFO      | CFG     | _       |    | AHB_PROT  |         |  |
| 23 | 22        | 21        | 20      | 19      | 18 | 17        | 16      |  |
| _  | LOCK_IF_L | LOCK_B    | LOCK_IF | _       | _  | _         | SOD     |  |
|    |           |           |         |         |    |           |         |  |
| 15 | 14        | 13        | 12      | 11      | 10 | 9         | 8       |  |
| _  | _         | DST_H2SEL | DST_REP | _       | _  | SRC_H2SEL | SRC_REP |  |
| 7  | 6         | 5         | 4       | 3       | 2  | 1         | 0       |  |
|    | DST_      | _PER      |         | SRC_PER |    |           |         |  |

This register can only be written if the WPEN bit is cleared in "DMAC Write Protection Mode Register" on page 527

#### SRC\_PER: Source with Peripheral identifier

Channel x Source Request is associated with peripheral identifier coded SRC\_PER handshaking interface.

#### DST\_PER: Destination with Peripheral identifier

Channel x Destination Request is associated with peripheral identifier coded DST\_PER handshaking interface.

#### • SRC REP: Source Reloaded from Previous

0 (CONTIGUOUS\_ADDR): When automatic mode is activated, source address is contiguous between two buffers.

1 (RELOAD\_ADDR): When automatic mode is activated, the source address and the control register are reloaded from previous transfer.

#### • SRC H2SEL: Software or Hardware Selection for the Source

0 (SW): Software handshaking interface is used to trigger a transfer request.

1 (HW): Hardware handshaking interface is used to trigger a transfer request.

#### • DST REP: Destination Reloaded from Previous

0 (CONTIGUOUS\_ADDR): When automatic mode is activated, destination address is contiguous between two buffers.

1 (RELOAD\_ADDR): When automatic mode is activated, the destination and the control register are reloaded from the previous transfer.

#### • DST H2SEL: Software or Hardware Selection for the Destination

0 (SW): Software handshaking interface is used to trigger a transfer request.

1 (HW): Hardware handshaking interface is used to trigger a transfer request.

#### • SOD: Stop On Done

0 (DISABLE): STOP ON DONE disabled, the descriptor fetch operation ignores the DMAC\_CTRLAx.DONE bit.

1 (ENABLE): STOP ON DONE activated, the DMAC module is automatically disabled if DMAC\_CTRLAx.DONE bit is set.

#### LOCK\_IF: Interface Lock

0 (DISABLE): Interface Lock capability is disabled

1 (ENABLE): Interface Lock capability is enabled

#### • LOCK\_B: Bus Lock

0 (DISABLE): AHB Bus Locking capability is disabled.

1(ENABLE): AHB Bus Locking capability is enabled.

#### LOCK\_IF\_L: Master Interface Arbiter Lock

0 (CHUNK): The Master Interface Arbiter is locked by the channel x for a chunk transfer.

1 (BUFFER): The Master Interface Arbiter is locked by the channel x for a buffer transfer.

#### • AHB\_PROT: AHB Protection

AHB\_PROT field provides additional information about a bus access and is primarily used to implement some level of protection.

| HPROT[3]    | HPROT[2]    | HPROT[1]     | HPROT[0] | Description          |
|-------------|-------------|--------------|----------|----------------------|
|             |             |              | 1        | Data access          |
|             |             | AHB_PROT[0]  |          | 0: User Access       |
|             |             | Alib_PROT[0] |          | 1: Privileged Access |
|             | AHB_PROT[1] |              |          | 0: Not Bufferable    |
|             | AND_PROTEI  |              |          | 1: Bufferable        |
| AUD DDOT[3] |             |              |          | 0: Not cacheable     |
| AHB_PROT[2] |             |              |          | 1: Cacheable         |

#### • FIFOCFG: FIFO Configuration

| o o o o |          |   |  |  |  |  |  |
|---------|----------|---|--|--|--|--|--|
| Value   | Name     | Description   |  |  |  |  |  |
| 00      | ALAP_CFG | The largest defined length AHB burst is performed on the destination AHB interface.                     |  |  |  |  |  |
| 01      | HALF_CFG | When half FIFO size is available/filled, a source/destination request is serviced.                      |  |  |  |  |  |
| 10      | ASAP_CFG | When there is enough space/data available to perform a single AHB access, then the request is serviced. |  |  |  |  |  |

## 30.8.19 DMAC Channel x [x = 0..7] Source Picture-in-Picture Configuration Register

Name: DMAC\_SPIPx [x = 0..7]

**Address:** 0xFFFFEC54 (0)[0], 0xFFFFEC7C (0)[1], 0xFFFFECA4 (0)[2], 0xFFFFECCC (0)[3], 0xFFFFECF4 (0)[4],

0xFFFFED1C (0)[5], 0xFFFFED44 (0)[6], 0xFFFFED6C (0)[7], 0xFFFFEE54 (1)[0], 0xFFFFEE7C (1)[1], 0xFFFFEEA4 (1)[2], 0xFFFFEECC (1)[3], 0xFFFFEEF4 (1)[4], 0xFFFFEF1C (1)[5], 0xFFFFEF44 (1)[6],

0xFFFFEF6C (1)[7]

Access: Read/Write

| 31 | 30            | 29 | 28 | 27 | 26 | 25      | 24     |  |  |  |
|----|---------------|----|----|----|----|---------|--------|--|--|--|
| _  | _             | -  | -  | _  | _  | SPIP_BO | UNDARY |  |  |  |

|    | SPIP_HOLE     |    |    |    |    |         |        |  |  |  |
| 7  | 6             | 5  | 4  | 3  | 2  | 1       | 0      |  |  |  |
|    | SPIP_HOLE     |    |    |    |    |         |        |  |  |  |

#### • SPIP\_HOLE: Source Picture-in-Picture Hole

This field indicates the value to add to the address when the programmable boundary has been reached.

## • SPIP\_BOUNDARY: Source Picture-in-Picture Boundary

This field indicates the number of source transfers to perform before the automatic address increment operation.

## 30.8.20 DMAC Channel x [x = 0..7] Destination Picture-in-Picture Configuration Register

Name: DMAC\_DPIPx [x = 0..7]

Address: 0xFFFFEC58 (0)[0], 0xFFFFEC80 (0)[1], 0xFFFFECA8 (0)[2], 0xFFFFECD0 (0)[3], 0xFFFFECF8 (0)[4],

0xFFFFED20 (0)[5], 0xFFFFED48 (0)[6], 0xFFFFED70 (0)[7], 0xFFFFEE58 (1)[0], 0xFFFFEE80 (1)[1], 0xFFFFEEA8 (1)[2], 0xFFFFEED0 (1)[3], 0xFFFFEEF8 (1)[4], 0xFFFFEF20 (1)[5], 0xFFFFEF48 (1)[6],

0xFFFFEF70 (1)[7]

Access: Read/Write

| 31 | 30            | 29 | 28 | 27 | 26 | 25      | 24     |  |  |  |
|----|---------------|----|----|----|----|---------|--------|--|--|--|
| _  | _             | -  | _  | _  | _  | DPIP_BC | UNDARY |  |  |  |
| 23 | 22            | 21 | 20 | 19 | 18 | 17      | 16     |  |  |  |
|    | DPIP_BOUNDARY |    |    |    |    |         |        |  |  |  |
| 15 | 14            | 13 | 12 | 11 | 10 | 9       | 8      |  |  |  |
|    | DPIP_HOLE     |    |    |    |    |         |        |  |  |  |
| 7  | 6             | 5  | 4  | 3  | 2  | 1       | 0      |  |  |  |
|    | DPIP_HOLE     |    |    |    |    |         |        |  |  |  |

#### • DPIP\_HOLE: Destination Picture-in-Picture Hole

This field indicates the value to add to the address when the programmable boundary has been reached.

## • DPIP\_BOUNDARY: Destination Picture-in-Picture Boundary

This field indicates the number of source transfers to perform before the automatic address increment operation.

# 30.8.21 DMAC Write Protection Mode Register

Name: DMAC\_WPMR

Address: 0xFFFFEDE4 (0), 0xFFFFEFE4 (1)

Access: Read/Write

| 31 | 30    | 29 | 28 | 27  | 26 | 25 | 24   |  |  |  |
|----|-------|----|----|-----|----|----|------|--|--|--|
|    | WPKEY |    |    |     |    |    |      |  |  |  |
| 23 | 22    | 21 | 20 | 19  | 18 | 17 | 16   |  |  |  |
|    |       |    | WP | KEY |    |    |      |  |  |  |
| 15 | 14    | 13 | 12 | 11  | 10 | 9  | 8    |  |  |  |
|    |       |    | WP | KEY |    |    |      |  |  |  |
| 7  | 6     | 5  | 4  | 3   | 2  | 1  | 0    |  |  |  |
| _  | _     | _  | _  | _   | _  | _  | WPEN |  |  |  |

#### • WPEN: Write Protection Enable

0: Disables the Write Protection if WPKEY corresponds to 0x444D41 ("DMA" in ASCII).

See Section 30.6.7 "Register Write Protection" for the list of registers that can be write-protected.

## • WPKEY: Write Protection Key

| Value    | Name   | Description   |
|----------|--------|---|
| 0x444D41 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. |
| UX444D41 | PASSWD | Always reads as 0.  |

<sup>1:</sup> Enables the Write Protection if WPKEY corresponds to 0x444D41 ("DMA" in ASCII).

# 30.8.22 DMAC Write Protection Status Register

Name: DMAC\_WPSR

Address: 0xFFFFEDE8 (0), 0xFFFFEFE8 (1)

Access: Read-only

| 31 | 30     | 29 | 28  | 27   | 26 | 25 | 24   |  |  |  |
|----|--------|----|-----|------|----|----|------|--|--|--|
| _  | _      | _  | -   | _    | _  | -  | _    |  |  |  |
| 23 | 22     | 21 | 20  | 19   | 18 | 17 | 16   |  |  |  |
|    | WPVSRC |    |     |      |    |    |      |  |  |  |
| 15 | 14     | 13 | 12  | 11   | 10 | 9  | 8    |  |  |  |
|    |        |    | WPV | /SRC |    |    |      |  |  |  |
| 7  | 6      | 5  | 4   | 3    | 2  | 1  | 0    |  |  |  |
| _  | _      | _  | _   | _    | _  | _  | WPVS |  |  |  |

#### • WPVS: Write Protection Violation Status

0: No write protection violation has occurred since the last read of the DMAC\_WPSR.

#### • WPVSRC: Write Protection Violation Source

When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

<sup>1:</sup> A write protection violation has occurred since the last read of the DMAC\_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

# 31. USB High Speed Device Port (UDPHS)

# 31.1 Description

The USB High Speed Device Port (UDPHS) is compliant with the Universal Serial Bus (USB), rev 2.0 High Speed device specification.

Each endpoint can be configured in one of several USB transfer types. It can be associated with one, two or three banks of a Dual-port RAM used to store the current data payload. If two or three banks are used, one DPR bank is read or written by the processor, while the other is read or written by the USB device peripheral. This feature is mandatory for isochronous endpoints.

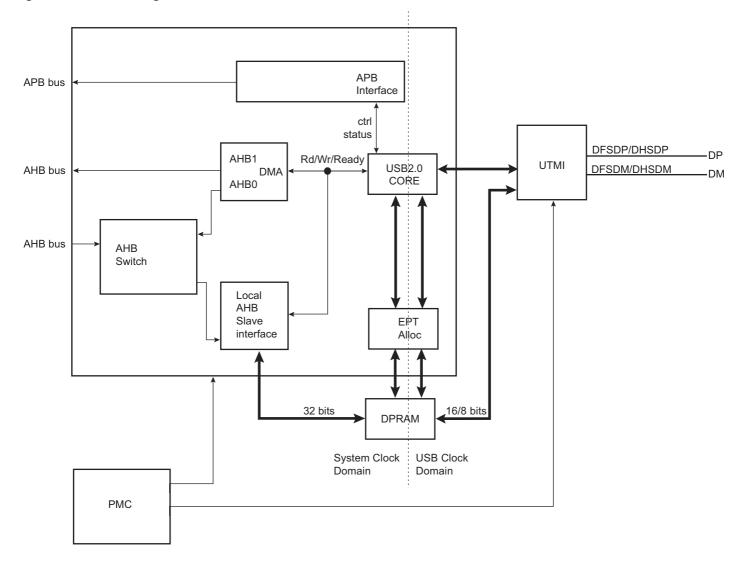

#### 31.2 Embedded Characteristics

- 1 Device High Speed
- 1 UTMI transceiver shared between Host and Device
- USB v2.0 High Speed Compliant, 480 Mbit/s
- 7 Endpoints up to 1024 bytes
- Embedded Dual-port RAM for Endpoints
- Suspend/Resume Logic (Command of UTMI)
- Up to Three Memory Banks for Endpoints (Not for Control Endpoint)
- 4 Kbytes of DPRAM

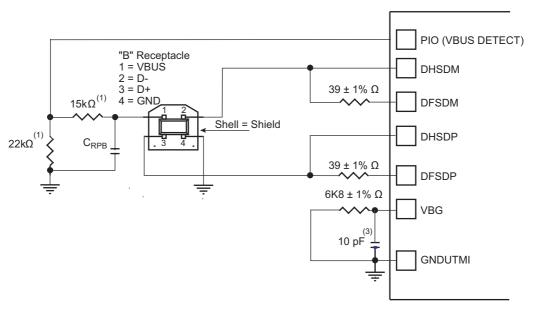

# 31.3 Block Diagram

Figure 31-1. Block Diagram

# 31.4 Typical Connection

Figure 31-2. Board Schematic

Notes: 1. The values shown on the 22 k $\Omega$  and 15 k $\Omega$  resistors are only valid with 3V3-supplied PIOs. Both 39  $\Omega$  resistors need to be placed as close to the device pins as possible.

- 2. CRPB: Upstream Facing Port Bypass Capacitance of 1  $\mu$ F to 10  $\mu$ F (refer to "DC Electrical Characteristics" in Universal Serial Bus Specification Rev. 2)
- 3. 10 pF capacitor on VBG is a provision and may not be populated.

# 31.5 Product Dependencies

#### 31.5.1 Power Management

The UDPHS is not continuously clocked.

For using the UDPHS, the programmer must first enable the UDPHS Clock in the Power Management Controller Peripheral Clock Enable Register (PMC\_PCER). Then enable the PLL in the PMC UTMI Clock Configuration Register (CKGR\_UCKR).

However, if the application does not require UDPHS operations, the UDPHS clock can be stopped when not needed and restarted later.

#### 31.5.2 Interrupt Sources

The UDPHS interrupt line is connected on one of the internal sources of the interrupt controller. Using the UDPHS interrupt requires the interrupt controller to be programmed first.

Table 31-1. Peripheral IDs

| Instance | ID |  |
|----------|----|--|
| UDPHS    | 23 |  |

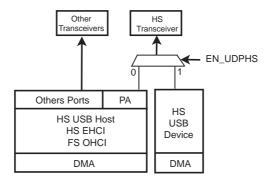

# 31.6 Functional Description

#### 31.6.1 UTMI transceivers Sharing

The High Speed USB Host Port A is shared with the High Speed USB Device port and connected to the second UTMI transceiver. The selection between Host Port A and USB Device is controlled by the UDPHS enable bit (EN\_UDPHS) located in the UDPHS\_CTRL register.

Figure 31-3. USB Selection

#### 31.6.2 USB V2.0 High Speed Device Port Introduction

The USB V2.0 High Speed Device Port provides communication services between host and attached USB devices. Each device is offered with a collection of communication flows (pipes) associated with each endpoint. Software on the host communicates with a USB Device through a set of communication flows.

#### 31.6.3 USB V2.0 High Speed Transfer Types

A communication flow is carried over one of four transfer types defined by the USB device.

A device provides several logical communication pipes with the host. To each logical pipe is associated an endpoint. Transfer through a pipe belongs to one of the four transfer types:

- Control Transfers: Used to configure a device at attach time and can be used for other device-specific purposes, including control of other pipes on the device.
- Bulk Data Transfers: Generated or consumed in relatively large burst quantities and have wide dynamic latitude in transmission constraints.
- Interrupt Data Transfers: Used for timely but reliable delivery of data, for example, characters or coordinates with human-perceptible echo or feedback response characteristics.
- Isochronous Data Transfers: Occupy a prenegotiated amount of USB bandwidth with a prenegotiated delivery latency. (Also called streaming real time transfers.)

As indicated below, transfers are sequential events carried out on the USB bus.

Endpoints must be configured according to the transfer type they handle.

Table 31-2. USB Communication Flow

| Transfer    | Direction      | Bandwidth Endpoint Size |               | Error Detection | Retrying  |
|-------------|----------------|-------------------------|---------------|-----------------|-----------|
| Control     | Bidirectional  | Not guaranteed          | 8, 16, 32, 64 | Yes             | Automatic |
| Isochronous | Unidirectional | Guaranteed 8–1024       |               | Yes             | No        |
| Interrupt   | Unidirectional | Not guaranteed 8–1024   |               | Yes             | Yes       |
| Bulk        | Unidirectional | Not guaranteed          | 8–512         | Yes             | Yes       |

#### 31.6.4 USB Transfer Event Definitions

A transfer is composed of one or several transactions as shown in the following table.

Table 31-3. USB Transfer Events

| Transfer                 |                              |  |
|--------------------------|------------------------------|--|
| Direction                | Туре                         | Transaction  |
| CONTROL (bidirectional)  | Control Transfer (1)         | <ul> <li>Setup transaction →Data IN transactions →Status OUT transaction</li> <li>Setup transaction →Data OUT transactions →Status IN transaction</li> <li>Setup transaction →Status IN transaction</li> </ul> |
| IN (device toward host)  | Bulk IN Transfer             | Data IN transaction →Data IN transaction   |
|                          | Interrupt IN Transfer        | Data IN transaction →Data IN transaction   |
|                          | Isochronous IN Transfer (2)  | Data IN transaction →Data IN transaction   |
| OUT (host toward device) | Bulk OUT Transfer            | Data OUT transaction →Data OUT transaction   |
|                          | Interrupt OUT Transfer       | Data OUT transaction →Data OUT transaction   |
|                          | Isochronous OUT Transfer (2) | Data OUT transaction →Data OUT transaction   |

Notes:

- 1. Control transfer must use endpoints with one bank and can be aborted using a stall handshake.
- 2. Isochronous transfers must use endpoints configured with two or three banks.

An endpoint handles all transactions related to the type of transfer for which it has been configured.

Table 31-4. UDPHS Endpoint Description

| Endpoint # | Mnemonic | Nb Bank | DMA | High Band<br>Width | Max. Endpoint Size | Endpoint Type                           |
|------------|----------|---------|-----|--------------------|--------------------|---|
| 0          | EPT_0    | 1       | N   | N                  | 64                 | Control                                 |
| 1          | EPT_1    | 2       | Υ   | Υ                  | 1024               | Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt |
| 2          | EPT_2    | 2       | Y   | Υ                  | 1024               | Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt |
| 3          | EPT_3    | 3       | Y   | N                  | 1024               | Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt |
| 4          | EPT_4    | 3       | Y   | N                  | 1024               | Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt |
| 5          | EPT_5    | 3       | Y   | Υ                  | 1024               | Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt |
| 6          | EPT_6    | 3       | Y   | Y                  | 1024               | Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt |

Note:

1. In Isochronous (Iso) mode, it is preferable that High Band Width capability is available.

The size of internal DPRAM is 4 KB.

Suspend and resume are automatically detected by the UDPHS device, which notifies the processor by raising an interrupt.

## 31.6.5 USB V2.0 High Speed BUS Transactions

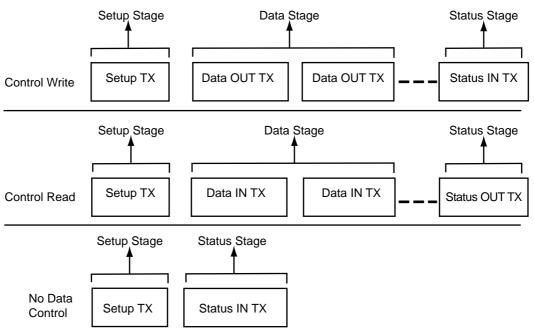

Each transfer results in one or more transactions over the USB bus.

There are five kinds of transactions flowing across the bus in packets:

- 1. Setup Transaction
- 2. Data IN Transaction
- 3. Data OUT Transaction
- 4. Status IN Transaction
- 5. Status OUT Transaction

Figure 31-4. Control Read and Write Sequences

A status IN or OUT transaction is identical to a data IN or OUT transaction.

#### 31.6.6 Endpoint Configuration

The endpoint 0 is always a control endpoint, it must be programmed and active in order to be enabled when the End Of Reset interrupt occurs.

To configure the endpoints:

- Fill the configuration register (UDPHS\_EPTCFG) with the endpoint size, direction (IN or OUT), type (CTRL, Bulk, IT, ISO) and the number of banks.
- Fill the number of transactions (NB\_TRANS) for isochronous endpoints.

Note: For control endpoints the direction has no effect.

- Verify that the EPT\_MAPD flag is set. This flag is set if the endpoint size and the number of banks are correct compared to the FIFO maximum capacity and the maximum number of allowed banks.
- Configure control flags of the endpoint and enable it in UDPHS\_EPTCTLENBx according to Section 31.7.12
   "UDPHS Endpoint Control Disable Register (Isochronous Endpoint)".

Control endpoints can generate interrupts and use only 1 bank.

All endpoints (except endpoint 0) can be configured either as Bulk, Interrupt or Isochronous. See Table 31-4. UDPHS Endpoint Description.

The maximum packet size they can accept corresponds to the maximum endpoint size.

Note: The endpoint size of 1024 is reserved for isochronous endpoints.

The size of the DPRAM is 4 KB. The DPR is shared by all active endpoints. The memory size required by the active endpoints must not exceed the size of the DPRAM.

SIZE\_DPRAM = SIZE \_EPT0

- + NB\_BANK\_EPT1 x SIZE\_EPT1
- + NB\_BANK\_EPT2 x SIZE\_EPT2
- + NB BANK EPT3 x SIZE EPT3

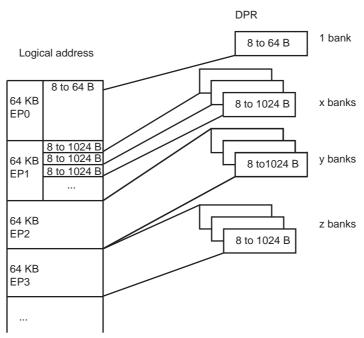

- + NB\_BANK\_EPT4 x SIZE\_EPT4
- + NB\_BANK\_EPT5 x SIZE\_EPT5
- + NB\_BANK\_EPT6 x SIZE\_EPT6
- +... (refer to 31.7.8 UDPHS Endpoint Configuration Register)

If a user tries to configure endpoints with a size the sum of which is greater than the DPRAM, then the EPT\_MAPD is not set.

The application has access to the physical block of DPR reserved for the endpoint through a 64 KB logical address space.

The physical block of DPR allocated for the endpoint is remapped all along the 64 KB logical address space. The application can write a 64 KB buffer linearly.

Figure 31-5. Logical Address Space for DPR Access

Configuration examples of UDPHS\_EPTCTLx (UDPHS Endpoint Control Disable Register (Isochronous Endpoint)) for Bulk IN endpoint type follow below.

- With DMA
  - AUTO\_VALID: Automatically validate the packet and switch to the next bank.
  - EPT\_ENABL: Enable endpoint.
- Without DMA:
  - TXRDY: An interrupt is generated after each transmission.
  - EPT\_ENABL: Enable endpoint.

Configuration examples of Bulk OUT endpoint type follow below.

- With DMA
  - AUTO\_VALID: Automatically validate the packet and switch to the next bank.
  - EPT\_ENABL: Enable endpoint.
- Without DMA
  - RXRDY\_TXKL: An interrupt is sent after a new packet has been stored in the endpoint FIFO.
  - EPT\_ENABL: Enable endpoint.

#### 31.6.7 DPRAM Management

Endpoints can only be allocated in ascending order, from the endpoint 0 to the last endpoint to be allocated. The user shall therefore configure them in the same order.

The allocation of an endpoint x starts when the Number of Banks field in the UDPHS Endpoint Configuration Register (UDPHS\_EPTCFGx.BK\_NUMBER) is different from zero. Then, the hardware allocates a memory area in the DPRAM and inserts it between the x-1 and x+1 endpoints. The x+1 endpoint memory window slides up and its data is lost. Note that the following endpoint memory windows (from x+2) do not slide.

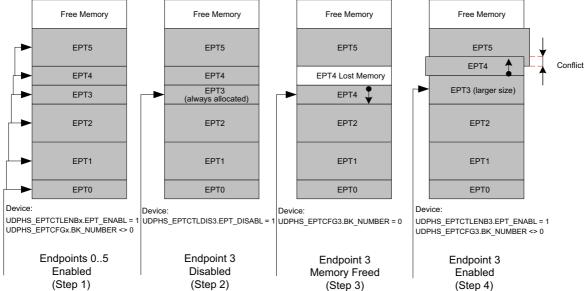

Disabling an endpoint, by writing a one to the Endpoint Disable bit in the UDPHS Endpoint Control Disable Register (UDPHS\_EPTCTLDISx.EPT\_DISABL), does not reset its configuration:

- Endpoint Banks (UDPHS\_EPTCFGx.BK\_NUMBER)
- Endpoint Size (UDPHS\_EPTCFGx.EPT\_SIZE)
- Endpoint Direction (UDPHS\_EPTCFGx.EPT\_DIR)
- Endpoint Type (UDPHS\_EPTCFGx.EPT\_TYPE)

To free its memory, the user shall write a zero to the UDPHS\_EPTCFGx.BK\_NUMBER field. The x+1 endpoint memory window then slides down and its data is lost. Note that the following endpoint memory windows (from x+2) do not slide.

Figure 31-6 illustrates the allocation and reorganization of the DPRAM in a typical example.

Figure 31-6. Example of DPRAM Allocation and Reorganization

#### **DPRAM** allocation sequence:

- 1. The endpoints 0 to 5 are enabled, configured and allocated in ascending order. Each endpoint then owns a memory area in the DPRAM.
- 2. The endpoint 3 is disabled, but its memory is kept allocated by the controller.
- 3. In order to free its memory, its UDPHS\_EPTCFGx.BK\_NUMBER field is written to zero. The endpoint 4 memory window slides down, but the endpoint 5 does not move.
- 4. If the user chooses to reconfigure the endpoint 3 with a larger size, the controller allocates a memory area after the endpoint 2 memory area and automatically slides up the endpoint 4 memory window. The endpoint 5 does not move and a memory conflict appears as the memory windows of the endpoints 4 and 5 overlap. The data of these endpoints is potentially lost.

Notes: 1. There is no way the data of the endpoint 0 can be lost (except if it is de-allocated) as the memory allocation and de-allocation may affect only higher endpoints.

- Deactivating then reactivating the same endpoint with the same configuration only modifies temporarily the
  controller DPRAM pointer and size for this endpoint. Nothing changes in the DPRAM, higher endpoints seem not
  to have been moved and their data is preserved as far as nothing has been written or received into them while
  changing the allocation state of the first endpoint.
- 3. When the user writes a value different from zero to the UDPHS\_EPTCFGx.BK\_NUMBER field, the Endpoint Mapped bit (UDPHS\_EPTCFGx.EPT\_MAPD) is set only if the configured size and number of banks are correct as compared to the endpoint maximal allowed values and to the maximal FIFO size (i.e., the DPRAM size). The UDPHS\_EPTCFGx.EPT\_MAPD value does not consider memory allocation conflicts.

#### 31.6.8 Transfer With DMA

USB packets of any length may be transferred when required by the UDPHS device. These transfers always feature sequential addressing.

Packet data AHB bursts may be locked on a DMA buffer basis for drastic overall AHB bus bandwidth performance boost with paged memories. These clock-cycle consuming memory row (or bank) changes will then likely not occur, or occur only once instead of several times, during a single big USB packet DMA transfer in case another AHB master addresses the memory. The locked bursts result in up to 128-word single-cycle unbroken AHB bursts for bulk endpoints and 256-word single-cycle unbroken bursts for isochronous endpoints.

This maximum burst length is then controlled by the lowest programmed USB endpoint size (EPT\_SIZE field in the UDPHS\_EPTCFGx register) and DMA Size (BUFF\_LENGTH field in the UDPHS\_DMACONTROLx register).

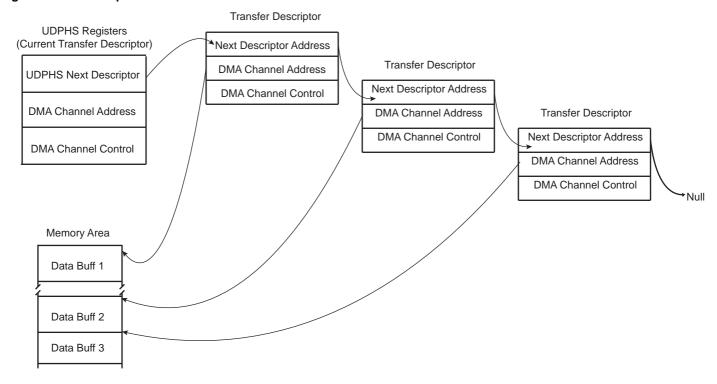

The USB 2.0 device average throughput may be up to nearly 60 Mbyte/s. Its internal slave average access latency decreases as burst length increases due to the 0 wait-state side effect of unchanged endpoints. If at least 0 wait-state word burst capability is also provided by the external DMA AHB bus slaves, each of both DMA AHB busses need less than 50% bandwidth allocation for full USB 2.0 bandwidth usage at 30 MHz, and less than 25% at 60 MHz.

The UDPHS DMA Channel Transfer Descriptor is described in Section 31.7.21 "UDPHS DMA Channel Transfer Descriptor".

Note: In case of debug, be careful to address the DMA to an SRAM address even if a remap is done.

Figure 31-7. Example of DMA Chained List

#### 31.6.9 Transfer Without DMA

**Important:** If the DMA is not to be used, it is necessary to disable it, otherwise it can be enabled by previous versions of software **without warning**. If this should occur, the DMA can process data before an interrupt without knowledge of the user.

The recommended means to disable DMA are as follows:

```
// Reset IP UDPHS
    AT91C_BASE_UDPHS->UDPHS_CTRL &= ~AT91C_UDPHS_EN_UDPHS;
    AT91C_BASE_UDPHS->UDPHS_CTRL |= AT91C_UDPHS_EN_UDPHS;
// With OR without DMA !!!
    for( i=1; i<=((AT91C_BASE_UDPHS->UDPHS_IPFEATURES &
AT91C_UDPHS_DMA_CHANNEL_NBR)>>4); i++ ) {
// RESET endpoint canal DMA:
        // DMA stop channel command
        AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0; // STOP
command
// Disable endpoint
        AT91C_BASE_UDPHS->UDPHS_EPT[i].UDPHS_EPTCTLDIS |= 0XFFFFFFFF;
// Reset endpoint config
        AT91C_BASE_UDPHS->UDPHS_EPT[i].UDPHS_EPTCTLCFG = 0;
// Reset DMA channel (Buff count and Control field)
        AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0x02; // NON
STOP command
// Reset DMA channel 0 (STOP)
        AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0; // STOP
command
// Clear DMA channel status (read the register for clear it)
        AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMASTATUS =
AT91C_BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMASTATUS;
}
```

## 31.6.10 Handling Transactions with USB V2.0 Device Peripheral

#### 31.6.10.1 Setup Transaction

The setup packet is valid in the DPR while RX\_SETUP is set. Once RX\_SETUP is cleared by the application, the UDPHS accepts the next packets sent over the device endpoint.

When a valid setup packet is accepted by the UDPHS:

- The UDPHS device automatically acknowledges the setup packet (sends an ACK response)
- Payload data is written in the endpoint
- Sets the RX SETUP interrupt
- The BYTE\_COUNT field in the UDPHS\_EPTSTAx register is updated

An endpoint interrupt is generated while RX\_SETUP in the UDPHS\_EPTSTAx register is not cleared. This interrupt is carried out to the microcontroller if interrupts are enabled for this endpoint.

Thus, firmware must detect RX\_SETUP polling UDPHS\_EPTSTAx or catching an interrupt, read the setup packet in the FIFO, then clear the RX\_SETUP bit in the UDPHS\_EPTCLRSTA register to acknowledge the setup stage.

If STALL\_SNT was set to 1, then this bit is automatically reset when a setup token is detected by the device. Then, the device still accepts the setup stage. (See Section 31.6.10.5 "STALL").

#### 31.6.10.2 NYET

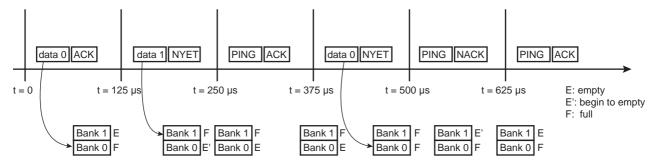

NYET is a High Speed only handshake. It is returned by a High Speed endpoint as part of the PING protocol.

High Speed devices must support an improved NAK mechanism for Bulk OUT and control endpoints (except setup stage). This mechanism allows the device to tell the host whether it has sufficient endpoint space for the next OUT transfer (see USB 2.0 spec 8.5.1 NAK Limiting via Ping Flow Control).

The NYET/ACK response to a High Speed Bulk OUT transfer and the PING response are automatically handled by hardware in the UDPHS\_EPTCTLx register (except when the user wants to force a NAK response by using the NYET\_DIS bit).

If the endpoint responds instead to the OUT/DATA transaction with an NYET handshake, this means that the endpoint accepted the data but does not have room for another data payload. The host controller must return to using a PING token until the endpoint indicates it has space available.

Figure 31-8. NYET Example with Two Endpoint Banks

#### 31.6.10.3 Data IN

#### **Bulk IN or Interrupt IN**

Data IN packets are sent by the device during the data or the status stage of a control transfer or during an (interrupt/bulk/isochronous) IN transfer. Data buffers are sent packet by packet under the control of the application or under the control of the DMA channel.

There are three ways for an application to transfer a buffer in several packets over the USB:

- packet by packet (see below)
- 64 KB (see below)
- DMA (see below)

#### Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host)

The application can write one or several banks.

A simple algorithm can be used by the application to send packets regardless of the number of banks associated to the endpoint.

Algorithm Description for Each Packet:

- The application waits for TXRDY flag to be cleared in the UDPHS\_EPTSTAx register before it can perform a
  write access to the DPR.
- The application writes one USB packet of data in the DPR through the 64 KB endpoint logical memory window.
- The application sets TXRDY flag in the UDPHS\_EPTSETSTAx register.

The application is notified that it is possible to write a new packet to the DPR by the TXRDY interrupt. This interrupt can be enabled or masked by setting the TXRDY bit in the UDPHS\_EPTCTLENB/UDPHS\_EPTCTLDIS register.

Algorithm Description to Fill Several Packets:

Using the previous algorithm, the application is interrupted for each packet. It is possible to reduce the application overhead by writing linearly several banks at the same time. The AUTO\_VALID bit in the UDPHS\_EPTCTLx must be set by writing the AUTO\_VALID bit in the UDPHS\_EPTCTLENBx register.

The auto-valid-bank mechanism allows the transfer of data (IN and OUT) without the intervention of the CPU. This means that bank validation (set TXRDY or clear the RXRDY\_TXKL bit) is done by hardware.

- The application checks the BUSY\_BANK\_STA field in the UDPHS\_EPTSTAx register. The application must wait that at least one bank is free.
- The application writes a number of bytes inferior to the number of free DPR banks for the endpoint. Each time the application writes the last byte of a bank, the TXRDY signal is automatically set by the UDPHS.
- If the last packet is incomplete (i.e., the last byte of the bank has not been written) the application must set the TXRDY bit in the UDPHS\_EPTSETSTAx register.

The application is notified that all banks are free, so that it is possible to write another burst of packets by the BUSY\_BANK interrupt. This interrupt can be enabled or masked by setting the BUSY\_BANK flag in the UDPHS\_EPTCTLENB and UDPHS\_EPTCTLDIS registers.

This algorithm must not be used for isochronous transfer. In this case, the ping-pong mechanism does not operate.

A Zero Length Packet can be sent by setting just the TXRDY flag in the UDPHS\_EPTSETSTAx register.

#### **Bulk IN or Interrupt IN: Sending a Buffer Using DMA (Device to Host)**

The UDPHS integrates a DMA host controller. This DMA controller can be used to transfer a buffer from the memory to the DPR or from the DPR to the processor memory under the UDPHS control. The DMA can be used for all transfer types except control transfer.

Example DMA configuration:

- 1. Program UDPHS\_DMAADDRESS x with the address of the buffer that should be transferred.
- 2. Enable the interrupt of the DMA in UDPHS IEN
- 3. Program UDPHS\_ DMACONTROLx:
  - Size of buffer to send: size of the buffer to be sent to the host.
  - END\_B\_EN: The endpoint can validate the packet (according to the values programmed in the AUTO\_VALID and SHRT\_PCKT fields of UDPHS\_EPTCTLx.) (See Section 31.7.12 "UDPHS Endpoint Control Disable Register (Isochronous Endpoint)" and Figure 31-13)
  - END\_BUFFIT: generate an interrupt when the BUFF\_COUNT in UDPHS\_DMASTATUSx reaches 0.
  - CHANN\_ENB: Run and stop at end of buffer

The auto-valid-bank mechanism allows the transfer of data (IN & OUT) without the intervention of the CPU. This means that bank validation (set TXRDY or clear the RXRDY\_TXKL bit) is done by hardware.

A transfer descriptor can be used. Instead of programming the register directly, a descriptor should be programmed and the address of this descriptor is then given to UDPHS\_DMANXTDSC to be processed after setting the LDNXT\_DSC field (Load Next Descriptor Now) in UDPHS\_DMACONTROLx register.

The structure that defines this transfer descriptor must be aligned.

Each buffer to be transferred must be described by a DMA Transfer descriptor (see Section 31.7.21 "UDPHS DMA Channel Transfer Descriptor"). Transfer descriptors are chained. Before executing transfer of the buffer, the UDPHS may fetch a new transfer descriptor from the memory address pointed by the UDPHS\_DMANXTDSCx register. Once the transfer is complete, the transfer status is updated in the UDPHS\_DMASTATUSx register.

To chain a new transfer descriptor with the current DMA transfer, the DMA channel must be stopped. To do so, INTDIS\_DMA and TXRDY may be set in the UDPHS\_EPTCTLENBx register. It is also possible for the application to wait for the completion of all transfers. In this case the LDNXT\_DSC bit in the last transfer descriptor UDPHS DMACONTROLx register must be set to 0 and the CHANN ENB bit set to 1.

Then the application can chain a new transfer descriptor.

The INTDIS\_DMA can be used to stop the current DMA transfer if an enabled interrupt is triggered. This can be used to stop DMA transfers in case of errors.

The application can be notified at the end of any buffer transfer (ENB\_BUFFIT bit in the UDPHS\_DMACONTROLx register).

Figure 31-9. Data IN Transfer for Endpoint with One Bank

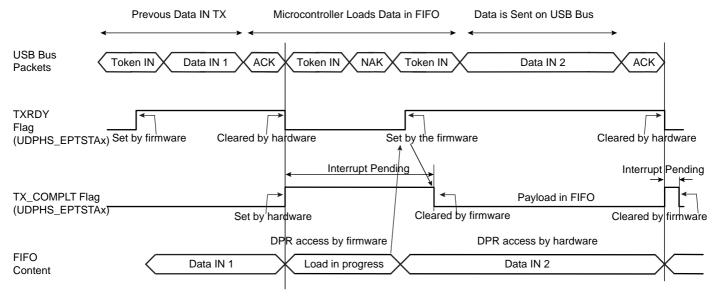

Figure 31-10. Data IN Transfer for Endpoint with Two Banks

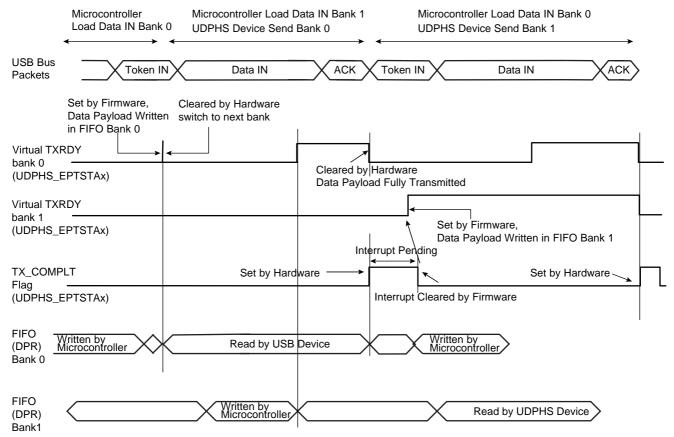

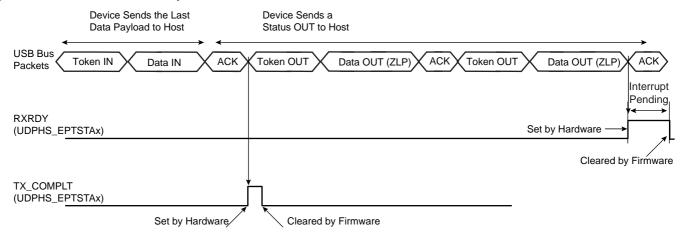

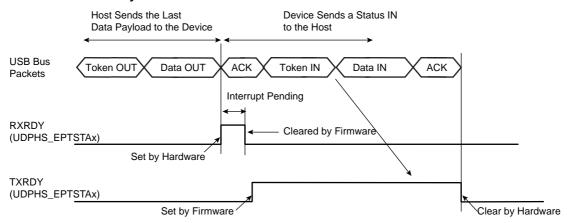

Figure 31-11. Data IN Followed By Status OUT Transfer at the End of a Control Transfer

Note: A NAK handshake is always generated at the first status stage token.

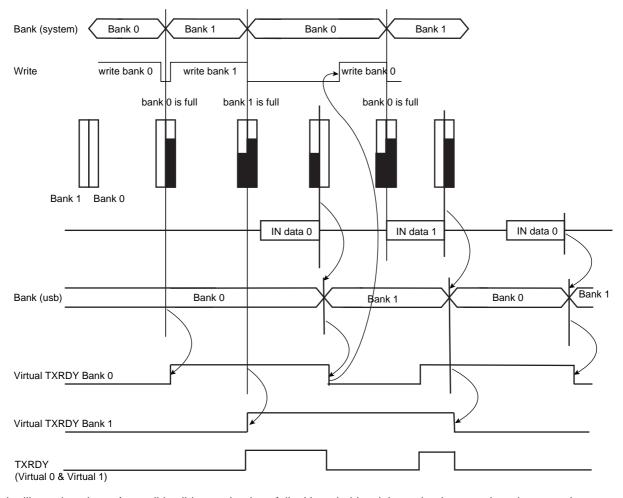

Figure 31-12. Data OUT Followed by Status IN Transfer

Note: Before proceeding to the status stage, the software should determine that there is no risk of extra data from the host (data stage). If not certain (non-predictable data stage length), then the software should wait for a NAK-IN interrupt before proceeding to the status stage. This precaution should be taken to avoid collision in the FIFO.

Figure 31-13. Autovalid with DMA

Note: In the illustration above Autovalid validates a bank as full, although this might not be the case, in order to continue processing data and to send to DMA.

#### **Isochronous IN**

Isochronous-IN is used to transmit a stream of data whose timing is implied by the delivery rate. Isochronous transfer provides periodic, continuous communication between host and device.

It guarantees bandwidth and low latencies appropriate for telephony, audio, video, etc.

If the endpoint is not available (TXRDY\_TRER = 0), then the device does not answer to the host. An ERR\_FL\_ISO interrupt is generated in the UDPHS\_EPTSTAx register and once enabled, then sent to the CPU.

The STALL SNT command bit is not used for an ISO-IN endpoint.

### **High Bandwidth Isochronous Endpoint Handling: IN Example**

For high bandwidth isochronous endpoints, the DMA can be programmed with the number of transactions (BUFF\_LENGTH field in UDPHS\_DMACONTROLx) and the system should provide the required number of packets per microframe, otherwise, the host will notice a sequencing problem.

A response should be made to the first token IN recognized inside a microframe under the following conditions:

• If at least one bank has been validated, the correct DATAx corresponding to the programmed Number Of Transactions per Microframe (NB\_TRANS) should be answered. In case of a subsequent missed or corrupted token IN inside the microframe, the USB 2.0 Core available data bank(s) that should normally have been transmitted during that microframe shall be flushed at its end. If this flush occurs, an error condition is flagged (ERR\_FLUSH is set in UDPHS\_EPTSTAx).

- If no bank is validated yet, the default DATA0 ZLP is answered and underflow is flagged (ERR\_FL\_ISO is set in UDPHS\_EPTSTAx). Then, no data bank is flushed at microframe end.
- If no data bank has been validated at the time when a response should be made for the second transaction of NB\_TRANS = 3 transactions microframe, a DATA1 ZLP is answered and underflow is flagged (ERR\_FL\_ISO is set in UDPHS\_EPTSTAx). If and only if remaining untransmitted banks for that microframe are available at its end, they are flushed and an error condition is flagged (ERR\_FLUSH is set in UDPHS\_EPTSTAx).
- If no data bank has been validated at the time when a response should be made for the last programmed transaction of a microframe, a DATA0 ZLP is answered and underflow is flagged (ERR\_FL\_ISO is set in UDPHS\_EPTSTAx). If and only if the remaining untransmitted data bank for that microframe is available at its end, it is flushed and an error condition is flagged (ERR\_FLUSH is set in UDPHS\_EPTSTAx).
- If at the end of a microframe no valid token IN has been recognized, no data bank is flushed and no error condition is reported.

At the end of a microframe in which at least one data bank has been transmitted, if less than NB\_TRANS banks have been validated for that microframe, an error condition is flagged (ERR\_TRANS is set in UDPHS\_EPTSTAX).

Cases of Error (in UDPHS\_EPTSTAx)

- ERR\_FL\_ISO: There was no data to transmit inside a microframe, so a ZLP is answered by default.
- ERR\_FLUSH: At least one packet has been sent inside the microframe, but the number of token IN received
  is lesser than the number of transactions actually validated (TXRDY\_TRER) and likewise with the
  NB\_TRANS programmed.
- ERR\_TRANS: At least one packet has been sent inside the microframe, but the number of token IN received
  is lesser than the number of programmed NB\_TRANS transactions and the packets not requested were not
  validated.
- ERR\_FL\_ISO + ERR\_FLUSH: At least one packet has been sent inside the microframe, but the data has not been validated in time to answer one of the following token IN.
- ERR\_FL\_ISO + ERR\_TRANS: At least one packet has been sent inside the microframe, but the data has
  not been validated in time to answer one of the following token IN and the data can be discarded at the
  microframe end.
- ERR\_FLUSH + ERR\_TRANS: The first token IN has been answered and it was the only one received, a second bank has been validated but not the third, whereas NB\_TRANS was waiting for three transactions.
- ERR\_FL\_ISO + ERR\_FLUSH + ERR\_TRANS: The first token IN has been treated, the data for the second
  Token IN was not available in time, but the second bank has been validated before the end of the
  microframe. The third bank has not been validated, but three transactions have been set in NB TRANS.

#### 31.6.10.4 Data OUT

## **Bulk OUT or Interrupt OUT**

Like data IN, data OUT packets are sent by the host during the data or the status stage of control transfer or during an interrupt/bulk/isochronous OUT transfer. Data buffers are sent packet by packet under the control of the application or under the control of the DMA channel.

# **Bulk OUT or Interrupt OUT: Receiving a Packet Under Application Control (Host to Device)**

Algorithm Description for Each Packet:

- The application enables an interrupt on RXRDY\_TXKL.
- When an interrupt on RXRDY\_TXKL is received, the application knows that UDPHS\_EPTSTAx register BYTE COUNT bytes have been received.
- The application reads the BYTE\_COUNT bytes from the endpoint.
- The application clears RXRDY TXKL.

Note: If the application does not know the size of the transfer, it may **not** be a good option to use AUTO\_VALID. Because if a zero-length-packet is received, the RXRDY\_TXKL is automatically cleared by the AUTO\_VALID hardware and if the endpoint interrupt is triggered, the software will not find its originating flag when reading the UDPHS\_EPTSTAX register.

Algorithm to Fill Several Packets:

- The application enables the interrupts of BUSY BANK and AUTO VALID.
- When a BUSY\_BANK interrupt is received, the application knows that all banks available for the endpoint have been filled. Thus, the application can read all banks available.

If the application does not know the size of the receive buffer, instead of using the BUSY\_BANK interrupt, the application must use RXRDY\_TXKL.

## **Bulk OUT or Interrupt OUT: Sending a Buffer Using DMA (Host To Device)**

To use the DMA setting, the AUTO\_VALID field is mandatory.

See Bulk IN or Interrupt IN: Sending a Buffer Using DMA (Device to Host) for more information.

DMA Configuration Example:

- 1. First program UDPHS DMAADDRESSx with the address of the buffer that should be transferred.
- 2. Enable the interrupt of the DMA in UDPHS\_IEN
- 3. Program the DMA Channelx Control Register:
  - Size of buffer to be sent.
  - END\_B\_EN: Can be used for OUT packet truncation (discarding of unbuffered packet data) at the end
    of DMA buffer.
  - END\_BUFFIT: Generate an interrupt when BUFF\_COUNT in the UDPHS\_DMASTATUSx register reaches 0.
  - END\_TR\_EN: End of transfer enable, the UDPHS device can put an end to the current DMA transfer, in case of a short packet.
  - END\_TR\_IT: End of transfer interrupt enable, an interrupt is sent after the last USB packet has been transferred by the DMA, if the USB transfer ended with a short packet. (Beneficial when the receive size is unknown.)
  - CHANN\_ENB: Run and stop at end of buffer.

For OUT transfer, the bank will be automatically cleared by hardware when the application has read all the bytes in the bank (the bank is empty).

- Notes: 1. When a zero-length-packet is received, RXRDY\_TXKL bit in UDPHS\_EPTSTAx is cleared automatically by AUTO\_VALID, and the application knows of the end of buffer by the presence of the END\_TR\_IT.
  - If the host sends a zero-length packet, and the endpoint is free, then the device sends an ACK. No data is written in the endpoint, the RXRDY\_TXKL interrupt is generated, and the BYTE\_COUNT field in UDPHS\_EPTSTAx is null.

Figure 31-14. Data OUT Transfer for Endpoint with One Bank

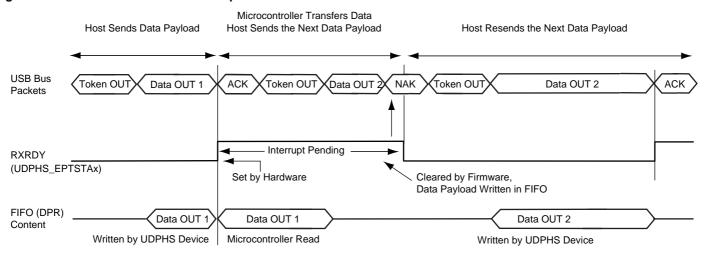

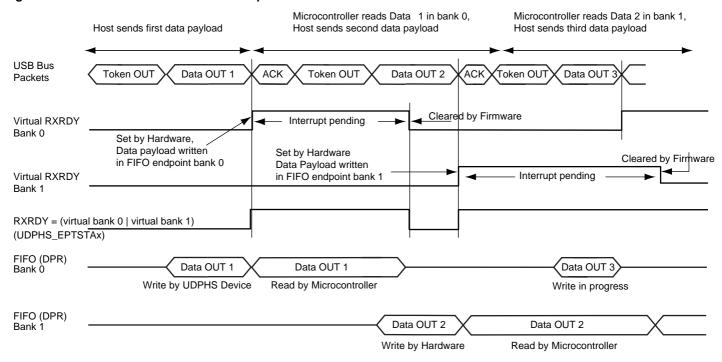

Figure 31-15. Data OUT Transfer for an Endpoint with Two Banks

# **High Bandwidth Isochronous Endpoint OUT**

USB 2.0 supports individual High Speed isochronous endpoints that require data rates up to 192 Mb/s (24 MB/s): 3x1024 data bytes per microframe.

To support such a rate, two or three banks may be used to buffer the three consecutive data packets. The microcontroller (or the DMA) should be able to empty the banks very rapidly (at least 24 MB/s on average).

NB\_TRANS field in UDPHS\_EPTCFGx register = Number Of Transactions per Microframe.

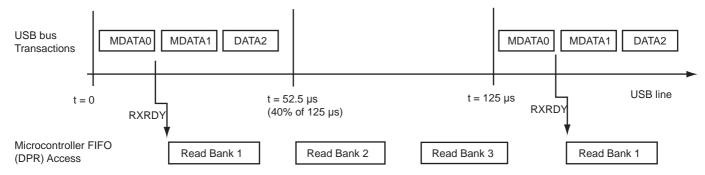

If NB\_TRANS > 1 then it is High Bandwidth.

#### Example:

- If NB\_TRANS = 3, the sequence should be either
  - MData0
  - MData0/Data1
  - MData0/Data1/Data2
- If NB TRANS = 2, the sequence should be either
  - MData0
  - MData0/Data1
- If NB\_TRANS = 1, the sequence should be
  - Data0

Figure 31-16. Bank Management, Example of Three Transactions per Microframe

#### **Isochronous Endpoint Handling: OUT Example**

The user can ascertain the bank status (free or busy), and the toggle sequencing of the data packet for each bank with the UDPHS\_EPTSTAx register in the three fields as follows:

- TOGGLESQ STA: PID of the data stored in the current bank
- CURBK: Number of the bank currently being accessed by the microcontroller.
- BUSY BANK STA: Number of busy bank

This is particularly useful in case of a missing data packet.

If the inter-packet delay between the OUT token and the Data is greater than the USB standard, then the ISO-OUT transaction is ignored. (Payload data is not written, no interrupt is generated to the CPU.)

If there is a data CRC (Cyclic Redundancy Check) error, the payload is, none the less, written in the endpoint. The ERR\_CRC\_NTR flag is set in UDPHS\_EPTSTAx register.

If the endpoint is already full, the packet is not written in the DPRAM. The ERR\_FL\_ISO flag is set in UDPHS EPTSTAx.

If the payload data is greater than the maximum size of the endpoint, then the ERR\_OVFLW flag is set. It is the task of the CPU to manage this error. The data packet is written in the endpoint (except the extra data).

If the host sends a Zero Length Packet, and the endpoint is free, no data is written in the endpoint, the RXRDY TXKL flag is set, and the BYTE COUNT field in UDPHS EPTSTAx register is null.

The FRCESTALL command bit is unused for an isochronous endpoint.

Otherwise, payload data is written in the endpoint, the RXRDY\_TXKL interrupt is generated and the BYTE\_COUNT in UDPHS\_EPTSTAx register is updated.

#### 31.6.10.5 STALL

STALL is returned by a function in response to an IN token or after the data phase of an OUT or in response to a PING transaction. STALL indicates that a function is unable to transmit or receive data, or that a control pipe request is not supported.

OUT

To stall an endpoint, set the FRCESTALL bit in UDPHS\_EPTSETSTAx register and after the STALL\_SNT flag has been set, set the TOGGLE\_SEG bit in the UDPHS\_EPTCLRSTAx register.

IN

Set the FRCESTALL bit in UDPHS\_EPTSETSTAx register.

Figure 31-17. Stall Handshake Data OUT Transfer

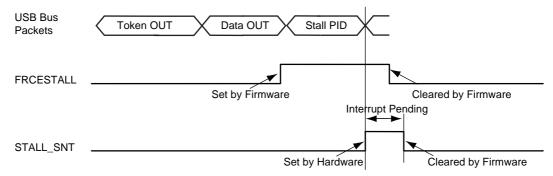

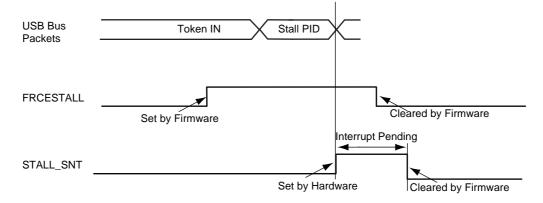

Figure 31-18. Stall Handshake Data IN Transfer

#### 31.6.11 Speed Identification

The high speed reset is managed by hardware.

At the connection, the host makes a reset which could be a classic reset (full speed) or a high speed reset.

At the end of the reset process (full or high), the ENDRESET interrupt is generated.

Then the CPU should read the SPEED bit in UDPHS INTSTAx to ascertain the speed mode of the device.

#### 31.6.12 USB V2.0 High Speed Global Interrupt

Interrupts are defined in Section 31.7.3 "UDPHS Interrupt Enable Register" (UDPHS\_IEN) and in Section 31.7.4 "UDPHS Interrupt Status Register" (UDPHS\_INTSTA).

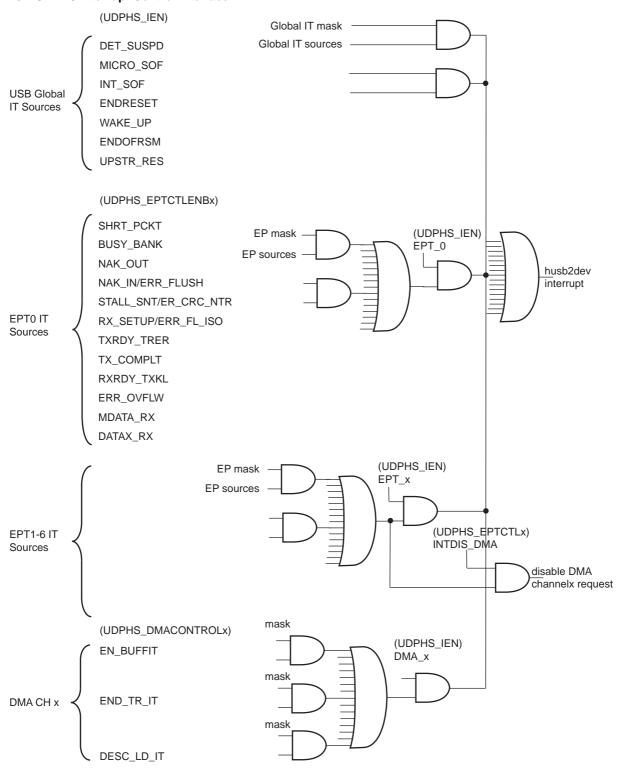

# 31.6.13 Endpoint Interrupts

Interrupts are enabled in UDPHS\_IEN (see Section 31.7.3 "UDPHS Interrupt Enable Register") and individually masked in UDPHS\_EPTCTLENBx (see Section 31.7.9 "UDPHS Endpoint Control Enable Register (Control, Bulk, Interrupt Endpoints)").

Table 31-5. Endpoint Interrupt Source Masks

| SHRT_PCKT             | Short Packet Interrupt                                     |
|-----------------------|--|
| BUSY_BANK             | Busy Bank Interrupt  |
| NAK_OUT               | NAKOUT Interrupt   |
| NAK_IN/ERR_FLUSH      | NAKIN/Error Flush Interrupt                                |
| STALL_SNT/ERR_CRC_NTR | Stall Sent/CRC error/Number of Transaction Error Interrupt |
| RX_SETUP/ERR_FL_ISO   | Received SETUP/Error Flow Interrupt                        |
| TXRDY_TRER            | TX Packet Read/Transaction Error Interrupt                 |
| TX_COMPLT             | Transmitted IN Data Complete Interrupt                     |
| RXRDY_TXKL            | Received OUT Data Interrupt                                |
| ERR_OVFLW             | Overflow Error Interrupt                                   |
| MDATA_RX              | MDATA Interrupt  |
| DATAX_RX              | DATAx Interrupt  |

Figure 31-19. UDPHS Interrupt Control Interface

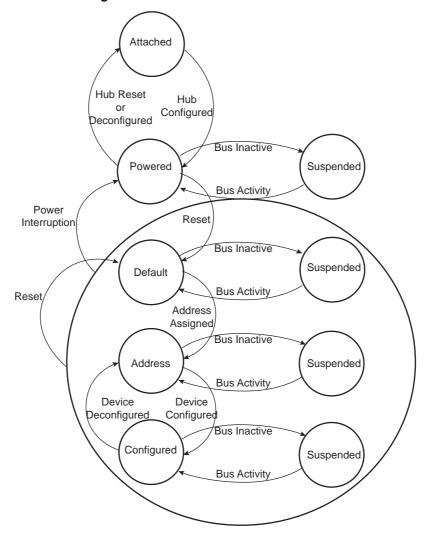

## 31.6.14 Power Modes

#### 31.6.14.1 Controlling Device States

A USB device has several possible states. Refer to Chapter 9 (USB Device Framework) of the Universal Serial Bus Specification, Rev 2.0.

Figure 31-20. UDPHS Device State Diagram

Movement from one state to another depends on the USB bus state or on standard requests sent through control transactions via the default endpoint (endpoint 0).

After a period of bus inactivity, the USB device enters Suspend mode. Accepting Suspend/Resume requests from the USB host is mandatory. Constraints in Suspend mode are very strict for bus-powered applications; devices may not consume more than  $500 \, \mu A$  on the USB bus.

While in Suspend mode, the host may wake up a device by sending a resume signal (bus activity) or a USB device may send a wake-up request to the host, e.g., waking up a PC by moving a USB mouse.

The wake-up feature is not mandatory for all devices and must be negotiated with the host.

#### 31.6.14.2 Not Powered State

Self powered devices can detect 5V VBUS using a PIO. When the device is not connected to a host, device power consumption can be reduced by the DETACH bit in UDPHS\_CTRL. Disabling the transceiver is automatically done. HSDM, HSDP, FSDP and FSDP lines are tied to GND pull-downs integrated in the hub downstream ports.

#### 31.6.14.3 Entering Attached State

When no device is connected, the USB FSDP and FSDM signals are tied to GND by 15 K $\Omega$  pull-downs integrated in the hub downstream ports. When a device is attached to an hub downstream port, the device connects a 1.5 K $\Omega$  pull-up on FSDP. The USB bus line goes into IDLE state, FSDP is pulled-up by the device 1.5 K $\Omega$  resistor to 3.3V and FSDM is pulled-down by the 15 K $\Omega$  resistor to GND of the host.

After pull-up connection, the device enters the powered state. The transceiver remains disabled until bus activity is detected.

In case of low power consumption need, the device can be stopped. When the device detects the VBUS, the software must enable the USB transceiver by enabling the EN\_UDPHS bit in UDPHS\_CTRL register.

The software can detach the pull-up by setting DETACH bit in UDPHS\_CTRL register.

## 31.6.14.4 From Powered State to Default State (Reset)

After its connection to a USB host, the USB device waits for an end-of-bus reset. The unmasked flag ENDRESET is set in the UDPHS\_IEN register and an interrupt is triggered.

Once the ENDRESET interrupt has been triggered, the device enters Default State. In this state, the UDPHS software must:

- Enable the default endpoint, setting the EPT\_ENABL flag in the UDPHS\_EPTCTLENB[0] register and, optionally, enabling the interrupt for endpoint 0 by writing 1 in EPT\_0 of the UDPHS\_IEN register. The enumeration then begins by a control transfer.
- Configure the Interrupt Mask Register which has been reset by the USB reset detection
- Enable the transceiver.

In this state, the EN\_UDPHS bit in UDPHS\_CTRL register must be enabled.

#### 31.6.14.5 From Default State to Address State (Address Assigned)

After a Set Address standard device request, the USB host peripheral enters the address state.

**Warning**: before the device enters address state, it must achieve the Status IN transaction of the control transfer, i.e., the UDPHS device sets its new address once the TX\_COMPLT flag in the UDPHS\_EPTCTL[0] register has been received and cleared.

To move to address state, the driver software sets the DEV\_ADDR field and the FADDR\_EN flag in the UDPHS\_CTRL register.

# 31.6.14.6 From Address State to Configured State (Device Configured)

Once a valid Set Configuration standard request has been received and acknowledged, the device enables endpoints corresponding to the current configuration. This is done by setting the BK\_NUMBER, EPT\_TYPE, EPT\_DIR and EPT\_SIZE fields in the UDPHS\_EPTCFGx registers and enabling them by setting the EPT\_ENABL flag in the UDPHS\_EPTCTLENBx registers, and, optionally, enabling corresponding interrupts in the UDPHS\_IEN register.

#### 31.6.14.7 Entering Suspend State (Bus Activity)

When a Suspend (no bus activity on the USB bus) is detected, the DET\_SUSPD signal in the UDPHS\_STA register is set. This triggers an interrupt if the corresponding bit is set in the UDPHS\_IEN register. This flag is cleared by writing to the UDPHS\_CLRINT register. Then the device enters Suspend mode.

In this state bus powered devices must drain less than 500  $\mu$ A from the 5V VBUS. As an example, the microcontroller switches to slow clock, disables the PLL and main oscillator, and goes into Idle mode. It may also switch off other devices on the board.

The UDPHS device peripheral clocks can be switched off. Resume event is asynchronously detected.

### 31.6.14.8 Receiving a Host Resume

In Suspend mode, a resume event on the USB bus line is detected asynchronously, transceiver and clocks disabled (however the pull-up should not be removed).

Once the resume is detected on the bus, the signal WAKE\_UP in the UDPHS\_INTSTA is set. It may generate an interrupt if the corresponding bit in the UDPHS\_IEN register is set. This interrupt may be used to wake-up the core, enable PLL and main oscillators and configure clocks.

### 31.6.14.9 Sending an External Resume

In Suspend State it is possible to wake-up the host by sending an external resume.

The device waits at least 5 ms after being entered in Suspend State before sending an external resume.

The device must force a K state from 1 to 15 ms to resume the host.

#### 31.6.15 Test Mode

A device must support the TEST\_MODE feature when in the Default, Address or Configured High Speed device states.

#### TEST MODE can be:

- Test J
- Test\_K
- Test\_Packet
- Test\_SEO\_NAK

#### (See Section 31.7.7 "UDPHS Test Register" for definitions of each test mode.)

#### **USB High Speed Device Port (UDPHS) User Interface** 31.7

Table 31-6. **Register Mapping** 

| Offset                         | Register                                      | Name             | Access     | Reset                      |

- Notes: 1. The reset value for UDPHS\_EPTCTL0 is 0x0000\_0001.
  - 2. The addresses for the UDPHS Endpoint registers shown here are for UDPHS Endpoint0. The structure of this group of registers is repeated successively for each endpoint according to the consecution of endpoint registers located between 0x120 and 0x1DC.
  - 3. The DMA channel index refers to the corresponding EP number. When no DMA channel is assigned to one EP, the associated registers are reserved. This is the case for EP0, so DMA Channel 0 registers are reserved.

# 31.7.1 UDPHS Control Register

Name: UDPHS\_CTRL
Address: 0xF803C000
Access: Road/M/rite

| Access:  | Read/Write |    |    |           |          |        |          |
|----------|------------|----|----|-----------|----------|--------|----------|
| 31       | 30         | 29 | 28 | 27        | 26       | 25     | 24       |
| _        | _          | _  | _  | _         | _        | _      | _        |
| 23       | 22         | 21 | 20 | 19        | 18       | 17     | 16       |
| _        | _          | _  | _  | _         | _        | _      | -        |
| 15       | 14         | 13 | 12 | 11        | 10       | 9      | 8        |
| _        | _          | -  | _  | PULLD_DIS | REWAKEUP | DETACH | EN_UDPHS |
| 7        | 6          | 5  | 4  | 3         | 2        | 1      | 0        |
| FADDR_EN |            |    |    | DEV_ADDR  |          | •      |          |

# • DEV\_ADDR: UDPHS Address (cleared upon USB reset)

This field contains the default address (0) after power-up or UDPHS bus reset (read), or it is written with the value set by a SET\_ADDRESS request received by the device firmware (write).

## FADDR\_EN: Function Address Enable (cleared upon USB reset)

0: Device is not in address state (read), or only the default function address is used (write).

1: Device is in address state (read), or this bit is set by the device firmware after a successful status phase of a SET\_ADDRESS transaction (write). When set, the only address accepted by the UDPHS controller is the one stored in the UDPHS Address field. It will not be cleared afterwards by the device firmware. It is cleared by hardware on hardware reset, or when UDPHS bus reset is received.

#### • EN UDPHS: UDPHS Enable

0: UDPHS is disabled (read), or this bit disables and resets the UDPHS controller (write). Switch the host to UTMI. .

1: UDPHS is enabled (read), or this bit enables the UDPHS controller (write). Switch the host to UTMI.

#### • DETACH: Detach Command

0: UDPHS is attached (read), or this bit pulls up the DP line (attach command) (write).

1: UDPHS is detached, UTMI transceiver is suspended (read), or this bit simulates a detach on the UDPHS line and forces the UTMI transceiver into suspend state (Suspend M = 0) (write).

See PULLD DIS description below.

## • REWAKEUP: Send Remote Wake Up (cleared upon USB reset)

0: Remote Wake Up is disabled (read), or this bit has no effect (write).

1: Remote Wake Up is enabled (read), or this bit forces an external interrupt on the UDPHS controller for Remote Wake UP purposes.

An Upstream Resume is sent only after the UDPHS bus has been in SUSPEND state for at least 5 ms.

This bit is automatically cleared by hardware at the end of the Upstream Resume.

# • PULLD\_DIS: Pull-Down Disable (cleared upon USB reset)

When set, there is no pull-down on DP & DM. (DM Pull-Down = DP Pull-Down = 0).

Note: If the DETACH bit is also set, device DP & DM are left in high impedance state.

(See DETACH description above.)

| DETACH | PULLD_DIS | DP                   | DM                   | Condition                          |
|--------|-----------|----------------------|----------------------|------------------------------------|
| 0      | 0         | Pull up              | Pull down            | Not recommended                    |
| 0      | 1         | Pull up              | High impedance state | VBUS present                       |
| 1      | 0         | Pull down            | Pull down            | No VBUS                            |
| 1      | 1         | High impedance state | High impedance state | VBUS present & software disconnect |

# 31.7.2 UDPHS Frame Number Register

Name: UDPHS\_FNUM
Address: 0xF803C004
Access: Read-only

| A00033.  | todd offig |              |    |        |        |             |    |

| _        | _          |              |    | FRAME_ | NUMBER |             |    |
| 7        | 6          | 5            | 4  | 3      | 2      | 1           | 0  |
|          | F          | FRAME_NUMBER | 3  |        | MIC    | CRO_FRAME_N | UM |

# • MICRO\_FRAME\_NUM: Microframe Number (cleared upon USB reset)

Number of the received microframe (0 to 7) in one frame. This field is reset at the beginning of each new frame (1 ms). One microframe is received each 125 microseconds (1 ms/8).

# • FRAME\_NUMBER: Frame Number as defined in the Packet Field Formats (cleared upon USB reset)

This field is provided in the last received SOF packet (see INT\_SOF in the UDPHS Interrupt Status Register).

# FNUM\_ERR: Frame Number CRC Error (cleared upon USB reset)

This bit is set by hardware when a corrupted Frame Number in Start of Frame packet (or Micro SOF) is received. This bit and the INT\_SOF (or MICRO\_SOF) interrupt are updated at the same time.

- 1: Enable Suspend Interrupt.

# • MICRO\_SOF: Micro-SOF Interrupt Enable (cleared upon USB reset)

- 0: Disable Micro-SOF Interrupt.
- 1: Enable Micro-SOF Interrupt.

## INT\_SOF: SOF Interrupt Enable (cleared upon USB reset)

- 0: Disable SOF Interrupt.
- 1: Enable SOF Interrupt.

# • ENDRESET: End Of Reset Interrupt Enable (cleared upon USB reset)

- 0: Disable End Of Reset Interrupt.
- 1: Enable End Of Reset Interrupt. Automatically enabled after USB reset.

# • WAKE\_UP: Wake Up CPU Interrupt Enable (cleared upon USB reset)

- 0: Disable Wake Up CPU Interrupt.
- 1: Enable Wake Up CPU Interrupt.

## • ENDOFRSM: End Of Resume Interrupt Enable (cleared upon USB reset)

- 0: Disable Resume Interrupt.
- 1: Enable Resume Interrupt.

## • UPSTR\_RES: Upstream Resume Interrupt Enable (cleared upon USB reset)

- 0: Disable Upstream Resume Interrupt.
- 1: Enable Upstream Resume Interrupt.

- EPT\_x: Endpoint x Interrupt Enable (cleared upon USB reset)
- 0: Disable the interrupts for this endpoint.
- 1: Enable the interrupts for this endpoint.
- DMA\_x: DMA Channel x Interrupt Enable (cleared upon USB reset)
- 0: Disable the interrupts for this channel.
- 1: Enable the interrupts for this channel.

# 31.7.4 UDPHS Interrupt Status Register

Name: UDPHS INTSTA

Address: 0xF803C014

Access: Read-only

| 31        | 30       | 29      | 28       | 27      | 26        | 25        | 24    |
|-----------|----------|---------|----------|---------|-----------|-----------|-------|
| _         | DMA_6    | DMA_5   | DMA_4    | DMA_3   | DMA_2     | DMA_1     | _     |
| 23        | 22       | 21      | 20       | 19      | 18        | 17        | 16    |
| _         | _        | _       | _        | _       | _         | _         | _     |
| 15        | 14       | 13      | 12       | 11      | 10        | 9         | 8     |
| _         | EPT_6    | EPT_5   | EPT_4    | EPT_3   | EPT_2     | EPT_1     | EPT_0 |
| 7         | 6        | 5       | 4        | 3       | 2         | 1         | 0     |
| UPSTR_RES | ENDOFRSM | WAKE_UP | ENDRESET | INT_SOF | MICRO_SOF | DET_SUSPD | SPEED |

# • SPEED: Speed Status

0: Reset by hardware when the hardware is in Full Speed mode.

1: Set by hardware when the hardware is in High Speed mode.

### • DET\_SUSPD: Suspend Interrupt

0: Cleared by setting the DET\_SUSPD bit in UDPHS\_CLRINT register.

1: Set by hardware when a UDPHS Suspend (Idle bus for three frame periods, a J state for 3 ms) is detected. This triggers a UDPHS interrupt when the DET SUSPD bit is set in UDPHS IEN register.

#### MICRO\_SOF: Micro Start Of Frame Interrupt

0: Cleared by setting the MICRO\_SOF bit in UDPHS\_CLRINT register.

1: Set by hardware when an UDPHS micro start of frame PID (SOF) has been detected (every 125 us) or synthesized by the macro. This triggers a UDPHS interrupt when the MICRO\_SOF bit is set in UDPHS\_IEN. In case of detected SOF, the MICRO\_FRAME\_NUM field in UDPHS\_FNUM register is incremented and the FRAME\_NUMBER field does not change.

Note: The Micro Start Of Frame Interrupt (MICRO\_SOF), and the Start Of Frame Interrupt (INT\_SOF) are not generated at the same time.

#### INT\_SOF: Start Of Frame Interrupt

0: Cleared by setting the INT\_SOF bit in UDPHS\_CLRINT.

1: Set by hardware when an UDPHS Start Of Frame PID (SOF) has been detected (every 1 ms) or synthesized by the macro. This triggers a UDPHS interrupt when the INT\_SOF bit is set in UDPHS\_IEN register. In case of detected SOF, in High Speed mode, the MICRO\_FRAME\_NUMBER field is cleared in UDPHS\_FNUM register and the FRAME\_NUMBER field is updated.

### • ENDRESET: End Of Reset Interrupt

0: Cleared by setting the ENDRESET bit in UDPHS\_CLRINT.

1: Set by hardware when an End Of Reset has been detected by the UDPHS controller. This triggers a UDPHS interrupt when the ENDRESET bit is set in UDPHS\_IEN.

# WAKE\_UP: Wake Up CPU Interrupt

0: Cleared by setting the WAKE\_UP bit in UDPHS\_CLRINT.

1: Set by hardware when the UDPHS controller is in SUSPEND state and is re-activated by a filtered non-idle signal from the UDPHS line (not by an upstream resume). This triggers a UDPHS interrupt when the WAKE\_UP bit is set in UDPHS\_IEN register. When receiving this interrupt, the user has to enable the device controller clock prior to operation. Note: this interrupt is generated even if the device controller clock is disabled.

## ENDOFRSM: End Of Resume Interrupt

0: Cleared by setting the ENDOFRSM bit in UDPHS\_CLRINT.

1: Set by hardware when the UDPHS controller detects a good end of resume signal initiated by the host. This triggers a UDPHS interrupt when the ENDOFRSM bit is set in UDPHS\_IEN.

## UPSTR\_RES: Upstream Resume Interrupt

0: Cleared by setting the UPSTR\_RES bit in UDPHS\_CLRINT.

1: Set by hardware when the UDPHS controller is sending a resume signal called "upstream resume". This triggers a UDPHS interrupt when the UPSTR\_RES bit is set in UDPHS\_IEN.

### EPT\_x: Endpoint x Interrupt (cleared upon USB reset)

0: Reset when the UDPHS\_EPTSTAx interrupt source is cleared.

1: Set by hardware when an interrupt is triggered by the UDPHS\_EPTSTAx register and this endpoint interrupt is enabled by the EPT\_x bit in UDPHS\_IEN.

### DMA\_x: DMA Channel x Interrupt

0: Reset when the UDPHS\_DMASTATUSx interrupt source is cleared.

1: Set by hardware when an interrupt is triggered by the DMA Channelx and this endpoint interrupt is enabled by the DMA\_x bit in UDPHS\_IEN.

# 31.7.5 UDPHS Clear Interrupt Register

# • EPT\_x: Endpoint x Reset

0: No effect.

Setting this bit clears all bits in the Endpoint status UDPHS\_EPTSTAx register except the TOGGLESQ\_STA field.

<sup>1:</sup> Reset the Endpointx state.

# 31.7.7 UDPHS Test Register

Name: UDPHS\_TST
Address: 0xF803C0E0

| ACCESS. | Read/Wille |         |         |       |       |      |       |
|---------|------------|---------|---------|-------|-------|------|-------|
| 31      | 30         | 29      | 28      | 27    | 26    | 25   | 24    |
| _       | _          | _       | -       | -     | -     | _    | -     |
| 23      | 22         | 21      | 20      | 19    | 18    | 17   | 16    |
| _       | -          | _       | _       | -     | _     | _    | _     |
| 15      | 14         | 13      | 12      | 11    | 10    | 9    | 8     |
| _       | _          | _       | _       | _     | _     | -    | _     |
| 7       | 6          | 5       | 4       | 3     | 2     | 1    | 0     |
| _       | _          | OPMODE2 | TST_PKT | TST_K | TST_J | SPEE | D_CFG |
|         |            |         |         |       |       |      |       |

# • SPEED\_CFG: Speed Configuration

| Value | Name       | Description  |
|-------|------------|--|
| 0     | NORMAL     | Normal mode: The macro is in Full Speed mode, ready to make a High Speed identification, if the host supports it and then to automatically switch to High Speed mode.      |
| 1     | _          | Reserved   |
| 2     | HIGH_SPEED | Force High Speed: Set this value to force the hardware to work in High Speed mode. Only for debug or test purpose.   |
| 3     | FULL_SPEED | Force Full Speed: Set this value to force the hardware to work only in Full Speed mode. In this configuration, the macro will not respond to a High Speed reset handshake. |

#### • TST J: Test J Mode

0: No effect.

1: Set to send the J state on the UDPHS line. This enables the testing of the high output drive level on the D+ line.

## • TST\_K: Test K Mode

0: No effect.

1: Set to send the K state on the UDPHS line. This enables the testing of the high output drive level on the D- line.

#### TST\_PKT: Test Packet Mode

0: No effect.

1: Set to repetitively transmit the packet stored in the current bank. This enables the testing of rise and fall times, eye patterns, jitter, and any other dynamic waveform specifications.

#### OPMODE2: OpMode2

0: No effect.

1: Set to force the OpMode signal (UTMI interface) to "10", to disable the bit-stuffing and the NRZI encoding.

Note: For the Test mode, Test\_SE0\_NAK (see Universal Serial Bus Specification, Revision 2.0: 7.1.20, Test Mode Support). Force the device in High Speed mode, and configure a bulk-type endpoint. Do not fill this endpoint for sending NAK to the host. Upon command, a port's transceiver must enter the High Speed Receive mode and remain in that mode until the exit action is taken. This enables the testing of output impedance, low level output voltage and loading characteristics. In addition, while in this mode, upstream facing ports (and only upstream facing ports) must respond to any IN token packet with a NAK handshake (only

if the packet CRC is determined to be correct) within the normal allowed device response time. This enables testing of the device

squelch level circuitry and, additionally, provides a general purpose stimulus/response test for basic functional testing.

# 31.7.8 UDPHS Endpoint Configuration Register

Name: UDPHS\_EPTCFGx [x=0..6]

**Address:** 0xF803C100 [0], 0xF803C120 [1], 0xF803C140 [2], 0xF803C160 [3], 0xF803C180 [4], 0xF803C1A0 [5],

0xF803C1C0 [6]

Access: Read/Write

| 31        | 30 | 29   | 28   | 27      | 26 | 25       | 24 |
|-----------|----|------|------|---------|----|----------|----|
| EPT_MAPD  | _  | _    | _    | _       | _  | _        | _  |
| 23        | 22 | 21   | 20   | 19      | 18 | 17       | 16 |
| _         | -  | -    | _    | _       | -  | ı        | _  |
| 15        | 14 | 13   | 12   | 11      | 10 | 9        | 8  |
| _         | -  | -    | _    | _       | -  | NB_TRANS |    |
| 7         | 6  | 5    | 4    | 3       | 2  | 1        | 0  |
| BK_NUMBER |    | EPT_ | TYPE | EPT_DIR |    | EPT_SIZE |    |

## • EPT\_SIZE: Endpoint Size (cleared upon USB reset)

Set this field according to the endpoint size(1) in bytes (see Section 31.6.6 "Endpoint Configuration").

| Value | Name | Description |
|-------|------|-------------|
| 0     | 8    | 8 bytes     |
| 1     | 16   | 16 bytes    |
| 2     | 32   | 32 bytes    |
| 3     | 64   | 64 bytes    |
| 4     | 128  | 128 bytes   |
| 5     | 256  | 256 bytes   |
| 6     | 512  | 512 bytes   |
| 7     | 1024 | 1024 bytes  |

Note: 1. 1024 bytes is only for isochronous endpoint.

## • EPT\_DIR: Endpoint Direction (cleared upon USB reset)

0: Clear this bit to configure OUT direction for Bulk, Interrupt and Isochronous endpoints.

1: Set this bit to configure IN direction for Bulk, Interrupt and Isochronous endpoints.

For Control endpoints this bit has no effect and should be left at zero.

## • EPT\_TYPE: Endpoint Type (cleared upon USB reset)

Set this field according to the endpoint type (see Section 31.6.6 "Endpoint Configuration").

(Endpoint 0 should always be configured as control)

| Value | Name  | Description          |
|-------|-------|----------------------|
| 0     | CTRL8 | Control endpoint     |
| 1     | ISO   | Isochronous endpoint |
| 2     | BULK  | Bulk endpoint        |
| 3     | INT   | Interrupt endpoint   |

# • BK\_NUMBER: Number of Banks (cleared upon USB reset)

Set this field according to the endpoint's number of banks (see Section 31.6.6 "Endpoint Configuration").

| Value | Name | Description                                     |
|-------|------|---|
| 0     | 0    | Zero bank, the endpoint is not mapped in memory |
| 1     | 1    | One bank (bank 0)                               |
| 2     | 2    | Double bank (Ping-Pong: bank0/bank1)            |
| 3     | 3    | Triple bank (bank0/bank1/bank2)                 |

# • NB\_TRANS: Number Of Transaction per Microframe (cleared upon USB reset)

The Number of transactions per microframe is set by software.

Note: Meaningful for high bandwidth isochronous endpoint only.

## • EPT\_MAPD: Endpoint Mapped (cleared upon USB reset)

0: The user should reprogram the register with correct values.

- 1: Set by hardware when the endpoint size (EPT\_SIZE) and the number of banks (BK\_NUMBER) are correct regarding:
  - The FIFO max capacity (FIFO\_MAX\_SIZE in UDPHS\_IPFEATURES register)
  - The number of endpoints/banks already allocated
  - The number of allowed banks for this endpoint

# 31.7.9 UDPHS Endpoint Control Enable Register (Control, Bulk, Interrupt Endpoints)

Name: UDPHS\_EPTCTLENBx [x=0..6]

**Address:** 0xF803C104 [0], 0xF803C124 [1], 0xF803C144 [2], 0xF803C164 [3], 0xF803C184 [4], 0xF803C1A4 [5],

0xF803C1C4 [6]

Access: Write-only

| _         | _      | _         | NYET_DIS | INTDIS_DMA | _         | AUTO_VALID | EPT_ENABL |

This register view is relevant only if EPT\_TYPE = 0x0, 0x2 or 0x3 in "UDPHS Endpoint Configuration Register".

For additional information, see "UDPHS Endpoint Control Register (Control, Bulk, Interrupt Endpoints)".

### • EPT\_ENABL: Endpoint Enable

0: No effect.

1: Enable endpoint according to the device configuration.

### • AUTO VALID: Packet Auto-Valid Enable

0: No effect.

1: Enable this bit to automatically validate the current packet and switch to the next bank for both IN and OUT transfers.

### INTDIS\_DMA: Interrupts Disable DMA

0: No effect.

1: If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled.

## • NYET DIS: NYET Disable (Only for High Speed Bulk OUT endpoints)

0: No effect.

1: Forces an ACK response to the next High Speed Bulk OUT transfer instead of a NYET response.

## • ERR\_OVFLW: Overflow Error Interrupt Enable

0: No effect.

1: Enable Overflow Error Interrupt.

#### RXRDY\_TXKL: Received OUT Data Interrupt Enable

0: No effect.

1: Enable Received OUT Data Interrupt.

# • TX\_COMPLT: Transmitted IN Data Complete Interrupt Enable

0: No effect.

1: Enable Transmitted IN Data Complete Interrupt.

## TXRDY: TX Packet Ready Interrupt Enable

0: No effect.

1: Enable TX Packet Ready/Transaction Error Interrupt.

## • RX\_SETUP: Received SETUP

0: No effect.

1: Enable RX\_SETUP Interrupt.

## • STALL\_SNT: Stall Sent Interrupt Enable

0: No effect.

1: Enable Stall Sent Interrupt.

## NAK\_IN: NAKIN Interrupt Enable

0: No effect.

1: Enable NAKIN Interrupt.

# NAK\_OUT: NAKOUT Interrupt Enable

0: No effect.

1: Enable NAKOUT Interrupt.

## • BUSY\_BANK: Busy Bank Interrupt Enable

0: No effect.

1: Enable Busy Bank Interrupt.

# • SHRT\_PCKT: Short Packet Send/Short Packet Interrupt Enable

For OUT endpoints:

0: No effect.

1: Enable Short Packet Interrupt.

**For IN endpoints:** Guarantees short packet at end of DMA Transfer if the UDPHS\_DMACONTROLx register END\_B\_EN and UDPHS\_EPTCTLx register AUTOVALID bits are also set.

# 31.7.10 UDPHS Endpoint Control Enable Register (Isochronous Endpoints)

Name: UDPHS\_EPTCTLENBx [x=0..6] (ISOENDPT)

**Address:** 0xF803C104 [0], 0xF803C124 [1], 0xF803C144 [2], 0xF803C164 [3], 0xF803C184 [4], 0xF803C1A4 [5],

0xF803C1C4 [6]

Access: Write-only

| 31        | 30        | 29          | 28         | 27         | 26        | 25         | 24        |
|-----------|-----------|-------------|------------|------------|-----------|------------|-----------|

| MDATA_RX  | DATAX_RX  | -           | _          | INTDIS_DMA | _         | AUTO_VALID | EPT_ENABL |

This register view is relevant only if EPT\_TYPE = 0x1 in "UDPHS Endpoint Configuration Register".

For additional information, see "UDPHS Endpoint Control Register (Isochronous Endpoint)".

### • EPT\_ENABL: Endpoint Enable

0: No effect.

1: Enable endpoint according to the device configuration.

## • AUTO VALID: Packet Auto-Valid Enable

0: No effect.

1: Enable this bit to automatically validate the current packet and switch to the next bank for both IN and OUT transfers.

### INTDIS\_DMA: Interrupts Disable DMA

0: No effect.

1: If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled.

# • DATAX\_RX: DATAx Interrupt Enable (Only for high bandwidth Isochronous OUT endpoints)

0: No effect.

1: Enable DATAx Interrupt.

## MDATA\_RX: MDATA Interrupt Enable (Only for high bandwidth Isochronous OUT endpoints)

0: No effect.

1: Enable MDATA Interrupt.

#### ERR\_OVFLW: Overflow Error Interrupt Enable

0: No effect.

1: Enable Overflow Error Interrupt.

- RXRDY\_TXKL: Received OUT Data Interrupt Enable
- 0: No effect.
- 1: Enable Received OUT Data Interrupt.
- TX\_COMPLT: Transmitted IN Data Complete Interrupt Enable
- 0: No effect.
- 1: Enable Transmitted IN Data Complete Interrupt.
- TXRDY\_TRER: TX Packet Ready/Transaction Error Interrupt Enable
- 0: No effect.
- 1: Enable TX Packet Ready/Transaction Error Interrupt.
- ERR\_FL\_ISO: Error Flow Interrupt Enable
- 0: No effect.
- 1: Enable Error Flow ISO Interrupt.
- ERR\_CRC\_NTR: ISO CRC Error/Number of Transaction Error Interrupt Enable
- 0: No effect.
- 1: Enable Error CRC ISO/Error Number of Transaction Interrupt.
- ERR\_FLUSH: Bank Flush Error Interrupt Enable
- 0: No effect.
- 1: Enable Bank Flush Error Interrupt.
- BUSY\_BANK: Busy Bank Interrupt Enable
- 0: No effect.
- 1: Enable Busy Bank Interrupt.
- SHRT\_PCKT: Short Packet Send/Short Packet Interrupt Enable

For OUT endpoints:

- 0: No effect.
- 1: Enable Short Packet Interrupt.

**For IN endpoints:** Guarantees short packet at end of DMA Transfer if the UDPHS\_DMACONTROLx register END\_B\_EN and UDPHS\_EPTCTLx register AUTOVALID bits are also set.

| _         | -      | -         | NYET_DIS | INTDIS_DMA | _         | AUTO_VALID | EPT_ENABL |

This register view is relevant only if EPT\_TYPE = 0x0, 0x2 or 0x3 in "UDPHS Endpoint Configuration Register".

#### • EPT ENABL: Endpoint Enable (cleared upon USB reset)

0: The endpoint is disabled according to the device configuration. Endpoint 0 should always be enabled after a hardware or UDPHS bus reset and participate in the device configuration.

## AUTO\_VALID: Packet Auto-Valid Enabled (Not for CONTROL Endpoints) (cleared upon USB reset)

Set this bit to automatically validate the current packet and switch to the next bank for both IN and OUT endpoints.

#### For IN Transfer:

If this bit is set, the UDPHS\_EPTSTAx register TXRDY bit is set automatically when the current bank is full and at the end of DMA buffer if the UDPHS\_DMACONTROLx register END\_B\_EN bit is set.

The user may still set the UDPHS\_EPTSTAx register TXRDY bit if the current bank is not full, unless the user needs to send a Zero Length Packet by software.

#### For OUT Transfer:

If this bit is set, the UDPHS\_EPTSTAx register RXRDY\_TXKL bit is automatically reset for the current bank when the last packet byte has been read from the bank FIFO or at the end of DMA buffer if the UDPHS\_DMACONTROLx register END\_B\_EN bit is set. For example, to truncate a padded data packet when the actual data transfer size is reached.

The user may still clear the UDPHS\_EPTSTAx register RXRDY\_TXKL bit, for example, after completing a DMA buffer by software if UDPHS\_DMACONTROLx register END\_B\_EN bit was disabled or in order to cancel the read of the remaining data bank(s).

## INTDIS\_DMA: Interrupt Disables DMA (cleared upon USB reset)

If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled regardless of the UDPHS\_IEN register EPT\_x bit for this endpoint. Then, the firmware will have to clear or disable the interrupt source or clear this bit if transfer completion is needed.

If the exception raised is associated with the new system bank packet, then the previous DMA packet transfer is normally completed, but the new DMA packet transfer is not started (not requested).

<sup>1:</sup> The endpoint is enabled according to the device configuration.

If the exception raised is not associated to a new system bank packet (NAK\_IN, NAK\_OUT...), then the request cancellation may happen at any time and may immediately stop the current DMA transfer.

This may be used, for example, to identify or prevent an erroneous packet to be transferred into a buffer or to complete a DMA buffer by software after reception of a short packet.

### NYET\_DIS: NYET Disable (Only for High Speed Bulk OUT Endpoints) (cleared upon USB reset)

- 0: Lets the hardware handle the handshake response for the High Speed Bulk OUT transfer.
- 1: Forces an ACK response to the next High Speed Bulk OUT transfer instead of a NYET response.

Note: According to the *Universal Serial Bus Specification, Rev 2.0* (8.5.1.1 NAK Responses to OUT/DATA During PING Protocol), a NAK response to an HS Bulk OUT transfer is expected to be an unusual occurrence.

#### • ERR OVFLW: Overflow Error Interrupt Enabled (cleared upon USB reset)

- 0: Overflow Error Interrupt is masked.
- 1: Overflow Error Interrupt is enabled.

## RXRDY\_TXKL: Received OUT Data Interrupt Enabled (cleared upon USB reset)

- 0: Received OUT Data Interrupt is masked.
- 1: Received OUT Data Interrupt is enabled.

## TX\_COMPLT: Transmitted IN Data Complete Interrupt Enabled (cleared upon USB reset)

- 0: Transmitted IN Data Complete Interrupt is masked.
- 1: Transmitted IN Data Complete Interrupt is enabled.

### • TXRDY: TX Packet Ready Interrupt Enabled (cleared upon USB reset)

- 0: TX Packet Ready Interrupt is masked.
- 1: TX Packet Ready Interrupt is enabled.

**Caution:** Interrupt source is active as long as the corresponding UDPHS\_EPTSTAx register TXRDY flag remains low. If there are no more banks available for transmitting after the software has set UDPHS\_EPTSTAx/TXRDY for the last transmit packet, then the interrupt source remains inactive until the first bank becomes free again to transmit at UDPHS\_EPTSTAx/TXRDY hardware clear.

#### RX\_SETUP: Received SETUP Interrupt Enabled (cleared upon USB reset)

- 0: Received SETUP is masked.
- 1: Received SETUP is enabled.

#### STALL SNT: Stall Sent Interrupt Enabled (cleared upon USB reset)

- 0: Stall Sent Interrupt is masked.
- 1: Stall Sent Interrupt is enabled.

## NAK\_IN: NAKIN Interrupt Enabled (cleared upon USB reset)

- 0: NAKIN Interrupt is masked.
- 1: NAKIN Interrupt is enabled.

## NAK\_OUT: NAKOUT Interrupt Enabled (cleared upon USB reset)

- 0: NAKOUT Interrupt is masked.
- 1: NAKOUT Interrupt is enabled.

# • BUSY\_BANK: Busy Bank Interrupt Enabled (cleared upon USB reset)

0: BUSY\_BANK Interrupt is masked.

1: BUSY\_BANK Interrupt is enabled.

For OUT endpoints: an interrupt is sent when all banks are busy.

For IN endpoints: an interrupt is sent when all banks are free.

# • SHRT\_PCKT: Short Packet Interrupt Enabled (cleared upon USB reset)

For OUT endpoints: send an Interrupt when a Short Packet has been received.

0: Short Packet Interrupt is masked.

1: Short Packet Interrupt is enabled.

**For IN endpoints**: a Short Packet transmission is guaranteed upon end of the DMA Transfer, thus signaling a BULK or INTERRUPT end of transfer, but only if the UDPHS\_DMACONTROLx register END\_B\_EN and UDPHS\_EPTCTLx register AUTO\_VALID bits are also set.

# 31.7.14 UDPHS Endpoint Control Register (Isochronous Endpoint)

Name: UDPHS\_EPTCTLx [x=0..6] (ISOENDPT)

| _         | ERR_FLUSH | ERR_CRC_NTR | ERR_FL_ISO | TXRDY_TRER | TX_COMPLT | RXRDY_TXKL | ERR_OVFLW |
|           |           |             |            |            |           |            |           |
| 7         | 6         | 5           | 4          | 3          | 2         | 1          | 0         |
| MDATA_RX  | DATAX_RX  | _           | _          | INTDIS_DMA | _         | AUTO_VALID | EPT_ENABL |

This register view is relevant only if EPT\_TYPE = 0x1 in "UDPHS Endpoint Configuration Register".

#### • EPT ENABL: Endpoint Enable (cleared upon USB reset)

0: The endpoint is disabled according to the device configuration. Endpoint 0 should always be enabled after a hardware or UDPHS bus reset and participate in the device configuration.

1: The endpoint is enabled according to the device configuration.

## • AUTO\_VALID: Packet Auto-Valid Enabled (cleared upon USB reset)

Set this bit to automatically validate the current packet and switch to the next bank for both IN and OUT endpoints.

#### For IN Transfer:

If this bit is set, the UDPHS\_EPTSTAx register TXRDY\_TRER bit is set automatically when the current bank is full and at the end of DMA buffer if the UDPHS\_DMACONTROLx register END\_B\_EN bit is set.

The user may still set the UDPHS\_EPTSTAx register TXRDY\_TRER bit if the current bank is not full, unless the user needs to send a Zero Length Packet by software.

#### For OUT Transfer:

If this bit is set, the UDPHS\_EPTSTAx register RXRDY\_TXKL bit is automatically reset for the current bank when the last packet byte has been read from the bank FIFO or at the end of DMA buffer if the UDPHS\_DMACONTROLx register END\_B\_EN bit is set. For example, to truncate a padded data packet when the actual data transfer size is reached.

The user may still clear the UDPHS\_EPTSTAx register RXRDY\_TXKL bit, for example, after completing a DMA buffer by software if UDPHS\_DMACONTROLx register END\_B\_EN bit was disabled or in order to cancel the read of the remaining data bank(s).

## INTDIS\_DMA: Interrupt Disables DMA (cleared upon USB reset)

If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled regardless of the UDPHS\_IEN register EPT\_x bit for this endpoint. Then, the firmware will have to clear or disable the interrupt source or clear this bit if transfer completion is needed.

If the exception raised is associated with the new system bank packet, then the previous DMA packet transfer is normally completed, but the new DMA packet transfer is not started (not requested).

If the exception raised is not associated to a new system bank packet (ex: ERR\_FL\_ISO), then the request cancellation may happen at any time and may immediately stop the current DMA transfer.

This may be used, for example, to identify or prevent an erroneous packet to be transferred into a buffer or to complete a DMA buffer by software after reception of a short packet, or to perform buffer truncation on ERR\_FL\_ISO interrupt for adaptive rate.

- DATAX\_RX: DATAx Interrupt Enabled (Only for High Bandwidth Isochronous OUT endpoints) (cleared upon USB reset)
- 0: No effect.
- 1: Send an interrupt when a DATA2, DATA1 or DATA0 packet has been received meaning the whole microframe data payload has been received.
- MDATA\_RX: MDATA Interrupt Enabled (Only for High Bandwidth Isochronous OUT endpoints) (cleared upon USB reset)
- 0: No effect.
- 1: Send an interrupt when an MDATA packet has been received and so at least one packet of the microframe data payload has been received.
- ERR\_OVFLW: Overflow Error Interrupt Enabled (cleared upon USB reset)
- 0: Overflow Error Interrupt is masked.
- 1: Overflow Error Interrupt is enabled.
- RXRDY\_TXKL: Received OUT Data Interrupt Enabled (cleared upon USB reset)
- 0: Received OUT Data Interrupt is masked.
- 1: Received OUT Data Interrupt is enabled.
- TX\_COMPLT: Transmitted IN Data Complete Interrupt Enabled (cleared upon USB reset)
- 0: Transmitted IN Data Complete Interrupt is masked.
- 1: Transmitted IN Data Complete Interrupt is enabled.
- TXRDY\_TRER: TX Packet Ready/Transaction Error Interrupt Enabled (cleared upon USB reset)
- 0: TX Packet Ready/Transaction Error Interrupt is masked.
- 1: TX Packet Ready/Transaction Error Interrupt is enabled.

**Caution:** Interrupt source is active as long as the corresponding UDPHS\_EPTSTAx register TXRDY\_TRER flag remains low. If there are no more banks available for transmitting after the software has set UDPHS\_EPTSTAx/TXRDY\_TRER for the last transmit packet, then the interrupt source remains inactive until the first bank becomes free again to transmit at UDPHS\_EPTSTAx/TXRDY\_TRER hardware clear.

- ERR\_FL\_ISO: Error Flow Interrupt Enabled (cleared upon USB reset)
- 0: Error Flow Interrupt is masked.
- 1: Error Flow Interrupt is enabled.
- ERR CRC NTR: ISO CRC Error/Number of Transaction Error Interrupt Enabled (cleared upon USB reset)
- 0: ISO CRC error/number of Transaction Error Interrupt is masked.
- 1: ISO CRC error/number of Transaction Error Interrupt is enabled.

# • ERR\_FLUSH: Bank Flush Error Interrupt Enabled (cleared upon USB reset)

0: Bank Flush Error Interrupt is masked.

1: Bank Flush Error Interrupt is enabled.

#### BUSY\_BANK: Busy Bank Interrupt Enabled (cleared upon USB reset)

0: BUSY\_BANK Interrupt is masked.

1: BUSY\_BANK Interrupt is enabled.

For OUT endpoints: An interrupt is sent when all banks are busy.

For IN endpoints: An interrupt is sent when all banks are free.

## • SHRT\_PCKT: Short Packet Interrupt Enabled (cleared upon USB reset)

For OUT endpoints: send an Interrupt when a Short Packet has been received.

0: Short Packet Interrupt is masked.

1: Short Packet Interrupt is enabled.

**For IN endpoints**: A Short Packet transmission is guaranteed upon end of the DMA Transfer, thus signaling an end of isochronous (micro-)frame data, but only if the UDPHS\_DMACONTROLx register END\_B\_EN and UDPHS\_EPTCTLx register AUTO\_VALID bits are also set.

For additional information, see "UDPHS Endpoint Status Register (Control, Bulk, Interrupt Endpoints)".

#### • FRCESTALL: Stall Handshake Request Set

0: No effect.

1: Set this bit to request a STALL answer to the host for the next handshake

Refer to chapters 8.4.5 (Handshake Packets) and 9.4.5 (Get Status) of the *Universal Serial Bus Specification*, *Rev 2.0* for more information on the STALL handshake.

# • RXRDY\_TXKL: KILL Bank Set (for IN Endpoint)

0: No effect.

1: Kill the last written bank.

# • TXRDY: TX Packet Ready Set

0: No effect.

- 1: Set this bit after a packet has been written into the endpoint FIFO for IN data transfers
  - This flag is used to generate a Data IN transaction (device to host).
  - Device firmware checks that it can write a data payload in the FIFO, checking that TXRDY is cleared.
  - Transfer to the FIFO is done by writing in the "Buffer Address" register.
  - Once the data payload has been transferred to the FIFO, the firmware notifies the UDPHS device setting TXRDY to one.
  - UDPHS bus transactions can start.
  - TXCOMP is set once the data payload has been received by the host.
  - Data should be written into the endpoint FIFO only after this bit has been cleared.
  - Set this bit without writing data to the endpoint FIFO to send a Zero Length Packet.

### RXRDY\_TXKL: KILL Bank Set (for IN Endpoint)

0: No effect.

1: Kill the last written bank.

## TXRDY\_TRER: TX Packet Ready Set

0: No effect.

1: Set this bit after a packet has been written into the endpoint FIFO for IN data transfers

- This flag is used to generate a Data IN transaction (device to host).
- Device firmware checks that it can write a data payload in the FIFO, checking that TXRDY\_TRER is cleared.
- Transfer to the FIFO is done by writing in the "Buffer Address" register.
- Once the data payload has been transferred to the FIFO, the firmware notifies the UDPHS device setting TXRDY\_TRER to one.
- UDPHS bus transactions can start.
- TXCOMP is set once the data payload has been sent.
- Data should be written into the endpoint FIFO only after this bit has been cleared.
- Set this bit without writing data to the endpoint FIFO to send a Zero Length Packet.

For additional information, see "UDPHS Endpoint Status Register (Control, Bulk, Interrupt Endpoints)".

### • FRCESTALL: Stall Handshake Request Clear

0: No effect.

1: Clear the STALL request. The next packets from host will not be STALLed.

## • TOGGLESQ: Data Toggle Clear

0: No effect.

1: Clear the PID data of the current bank

For OUT endpoints, the next received packet should be a DATA0.

For IN endpoints, the next packet will be sent with a DATA0 PID.

### RXRDY\_TXKL: Received OUT Data Clear

0: No effect.

1: Clear the RXRDY\_TXKL flag of UDPHS\_EPTSTAx.

# • TX\_COMPLT: Transmitted IN Data Complete Clear

0: No effect.

1: Clear the TX\_COMPLT flag of UDPHS\_EPTSTAx.

## • RX\_SETUP: Received SETUP Clear

0: No effect.

1: Clear the RX\_SETUP flags of UDPHS\_EPTSTAx.

#### STALL SNT: Stall Sent Clear

0: No effect.

1: Clear the STALL\_SNT flags of UDPHS\_EPTSTAx.

- NAK\_IN: NAKIN Clear
- 0: No effect.
- 1: Clear the NAK\_IN flags of UDPHS\_EPTSTAx.
- NAK\_OUT: NAKOUT Clear
- 0: No effect.
- 1: Clear the NAK\_OUT flag of UDPHS\_EPTSTAx.

| TOGGLES   | SQ_STA | FRCESTALL | _        | _          | _         | _          | _         |

This register view is relevant only if EPT\_TYPE = 0x0, 0x2 or 0x3 in "UDPHS Endpoint Configuration Register".

#### • FRCESTALL: Stall Handshake Request (cleared upon USB reset)

0: No effect.

1: If set a STALL answer will be done to the host for the next handshake.

This bit is reset by hardware upon received SETUP.

## TOGGLESQ\_STA: Toggle Sequencing (cleared upon USB reset)

Toggle Sequencing:

- IN endpoint: It indicates the PID Data Toggle that will be used for the next packet sent. This is not relative to the current bank.
- CONTROL and OUT endpoint:

These bits are set by hardware to indicate the PID data of the current bank:

| Value | Name  | Description                                      |
|-------|-------|--|
| 0     | DATA0 | DATA0  |
| 1     | DATA1 | DATA1  |
| 2     | DATA2 | Reserved for High Bandwidth Isochronous Endpoint |
| 3     | MDATA | Reserved for High Bandwidth Isochronous Endpoint |

Notes: 1. In OUT transfer, the Toggle information is meaningful only when the current bank is busy (Received OUT Data = 1).

- 2. These bits are updated for OUT transfer:
  - A new data has been written into the current bank.
  - The user has just cleared the Received OUT Data bit to switch to the next bank.
- 3. This field is reset to DATA1 by the UDPHS\_EPTCLRSTAx register TOGGLESQ bit, and by UDPHS\_EPTCTLDISx (disable endpoint).

## • ERR\_OVFLW: Overflow Error (cleared upon USB reset)

This bit is set by hardware when a new too-long packet is received.

Example: If the user programs an endpoint 64 bytes wide and the host sends 128 bytes in an OUT transfer, then the Over-flow Error bit is set.

This bit is updated at the same time as the BYTE COUNT field.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

#### • RXRDY TXKL: Received OUT Data/KILL Bank (cleared upon USB reset)

- Received OUT Data (for OUT endpoint or Control endpoint):

This bit is set by hardware after a new packet has been stored in the endpoint FIFO.

This bit is cleared by the device firmware after reading the OUT data from the endpoint.

For multi-bank endpoints, this bit may remain active even when cleared by the device firmware, this if an other packet has been received meanwhile.

Hardware assertion of this bit may generate an interrupt if enabled by the UDPHS\_EPTCTLx register RXRDY\_TXKL bit.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

- KILL Bank (for IN endpoint):
- The bank is really cleared or the bank is sent, BUSY\_BANK\_STA is decremented.
- The bank is not cleared but sent on the IN transfer, TX\_COMPLT
- The bank is not cleared because it was empty. The user should wait that this bit is cleared before trying to clear another packet.

Note: "Kill a packet" may be refused if at the same time, an IN token is coming and the current packet is sent on the UDPHS line. In this case, the TX\_COMPLT bit is set. Take notice however, that if at least two banks are ready to be sent, there is no problem to kill a packet even if an IN token is coming. In fact, in that case, the current bank is sent (IN transfer) and the last bank is killed.

#### • TX COMPLT: Transmitted IN Data Complete (cleared upon USB reset)

This bit is set by hardware after an IN packet has been accepted (ACK'ed) by the host.

This bit is reset by UDPHS EPTRST register EPT x (reset endpoint), and by UDPHS EPTCTLDISx (disable endpoint).

# • TXRDY: TX Packet Ready (cleared upon USB reset)

This bit is cleared by hardware after the host has acknowledged the packet.

For Multi-bank endpoints, this bit may remain clear even after software is set if another bank is available to transmit.

Hardware clear of this bit may generate an interrupt if enabled by the UDPHS\_EPTCTLx register TXRDY bit.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

#### • RX SETUP: Received SETUP (cleared upon USB reset)

(for Control endpoint only)

This bit is set by hardware when a valid SETUP packet has been received from the host.

It is cleared by the device firmware after reading the SETUP data from the endpoint FIFO.

## • STALL\_SNT: Stall Sent (cleared upon USB reset)

- (for Control, Bulk and Interrupt endpoints)

This bit is set by hardware after a STALL handshake has been sent as requested by the UDPHS\_EPTSTAx register FRCESTALL bit.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

## NAK\_IN: NAK IN (cleared upon USB reset)

This bit is set by hardware when a NAK handshake has been sent in response to an IN request from the Host.

This bit is cleared by software.

### NAK\_OUT: NAK OUT (cleared upon USB reset)

This bit is set by hardware when a NAK handshake has been sent in response to an OUT or PING request from the Host. This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by EPT\_CTL\_DISx (disable endpoint).

# • CURBK\_CTLDIR: Current Bank/Control Direction (cleared upon USB reset)

- Current Bank (not relevant for Control endpoint):

These bits are set by hardware to indicate the number of the current bank.

| Value | Name  | Description             |
|-------|-------|-------------------------|
| 0     | BANK0 | Bank 0 (or single bank) |
| 1     | BANK1 | Bank 1                  |
| 2     | BANK2 | Bank 2                  |

Note: The current bank is updated each time the user:

- Sets the TX Packet Ready bit to prepare the next IN transfer and to switch to the next bank.
- Clears the received OUT data bit to access the next bank.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

- Control Direction (for Control endpoint only):
- 0: A Control Write is requested by the Host.
- 1: A Control Read is requested by the Host.

Notes: 1. This bit corresponds with the 7th bit of the bmRequestType (Byte 0 of the Setup Data).

2. This bit is updated after receiving new setup data.

## • BUSY\_BANK\_STA: Busy Bank Number (cleared upon USB reset)

These bits are set by hardware to indicate the number of busy banks.

**IN endpoint**: It indicates the number of busy banks filled by the user, ready for IN transfer.

**OUT endpoint**: It indicates the number of busy banks filled by OUT transaction from the Host.

| Value | Name       | Description        |
|-------|------------|--------------------|
| 0     | 0BUSYBANK  | All banks are free |
| 1     | 1BUSYBANK  | 1 busy bank        |
| 2     | 2BUSYBANKS | 2 busy banks       |
| 3     | 3BUSYBANKS | 3 busy banks       |

# • BYTE\_COUNT: UDPHS Byte Count (cleared upon USB reset)

Byte count of a received data packet.

This field is incremented after each write into the endpoint (to prepare an IN transfer).

This field is decremented after each reading into the endpoint (OUT transfer).

This field is also updated at RXRDY\_TXKL flag clear with the next bank.

This field is also updated at TXRDY flag set with the next bank.

This field is reset by EPT\_x of UDPHS\_EPTRST register.

# • SHRT\_PCKT: Short Packet (cleared upon USB reset)

An OUT Short Packet is detected when the receive byte count is less than the configured UDPHS\_EPTCFGx register EPT\_Size.

This bit is updated at the same time as the BYTE\_COUNT field.

# 31.7.20 UDPHS Endpoint Status Register (Isochronous Endpoint)

| 7         | 6         | 5           | 4          | 3          | 2         | 1          | 0         |
| TOGGLE    | SQ_STA    | _           | _          | _          | _         | _          | _         |

This register view is relevant only if EPT\_TYPE = 0x1 in "UDPHS Endpoint Configuration Register".

#### • TOGGLESQ STA: Toggle Sequencing (cleared upon USB reset)

Toggle Sequencing:

- IN endpoint: It indicates the PID Data Toggle that will be used for the next packet sent. This is not relative to the current bank.
- OUT endpoint:

These bits are set by hardware to indicate the PID data of the current bank:

| Value | Name  | Description  |
|-------|-------|--|
| 0     | DATA0 | DATA0  |
| 1     | DATA1 | DATA1  |
| 2     | DATA2 | Data2 (only for High Bandwidth Isochronous Endpoint) |
| 3     | MDATA | MData (only for High Bandwidth Isochronous Endpoint) |

Notes: 1. In OUT transfer, the Toggle information is meaningful only when the current bank is busy (Received OUT Data = 1).

- 2. These bits are updated for OUT transfer:
  - A new data has been written into the current bank.
  - The user has just cleared the Received OUT Data bit to switch to the next bank.
- 3. For High Bandwidth Isochronous Out endpoint, it is recommended to check the UDPHS\_EPTSTAx/TXRDY\_TRER bit to know if the toggle sequencing is correct or not.
- 4. This field is reset to DATA1 by the UDPHS\_EPTCLRSTAx register TOGGLESQ bit, and by UDPHS\_EPTCTLDISx (disable endpoint).

## ERR\_OVFLW: Overflow Error (cleared upon USB reset)

This bit is set by hardware when a new too-long packet is received.

Example: If the user programs an endpoint 64 bytes wide and the host sends 128 bytes in an OUT transfer, then the Over-flow Error bit is set.

This bit is updated at the same time as the BYTE COUNT field.

#### • RXRDY TXKL: Received OUT Data/KILL Bank (cleared upon USB reset)

- Received OUT Data (for OUT endpoint or Control endpoint):

This bit is set by hardware after a new packet has been stored in the endpoint FIFO.

This bit is cleared by the device firmware after reading the OUT data from the endpoint.

For multi-bank endpoints, this bit may remain active even when cleared by the device firmware, this if an other packet has been received meanwhile.

Hardware assertion of this bit may generate an interrupt if enabled by the UDPHS EPTCTLx register RXRDY TXKL bit.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

- KILL Bank (for IN endpoint):
- The bank is really cleared or the bank is sent, BUSY\_BANK\_STA is decremented.
- The bank is not cleared but sent on the IN transfer, TX\_COMPLT
- The bank is not cleared because it was empty. The user should wait that this bit is cleared before trying to clear another packet.

Note: "Kill a packet" may be refused if at the same time, an IN token is coming and the current packet is sent on the UDPHS line. In this case, the TX\_COMPLT bit is set. Take notice however, that if at least two banks are ready to be sent, there is no problem to kill a packet even if an IN token is coming. In fact, in that case, the current bank is sent (IN transfer) and the last bank is killed.

## TX\_COMPLT: Transmitted IN Data Complete (cleared upon USB reset)

This bit is set by hardware after an IN packet has been sent.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

#### TXRDY TRER: TX Packet Ready/Transaction Error (cleared upon USB reset)

- TX Packet Ready:

This bit is cleared by hardware, as soon as the packet has been sent.

For Multi-bank endpoints, this bit may remain clear even after software is set if another bank is available to transmit.

Hardware clear of this bit may generate an interrupt if enabled by the UDPHS\_EPTCTLx register TXRDY\_TRER bit.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

- Transaction Error (for high bandwidth isochronous OUT endpoints) (Read-Only):

This bit is set by hardware when a transaction error occurs inside one microframe.

If one toggle sequencing problem occurs among the n-transactions (n = 1, 2 or 3) inside a microframe, then this bit is still set as long as the current bank contains one "bad" n-transaction (see "CURBK: Current Bank (cleared upon USB reset)"). As soon as the current bank is relative to a new "good" n-transactions, then this bit is reset.

Notes: 1. A transaction error occurs when the toggle sequencing does not comply with the *Universal Serial Bus Specification, Rev 2.0* (5.9.2 High Bandwidth Isochronous endpoints) (Bad PID, missing data....)

2. When a transaction error occurs, the user may empty all the "bad" transactions by clearing the Received OUT Data flag (RXRDY\_TXKL).

If this bit is reset, then the user should consider that a new n-transaction is coming.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

#### ERR FL ISO: Error Flow (cleared upon USB reset)

This bit is set by hardware when a transaction error occurs.

- Isochronous IN transaction is missed, the micro has no time to fill the endpoint (underflow).
- Isochronous OUT data is dropped because the bank is busy (overflow).

# • ERR\_CRC\_NTR: CRC ISO Error/Number of Transaction Error (cleared upon USB reset)

- CRC ISO Error (for Isochronous OUT endpoints) (Read-only):

This bit is set by hardware if the last received data is corrupted (CRC error on data).

This bit is updated by hardware when new data is received (Received OUT Data bit).

- Number of Transaction Error (for High Bandwidth Isochronous IN endpoints):

This bit is set at the end of a microframe in which at least one data bank has been transmitted, if less than the number of transactions per micro-frame banks (UDPHS\_EPTCFGx register NB\_TRANS) have been validated for transmission inside this microframe.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

#### • ERR FLUSH: Bank Flush Error (cleared upon USB reset)

- (for High Bandwidth Isochronous IN endpoints)

This bit is set when flushing unsent banks at the end of a microframe.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by EPT\_CTL\_DISx (disable endpoint).

# • CURBK: Current Bank (cleared upon USB reset)

- Current Bank:

These bits are set by hardware to indicate the number of the current bank.

| Value | Name  | Description             |
|-------|-------|-------------------------|
| 0     | BANK0 | Bank 0 (or single bank) |
| 1     | BANK1 | Bank 1                  |
| 2     | BANK2 | Bank 2                  |

Note: The current bank is updated each time the user:

- Sets the TX Packet Ready bit to prepare the next IN transfer and to switch to the next bank.
- Clears the received OUT data bit to access the next bank.

This bit is reset by UDPHS EPTRST register EPT x (reset endpoint) and by UDPHS EPTCTLDISx (disable endpoint).

## • BUSY\_BANK\_STA: Busy Bank Number (cleared upon USB reset)

These bits are set by hardware to indicate the number of busy banks.

- IN endpoint: It indicates the number of busy banks filled by the user, ready for IN transfer.
- OUT endpoint: It indicates the number of busy banks filled by OUT transaction from the Host.

| Value | Name       | Description        |
|-------|------------|--------------------|
| 0     | 0BUSYBANK  | All banks are free |
| 1     | 1BUSYBANK  | 1 busy bank        |
| 2     | 2BUSYBANKS | 2 busy banks       |
| 3     | 3BUSYBANKS | 3 busy banks       |

# • BYTE\_COUNT: UDPHS Byte Count (cleared upon USB reset)

Byte count of a received data packet.

This field is incremented after each write into the endpoint (to prepare an IN transfer).

This field is decremented after each reading into the endpoint (OUT transfer).

This field is also updated at RXRDY\_TXKL flag clear with the next bank.

This field is also updated at TXRDY\_TRER flag set with the next bank.

This field is reset by EPT\_x of UDPHS\_EPTRST register.

# • SHRT\_PCKT: Short Packet (cleared upon USB reset)

An OUT Short Packet is detected when the receive byte count is less than the configured UDPHS\_EPTCFGx register EPT\_Size.

This bit is updated at the same time as the BYTE\_COUNT field.

## 31.7.21 UDPHS DMA Channel Transfer Descriptor

The DMA channel transfer descriptor is loaded from the memory.

Be careful with the alignment of this buffer.

The structure of the DMA channel transfer descriptor is defined by three parameters as described below:

Offset 0:

The address must be aligned: 0xXXXX0

Next Descriptor Address Register: UDPHS\_DMANXTDSCx

Offset 4:

The address must be aligned: 0xXXXX4

DMA Channelx Address Register: UDPHS\_DMAADDRESSx

Offset 8:

The address must be aligned: 0xXXXX8

DMA Channelx Control Register: UDPHS\_DMACONTROLx

To use the DMA channel transfer descriptor, fill the structures with the correct value (as described in the following pages).

Then write directly in UDPHS\_DMANXTDSCx the address of the descriptor to be used first.

Then write 1 in the LDNXT\_DSC bit of UDPHS\_DMACONTROLx (load next channel transfer descriptor). The descriptor is automatically loaded upon Endpointx request for packet transfer.

# 31.7.22 UDPHS DMA Next Descriptor Address Register

Name: UDPHS\_DMANXTDSCx [x = 0..5]

**Address:** 0xF803C300 [0], 0xF803C310 [1], 0xF803C320 [2], 0xF803C330 [3], 0xF803C340 [4], 0xF803C350 [5]

Access: Read/Write

| 31 | 30          | 29 | 28     | 27     | 26 | 25 | 24 |  |
|----|-------------|----|--------|--------|----|----|----|--|
|    |             |    | NXT_DS | SC_ADD |    |    |    |  |
| 23 | 22          | 21 | 20     | 19     | 18 | 17 | 16 |  |
|    | NXT_DSC_ADD |    |        |        |    |    |    |  |
| 15 | 14          | 13 | 12     | 11     | 10 | 9  | 8  |  |
|    | NXT_DSC_ADD |    |        |        |    |    |    |  |
| 7  | 6           | 5  | 4      | 3      | 2  | 1  | 0  |  |
|    | NXT_DSC_ADD |    |        |        |    |    |    |  |

Note: Channel 0 is not used.

# NXT\_DSC\_ADD: Next Descriptor Address

This field points to the next channel descriptor to be processed. This channel descriptor must be aligned, so bits 0 to 3 of the address must be equal to zero.

## 31.7.23 UDPHS DMA Channel Address Register

Name: UDPHS\_DMAADDRESSx [x = 0..5]

**Address:** 0xF803C304 [0], 0xF803C314 [1], 0xF803C324 [2], 0xF803C334 [3], 0xF803C344 [4], 0xF803C354 [5]

Access: Read/Write

| 31 | 30       | 29 | 28   | 27   | 26 | 25 | 24 |
|----|----------|----|------|------|----|----|----|
|    |          |    | BUFF | _ADD |    |    |    |
| 23 | 22       | 21 | 20   | 19   | 18 | 17 | 16 |
|    | BUFF_ADD |    |      |      |    |    |    |

|    | BUFF_ADD |    |      |      |    |    |    |
| 7  | 6        | 5  | 4    | 3    | 2  | 1  | 0  |
|    |          |    | BUFF | _ADD |    |    |    |

Note: Channel 0 is not used.

#### • BUFF ADD: Buffer Address

This field determines the AHB bus starting address of a DMA channel transfer.

Channel start and end addresses may be aligned on any byte boundary.

The firmware may write this field only when the UDPHS\_DMASTATUS register CHANN\_ENB bit is clear.

This field is updated at the end of the address phase of the current access to the AHB bus. It is incrementing of the access byte width. The access width is 4 bytes (or less) at packet start or end, if the start or end address is not aligned on a word boundary.

The packet start address is either the channel start address or the next channel address to be accessed in the channel buffer.

The packet end address is either the channel end address or the latest channel address accessed in the channel buffer.

The channel start address is written by software or loaded from the descriptor, whereas the channel end address is either determined by the end of buffer or the UDPHS device, USB end of transfer if the UDPHS\_DMACONTROLx register END\_TR\_EN bit is set.

## 31.7.24 UDPHS DMA Channel Control Register

Name: UDPHS\_DMACONTROLx [x = 0..5]

**Address:** 0xF803C308 [0], 0xF803C318 [1], 0xF803C328 [2], 0xF803C338 [3], 0xF803C348 [4], 0xF803C358 [5]

Access: Read/Write

| 7100000.  | toda, wiito |            |           |          |           |           |           |

| _         | _           | _          | _         | _        | _         | _         | _         |
| 7         | 6           | 5          | 4         | 3        | 2         | 1         | 0         |
| BURST_LCK | DESC_LD_IT  | END_BUFFIT | END_TR_IT | END_B_EN | END_TR_EN | LDNXT_DSC | CHANN_ENB |

Note: Channel 0 is not used.

### • CHANN ENB: (Channel Enable Command)

0: DMA channel is disabled at and no transfer will occur upon request. This bit is also cleared by hardware when the channel source bus is disabled at end of buffer.

If the UDPHS\_DMACONTROL register LDNXT\_DSC bit has been cleared by descriptor loading, the firmware will have to set the corresponding CHANN\_ENB bit to start the described transfer, if needed.

If the UDPHS\_DMACONTROL register LDNXT\_DSC bit is cleared, the channel is frozen and the channel registers may then be read and/or written reliably as soon as both UDPHS\_DMASTATUS register CHANN\_ENB and CHANN\_ACT flags read as 0.

If a channel request is currently serviced when this bit is cleared, the DMA FIFO buffer is drained until it is empty, then the UDPHS DMASTATUS register CHANN ENB bit is cleared.

If the LDNXT\_DSC bit is set at or after this bit clearing, then the currently loaded descriptor is skipped (no data transfer occurs) and the next descriptor is immediately loaded.

1: UDPHS\_DMASTATUS register CHANN\_ENB bit will be set, thus enabling DMA channel data transfer. Then any pending request will start the transfer. This may be used to start or resume any requested transfer.

#### LDNXT\_DSC: Load Next Channel Transfer Descriptor Enable (Command)

0: No channel register is loaded after the end of the channel transfer.

1: The channel controller loads the next descriptor after the end of the current transfer, i.e., when the UDPHS\_DMASTATUS/CHANN\_ENB bit is reset.

If the UDPHS\_DMA CONTROL/CHANN\_ENB bit is cleared, the next descriptor is immediately loaded upon transfer request.

**DMA Channel Control Command Summary** 

| LDNXT_DSC | CHANN_ENB | Description                   |
|-----------|-----------|-------------------------------|
| 0         | 0         | Stop now                      |
| 0         | 1         | Run and stop at end of buffer |
| 1         | 0         | Load next descriptor now      |
| 1         | 1         | Run and link at end of buffer |

# • END\_TR\_EN: End of Transfer Enable (Control)

Used for OUT transfers only.

0: USB end of transfer is ignored.

1: UDPHS device can put an end to the current buffer transfer.

When set, a BULK or INTERRUPT short packet or the last packet of an ISOCHRONOUS (micro) frame (DATAX) will close the current buffer and the UDPHS\_DMASTATUSx register END\_TR\_ST flag will be raised.

This is intended for UDPHS non-prenegotiated end of transfer (BULK or INTERRUPT) or ISOCHRONOUS microframe data buffer closure.

#### • END B EN: End of Buffer Enable (Control)

0: DMA Buffer End has no impact on USB packet transfer.

1: Endpoint can validate the packet (according to the values programmed in the UDPHS\_EPTCTLx register AUTO\_VALID and SHRT\_PCKT fields) at DMA Buffer End, i.e., when the UDPHS\_DMASTATUS register BUFF\_COUNT reaches 0.

This is mainly for short packet IN validation initiated by the DMA reaching end of buffer, but could be used for OUT packet truncation (discarding of unwanted packet data) at the end of DMA buffer.

#### END\_TR\_IT: End of Transfer Interrupt Enable

0: UDPHS device initiated buffer transfer completion will not trigger any interrupt at UDPHS\_STATUSx/END\_TR\_ST rising.

1: An interrupt is sent after the buffer transfer is complete, if the UDPHS device has ended the buffer transfer.

Use when the receive size is unknown.

### • END\_BUFFIT: End of Buffer Interrupt Enable

0: UDPHS\_DMA\_STATUSx/END\_BF\_ST rising will not trigger any interrupt.

1: An interrupt is generated when the UDPHS\_DMASTATUSx register BUFF\_COUNT reaches zero.

## • DESC\_LD\_IT: Descriptor Loaded Interrupt Enable

0: UDPHS\_DMASTATUSx/DESC\_LDST rising will not trigger any interrupt.

1: An interrupt is generated when a descriptor has been loaded from the bus.

## BURST\_LCK: Burst Lock Enable

0: The DMA never locks bus access.

1: USB packets AHB data bursts are locked for maximum optimization of the bus bandwidth usage and maximization of flyby AHB burst duration.

## BUFF\_LENGTH: Buffer Byte Length (Write-only)

This field determines the number of bytes to be transferred until end of buffer. The maximum channel transfer size (64 KBytes) is reached when this field is 0 (default value). If the transfer size is unknown, this field should be set to 0, but the transfer end may occur earlier under UDPHS device control.

When this field is written, The UDPHS\_DMASTATUSx register BUFF\_COUNT field is updated with the write value.

Notes: 1. Bits [31:2] are only writable when issuing a channel Control Command other than "Stop Now".

2. For reliability it is highly recommended to wait for both UDPHS\_DMASTATUSx register CHAN\_ACT and CHAN\_ENB flags are at 0, thus ensuring the channel has been stopped before issuing a command other than "Stop Now".

# 31.7.25 UDPHS DMA Channel Status Register

Name: UDPHS\_DMASTATUSx [x = 0..5]

**Address:** 0xF803C30C [0], 0xF803C31C [1], 0xF803C32C [2], 0xF803C33C [3], 0xF803C34C [4], 0xF803C35C [5]

Access: Read/Write

Note: Channel 0 is not used.

#### • CHANN ENB: Channel Enable Status

0: The DMA channel no longer transfers data, and may load the next descriptor if the UDPHS\_DMACONTROLx register LDNXT\_DSC bit is set.

When any transfer is ended either due to an elapsed byte count or a UDPHS device initiated transfer end, this bit is automatically reset.

1: The DMA channel is currently enabled and transfers data upon request.

This bit is normally set or cleared by writing into the UDPHS\_DMACONTROLx register CHANN\_ENB bit either by software or descriptor loading.

If a channel request is currently serviced when the UDPHS\_DMACONTROLx register CHANN\_ENB bit is cleared, the DMA FIFO buffer is drained until it is empty, then this status bit is cleared.

#### CHANN ACT: Channel Active Status

0: The DMA channel is no longer trying to source the packet data.

When a packet transfer is ended this bit is automatically reset.

1: The DMA channel is currently trying to source packet data, i.e., selected as the highest-priority requesting channel.

When a packet transfer cannot be completed due to an END\_BF\_ST, this flag stays set during the next channel descriptor load (if any) and potentially until UDPHS packet transfer completion, if allowed by the new descriptor.

#### END TR ST: End of Channel Transfer Status

0: Cleared automatically when read by software.

1: Set by hardware when the last packet transfer is complete, if the UDPHS device has ended the transfer.

Valid until the CHANN ENB flag is cleared at the end of the next buffer transfer.

## • END\_BF\_ST: End of Channel Buffer Status

0: Cleared automatically when read by software.

1: Set by hardware when the BUFF COUNT downcount reach zero.

Valid until the CHANN\_ENB flag is cleared at the end of the next buffer transfer.

## • DESC\_LDST: Descriptor Loaded Status

0: Cleared automatically when read by software.

1: Set by hardware when a descriptor has been loaded from the system bus.

Valid until the CHANN\_ENB flag is cleared at the end of the next buffer transfer.

# • BUFF\_COUNT: Buffer Byte Count

This field determines the current number of bytes still to be transferred for this buffer.

This field is decremented from the AHB source bus access byte width at the end of this bus address phase.

The access byte width is 4 by default, or less, at DMA start or end, if the start or end address is not aligned on a word boundary.

At the end of buffer, the DMA accesses the UDPHS device only for the number of bytes needed to complete it.

This field value is reliable (stable) only if the channel has been stopped or frozen (UDPHS\_EPTCTLx register NT\_DIS\_DMA bit is used to disable the channel request) and the channel is no longer active CHANN\_ACT flag is 0.

Note: For OUT endpoints, if the receive buffer byte length (BUFF\_LENGTH) has been defaulted to zero because the USB transfer length is unknown, the actual buffer byte length received will be 0x10000-BUFF\_COUNT.

# 32. USB Host High Speed Port (UHPHS)

# 32.1 Description

The USB Host High Speed Port (UHPHS) interfaces the USB with the host application. It handles Open HCI protocol (Open Host Controller Interface) as well as Enhanced HCI protocol (Enhanced Host Controller Interface).

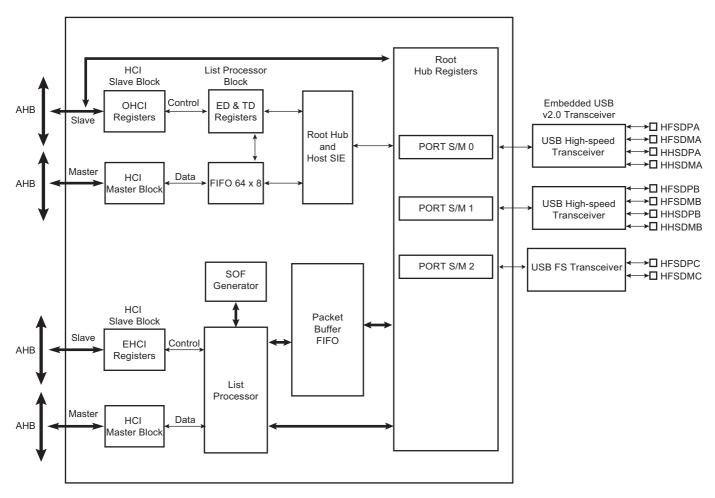

## 32.2 Embedded Characteristics

- Compliant with Enhanced HCI Rev 1.0 Specification
  - Compliant with USB V2.0 High-speed
  - Supports High-speed 480 Mbps
- Compliant with OpenHCI Rev 1.0 Specification
  - Compliant with USB V2.0 Full-speed and Low-speed Specification
  - Supports both Low-speed 1.5 Mbps and Full-speed 12 Mbps USB devices
- Root Hub Integrated with 2 Downstream USB HS Ports and 1 FS Port
- Embedded USB Transceivers
- Supports Power Management
- 2 Hosts (A and B) High Speed (EHCI), Port A shared with UDPHS
- 1 Host (C) Full Speed only (OHCI)

# 32.3 Block Diagram

Figure 32-1. Block Diagram

Access to the USB host operational registers is achieved through the AHB bus slave interface. The Open HCI host controller and Enhanced HCI host controller initialize master DMA transfers through the AHB bus master interface as follows:

- Fetches endpoint descriptors and transfer descriptors
- Access to endpoint data from system memory
- Access to the HC communication area
- Write status and retire transfer descriptor

Memory access errors (abort, misalignment) lead to an "Unrecoverable Error" indicated by the corresponding flag in the host controller operational registers.

The USB root hub is integrated in the USB host. Several USB downstream ports are available. The number of downstream ports can be determined by the software driver reading the root hub's operational registers. Device connection is automatically detected by the USB host port logic.

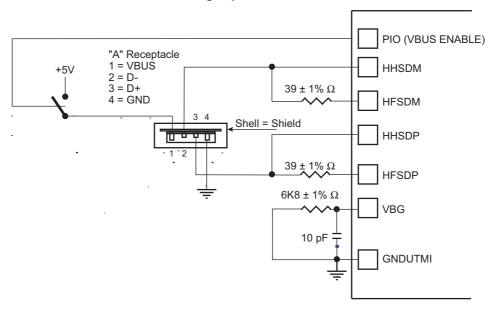

USB physical transceivers are integrated in the product and driven by the root hub's ports.

Over current protection on ports can be activated by the USB host controller. Atmel's standard product does not dedicate pads to external over current protection.

# 32.4 Typical Connection

Figure 32-2. Board Schematic to Interface UHP High-speed Host Controller

Note: 10 pF capacitor on VBG is a provision and may not be populated.

# 32.5 Product Dependencies

#### 32.5.1 I/O Lines

HFSDPs, HFSDMs, HHSDPs and HHSDMs are not controlled by any PIO controllers. The embedded USB High Speed physical transceivers are controlled by the USB host controller.

One transceiver is shared with the USB High Speed Device (port A). The selection between Host Port A and USB Device is controlled by the UDPHS enable bit (EN\_UDPHS) located in the UDPHS\_CTRL register.

In the case the port A is driven by the USB High Speed Device, the output signals are DFSDP, DFSDM, DHSDP and DHSDM. The transceiver is automatically selected for Device operation once the USB High Speed Device is enabled.

In the case the port A is driven by the USB High Speed Host, the output signals are HFSDPA, HFSDMA, HHSDPA and HHSDMA.

#### 32.5.2 Power Management

The system embeds 2 transceivers.

The USB Host High Speed requires a 480 MHz clock for the embedded High-speed transceivers. This clock (UPLLCK) is provided by the UTMI PLL.

In case power consumption is saved by stopping the UTMI PLL, high-speed operations are not possible. Nevertheless, OHCI Full-speed operations remain possible by selecting PLLACK as the input clock of OHCI.

The High-speed transceiver returns a 30 MHz clock to the USB Host controller.

The USB Host controller requires 48 MHz and 12 MHz clocks for OHCI full-speed operations. These clocks must be generated by a PLL with a correct accuracy of ± 0.25% thanks to USBDIV field.

Thus the USB Host peripheral receives three clocks from the Power Management Controller (PMC): the Peripheral Clock (MCK domain), the UHP48M and the UHP12M (built-in UHP48M divided by four) used by the OHCI to interface with the bus USB signals (recovered 12 MHz domain) in Full-speed operations.

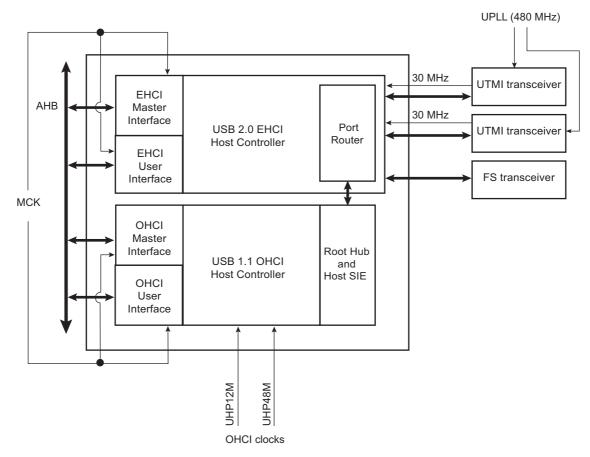

For High-speed operations, perform the following:

- Enable UHP peripheral clock, bit (1 << AT91C\_ID\_UHPHS) in PMC\_PCER.</li>
- Write UPLLCOUNT field in CKGR\_UCKR.
- Enable UPLL, bit AT91C\_CKGR\_UPLLEN in CKGR\_UCKR.
- Wait until UTMI PLL is locked. LOCKU bit set in PMC\_SR.
- Enable BIAS, bit AT91C\_CKGR\_BIASEN in CKGR\_UCKR.
- Select UPLLCK as Input clock of OHCI part (set USBS bit in PMC\_USB register).
- Program the OHCI clocks (UHP48M and UHP12M) with USBDIV field in PMC\_USB register. USBDIV must be 9 (division by 10) if UPLLCK is selected.
- Enable OHCI clocks (set UHP bit in PMC\_SCER).

For OHCI Full-speed operations only, perform the following:

- Enable UHP peripheral clock, bit (1 << AT91C\_ID\_UHPHS) in PMC\_PCER.</li>
- Select PLLACK as Input clock of OHCI part (clear USBS bit in PMC\_USB register).
- Program the OHCI clocks (UHP48M and UHP12M) with USBDIV field in PMC\_USB register. USBDIV value
  is to calculated regarding the PLLACK value and USB Full-speed accuracy.
- Enable the OHCI clocks (set UHP bit in PMC\_SCER).

Figure 32-3. UHP Clock Trees

#### 32.5.3 Interrupt Sources

The USB host interface has an interrupt line connected to the interrupt controller.

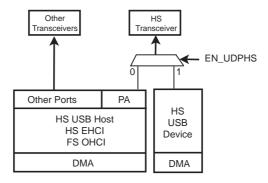

Handling USB host interrupts requires programming the interrupt controller before configuring the UHPHS.

# 32.6 Functional Description

#### 32.6.1 UTMI Transceivers Sharing

The High Speed USB Host Port A is shared with the High Speed USB Device port and connected to the second UTMI transceiver. The selection between Host Port A and USB device is controlled by the UDPHS enable bit (EN\_UDPHS) located in the UDPHS\_CTRL register.

Figure 32-4. USB Selection

#### 32.6.2 EHCI

The USB Host Port controller is fully compliant with the Enhanced HCI specification. The USB Host Port User Interface (registers description) can be found in the Enhanced HCI Rev 1.0 Specification available on <a href="https://www.usb.org">www.usb.org</a>. The standard EHCI USB stack driver can be easily ported to Atmel's architecture in the same way all existing class drivers run, without hardware specialization.

#### 32.6.3 OHCI

The USB Host Port integrates a root hub and transceivers on downstream ports. It provides several Full-speed half-duplex serial communication ports at a baud rate of 12 Mbit/s. Up to 127 USB devices (printer, camera, mouse, keyboard, disk, etc.) and the USB hub can be connected to the USB host in the USB "tiered star" topology.

The USB Host Port controller is fully compliant with the Open HCI specification. The USB Host Port User Interface (registers description) can be found in the Open HCI Rev 1.0 Specification available on <a href="https://www.usb.org">www.usb.org</a>. The standard OHCI USB stack driver can be easily ported to Atmel's architecture, in the same way all existing class drivers run without hardware specialization.

This means that all standard class devices are automatically detected and available to the user's application. As an example, integrating an HID (Human Interface Device) class driver provides a plug & play feature for all USB keyboards and mouses.

# 33. High Speed Multimedia Card Interface (HSMCI)

# 33.1 Description

The High Speed Multimedia Card Interface (HSMCI) supports the MultiMedia Card (MMC) Specification V4.3, the SD Memory Card Specification V2.0, the SDIO V2.0 specification and CE-ATA V1.1.

The HSMCI includes a command register, response registers, data registers, timeout counters and error detection logic that automatically handle the transmission of commands and, when required, the reception of the associated responses and data with a limited processor overhead.

The HSMCI supports stream, block and multi block data read and write, and is compatible with the DMA Controller (DMAC), minimizing processor intervention for large buffer transfers.

The HSMCI operates at a rate of up to Master Clock divided by 2 and supports the interfacing of 1 slot(s). Each slot may be used to interface with a High Speed MultiMedia Card bus (up to 30 Cards) or with an SD Memory Card. A bit field in the SD Card Register performs this selection.

The SD Memory Card communication is based on a 9-pin interface (clock, command, four data and three power lines) and the High Speed MultiMedia Card on a 7-pin interface (clock, command, one data, three power lines and one reserved for future use).

The SD Memory Card interface also supports High Speed MultiMedia Card operations. The main differences between SD and High Speed MultiMedia Cards are the initialization process and the bus topology.

HSMCI fully supports CE-ATA Revision 1.1, built on the MMC System Specification v4.0. The module includes dedicated hardware to issue the command completion signal and capture the host command completion signal disable.

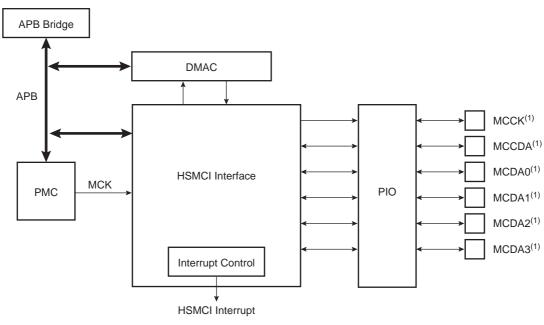

## 33.2 Embedded Characteristics

- Compatible with MultiMedia Card Specification Version 4.3
- Compatible with SD Memory Card Specification Version 2.0
- Compatible with SDIO Specification Version 2.0
- Compatible with CE-ATA Specification 1.1
- Cards Clock Rate Up to Master Clock Divided by 2
- Boot Operation Mode Support
- High Speed Mode Support
- Embedded Power Management to Slow Down Clock Rate When Not Used
- Supports 1 Multiplexed Slot(s)
  - Each Slot for either a High Speed MultiMedia Card Bus (Up to 30 Cards) or an SD Memory Card
- Support for Stream, Block and Multi-block Data Read and Write
- Supports Connection to DMA Controller (DMAC)
  - Minimizes Processor Intervention for Large Buffer Transfers
- Built in FIFO (from 16 to 256 bytes) with Large Memory Aperture Supporting Incremental Access
- Support for CE-ATA Completion Signal Disable Command
- Protection Against Unexpected Modification On-the-Fly of the Configuration Registers

# 33.3 Block Diagram

Figure 33-1. Block Diagram (4-bit configuration)

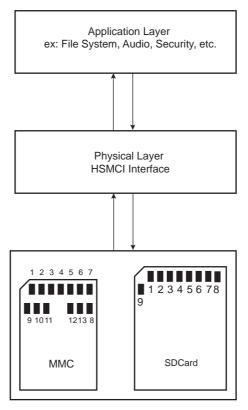

Note: 1. When several HSMCI (x HSMCI) are embedded in a product, MCCK refers to HSMCIx\_CK, MCCDA to HSMCIx\_CDA, MCDAy to HSMCIx\_DAy.

2. I: Input, O: Output, PP: Push/Pull, OD: Open Drain.

# 33.6 Product Dependencies

#### 33.6.1 I/O Lines

The pins used for interfacing the High Speed MultiMedia Cards or SD Cards are multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the peripheral functions to HSMCI pins.

Table 33-2. I/O Lines

| Instance | Signal   | I/O Line | Peripheral |
|----------|----------|----------|------------|
| HSMCI0   | MCI0_CDA | PA16     | Α          |
| HSMCI0   | MCI0_CK  | PA17     | Α          |
| HSMCI0   | MCI0_DA0 | PA15     | Α          |
| HSMCI0   | MCI0_DA1 | PA18     | Α          |
| HSMCI0   | MCI0_DA2 | PA19     | Α          |
| HSMCI0   | MCI0_DA3 | PA20     | Α          |
| HSMCI1   | MCI1_CDA | PA12     | В          |
| HSMCI1   | MCI1_CK  | PA13     | В          |
| HSMCI1   | MCI1_DA0 | PA11     | В          |
| HSMCI1   | MCI1_DA1 | PA2      | В          |
| HSMCI1   | MCI1_DA2 | PA3      | В          |
| HSMCI1   | MCI1_DA3 | PA4      | В          |

## 33.6.2 Power Management

The HSMCI is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the HSMCI clock.

## 33.6.3 Interrupt Sources

The HSMCI has an interrupt line connected to the interrupt controller.

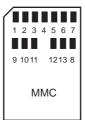

Handling the HSMCI interrupt requires programming the interrupt controller before configuring the HSMCI.

Table 33-3. Peripheral IDs

| _        |    |
|----------|----|
| Instance | ID |
| HSMCI0   | 12 |
| HSMCI1   | 26 |

# 33.7 Bus Topology

Figure 33-3. High Speed MultiMedia Memory Card Bus Topology

The High Speed MultiMedia Card communication is based on a 13-pin serial bus interface. It has three communication lines and four supply lines.

Table 33-4. **Bus Topology** 

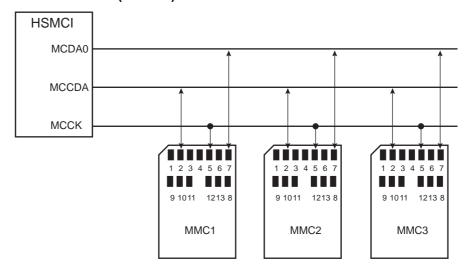

| Pin Number | Name   | Type <sup>(1)</sup> | Description           | HSMCI Pin Name <sup>(2)</sup><br>(Slot z) |
|------------|--------|---------------------|-----------------------|---|
| 1          | DAT[3] | I/O/PP              | Data                  | MCDz3                                     |
| 2          | CMD    | I/O/PP/OD           | Command/response      | MCCDz                                     |
| 3          | VSS1   | S                   | Supply voltage ground | VSS                                       |
| 4          | VDD    | S                   | Supply voltage        | VDD                                       |
| 5          | CLK    | I/O                 | Clock                 | MCCK                                      |
| 6          | VSS2   | S                   | Supply voltage ground | VSS                                       |
| 7          | DAT[0] | I/O/PP              | Data 0                | MCDz0                                     |
| 8          | DAT[1] | I/O/PP              | Data 1                | MCDz1                                     |
| 9          | DAT[2] | I/O/PP              | Data 2                | MCDz2                                     |

Notes:

I: Input, O: Output, PP: Push/Pull, OD: Open Drain.

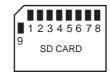

When several HSMCI (x HSMCI) are embedded in a product, MCCK refers to HSMCIx\_CK, MCCDA to HSMCIx\_CDA, MCDAy to HSMCIx\_DAy.

Figure 33-4. **MMC Bus Connections (One Slot)** 

Note: When several HSMCI (x HSMCI) are embedded in a product, MCCK refers to HSMCIx\_CK, MCCDA to HSMCIx\_CDA MCDAy to HSMCIx\_DAy.

Figure 33-5. SD Memory Card Bus Topology

The SD Memory Card bus includes the signals listed in Table 33-5.

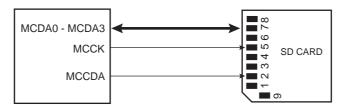

**SD Memory Card Bus Signals** Table 33-5.

| Pin Number | Name      | Type <sup>(1)</sup> | Description                  | HSMCI Pin Name <sup>(2)</sup><br>(Slot z) |
|------------|-----------|---------------------|------------------------------|---|
| 1          | CD/DAT[3] | I/O/PP              | Card detect/ Data line Bit 3 | MCDz3                                     |
| 2          | CMD       | PP                  | Command/response             | MCCDz                                     |
| 3          | VSS1      | S                   | Supply voltage ground        | VSS                                       |
| 4          | VDD       | S                   | Supply voltage               | VDD                                       |
| 5          | CLK       | I/O                 | Clock                        | MCCK                                      |
| 6          | VSS2      | S                   | Supply voltage ground        | VSS                                       |
| 7          | DAT[0]    | I/O/PP              | Data line Bit 0              | MCDz0                                     |
| 8          | DAT[1]    | I/O/PP              | Data line Bit 1 or Interrupt | MCDz1                                     |
| 9          | DAT[2]    | I/O/PP              | Data line Bit 2              | MCDz2                                     |

Notes: 1.

- I: input, O: output, PP: Push Pull, OD: Open Drain.
- When several HSMCI (x HSMCI) are embedded in a product, MCCK refers to HSMCIx\_CK, MCCDA to HSMCIx\_CDA, MCDAy to HSMCIx\_DAy.

Figure 33-6. SD Card Bus Connections with One Slot

When several HSMCI (x HSMCI) are embedded in a product, MCCK refers to HSMCIx\_CK, MCCDA to HSMCIx\_CDA Note: MCDAy to HSMCIx\_DAy.

When the HSMCI is configured to operate with SD memory cards, the width of the data bus can be selected in the HSMCI SDCR. Clearing the SDCBUS bit in this register means that the width is one bit; setting it means that the width is four bits. In the case of High Speed MultiMedia cards, only the data line 0 is used. The other data lines can be used as independent PIOs.

#### 33.8 **High Speed MultiMedia Card Operations**

After a power-on reset, the cards are initialized by a special message-based High Speed MultiMedia Card bus protocol. Each message is represented by one of the following tokens:

- Command—A command is a token that starts an operation. A command is sent from the host either to a single card (addressed command) or to all connected cards (broadcast command). A command is transferred serially on the CMD line.
- Response—A response is a token which is sent from an addressed card or (synchronously) from all connected cards to the host as an answer to a previously received command. A response is transferred serially on the CMD line.
- Data—Data can be transferred from the card to the host or vice versa. Data is transferred via the data line.

Card addressing is implemented using a session address assigned during the initialization phase by the bus controller to all currently connected cards. Their unique CID number identifies individual cards.

The structure of commands, responses and data blocks is described in the High Speed MultiMedia Card System Specification. See also Table 33-6 on page 614.

High Speed MultiMedia Card bus data transfers are composed of these tokens.

There are different types of operations. Addressed operations always contain a command and a response token. In addition, some operations have a data token; the others transfer their information directly within the command or response structure. In this case, no data token is present in an operation. The bits on the DAT and the CMD lines are transferred synchronous to the clock HSMCI clock.

Two types of data transfer commands are defined:

- Sequential commands—These commands initiate a continuous data stream. They are terminated only when a stop command follows on the CMD line. This mode reduces the command overhead to an absolute minimum.
- Block-oriented commands—These commands send a data block succeeded by CRC bits.

Both read and write operations allow either single or multiple block transmission. A multiple block transmission is terminated when a stop command follows on the CMD line similarly to the sequential read or when a multiple block transmission has a predefined block count (see Section 33.8.2 "Data Transfer Operation").

The HSMCI provides a set of registers to perform the entire range of High Speed MultiMedia Card operations.

#### 33.8.1 Command - Response Operation

After reset, the HSMCI is disabled and becomes valid after setting the MCIEN bit in the HSMCI\_CR.

The PWSEN bit saves power by dividing the HSMCI clock by 2<sup>PWSDIV</sup> + 1 when the bus is inactive.

The two bits, RDPROOF and WRPROOF in the HSMCI Mode Register (HSMCI\_MR) allow stopping the HSMCI clock during read or write access if the internal FIFO is full. This will guarantee data integrity, not bandwidth.

All the timings for High Speed MultiMedia Card are defined in the High Speed MultiMedia Card System Specification.

The two bus modes (open drain and push/pull) needed to process all the operations are defined in the HSMCI Command Register (HSMCI\_CMDR). The HSMCI\_CMDR allows a command to be carried out.

For example, to perform an ALL SEND CID command:

|     |   | Host Command |         |     | N <sub>ID</sub> Cycles |   | Response |   |   | High Impedance State |             |   |   |   |
|-----|---|--------------|---------|-----|------------------------|---|----------|---|---|----------------------|-------------|---|---|---|
| CMD | S | Т            | Content | CRC | Е                      | Z | *****    | Z | S | Т                    | CID Content | Z | Z | Z |

The command ALL\_SEND\_CID and the fields and values for the HSMCI\_CMDR are described in Table 33-6 and Table 33-7.

Table 33-6. ALL\_SEND\_CID Command Description

| CMD Index | Туре               | Argument          | Response | Abbreviation | Command Description                                      |
|-----------|--------------------|-------------------|----------|--------------|--|
| CMD2      | bcr <sup>(1)</sup> | [31:0] stuff bits | R2       | ALL_SEND_CID | Asks all cards to send their CID numbers on the CMD line |

Note: 1. bcr means broadcast command with response.

Table 33-7. Fields and Values for HSMCI\_CMDR

| Field  | Value                                  |
|--|--|
| CMDNB (command number)                       | 2 (CMD2)                               |
| RSPTYP (response type)                       | 2 (R2: 136 bits response)              |
| SPCMD (special command)                      | 0 (not a special command)              |
| OPCMD (open drain command)                   | 1                                      |
| MAXLAT (max latency for command to response) | 0 (NID cycles ==> 5 cycles)            |
| TRCMD (transfer command)                     | 0 (No transfer)                        |
| TRDIR (transfer direction)                   | X (available only in transfer command) |
| TRTYP (transfer type)                        | X (available only in transfer command) |
| IOSPCMD (SDIO special command)               | 0 (not a special command)              |

The HSMCI\_ARGR contains the argument field of the command.

To send a command, the user must perform the following steps:

- Fill the argument register (HSMCI\_ARGR) with the command argument.
- Set the command register (HSMCI\_CMDR) (see Table 33-7).

The command is sent immediately after writing the command register.

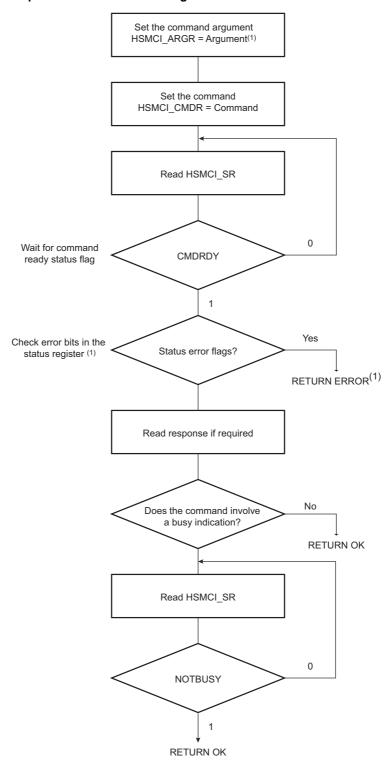

While the card maintains a busy indication (at the end of a STOP\_TRANSMISSION command CMD12, for example), a new command shall not be sent. The NOTBUSY flag in the Status Register (HSMCI\_SR) is asserted when the card releases the busy indication.

If the command requires a response, it can be read in the HSMCI Response Register (HSMCI\_RSPR). The response size can be from 48 bits up to 136 bits depending on the command. The HSMCI embeds an error detection to prevent any corrupted data during the transfer.

The following flowchart shows how to send a command to the card and read the response if needed. In this example, the status register bits are polled but setting the appropriate bits in the HSMCI Interrupt Enable Register (HSMCI\_IER) allows using an interrupt method.

Figure 33-7. Command/Response Functional Flow Diagram

Note: If the command is SEND\_OP\_COND, the CRC error flag is always present (refer to R3 response in the High Speed MultiMedia Card specification).

#### 33.8.2 Data Transfer Operation

The High Speed MultiMedia Card allows several read/write operations (single block, multiple blocks, stream, etc.). These kinds of transfer can be selected setting the Transfer Type (TRTYP) field in the HSMCI Command Register (HSMCI\_CMDR).

These operations can be done using the features of the DMA Controller.

In all cases, the block length (BLKLEN field) must be defined either in the HSMCI Mode Register (HSMCI\_MR) or in the HSMCI Block Register (HSMCI\_BLKR). This field determines the size of the data block.

Consequent to MMC Specification 3.1, two types of multiple block read (or write) transactions are defined (the host can use either one at any time):

- Open-ended/Infinite Multiple block read (or write):
  - The number of blocks for the read (or write) multiple block operation is not defined. The card will continuously transfer (or program) data blocks until a stop transmission command is received.
- Multiple block read (or write) with predefined block count (since version 3.1 and higher):

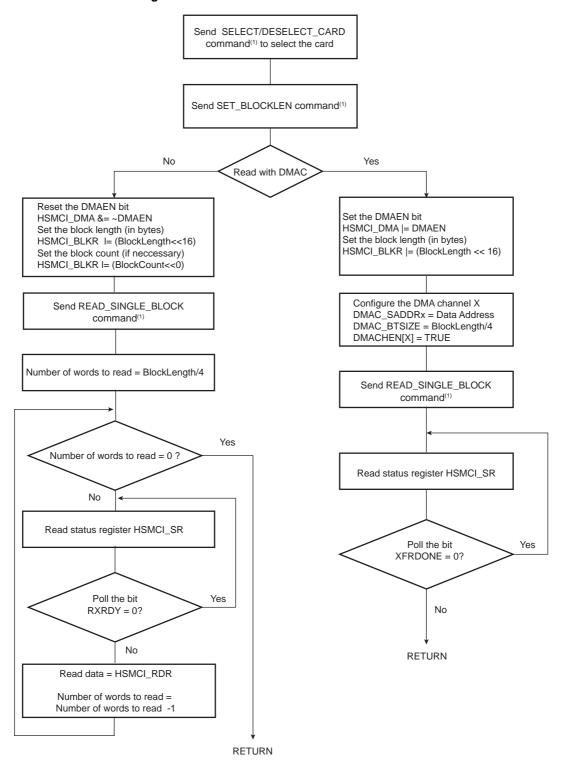

The card will transfer (or program) the requested number of data blocks and terminate the transaction. The stop command is not required at the end of this type of multiple block read (or write), unless terminated with an error. In order to start a multiple block read (or write) with predefined block count, the host must correctly program the HSMCI Block Register (HSMCI\_BLKR). Otherwise the card will start an open-ended multiple block read. The BCNT field of the HSMCI\_BLKR defines the number of blocks to transfer (from 1 to 65535 blocks). Programming the value 0 in the BCNT field corresponds to an infinite block transfer.

### 33.8.3 Read Operation

The following flowchart (Figure 33-8) shows how to read a single block with or without use of DMAC facilities. In this example, a polling method is used to wait for the end of read. Similarly, the user can configure the HSMCI Interrupt Enable Register (HSMCI\_IER) to trigger an interrupt at the end of read.

Figure 33-8. Read Functional Flow Diagram

Notes: 1. It is assumed that this command has been correctly sent (see Figure 33-7).

#### 33.8.4 Write Operation

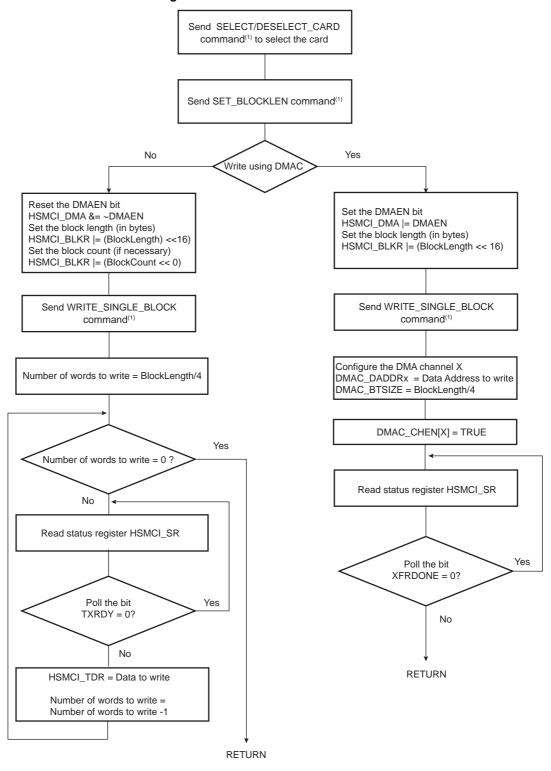

In write operation, the HSMCI Mode Register (HSMCI\_MR) is used to define the padding value when writing non-multiple block size. If the bit PADV is 0, then 0x00 value is used when padding data, otherwise 0xFF is used.

If set, the bit DMAEN in the HSMCI DMA Condiguration Register (HSMCI\_DMA) enables DMA transfer.

The flowchart in Figure 33-9 shows how to write a single block with or without use of DMA facilities. Polling or interrupt method can be used to wait for the end of write according to the contents of the HSMCI Interrupt Mask Register (HSMCI\_IMR).

Figure 33-9. Write Functional Flow Diagram

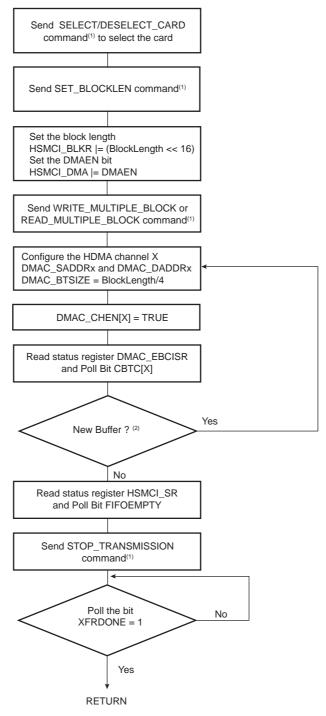

Note: It is assumed that this command has been correctly sent (see Figure 33-7).

The flowchart in Figure 33-10 shows how to manage read multiple block and write multiple block transfers with the DMA Controller. Polling or interrupt method can be used to wait for the end of write according to the contents of the HSMCI\_IMR.

Figure 33-10. Read Multiple Block and Write Multiple Block

Notes: 1. It is assumed that this command has been correctly sent (see Figure 33-7).

2. Handle errors reported in HSMCI\_SR.

### 33.8.5 WRITE\_SINGLE\_BLOCK Operation using DMA Controller

- 1. Wait until the current command execution has successfully terminated.
  - c. Check that CMDRDY and NOTBUSY fields are asserted in HSMCI\_SR
- 2. Program the block length in the card. This value defines the value block\_length.
- 3. Program the block length in the HSMCI Configuration Register with block\_length value.
- 4. Configure the fields of the HSMCI\_DMA register as follows:
  - OFFSET field with dma\_offset.
  - CHKSIZE is user defined and set according to DMAC\_CTRLAx.DCSIZE.
  - DMAEN is set to true to enable DMA hardware handshaking in the HSMCI. This bit was previously set to false.
- 5. Issue a WRITE\_SINGLE\_BLOCK command writing HSMCI\_ARG then HSMCI\_CMDR.
- 6. Program the DMA Controller.
  - a. Read the channel register to choose an available (disabled) channel.
  - Clear any pending interrupts on the channel from the previous DMAC transfer by reading the DMAC\_EBCISR.
  - c. Program the channel registers.
  - d. The DMAC\_SADDRx for Channel x must be set to the location of the source data. When the first data location is not word aligned, the two LSB bits define the temporary value called *dma\_offset*. The two LSB bits of DMAC\_SADDRx must be configured to 0.
  - e. The DMAC\_DADDRx for Channel x must be set with the starting address of the HSMCI\_FIFO address.
  - f. Configure the fields of DMAC\_CTRLAx for Channel x as follows:
    - -DST WIDTH is set to WORD.
    - -SRC WIDTH is set to WORD.
    - -DCSIZE must be set according to the value of HSMCI\_DMA.CHKSIZE field.
    - -BTSIZE is programmed with *CEILING((block\_length + dma\_offset) / 4)*, where the ceiling function is the function that returns the smallest integer not less than x.
  - g. Configure the fields of DMAC CTRLBx for Channel x as follows:
    - -DST\_INCR is set to INCR, the block\_length value must not be larger than the HSMCI\_FIFO aperture.
    - -SRC\_INCR is set to INCR.
    - -FC field is programmed with memory to peripheral flow control mode.
    - -Both DST\_DSCR and SRC\_DSCR are set (descriptor fetch is disabled).
    - -DIF and SIF are set with their respective layer ID. If SIF is different from DIF, the DMA controller is able to prefetch data and write HSMCI simultaneously.
  - h. Configure the fields of DMAC\_CFGx for Channel x as follows:
    - -FIFOCFG defines the watermark of the DMAC channel FIFO.
    - -DST\_H2SEL is set to true to enable hardware handshaking on the destination.
    - –DST\_PER is programmed with the hardware handshaking ID of the targeted HSMCI Host Controller.
  - i. Enable Channel x, writing one to DMAC\_CHER[x]. The DMAC is ready and waiting for request.
- 7. Wait for XFRDONE in the HSMCI SR.

## 33.8.6 READ\_SINGLE\_BLOCK Operation using DMA Controller

#### 33.8.6.1 Block Length is Multiple of 4

- 1. Wait until the current command execution has successfully completed.
  - a. Check that CMDRDY and NOTBUSY are asserted in HSMCI\_SR.
- 2. Program the block length in the card. This value defines the value block\_length.
- 3. Program the block length in the HSMCI Configuration Register with block\_length value.
- 4. Set RDPROOF bit in HSMCI\_MR to avoid overflow.
- 5. Configure the fields of the HSMCI\_DMA register as follows:
  - a. ROPT bit is configured to 0.
  - b. OFFSET field is configured to 0.
  - c. CHKSIZE is user defined.
  - d. DMAEN is set to true to enable DMAC hardware handshaking in the HSMCI. This bit was previously set to false.
- 6. Issue a READ\_SINGLE\_BLOCK command.
- 7. Program the DMA controller.
  - a. Read the channel register to choose an available (disabled) channel.
  - b. Clear any pending interrupts on the channel from the previous DMA transfer by reading the DMAC\_EBCISR.
  - c. Program the channel registers.
  - d. The DMAC\_SADDRx for Channel x must be set with the starting address of the HSMCI\_FIFO address.
  - e. The DMAC\_DADDRx for Channel x must be word aligned.
  - f. Configure the fields of the DMAC\_CTRLAx register for Channel x as follows:
    - -DST\_WIDTH is set to WORD.
    - -SRC\_WIDTH is set to WORD.
    - -SCSIZE must be set according to the value of HSMCI\_DMA.CHKSIZE.
    - -BTSIZE is programmed with block\_length/4.
  - g. Configure the fields of the DMAC\_CFGx register for Channel x as follows:
    - -DST INCR is set to INCR.
    - -SRC INCR is set to INCR.
    - -FC field is programmed with peripheral to memory flow control mode.
    - -Both DST\_DSCR and SRC\_DSCR are set (descriptor fetch is disabled).
    - -DIF and SIF are set with their respective layer ID. If SIF is different from DIF, the DMA controller is able to prefetch data and write HSMCI simultaneously.
  - h. Configure the fields of the DMAC CFGx register for Channel x as follows:
    - -FIFOCFG defines the watermark of the DMA channel FIFO.
    - -SRC H2SEL is set to true to enable hardware handshaking on the destination.
    - -SRC\_PER is programmed with the hardware handshaking ID of the targeted HSMCI Host Controller.
  - -Enable Channel x, writing one to DMAC\_CHER[x]. The DMAC is ready and waiting for request.
- 8. Wait for XFRDONE in the HSMCI SR.

#### 33.8.6.2 Block Length is Not Multiple of 4 and Padding Not Used (HSMCI\_DMA.ROPT = 0)

In the previous DMA transfer flow (block length multiple of 4), the DMA controller is configured to use only WORD AHB access. When the block length is no longer a multiple of 4 this is no longer true. The DMA controller is programmed to copy exactly the block length number of bytes using two transfer descriptors.

- 1. Use the previous step until READ\_SINGLE\_BLOCK then
- 2. Program the DMA controller to use a two descriptors linked list.
  - a. Read the channel register to choose an available (disabled) channel.
  - b. Clear any pending interrupts on the channel from the previous DMA transfer by reading the DMAC\_EBCISR.
  - c. Program the channel registers in the Memory for the first descriptor. This descriptor will be word oriented. This descriptor is referred to as LLI\_W, standing for LLI word oriented transfer.
  - d. The LLI\_W.DMAC\_SADDRx field in memory must be set with the starting address of the HSMCI\_FIFO address.
  - e. The LLI\_W.DMAC\_DADDRx field in the memory must be word aligned.
  - f. Configure the fields of LLI W.DMAC CTRLAx as follows:
    - -DST WIDTH is set to WORD.
    - -SRC WIDTH is set to WORD.
    - -SCSIZE must be set according to the value of HSMCI\_DMA.CHKSIZE.
    - -BTSIZE is programmed with *block\_length/4*. If BTSIZE is zero, this descriptor is skipped later.
  - g. Configure the fields of LLI\_W.DMAC\_CTRLBx as follows:
    - -DST INCR is set to INCR
    - -SRC INCR is set to INCR
    - -FC field is programmed with peripheral to memory flow control mode.
    - –SRC\_DSCR is set to zero. (descriptor fetch is enabled for the SRC)
    - –DST\_DSCR is set to one. (descriptor fetch is disabled for the DST)
    - -DIF and SIF are set with their respective layer ID. If SIF is different from DIF, DMA controller is able to prefetch data and write HSMCI simultaneously.
  - h. Configure the fields of LLI\_W.DMAC\_CFGx for Channel x as follows:
    - -FIFOCFG defines the watermark of the DMA channel FIFO.
    - -DST REP is set to zero meaning that address are contiguous.
    - -SRC\_H2SEL is set to true to enable hardware handshaking on the destination.
    - –SRC\_PER is programmed with the hardware handshaking ID of the targeted HSMCI Host Controller.
  - i. Program LLI\_W.DMAC\_DSCRx with the address of LLI\_B descriptor. And set DSCRx\_IF to the AHB Layer ID. This operation actually links the Word oriented descriptor on the second byte oriented descriptor. When block\_length[1:0] is equal to 0 (multiple of 4) LLI\_W.DMAC\_DSCRx points to 0, only LLI\_W is relevant.
  - j. Program the channel registers in the Memory for the second descriptor. This descriptor will be byte oriented. This descriptor is referred to as LLI\_B, standing for LLI Byte oriented.
  - k. The LLI\_B.DMAC\_SADDRx field in memory must be set with the starting address of the HSMCI\_FIFO address.
  - I. The LLI\_B.DMAC\_DADDRx is not relevant if previous word aligned descriptor was enabled. If 1, 2 or 3 bytes are transferred that address is user defined and not word aligned.
  - m. Configure the fields of LLI\_B.DMAC\_CTRLAx as follows:
    - -DST\_WIDTH is set to BYTE.

- -SRC WIDTH is set to BYTE.
- -SCSIZE must be set according to the value of HSMCI\_DMA.CHKSIZE.
- -BTSIZE is programmed with block\_length[1:0]. (last 1, 2, or 3 bytes of the buffer).
- n. Configure the fields of LLI\_B.DMAC\_CTRLBx as follows:
  - -DST INCR is set to INCR
  - -SRC\_INCR is set to INCR
  - -FC field is programmed with peripheral to memory flow control mode.
  - -Both SRC\_DSCR and DST\_DSCR are set (descriptor fetch is disabled) or Next descriptor location points to 0.
  - -DIF and SIF are set with their respective layer ID. If SIF is different from DIF, DMA Controller is able to prefetch data and write HSMCI simultaneously.
- o. Configure the LLI\_B.DMAC\_CFGx memory location for Channel x as follows:
  - -FIFOCFG defines the watermark of the DMA channel FIFO.
  - -SRC\_H2SEL is set to true to enable hardware handshaking on the destination.
  - -SRC\_PER is programmed with the hardware handshaking ID of the targeted HSMCI Host Controller.
- p. Program LLI\_B.DMAC\_DSCR with 0.
- q. Program the DMAC\_CTRLBx register for Channel x with 0. Its content is updated with the LLI fetch operation.
- r. Program DMAC\_DSCRx with the address of LLI\_W if *block\_length* greater than 4 else with address of LLI\_B.
- s. Enable Channel x writing one to DMAC\_CHER[x]. The DMAC is ready and waiting for request.
- 3. Wait for XFRDONE in the HSMCI SR.

#### 33.8.6.3 Block Length is Not Multiple of 4, with Padding Value (HSMCI\_DMA.ROPT = 1)

When the ROPT bit is set, the DMA Controller performs only WORD access on the bus to transfer a non-multiple of 4 block length, unlike the previous flow, in which the transfer size is rounded to the nearest multiple of 4.

- 1. Program the HSMCI, see previous flow.
  - ROPT bit is set.
- 2. Program the DMA Controller
  - a. Read the channel register to choose an available (disabled) channel.
  - b. Clear any pending interrupts on the channel from the previous DMA transfer by reading the DMAC EBCISR.
  - c. Program the channel registers.
  - d. The DMAC\_SADDRx for Channel x must be set with the starting address of the HSMCI\_FIFO address.
  - e. The DMAC DADDRx for Channel x must be word aligned.
  - f. Configure the fields of DMAC CTRLAx for Channel x as follows:
    - -DST WIDTH is set to WORD
    - -SRC WIDTH is set to WORD
    - -SCSIZE must be set according to the value of HSMCI DMA.CHKSIZE.
    - -BTSIZE is programmed with CEILING(block\_length/4).
  - g. Configure the fields of DMAC\_CTRLBx for Channel x as follows:
    - -DST\_INCR is set to INCR
    - -SRC\_INCR is set to INCR

- -FC field is programmed with peripheral to memory flow control mode.
- -Both DST\_DSCR and SRC\_DSCR are set (descriptor fetch is disabled).
- -DIF and SIF are set with their respective layer ID. If SIF is different from DIF, the DMA Controller is able to prefetch data and write HSMCI simultaneously.
- h. Configure the fields of DMAC\_CFGx for Channel x as follows:
  - -FIFOCFG defines the watermark of the DMA channel FIFO.
  - -SRC\_H2SEL is set to true to enable hardware handshaking on the destination.
  - -SRC\_PER is programmed with the hardware handshaking ID of the targeted HSMCI Host Controller.
  - -Enable Channel x writing one to DMAC\_CHER[x]. The DMAC is ready and waiting for request.
- 3. Wait for XFRDONE in the HSMCI\_SR.

#### 33.8.7 WRITE\_MULTIPLE\_BLOCK

#### 33.8.7.1 One Block per Descriptor

- 1. Wait until the current command execution has successfully terminated.
  - a. Check that CMDRDY and NOTBUSY are asserted in HSMCI\_SR.
- 2. Program the block length in the card. This value defines the value *block\_length*.
- 3. Program the block length in the HSMCI Configuration Register with block length value.
- 4. Configure the fields of the HSMCI\_DMA register as follows:
  - OFFSET field with dma offset.
  - CHKSIZE is user defined.
  - DMAEN is set to true to enable DMAC hardware handshaking in the HSMCI. This bit was previously set to false.
- 5. Issue a WRITE\_MULTIPLE\_BLOCK command.
- 6. Program the DMA Controller to use a list of descriptors. Each descriptor transfers one block of data. Block *n* of data is transferred with descriptor LLI(n).
  - a. Read the channel register to choose an available (disabled) channel.
  - b. Clear any pending interrupts on the channel from the previous DMAC transfer by reading the DMAC\_EBCISR.
  - c. Program a List of descriptors.
  - d. The LLI(n).DMAC\_SADDRx memory location for Channel x must be set to the location of the source data. When the first data location is not word aligned, the two LSB bits define the temporary value called *dma offset*. The two LSB bits of LLI(n).DMAC\_SADDRx must be configured to 0.
  - e. The LLI(n).DMAC\_DADDRx for Channel x must be set with the starting address of the HSMCI\_FIFO address.
  - f. Configure the fields of LLI(n).DMAC\_CTRLAx for Channel x as follows:
    - -DST\_WIDTH is set to WORD.
    - -SRC\_WIDTH is set to WORD.
    - -DCSIZE must be set according to the value of HSMCI\_DMA.CHKSIZE.
    - -BTSIZE is programmed with CEILING((block\_length + dma\_offset)/4).
  - g. Configure the fields of LLI(n).DMAC\_CTRLBx for Channel x as follows:
    - -DST\_INCR is set to INCR.
    - -SRC INCR is set to INCR.
    - -DST\_DSCR is configured to 0 (fetch operation is enabled for the destination).

- -SRC\_DSCR is set (source address is contiguous).
- -FC field is programmed with memory to peripheral flow control mode.
- -Both DST\_DSCR and SRC\_DSCR are set (descriptor fetch is disabled).
- –DIF and SIF are set with their respective layer ID. If SIF is different from DIF, DMA Controller is able to prefetch data and write HSMCI simultaneously.
- h. Configure the fields of LLI(n).DMAC\_CFGx for Channel x as follows:
  - -FIFOCFG defines the watermark of the DMA channel FIFO.
  - -DST H2SEL is set to true to enable hardware handshaking on the destination.
  - -SRC\_REP is configured to 0. (contiguous memory access at block boundary)
  - –DST\_PER is programmed with the hardware handshaking ID of the targeted HSMCI Host Controller.
- i. If LLI(n) is the last descriptor, then LLI(n).DSCR points to 0 else LLI(n) points to the start address of LLI(n+1).
- j. Program DMAC\_CTRLBx for the Channel Register x with 0. Its content is updated with the LLI fetch operation.
- k. Program DMAC\_DSCRx for the Channel Register x with the address of the first descriptor LLI(0).
- I. Enable Channel x writing one to DMAC\_CHER[x]. The DMA is ready and waiting for request.
- 7. Poll CBTC[x] bit in the DMAC EBCISR.
- 8. If a new list of buffers shall be transferred, repeat step 6. Check and handle HSMCI errors.
- 9. Poll FIFOEMPTY field in the HSMCI\_SR.
- 10. Send The STOP\_TRANSMISSION command writing HSMCI\_ARG then HSMCI\_CMDR.
- 11. Wait for XFRDONE in the HSMCI\_SR.

### 33.8.8 READ\_MULTIPLE\_BLOCK

#### 33.8.8.1 Block Length is a Multiple of 4

- 1. Wait until the current command execution has successfully terminated.
  - a. Check that CMDRDY and NOTBUSY are asserted in HSMCI SR.
- 2. Program the block length in the card. This value defines the value block\_length.
- 3. Program the block length in the HSMCI Configuration Register with block\_length value.
- 4. Set RDPROOF bit in HSMCI\_MR to avoid overflow.
- 5. Configure the fields of the HSMCI\_DMA register as follows:
  - ROPT bit is configured to 0.
  - OFFSET field is configured to 0.
  - CHKSIZE is user defined.
  - DMAEN is set to true to enable DMAC hardware handshaking in the HSMCI. This bit was previously set to false.
- 6. Issue a READ MULTIPLE BLOCK command.
- 7. Program the DMA Controller to use a list of descriptors:

- a. Read the channel register to choose an available (disabled) channel.
- b. Clear any pending interrupts on the channel from the previous DMA transfer by reading the DMAC\_EBCISR.
- c. Program the channel registers in the Memory with the first descriptor. This descriptor will be word oriented. This descriptor is referred to as LLI\_W(n), standing for LLI word oriented transfer for block *n*.
- d. The LLI\_W(n).DMAC\_SADDRx field in memory must be set with the starting address of the HSMCI\_FIFO address.
- e. The LLI W(n).DMAC DADDRx field in the memory must be word aligned.
- f. Configure the fields of LLI\_W(n).DMAC\_CTRLAx as follows:
  - -DST\_WIDTH is set to WORD
  - -SRC\_WIDTH is set to WORD
  - -SCSIZE must be set according to the value of HSMCI\_DMA.CHKSIZE.
  - -BTSIZE is programmed with block\_length/4.
- g. Configure the fields of LLI\_W(n).DMAC\_CTRLBx as follows:
  - -DST\_INCR is set to INCR.
  - -SRC INCR is set to INCR.
  - -FC field is programmed with peripheral to memory flow control mode.
  - -SRC\_DSCR is configured to 0 (descriptor fetch is enabled for the SRC).
  - -DST\_DSCR is set to TRUE (descriptor fetch is disabled for the DST).
  - -DIF and SIF are set with their respective layer ID. If SIF is different from DIF, the DMA Controller is able to prefetch data and write HSMCI simultaneously.
- h. Configure the fields of the LLI\_W(n).DMAC\_CFGx register for Channel x as follows:
  - -FIFOCFG defines the watermark of the DMA channel FIFO.
  - -DST\_REP is set to zero. Addresses are contiguous.
  - -SRC\_H2SEL is set to true to enable hardware handshaking on the destination.
  - -SRC\_PER is programmed with the hardware handshaking ID of the targeted HSMCI Host Controller.
- i. Program LLI\_W(n).DMAC\_DSCRx with the address of LLI\_W(n+1) descriptor. And set the DSCRx\_IF to the AHB Layer ID. This operation actually links descriptors together. If LLI\_W(n) is the last descriptor then LLI\_W(n).DMAC\_DSCRx points to 0.
- j. Program the DMAC\_CTRLBx register for Channel x with 0. Its content is updated with the LLI Fetch operation.
- k. Program DMAC\_DSCRx for Channel x with the address of LLI\_W(0).
- I. Enable Channel x writing one to DMAC\_CHER[x]. The DMA is ready and waiting for request.
- 8. Poll CBTC[x] bit in the DMAC\_EBCISR.
- 9. If a new list of buffer shall be transferred repeat step 6. Check and handle HSMCI errors.
- 10. Poll FIFOEMPTY field in the HSMCI\_SR.
- 11. Send The STOP TRANSMISSION command writing the HSMCI ARG then the HSMCI CMDR.
- 12. Wait for XFRDONE in the HSMCI\_SR.

## 33.8.8.2 Block Length is Not Multiple of 4 (HSMCI\_DMA.ROPT = 0)

Two DMA Transfer descriptors are used to perform the HSMCI block transfer.

- 1. Use the previous step to configure the HSMCI to perform a READ\_MULTIPLE\_BLOCK command.
- 2. Issue a READ\_MULTIPLE\_BLOCK command.
- 3. Program the DMA Controller to use a list of descriptors.

- a. Read the channel register to choose an available (disabled) channel.
- b. Clear any pending interrupts on the channel from the previous DMAC transfer by reading the DMAC\_EBCISR.
- c. For every block of data repeat the following procedure:
- d. Program the channel registers in the Memory for the first descriptor. This descriptor will be word oriented. This descriptor is referred to as LLI\_W(n) standing for LLI word oriented transfer for block *n*.
- e. The LLI\_W(n).DMAC\_SADDRx field in memory must be set with the starting address of the HSMCI\_FIFO address.
- f. The LLI W(n).DMAC DADDRx field in the memory must be word aligned.
- g. Configure the fields of LLI\_W(n).DMAC\_CTRLAx as follows:
  - -DST WIDTH is set to WORD.
  - -SRC\_WIDTH is set to WORD.
  - -SCSIZE must be set according to the value of HSMCI\_DMA.CHKSIZE.
  - -BTSIZE is programmed with block\_length/4. If BTSIZE is zero, this descriptor is skipped later.
- h. Configure the fields of LLI\_W(n).DMAC\_CTRLBx as follows:
  - -DST INCR is set to INCR.
  - -SRC\_INCR is set to INCR.
  - -FC field is programmed with peripheral to memory flow control mode.
  - -SRC\_DSCR is configured to 0 (descriptor fetch is enabled for the SRC).
  - -DST\_DSCR is set to TRUE (descriptor fetch is disabled for the DST).
  - -DIF and SIF are set with their respective layer ID. If SIF is different from DIF, the DMA Controller is able to prefetch data and write HSMCI simultaneously.
- i. Configure the fields of LLI\_W(n).DMAC\_CFGx for Channel x as follows:
  - -FIFOCFG defines the watermark of the DMA channel FIFO.
  - -DST\_REP is set to zero. Address are contiguous.
  - -SRC\_H2SEL is set to true to enable hardware handshaking on the destination.
  - –SRC\_PER is programmed with the hardware handshaking ID of the targeted HSMCI Host Controller.
- j. Program LLI\_W(n).DMAC\_DSCRx with the address of LLI\_B(n) descriptor. And set the DSCRx\_IF to the AHB Layer ID. This operation actually links the Word oriented descriptor on the second byte oriented descriptor. When <code>block\_length[1:0]</code> is equal to 0 (multiple of 4) LLI\_W(n).DMAC\_DSCRx points to 0, only LLI\_W(n) is relevant.
- k. Program the channel registers in the Memory for the second descriptor. This descriptor will be byte oriented. This descriptor is referred to as LLI\_B(n), standing for LLI Byte oriented.
- I. The LLI\_B(n).DMAC\_SADDRx field in memory must be set with the starting address of the HSMCI\_FIFO address.
- m. The LLI\_B(n).DMAC\_DADDRx is not relevant if previous word aligned descriptor was enabled. If 1, 2 or 3 bytes are transferred, that address is user defined and not word aligned.
- n. Configure the fields of LLI\_B(n).DMAC\_CTRLAx as follows:
  - -DST\_WIDTH is set to BYTE.
  - -SRC WIDTH is set to BYTE.
  - -SCSIZE must be set according to the value of HSMCI\_DMA.CHKSIZE.
  - -BTSIZE is programmed with *block\_length[1:0]*. (last 1, 2, or 3 bytes of the buffer).
- o. Configure the fields of LLI\_B(n).DMAC\_CTRLBx as follows:
  - –DST\_INCR is set to INCR.

- -SRC INCR is set to INCR.
- -FC field is programmed with peripheral to memory flow control mode.
- -Both SRC\_DSCR and DST\_DSCR are set (descriptor fetch is disabled) or Next descriptor location points to 0.
- -DIF and SIF are set with their respective layer ID. If SIF is different from DIF, the DMA Controller is able to prefetch data and write HSMCI simultaneously.
- p. Configure the LLI B(n).DMAC CFGx memory location for Channel x as follows:
  - -FIFOCFG defines the watermark of the DMAC channel FIFO.
  - -SRC\_H2SEL is set to true to enable hardware handshaking on the destination.
  - -SRC\_PER is programmed with the hardware handshaking ID of the targeted HSMCI Host Controller
- q. Program LLI\_B(n).DMAC\_DSCR with address of descriptor LLI\_W(n+1). If LLI\_B(n) is the last descriptor, then program LLI\_B(n).DMAC\_DSCR with 0.
- r. Program the DMAC\_CTRLBx register for Channel x with 0. Its content is updated with the LLI Fetch operation.
- s. Program DMAC\_DSCRx with the address of LLI\_W(0) if *block\_length* is greater than 4 else with address of LLI\_B(0).
- t. Enable Channel x writing one to DMAC\_CHER[x]. The DMAC is ready and waiting for request.
- 4. Enable DMADONE interrupt in the HSMCI\_IER.
- 5. Poll CBTC[x] bit in the DMAC\_EBCISR.
- 6. If a new list of buffers shall be transferred, repeat step 7. Check and handle HSMCI errors.
- 7. Poll FIFOEMPTY field in the HSMCI\_SR.
- 8. Send The STOP\_TRANSMISSION command writing HSMCI\_ARG then HSMCI\_CMDR.
- 9. Wait for XFRDONE in the HSMCI\_SR.

### 33.8.8.3 Block Length is Not a Multiple of 4 (HSMCI\_DMA.ROPT = 1)

One DMA Transfer descriptor is used to perform the HSMCI block transfer, the DMA writes a value rounded up to the nearest multiple of 4.

- 1. Use the previous step to configure the HSMCI to perform a READ MULTIPLE BLOCK.
- 2. Set the ROPT bit in the HSMCI DMA register.
- 3. Issue a READ\_MULTIPLE\_BLOCK command.
- 4. Program the DMA controller to use a list of descriptors:
  - a. Read the channel register to choose an available (disabled) channel.
  - b. Clear any pending interrupts on the channel from the previous DMAC transfer by reading the DMAC\_EBCISR.
  - c. Program the channel registers in the Memory with the first descriptor. This descriptor will be word oriented. This descriptor is referred to as LLI\_W(n), standing for LLI word oriented transfer for block *n*.
  - d. The LLI\_W(n).DMAC\_SADDRx field in memory must be set with the starting address of the HSMCI\_FIFO address.
  - e. The LLI W(n).DMAC DADDRx field in the memory must be word aligned.
  - f. Configure the fields of LLI\_W(n).DMAC\_CTRLAx as follows:
    - -DST\_WIDTH is set to WORD.
    - –SRC\_WIDTH is set to WORD.
    - –SCSIZE must be set according to the value of HSMCI\_DMA.CHKSIZE.
    - -BTSIZE is programmed with CEILING(block length/4).

- g. Configure the fields of LLI\_W(n).DMAC\_CTRLBx as follows:
  - -DST INCR is set to INCR
  - -SRC\_INCR is set to INCR
  - -FC field is programmed with peripheral to memory flow control mode.
  - -SRC DSCR is configured to 0. (descriptor fetch is enabled for the SRC)
  - -DST\_DSCR is set to TRUE. (descriptor fetch is disabled for the DST)
  - -DIF and SIF are set with their respective layer ID. If SIF is different from DIF, the DMA Controller is able to prefetch data and write HSMCI simultaneously.
- h. Configure the fields of LLI\_W(n).DMAC\_CFGx for Channel x as follows:
  - -FIFOCFG defines the watermark of the DMA channel FIFO.
  - -DST\_REP is set to zero. Address are contiguous.
  - -SRC\_H2SEL is set to true to enable hardware handshaking on the destination.
  - -SRC\_PER is programmed with the hardware handshaking ID of the targeted HSMCI Host Controller.
- i. Program LLI\_W(n).DMAC\_DSCRx with the address of LLI\_W(n+1) descriptor. And set the DSCRx\_IF to the AHB Layer ID. This operation actually links descriptors together. If LLI\_W(n) is the last descriptor then LLI\_W(n).DMAC\_DSCRx points to 0.
- j. Program the DMAC\_CTRLBx register for Channel x with 0. Its content is updated with the LLI Fetch operation.
- k. Program the DMAC\_DSCRx for Channel x with the address of LLI\_W(0).
- I. Enable Channel x writing one to DMAC\_CHER[x]. The DMAC is ready and waiting for request.
- 5. Poll CBTC[x] bit in the DMAC EBCISR.
- 6. If a new list of buffers shall be transferred repeat step 7. Check and handle HSMCI errors.
- 7. Poll FIFOEMPTY field in the HSMCI SR.
- 8. Send The STOP\_TRANSMISSION command writing the HSMCI\_ARG then the HSMCI\_CMDR.
- 9. Wait for XFRDONE in the HSMCI SR.

## 33.9 SD/SDIO Card Operation

The High Speed MultiMedia Card Interface allows processing of SD Memory (Secure Digital Memory Card) and SDIO (SD Input Output) Card commands.

SD/SDIO cards are based on the MultiMedia Card (MMC) format, but are physically slightly thicker and feature higher data transfer rates, a lock switch on the side to prevent accidental overwriting and security features. The physical form factor, pin assignment and data transfer protocol are forward-compatible with the High Speed MultiMedia Card with some additions. SD slots can actually be used for more than flash memory cards. Devices that support SDIO can use small devices designed for the SD form factor, such as GPS receivers, Wi-Fi or Bluetooth adapters, modems, barcode readers, IrDA adapters, FM radio tuners, RFID readers, digital cameras and more.

SD/SDIO is covered by numerous patents and trademarks, and licensing is only available through the Secure Digital Card Association.

The SD/SDIO Card communication is based on a 9-pin interface (Clock, Command, 4 x Data and 3 x Power lines). The communication protocol is defined as a part of this specification. The main difference between the SD/SDIO Card and the High Speed MultiMedia Card is the initialization process.

The SD/SDIO Card Register (HSMCI\_SDCR) allows selection of the Card Slot and the data bus width.

The SD/SDIO Card bus allows dynamic configuration of the number of data lines. After power up, by default, the SD/SDIO Card uses only DAT0 for data transfer. After initialization, the host can change the bus width (number of active data lines).

### 33.9.1 SDIO Data Transfer Type

SDIO cards may transfer data in either a multi-byte (1 to 512 bytes) or an optional block format (1 to 511 blocks), while the SD memory cards are fixed in the block transfer mode. The TRTYP field in the HSMCI Command Register (HSMCI\_CMDR) allows to choose between SDIO Byte or SDIO Block transfer.

The number of bytes/blocks to transfer is set through the BCNT field in the HSMCI Block Register (HSMCI\_BLKR). In SDIO Block mode, the field BLKLEN must be set to the data block size while this field is not used in SDIO Byte mode.

An SDIO Card can have multiple I/O or combined I/O and memory (called Combo Card). Within a multi-function SDIO or a Combo card, there are multiple devices (I/O and memory) that share access to the SD bus. In order to allow the sharing of access to the host among multiple devices, SDIO and combo cards can implement the optional concept of suspend/resume (Refer to the SDIO Specification for more details). To send a suspend or a resume command, the host must set the SDIO Special Command field (IOSPCMD) in the HSMCI Command Register.

#### 33.9.2 SDIO Interrupts

Each function within an SDIO or Combo card may implement interrupts (Refer to the SDIO Specification for more details). In order to allow the SDIO card to interrupt the host, an interrupt function is added to a pin on the DAT[1] line to signal the card's interrupt to the host. An SDIO interrupt on each slot can be enabled through the HSMCI Interrupt Enable Register. The SDIO interrupt is sampled regardless of the currently selected slot.

## 33.10 CE-ATA Operation

CE-ATA maps the streamlined ATA command set onto the MMC interface. The ATA task file is mapped onto MMC register space.

CE-ATA utilizes five MMC commands:

- GO IDLE STATE (CMD0): used for hard reset.
- STOP TRANSMISSION (CMD12): causes the ATA command currently executing to be aborted.
- FAST IO (CMD39): Used for single register access to the ATA taskfile registers, 8-bit access only.
- RW\_MULTIPLE\_REGISTERS (CMD60): used to issue an ATA command or to access the control/status registers.
- RW\_MULTIPLE\_BLOCK (CMD61): used to transfer data for an ATA command.

CE-ATA utilizes the same MMC command sequences for initialization as traditional MMC devices.

### 33.10.1 Executing an ATA Polling Command

- 1. Issue READ\_DMA\_EXT with RW\_MULTIPLE\_REGISTER (CMD60) for 8 KB of DATA.
- 2. Read the ATA status register until DRQ is set.
- 3. Issue RW\_MULTIPLE\_BLOCK (CMD61) to transfer DATA.
- 4. Read the ATA status register until DRQ && BSY are configured to 0.

## 33.10.2 Executing an ATA Interrupt Command

- 1. Issue READ\_DMA\_EXT with RW\_MULTIPLE\_REGISTER (CMD60) for 8 KB of DATA with nIEN field set to zero to enable the command completion signal in the device.
- 2. Issue RW\_MULTIPLE\_BLOCK (CMD61) to transfer DATA.
- 3. Wait for Completion Signal Received Interrupt.

### 33.10.3 Aborting an ATA Command

If the host needs to abort an ATA command prior to the completion signal it must send a special command to avoid potential collision on the command line. The SPCMD field of the HSMCI\_CMDR must be set to 3 to issue the CE-ATA completion Signal Disable Command.

#### 33.10.4 CE-ATA Error Recovery

Several methods of ATA command failure may occur, including:

- No response to an MMC command, such as RW MULTIPLE REGISTER (CMD60).
- CRC is invalid for an MMC command or response.
- CRC16 is invalid for an MMC data packet.
- ATA Status register reflects an error by setting the ERR bit to one.
- The command completion signal does not arrive within a host specified time out period.

Error conditions are expected to happen infrequently. Thus, a robust error recovery mechanism may be used for each error event. The recommended error recovery procedure after a timeout is:

- Issue the command completion signal disable if nIEN was cleared to zero and the RW\_MULTIPLE\_BLOCK (CMD61) response has been received.
- Issue STOP\_TRANSMISSION (CMD12) and successfully receive the R1 response.
- Issue a software reset to the CE-ATA device using FAST\_IO (CMD39).

If STOP\_TRANMISSION (CMD12) is successful, then the device is again ready for ATA commands. However, if the error recovery procedure does not work as expected or there is another timeout, the next step is to issue GO\_IDLE\_STATE (CMD0) to the device. GO\_IDLE\_STATE (CMD0) is a hard reset to the device and completely resets all device states.

Note that after issuing GO\_IDLE\_STATE (CMD0), all device initialization needs to be completed again. If the CE-ATA device completes all MMC commands correctly but fails the ATA command with the ERR bit set in the ATA Status register, no error recovery action is required. The ATA command itself failed implying that the device could not complete the action requested, however, there was no communication or protocol failure. After the device signals an error by setting the ERR bit to one in the ATA Status register, the host may attempt to retry the command.

## 33.11 HSMCI Boot Operation Mode

In boot operation mode, the processor can read boot data from the slave (MMC device) by keeping the CMD line low after power-on before issuing CMD1. The data can be read from either the boot area or user area, depending on register setting.

#### 33.11.1 Boot Procedure, Processor Mode

- Configure the HSMCI data bus width programming SDCBUS Field in the HSMCI\_SDCR. The BOOT\_BUS\_WIDTH field located in the device Extended CSD register must be set accordingly.
- 2. Set the byte count to 512 bytes and the block count to the desired number of blocks, writing BLKLEN and BCNT fields of the HSMCI\_BLKR.
- 3. Issue the Boot Operation Request command by writing to the HSMCI\_CMDR with SPCMD field set to BOOTREQ, TRDIR set to READ and TRCMD set to "start data transfer".
- 4. The BOOT\_ACK field located in the HSMCI\_CMDR must be set to one, if the BOOT\_ACK field of the MMC device located in the Extended CSD register is set to one.
- 5. Host processor can copy boot data sequentially as soon as the RXRDY flag is asserted.
- 6. When Data transfer is completed, host processor shall terminate the boot stream by writing the HSMCI\_CMDR with SPCMD field set to BOOTEND.

#### 33.11.2 Boot Procedure DMA Mode

- 1. Configure the HSMCI data bus width by programming SDCBUS Field in the HSMCI\_SDCR. The BOOT\_BUS\_WIDTH field in the device Extended CSD register must be set accordingly.
- 2. Set the byte count to 512 bytes and the block count to the desired number of blocks by writing BLKLEN and BCNT fields of the HSMCI\_BLKR.
- 3. Enable DMA transfer in the HSMCI\_DMA register.
- 4. Configure DMA controller, program the total amount of data to be transferred and enable the relevant channel.
- 5. Issue the Boot Operation Request command by writing to the HSMCI\_CMDR with SPCND set to BOOTREQ, TRDIR set to READ and TRCMD set to "start data transfer".
- DMA controller copies the boot partition to the memory.
- 7. When DMA transfer is completed, host processor shall terminate the boot stream by writing the HSMCI\_CMDR with SPCMD field set to BOOTEND.

## 33.12 HSMCI Transfer Done Timings

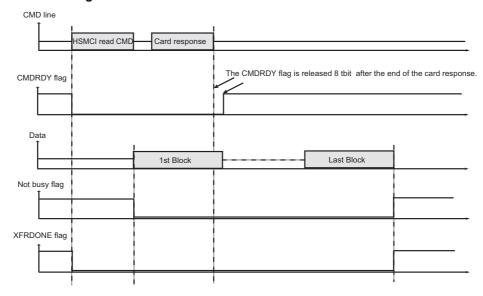

#### 33.12.1 Definition

The XFRDONE flag in the HSMCI\_SR indicates exactly when the read or write sequence is finished.

#### 33.12.2 Read Access

During a read access, the XFRDONE flag behaves as shown in Figure 33-11.

Figure 33-11. XFRDONE During a Read Access

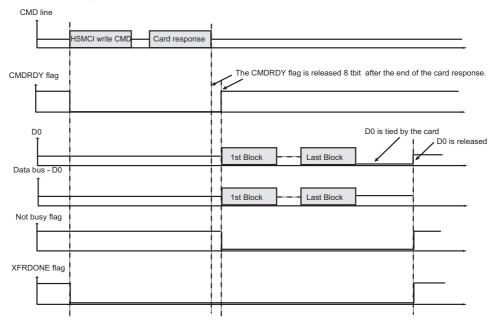

## 33.12.3 Write Access

During a write access, the XFRDONE flag behaves as shown in Figure 33-12.

Figure 33-12. XFRDONE During a Write Access

## 33.13 Register Write Protection

To prevent any single software error from corrupting HSMCI behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the HSMCI Write Protection Mode Register (HSMCI\_WPMR).

If a write access to a write-protected register is detected, the WPVS bit in the HSMCI Write Protection Status Register (HSMCI\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the HSMCI\_WPSR.

The following registers can be protected:

- HSMCI Mode Register
- HSMCI Data Timeout Register
- HSMCI SDCard/SDIO Register
- HSMCI Completion Signal Timeout Register
- HSMCI DMA Configuration Register
- HSMCI Configuration Register

# 33.14 High Speed MultiMedia Card Interface (HSMCI) User Interface

Table 33-8. Register Mapping

| Offset      | Register                           | Name          | Access     | Reset  |
|-------------|------------------------------------|---------------|------------|--------|
| 0x00        | Control Register                   | HSMCI_CR      | Write-only | _      |

| 0x48        | Interrupt Disable Register         | HSMCI_IDR     | Write-only | _      |
| 0x4C        | Interrupt Mask Register            | HSMCI_IMR     | Read-only  | 0x0    |
| 0x50        | DMA Configuration Register         | HSMCI_DMA     | Read/Write | 0x00   |
| 0x54        | Configuration Register             | HSMCI_CFG     | Read/Write | 0x00   |
| 0x58-0xE0   | Reserved                           | _             | _          | _      |
| 0xE4        | Write Protection Mode Register     | HSMCI_WPMR    | Read/Write | _      |
| 0xE8        | Write Protection Status Register   | HSMCI_WPSR    | Read-only  | _      |
| 0xEC-0xFC   | Reserved                           | -             | _          | _      |
| 0x100-0x1FC | Reserved                           | _             | _          | _      |
| 0x200       | FIFO Memory Aperture0              | HSMCI_FIFO0   | Read/Write | 0x0    |
|             |                                    |               |            |        |
| 0x5FC       | FIFO Memory Aperture255            | HSMCI_FIFO255 | Read/Write | 0x0    |

Notes: 1. The Response Register can be read by N accesses at the same HSMCI\_RSPR or at consecutive addresses (0x20 to 0x2C). N depends on the size of the response.

## 33.14.1 HSMCI Control Register

Name: HSMCI\_CR

**Address:** 0xF0008000 (0), 0xF000C000 (1)

Access: Write-only

| 31    | 30 | 29 | 28 | 27     | 26    | 25     | 24    |
|-------|----|----|----|--------|-------|--------|-------|
| _     | _  | _  | _  | _      | _     | _      | _     |
| 23    | 22 | 21 | 20 | 19     | 18    | 17     | 16    |
| _     | _  | _  | _  | _      | -     | -      | _     |
| 15    | 14 | 13 | 12 | 11     | 10    | 9      | 8     |
| _     | _  | _  | _  | _      | -     | -      | _     |
| 7     | 6  | 5  | 4  | 3      | 2     | 1      | 0     |
| SWRST | _  | _  | _  | PWSDIS | PWSEN | MCIDIS | MCIEN |

#### • MCIEN: Multi-Media Interface Enable

0: No effect.

1: Enables the Multi-Media Interface if MCDIS is 0.

### • MCIDIS: Multi-Media Interface Disable

0: No effect.

1: Disables the Multi-Media Interface.

#### • PWSEN: Power Save Mode Enable

0: No effect.

1: Enables the Power Saving Mode if PWSDIS is 0.

Warning: Before enabling this mode, the user must set a value different from 0 in the PWSDIV field of the HSMCI\_MR.

#### • PWSDIS: Power Save Mode Disable

0: No effect.

1: Disables the Power Saving Mode.

### • SWRST: Software Reset

0: No effect.

1: Resets the HSMCI. A software triggered hardware reset of the HSMCI is performed.

### 33.14.2 HSMCI Mode Register

Name: HSMCI\_MR

**Address:** 0xF0008004 (0), 0xF000C004 (1)

Access: Read/Write

| 31 | 30     | 29    | 28      | 27      | 26 | 25     | 24     |  |
|----|--------|-------|---------|---------|----|--------|--------|--|
| _  | _      | -     | _       | _       | _  | _      | _      |  |
| 23 | 22     | 21    | 20      | 19      | 18 | 17     | 16     |  |
| _  | _      | _     | _       | _       | _  | _      | CLKODD |  |
| 15 | 14     | 13    | 12      | 11      | 10 | 9      | 8      |  |
| _  | PADV   | FBYTE | WRPROOF | RDPROOF |    | PWSDIV |        |  |
| 7  | 6      | 5     | 4       | 3       | 2  | 1      | 0      |  |
|    | CLKDIV |       |         |         |    |        |        |  |

This register can only be written if the WPEN bit is cleared in the HSMCI Write Protection Mode Register.

### • CLKDIV: Clock Divider

High Speed MultiMedia Card Interface clock (MCCK or HSMCI\_CK) is Master Clock (MCK) divided by ({CLKDIV,CLKODD}+2).

### • PWSDIV: Power Saving Divider

High Speed MultiMedia Card Interface clock is divided by 2<sup>(PWSDIV)</sup> + 1 when entering Power Saving Mode.

<u>Warning:</u> This value must be different from 0 before enabling the Power Save Mode in the HSMCI\_CR (HSMCI\_PWSEN bit).

#### RDPROOF: Read Proof Enable

Enabling Read Proof allows to stop the HSMCI Clock during read access if the internal FIFO is full. This will guarantee data integrity, not bandwidth.

0: Disables Read Proof.

1: Enables Read Proof.

### • WRPROOF: Write Proof Enable

Enabling Write Proof allows to stop the HSMCI Clock during write access if the internal FIFO is full. This will guarantee data integrity, not bandwidth.

0: Disables Write Proof.

1: Enables Write Proof.

#### • FBYTE: Force Byte Transfer

Enabling Force Byte Transfer allow byte transfers, so that transfer of blocks with a size different from modulo 4 can be supported.

Warning: BLKLEN value depends on FBYTE.

0: Disables Force Byte Transfer.

1: Enables Force Byte Transfer.

## • PADV: Padding Value

0: 0x00 value is used when padding data in write transfer.

1: 0xFF value is used when padding data in write transfer.

PADV may be only in manual transfer.

### · CLKODD: Clock divider is odd

This bit is the least significant bit of the clock divider and indicates the clock divider parity.

## 33.14.3 HSMCI Data Timeout Register

Name: HSMCI\_DTOR

**Address:** 0xF0008008 (0), 0xF000C008 (1)

Access: Read/Write

| 31 | 30 | 29     | 28 | 27 | 26  | 25  | 24 |
|----|----|--------|----|----|-----|-----|----|
| _  | _  | _      | _  | _  | _   | _   | _  |
| 23 | 22 | 21     | 20 | 19 | 18  | 17  | 16 |
| _  | _  | _      | _  | -  | _   | _   | _  |
| 15 | 14 | 13     | 12 | 11 | 10  | 9   | 8  |
| _  | _  | _      | _  | _  | _   | _   | _  |
| 7  | 6  | 5      | 4  | 3  | 2   | 1   | 0  |
| _  |    | DTOMUL |    |    | DTO | CYC |    |

This register can only be written if the WPEN bit is cleared in the HSMCI Write Protection Mode Register.

### • DTOCYC: Data Timeout Cycle Number

This field determines the maximum number of Master Clock cycles that the HSMCI waits between two data block transfers. It equals (DTOCYC x Multiplier).

## • DTOMUL: Data Timeout Multiplier

| Value | Name    | Description      |
|-------|---------|------------------|
| 0     | 1       | DTOCYC           |
| 1     | 16      | DTOCYC x 16      |
| 2     | 128     | DTOCYC x 128     |
| 3     | 256     | DTOCYC x 256     |
| 4     | 1024    | DTOCYC x 1024    |
| 5     | 4096    | DTOCYC x 4096    |
| 6     | 65536   | DTOCYC x 65536   |
| 7     | 1048576 | DTOCYC x 1048576 |

If the data time-out set by DTOCYC and DTOMUL has been exceeded, the Data Time-out Error flag (DTOE) in the HSMCI Status Register (HSMCI\_SR) rises.

## 33.14.4 HSMCI SDCard/SDIO Register

Name: HSMCI\_SDCR

**Address:** 0xF000800C (0), 0xF000C00C (1)

Access: Read/Write

| 31     | 30 | 29 | 28 | 27 | 26 | 25  | 24  |
|--------|----|----|----|----|----|-----|-----|
| _      | _  | _  | -  | -  | ı  | -   | _   |
| 23     | 22 | 21 | 20 | 19 | 18 | 17  | 16  |
| _      | _  | _  | -  | -  | 1  | -   | _   |
| 15     | 14 | 13 | 12 | 11 | 10 | 9   | 8   |
| _      | _  | _  | -  | -  | 1  | -   | _   |
| 7      | 6  | 5  | 4  | 3  | 2  | 1   | 0   |
| SDCBUS |    | _  | _  | _  | _  | SDC | SEL |

This register can only be written if the WPEN bit is cleared in the HSMCI Write Protection Mode Register.

## • SDCSEL: SDCard/SDIO Slot

| Value | Name  | Description         |
|-------|-------|---------------------|
| 0     | SLOTA | Slot A is selected. |
| 1     | SLOTB | -                   |
| 2     | SLOTC | -                   |
| 3     | SLOTD | _                   |

## • SDCBUS: SDCard/SDIO Bus Width

| Value | Name | Description |
|-------|------|-------------|
| 0     | 1    | 1 bit       |
| 1     | _    | Reserved    |
| 2     | 4    | 4 bits      |
| 3     | 8    | 8 bits      |

## 33.14.5 HSMCI Argument Register

Name: HSMCI\_ARGR

**Address:** 0xF0008010 (0), 0xF000C010 (1)

Access: Read/Write

| 31 | 30  | 29 | 28 | 27 | 26 | 25 | 24 |  |  |  |  |
|----|-----|----|----|----|----|----|----|--|--|--|--|
|    | ARG |    |    |    |    |    |    |  |  |  |  |
| 23 | 22  | 21 | 20 | 19 | 18 | 17 | 16 |  |  |  |  |
|    | ARG |    |    |    |    |    |    |  |  |  |  |
| 15 | 14  | 13 | 12 | 11 | 10 | 9  | 8  |  |  |  |  |

• ARG: Command Argument

## 33.14.6 HSMCI Command Register

Name: HSMCI\_CMDR

**Address:** 0xF0008014 (0), 0xF000C014 (1)

Access: Write-only

| 31     | 30 | 29    | 28     | 27       | 26          | 25      | 24 |
|--------|----|-------|--------|----------|-------------|---------|----|
| _      | _  | _     | _      | BOOT_ACK | ATACS       | IOSPCMD |    |
| 23     | 22 | 21    | 20     | 19       | 18          | 17      | 16 |
| _      | _  |       | TRTYP  |          | TRDIR TRCMD |         |    |
| 15     | 14 | 13    | 12     | 11       | 10          | 9       | 8  |
| _      | _  | _     | MAXLAT | OPDCMD   | SPCMD       |         |    |
| 7      | 6  | 5     | 4      | 3        | 2           | 1       | 0  |
| RSPTYP |    | CMDNB |        |          |             |         |    |

This register is write-protected while CMDRDY is 0 in HSMCI\_SR. If an Interrupt command is sent, this register is only writable by an interrupt response (field SPCMD). This means that the current command execution cannot be interrupted or modified.

### • CMDNB: Command Number

This is the command index.

## • RSPTYP: Response Type

| Value | Name    | Description       |
|-------|---------|-------------------|
| 0     | NORESP  | No response       |
| 1     | 48_BIT  | 48-bit response   |
| 2     | 136_BIT | 136-bit response  |
| 3     | R1B     | R1b response type |

### • SPCMD: Special Command

| Value | Name    | Description   |
|-------|---------|---|
| 0     | STD     | Not a special CMD.  |
| 1     | INIT    | Initialization CMD: 74 clock cycles for initialization sequence.  |
| 2     | SYNC    | Synchronized CMD: Wait for the end of the current data block transfer before sending the pending command.   |
| 3     | CE_ATA  | CE-ATA Completion Signal disable Command.  The host cancels the ability for the device to return a command completion signal on the command line. |
| 4     | IT_CMD  | Interrupt command: Corresponds to the Interrupt Mode (CMD40).   |
| 5     | IT_RESP | Interrupt response: Corresponds to the Interrupt Mode (CMD40).  |
| 6     | BOR     | Boot Operation Request. Start a boot operation mode, the host processor can read boot data from the MMC device directly.                          |
| 7     | EBO     | End Boot Operation. This command allows the host processor to terminate the boot operation mode.  |

### • OPDCMD: Open Drain Command

0 (PUSHPULL): Push pull command.

1 (OPENDRAIN): Open drain command.

#### MAXLAT: Max Latency for Command to Response

0 (5): 5-cycle max latency.

1 (64): 64-cycle max latency.

#### • TRCMD: Transfer Command

| Value | Name           | Description         |
|-------|----------------|---------------------|
| 0     | NO_DATA        | No data transfer    |
| 1     | START_DAT<br>A | Start data transfer |
| 2     | STOP_DATA      | Stop data transfer  |
| 3     | _              | Reserved            |

## • TRDIR: Transfer Direction

0 (WRITE): Write. 1 (READ): Read.

## • TRTYP: Transfer Type

| Value | Name     | Description                |
|-------|----------|----------------------------|
| 0     | SINGLE   | MMC/SD Card Single Block   |
| 1     | MULTIPLE | MMC/SD Card Multiple Block |
| 2     | STREAM   | MMC Stream                 |
| 4     | BYTE     | SDIO Byte                  |
| 5     | BLOCK    | SDIO Block                 |

### • IOSPCMD: SDIO Special Command

| Value | Name    | Description                 |
|-------|---------|-----------------------------|
| 0     | STD     | Not an SDIO Special Command |
| 1     | SUSPEND | SDIO Suspend Command        |
| 2     | RESUME  | SDIO Resume Command         |

### ATACS: ATA with Command Completion Signal

0 (NORMAL): Normal operation mode.

1 (COMPLETION): This bit indicates that a completion signal is expected within a programmed amount of time (HSMCI\_CSTOR).

#### BOOT\_ACK: Boot Operation Acknowledge

The master can choose to receive the boot acknowledge from the slave when a Boot Request command is issued. When set to one this field indicates that a Boot acknowledge is expected within a programmable amount of time defined with DTOMUL and DTOCYC fields located in the HSMCI\_DTOR. If the acknowledge pattern is not received then an acknowledge timeout error is raised. If the acknowledge pattern is corrupted then an acknowledge pattern error is set.

### 33.14.7 HSMCI Block Register

Name: HSMCI\_BLKR

**Address:** 0xF0008018 (0), 0xF000C018 (1)

Access: Read/Write

| 31   | 30     | 29 | 28 | 27 | 26 | 25 | 24 |  |  |  |  |
|------|--------|----|----|----|----|----|----|--|--|--|--|
|      | BLKLEN |    |    |    |    |    |    |  |  |  |  |
| 23   | 22     | 21 | 20 | 19 | 18 | 17 | 16 |  |  |  |  |
|      | BLKLEN |    |    |    |    |    |    |  |  |  |  |
| 15   | 14     | 13 | 12 | 11 | 10 | 9  | 8  |  |  |  |  |
|      | BCNT   |    |    |    |    |    |    |  |  |  |  |
| 7    | 6      | 5  | 4  | 3  | 2  | 1  | 0  |  |  |  |  |
| BCNT |        |    |    |    |    |    |    |  |  |  |  |

#### BCNT: MMC/SDIO Block Count - SDIO Byte Count

This field determines the number of data byte(s) or block(s) to transfer.

The transfer data type and the authorized values for BCNT field are determined by the TRTYP field in the HSMCI Command Register (HSMCI\_CMDR).

When TRTYP = 1 (MMC/SDCARD Multiple Block), BCNT can be programmed from 1 to 65535, 0 corresponds to an infinite block transfer.

When TRTYP = 4 (SDIO Byte), BCNT can be programmed from 1 to 511, 0 corresponds to 512-byte transfer. Values in range 512 to 65536 are forbidden.

When TRTYP = 5 (SDIO Block), BCNT can be programmed from 1 to 511, 0 corresponds to an infinite block transfer. Values in range 512 to 65536 are forbidden.

<u>Warning:</u> In SDIO Byte and Block modes (TRTYP = 4 or 5), writing the 7 last bits of BCNT field with a value which differs from 0 is forbidden and may lead to unpredictable results.

#### · BLKLEN: Data Block Length

This field determines the size of the data block.

Bits 16 and 17 must be configured to 0 if FBYTE is disabled.

Note: In SDIO Byte mode, BLKLEN field is not used.

## 33.14.8 HSMCI Completion Signal Timeout Register

Name: HSMCI\_CSTOR

**Address:** 0xF000801C (0), 0xF000C01C (1)

**Access:** Read/Write

| 31 | 30      | 29 | 28 | 27      | 26 | 25 | 24 |
|----|---------|----|----|---------|----|----|----|
| _  | _       | _  | _  | _       | _  | _  | _  |
| 23 | 22      | 21 | 20 | 19      | 18 | 17 | 16 |
| _  | -       | -  | _  | _       | _  | _  | _  |
| 15 | 14      | 13 | 12 | 11      | 10 | 9  | 8  |
| _  | _       | _  | _  | _       | _  | _  | _  |
| 7  | 6       | 5  | 4  | 3       | 2  | 1  | 0  |
| _  | CSTOMUL |    |    | CSTOCYC |    |    |    |

This register can only be written if the WPEN bit is cleared in the HSMCI Write Protection Mode Register.

#### CSTOCYC: Completion Signal Timeout Cycle Number

This field determines the maximum number of Master Clock cycles that the HSMCI waits between two data block transfers. Its value is calculated by (CSTOCYC x Multiplier).

## • CSTOMUL: Completion Signal Timeout Multiplier

This field determines the maximum number of Master Clock cycles that the HSMCI waits between two data block transfers. Its value is calculated by (CSTOCYC x Multiplier).

These fields determine the maximum number of Master Clock cycles that the HSMCI waits between the end of the data transfer and the assertion of the completion signal. The data transfer comprises data phase and the optional busy phase. If a non-DATA ATA command is issued, the HSMCI starts waiting immediately after the end of the response until the completion signal.

Multiplier is defined by CSTOMUL as shown in the following table:

| Value | Name    | Description       |
|-------|---------|-------------------|
| 0     | 1       | CSTOCYC x 1       |
| 1     | 16      | CSTOCYC x 16      |
| 2     | 128     | CSTOCYC x 128     |
| 3     | 256     | CSTOCYC x 256     |
| 4     | 1024    | CSTOCYC x 1024    |
| 5     | 4096    | CSTOCYC x 4096    |
| 6     | 65536   | CSTOCYC x 65536   |
| 7     | 1048576 | CSTOCYC x 1048576 |

If the data time-out set by CSTOCYC and CSTOMUL has been exceeded, the Completion Signal Time-out Error flag (CSTOE) in the HSMCI Status Register (HSMCI\_SR) rises.

## 33.14.9 HSMCI Response Register

Name: HSMCI\_RSPR

**Address:** 0xF0008020 (0), 0xF000C020 (1)

Access: Read-only

| 31 | 30  | 29 | 28 | 27 | 26 | 25 | 24 |  |  |  |
|----|-----|----|----|----|----|----|----|--|--|--|
|    | RSP |    |    |    |    |    |    |  |  |  |
| 23 | 22  | 21 | 20 | 19 | 18 | 17 | 16 |  |  |  |
|    | RSP |    |    |    |    |    |    |  |  |  |
| 15 | 14  | 13 | 12 | 11 | 10 | 9  | 8  |  |  |  |
|    | RSP |    |    |    |    |    |    |  |  |  |
| 7  | 6   | 5  | 4  | 3  | 2  | 1  | 0  |  |  |  |
|    | RSP |    |    |    |    |    |    |  |  |  |

## • RSP: Response

Note: 1. The response register can be read by N accesses at the same HSMCI\_RSPR or at consecutive addresses (0x20 to 0x2C). N depends on the size of the response.

## 33.14.10 HSMCI Receive Data Register

Name: HSMCI\_RDR

**Address:** 0xF0008030 (0), 0xF000C030 (1)

Access: Read-only

| 31 | 30   | 29 | 28 | 27 | 26 | 25 | 24 |  |  |  |
|----|------|----|----|----|----|----|----|--|--|--|
|    | DATA |    |    |    |    |    |    |  |  |  |
| 23 | 22   | 21 | 20 | 19 | 18 | 17 | 16 |  |  |  |
|    | DATA |    |    |    |    |    |    |  |  |  |
| 15 | 14   | 13 | 12 | 11 | 10 | 9  | 8  |  |  |  |
|    | DATA |    |    |    |    |    |    |  |  |  |
| 7  | 6    | 5  | 4  | 3  | 2  | 1  | 0  |  |  |  |
|    | DATA |    |    |    |    |    |    |  |  |  |

• DATA: Data to Read

# 33.14.11 HSMCI Transmit Data Register

Name: HSMCI\_TDR

**Address:** 0xF0008034 (0), 0xF000C034 (1)

Access: Write-only

| 31 | 30   | 29 | 28 | 27  | 26 | 25 | 24 |  |  |  |
|----|------|----|----|-----|----|----|----|--|--|--|
|    |      |    | DA | ιΤΑ |    |    |    |  |  |  |
| 23 | 22   | 21 | 20 | 19  | 18 | 17 | 16 |  |  |  |
|    | DATA |    |    |     |    |    |    |  |  |  |

|    | DATA |    |    |     |    |    |    |  |  |  |

• DATA: Data to Write

# 33.14.12 HSMCI Status Register

Name: HSMCI\_SR

Address: 0xF0008040 (0), 0xF000C040 (1)

Access: Read-only

| 31    | 30   | 29      | 28       | 27      | 26        | 25      | 24       |
|-------|------|---------|----------|---------|-----------|---------|----------|
| UNRE  | OVRE | ACKRCVE | ACKRCV   | XFRDONE | FIFOEMPTY | DMADONE | BLKOVRE  |
| 23    | 22   | 21      | 20       | 19      | 18        | 17      | 16       |
| CSTOE | DTOE | DCRCE   | RTOE     | RENDE   | RCRCE     | RDIRE   | RINDE    |
| 15    | 14   | 13      | 12       | 11      | 10        | 9       | 8        |
| _     | _    | CSRCV   | SDIOWAIT | _       | _         | -       | SDIOIRQA |
| 7     | 6    | 5       | 4        | 3       | 2         | 1       | 0        |
| _     | _    | NOTBUSY | DTIP     | BLKE    | TXRDY     | RXRDY   | CMDRDY   |

#### CMDRDY: Command Ready (cleared by writing in HSMCI\_CMDR)

0: A command is in progress.

1: The last command has been sent.

# • RXRDY: Receiver Ready (cleared by reading HSMCI\_RDR)

0: Data has not yet been received since the last read of HSMCI\_RDR.

1: Data has been received since the last read of HSMCI\_RDR.

#### TXRDY: Transmit Ready (cleared by writing in HSMCI\_TDR)

0: The last data written in HSMCI\_TDR has not yet been transferred in the Shift Register.

1: The last data written in HSMCI\_TDR has been transferred in the Shift Register.

#### BLKE: Data Block Ended (cleared on read)

This flag must be used only for Write Operations.

0: A data block transfer is not yet finished.

1: A data block transfer has ended, including the CRC16 Status transmission. The flag is set for each transmitted CRC Status.

Refer to the MMC or SD Specification for more details concerning the CRC Status.

#### DTIP: Data Transfer in Progress (cleared at the end of CRC16 calculation)

0: No data transfer in progress.

1: The current data transfer is still in progress, including CRC16 calculation.

#### NOTBUSY: HSMCI Not Busy

A block write operation uses a simple busy signalling of the write operation duration on the data (DAT0) line: during a data transfer block, if the card does not have a free data receive buffer, the card indicates this condition by pulling down the data line (DAT0) to LOW. The card stops pulling down the data line as soon as at least one receive buffer for the defined data transfer block length becomes free.

Refer to the MMC or SD Specification for more details concerning the busy behavior.

For all the read operations, the NOTBUSY flag is cleared at the end of the host command.

For the Infinite Read Multiple Blocks, the NOTBUSY flag is set at the end of the STOP\_TRANSMISSION host command (CMD12).

For the Single Block Reads, the NOTBUSY flag is set at the end of the data read block.

For the Multiple Block Reads with predefined block count, the NOTBUSY flag is set at the end of the last received data block.

The NOTBUSY flag allows to deal with these different states.

- 0: The HSMCI is not ready for new data transfer. Cleared at the end of the card response.
- 1: The HSMCI is ready for new data transfer. Set when the busy state on the data line has ended. This corresponds to a free internal data receive buffer of the card.
- SDIOIRQA: SDIO Interrupt for Slot A (cleared on read)
- 0: No interrupt detected on SDIO Slot A.
- 1: An SDIO Interrupt on Slot A occurred.
- SDIOWAIT: SDIO Read Wait Operation Status
- 0: Normal Bus operation.
- 1: The data bus has entered IO wait state.
- CSRCV: CE-ATA Completion Signal Received (cleared on read)
- 0: No completion signal received since last status read operation.
- 1: The device has issued a command completion signal on the command line.
- RINDE: Response Index Error (cleared by writing in HSMCI\_CMDR)
- 0: No error.
- 1: A mismatch is detected between the command index sent and the response index received.
- RDIRE: Response Direction Error (cleared by writing in HSMCI\_CMDR)
- 0: No error.
- 1: The direction bit from card to host in the response has not been detected.
- RCRCE: Response CRC Error (cleared by writing in HSMCI\_CMDR)
- 0: No error.
- 1: A CRC7 error has been detected in the response.
- RENDE: Response End Bit Error (cleared by writing in HSMCI CMDR)
- 0: No error.
- 1: The end bit of the response has not been detected.
- RTOE: Response Time-out Error (cleared by writing in HSMCI\_CMDR)
- 0: No error.
- 1: The response time-out set by MAXLAT in the HSMCI\_CMDR has been exceeded.

# • DCRCE: Data CRC Error (cleared on read)

0: No error.

1: A CRC16 error has been detected in the last data block.

#### DTOE: Data Time-out Error (cleared on read)

0: No error.

1: The data time-out set by DTOCYC and DTOMUL in HSMCI\_DTOR has been exceeded.

# • CSTOE: Completion Signal Time-out Error (cleared on read)

0: No error.

1: The completion signal time-out set by CSTOCYC and CSTOMUL in HSMCI\_CSTOR has been exceeded.

# • BLKOVRE: DMA Block Overrun Error (cleared on read)

0: No error.

1: A new block of data is received and the DMA controller has not started to move the current pending block, a block overrun is raised.

#### DMADONE: DMA Transfer Done (cleared on read)

0: DMA buffer transfer has not completed since the last read of the HSMCI\_SR.

1: DMA buffer transfer has completed since the last read of the HSMCI\_SR.

#### • FIFOEMPTY: FIFO empty flag

0: FIFO contains at least one byte.

1: FIFO is empty.

#### XFRDONE: Transfer Done flag

0: A transfer is in progress.

1: Command Register is ready to operate and the data bus is in the idle state.

# ACKRCV: Boot Operation Acknowledge Received (cleared on read)

0: No Boot acknowledge received since the last read of the HSMCI\_SR.

1: A Boot acknowledge signal has been received since the last read of HSMCI\_SR.

#### • ACKRCVE: Boot Operation Acknowledge Error (cleared on read)

0: No boot operation error since the last read of HSMCI\_SR

1: Corrupted Boot Acknowledge signal received since the last read of HSMCI SR.

# • OVRE: Overrun (if FERRCTRL = 1, cleared by writing in HSMCI\_CMDR or cleared on read if FERRCTRL = 0)

0: No error.

1: At least one 8-bit received data has been lost (not read).

If FERRCTRL = 1 in HSMCI\_CFG, OVRE is cleared on read.

If FERRCTRL = 0 in HSMCI CFG, OVRE is cleared by writing HSMCI CMDR.

• UNRE: Underrun (if FERRCTRL = 1, cleared by writing in HSMCI\_CMDR or cleared on read if FERRCTRL = 0)

0: No error.

1: At least one 8-bit data has been sent without valid information (not written).

If FERRCTRL = 1 in HSMCI\_CFG, OVRE is cleared on read.

If FERRCTRL = 0 in HSMCI\_CFG, OVRE is cleared by writing HSMCI\_CMDR.

# 33.14.13 HSMCI Interrupt Enable Register

Name: HSMCI\_IER

**Address:** 0xF0008044 (0), 0xF000C044 (1)

Access: Write-only

| 31    | 30   | 29      | 28       | 27      | 26        | 25      | 24       |
|-------|------|---------|----------|---------|-----------|---------|----------|

| 7     | 6    | 5       | 4        | 3       | 2         | 1       | 0        |
| _     | _    | NOTBUSY | DTIP     | BLKE    | TXRDY     | RXRDY   | CMDRDY   |

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

• CMDRDY: Command Ready Interrupt Enable

• RXRDY: Receiver Ready Interrupt Enable

• TXRDY: Transmit Ready Interrupt Enable

• BLKE: Data Block Ended Interrupt Enable

• DTIP: Data Transfer in Progress Interrupt Enable

NOTBUSY: Data Not Busy Interrupt Enable

• SDIOIRQA: SDIO Interrupt for Slot A Interrupt Enable

• SDIOWAIT: SDIO Read Wait Operation Status Interrupt Enable

• CSRCV: Completion Signal Received Interrupt Enable

• RINDE: Response Index Error Interrupt Enable

RDIRE: Response Direction Error Interrupt Enable

RCRCE: Response CRC Error Interrupt Enable

RENDE: Response End Bit Error Interrupt Enable

RTOE: Response Time-out Error Interrupt Enable

• DCRCE: Data CRC Error Interrupt Enable

• DTOE: Data Time-out Error Interrupt Enable

CSTOE: Completion Signal Timeout Error Interrupt Enable

# 33.14.16 HSMCI DMA Configuration Register

Name: HSMCI\_DMA

**Address:** 0xF0008050 (0), 0xF000C050 (1)

Access: Read/Write

| 31 | 30 | 29  | 28   | 27 | 26 | 25  | 24    |
|----|----|-----|------|----|----|-----|-------|
| _  | _  | -   | _    | _  | _  | _   | _     |
| 23 | 22 | 21  | 20   | 19 | 18 | 17  | 16    |
| _  | -  | _   | _    | _  | _  | _   | _     |
| 15 | 14 | 13  | 12   | 11 | 10 | 9   | 8     |
| _  | _  | _   | ROPT | _  | -  | -   | DMAEN |
| 7  | 6  | 5   | 4    | 3  | 2  | 1   | 0     |
| _  | _  | CHK | SIZE | _  | _  | OFF | SET   |

This register can only be written if the WPEN bit is cleared in the HSMCI Write Protection Mode Register.

# • OFFSET: DMA Write Buffer Offset

This field indicates the number of discarded bytes when the DMA writes the first word of the transfer.

#### • CHKSIZE: DMA Channel Read and Write Chunk Size

The CHKSIZE field indicates the number of data available when the DMA chunk transfer request is asserted.

| Valu<br>e | Name | Description       |
|-----------|------|-------------------|
|           | Name | Description       |
| 0         | 1    | 1 data available  |
| 1         | 4    | 4 data available  |
| 2         | 8    | 8 data available  |
| 3         | 16   | 16 data available |

# • DMAEN: DMA Hardware Handshaking Enable

0: DMA interface is disabled.

1: DMA Interface is enabled.

Note: To avoid unpredictable behavior, DMA hardware handshaking must be disabled when CPU transfers are performed.

# ROPT: Read Optimization with padding

0: BLKLEN bytes are moved from the Memory Card to the system memory; two DMA descriptors are used when the transfer size is not a multiple of 4.

1: CEILING(BLKLEN/4) \* 4 bytes are moved from the Memory Card to the system memory; only one DMA descriptor is used.

# 33.14.17 HSMCI Configuration Register

Name: HSMCI CFG

**Address:** 0xF0008054 (0), 0xF000C054 (1)

Access: Read/Write

| 31 | 30 | 29 | 28       | 27 | 26 | 25 | 24       |
|----|----|----|----------|----|----|----|----------|
| _  | _  | _  | _        | _  | _  | _  | _        |
| 23 | 22 | 21 | 20       | 19 | 18 | 17 | 16       |
| _  | _  | -  | _        | _  | -  | ı  | _        |
| 15 | 14 | 13 | 12       | 11 | 10 | 9  | 8        |
| _  | _  | _  | LSYNC    | _  | _  | _  | HSMODE   |
| 7  | 6  | 5  | 4        | 3  | 2  | 1  | 0        |
| _  | _  | _  | FERRCTRL | _  | _  | _  | FIFOMODE |

This register can only be written if the WPEN bit is cleared in the HSMCI Write Protection Mode Register.

#### • FIFOMODE: HSMCI Internal FIFO control mode

0: A write transfer starts when a sufficient amount of data is written into the FIFO.

When the block length is greater than or equal to 3/4 of the HSMCI internal FIFO size, then the write transfer starts as soon as half the FIFO is filled. When the block length is greater than or equal to half the internal FIFO size, then the write transfer starts as soon as one quarter of the FIFO is filled. In other cases, the transfer starts as soon as the total amount of data is written in the internal FIFO.

1: A write transfer starts as soon as one data is written into the FIFO.

# • FERRCTRL: Flow Error flag reset control mode

0: When an underflow/overflow condition flag is set, a new Write/Read command is needed to reset the flag.

1: When an underflow/overflow condition flag is set, a read status resets the flag.

#### HSMODE: High Speed Mode

0: Default bus timing mode.

1: If set to one, the host controller outputs command line and data lines on the rising edge of the card clock. The Host driver shall check the high speed support in the card registers.

#### LSYNC: Synchronize on the last block

0: The pending command is sent at the end of the current data block.

1: The pending command is sent at the end of the block transfer when the transfer length is not infinite (block count shall be different from zero).

# 33.14.18 HSMCI Write Protection Mode Register

Name: HSMCI\_WPMR

**Address:** 0xF00080E4 (0), 0xF000C0E4 (1)

Access: Read/Write

| 31 | 30    | 29 | 28 | 27  | 26 | 25 | 24   |  |  |  |
|----|-------|----|----|-----|----|----|------|--|--|--|

# 34. Serial Peripheral Interface (SPI)

# 34.1 Description

The Serial Peripheral Interface (SPI) circuit is a synchronous serial data link that provides communication with external devices in Master or Slave mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a Shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the "master" which controls the data flow, while the other devices act as "slaves" which have data shifted into and out by the master. Different CPUs can take turn being masters (multiple master protocol, contrary to single master protocol where one CPU is always the master while all of the others are always slaves). One master can simultaneously shift data into multiple slaves. However, only one slave can drive its output to write data back to the master at any given time.

A slave device is selected when the master asserts its NSS signal. If multiple slave devices exist, the master generates a separate slave select signal for each slave (NPCS).

The SPI system consists of two data lines and two control lines:

- Master Out Slave In (MOSI)—This data line supplies the output data from the master shifted into the input(s) of the slave(s).
- Master In Slave Out (MISO)—This data line supplies the output data from a slave to the input of the master. There may be no more than one slave transmitting data during any particular transfer.
- Serial Clock (SPCK)—This control line is driven by the master and regulates the flow of the data bits. The master can transmit data at a variety of baud rates; there is one SPCK pulse for each bit that is transmitted.
- Slave Select (NSS)—This control line allows slaves to be turned on and off by hardware.

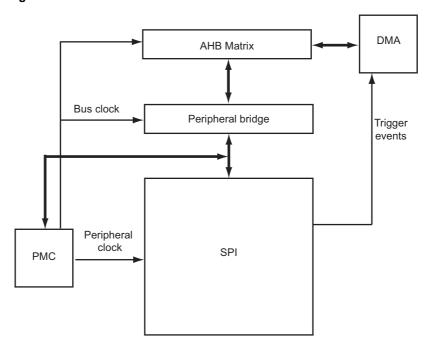

# 34.2 Embedded Characteristics

- Master or Slave Serial Peripheral Bus Interface
  - 8-bit to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select
  - Programmable transfer delay between consecutive transfers and delay before SPI clock per chip select
  - Programmable delay between chip selects
  - Selectable mode fault detection
- Master Mode can drive SPCK up to Peripheral Clock
- Master Mode Bit Rate can be Independent of the Processor/Peripheral Clock
- Slave mode operates on SPCK, asynchronously with core and bus clock
- Four chip selects with external decoder support allow communication with up to 15 peripherals
- Communication with Serial External Devices Supported
  - Serial memories, such as DataFlash and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - External coprocessors
- Connection to DMA Channel Capabilities, Optimizing Data Transfers
  - One channel for the receiver
  - One channel for the transmitter
- Register Write Protection

# 34.6.2 Power Management

The SPI can be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the SPI clock.

# 34.6.3 Interrupt

The SPI interface has an interrupt line connected to the interrupt controller. Handling the SPI interrupt requires programming the interrupt controller before configuring the SPI.

Table 34-3. Peripheral IDs

| Instance | ID |  |  |
|----------|----|--|--|
| SPI0     | 13 |  |  |
| SPI1     | 14 |  |  |

# 34.6.4 Direct Memory Access Controller (DMAC)

The SPI interface can be used in conjunction with the DMAC in order to reduce processor overhead. For a full description of the DMAC, refer to the relevant section.

# 34.7 Functional Description

#### 34.7.1 Modes of Operation

The SPI operates in Master mode or in Slave mode.

- The SPI operates in Master mode by setting the MSTR bit in the SPI Mode Register (SPI\_MR):
  - Pins NPCS0 to NPCS3 are all configured as outputs
  - The SPCK pin is driven
  - The MISO line is wired on the receiver input
  - The MOSI line is driven as an output by the transmitter.
- The SPI operates in Slave mode if the MSTR bit in the SPI MR is written to 0:
  - The MISO line is driven by the transmitter output
  - The MOSI line is wired on the receiver input
  - The SPCK pin is driven by the transmitter to synchronize the receiver.
  - The NPCS0 pin becomes an input, and is used as a slave select signal (NSS)
  - NPCS1 to NPCS3 are not driven and can be used for other purposes.

The data transfers are identically programmable for both modes of operation. The baud rate generator is activated only in Master mode.

#### 34.7.2 Data Transfer

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the SPI chip select registers (SPI\_CSRx). The clock phase is programmed with the NCPHA bit. These two parameters determine the edges of the clock signal on which data is driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Consequently, a master/slave pair must use the same parameter pair values to communicate. If multiple slaves are connected and require different configurations, the master must reconfigure itself each time it needs to communicate with a different slave.

Table 34-4 shows the four modes and corresponding parameter settings.

Table 34-4. SPI Bus Protocol Modes

| SPI Mode | CPOL | NCPHA | Shift SPCK Edge | Capture SPCK Edge | SPCK Inactive Level |
|----------|------|-------|-----------------|-------------------|---------------------|
| 0        | 0    | 1     | Falling         | Rising            | Low                 |
| 1        | 0    | 0     | Rising          | Falling           | Low                 |
| 2        | 1    | 1     | Rising          | Falling           | High                |
| 3        | 1    | 0     | Falling         | Rising            | High                |

Figure 34-3 and Figure 34-4 show examples of data transfers.

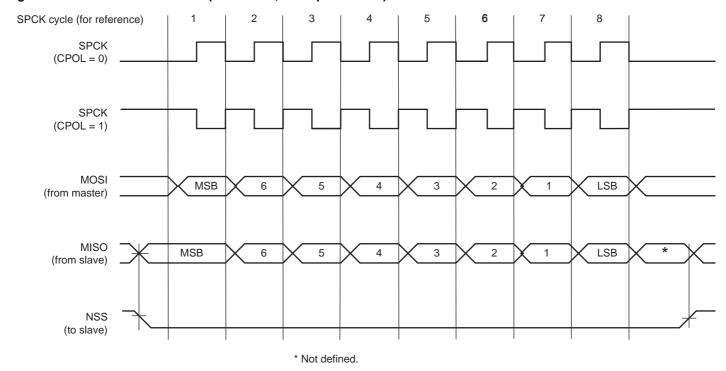

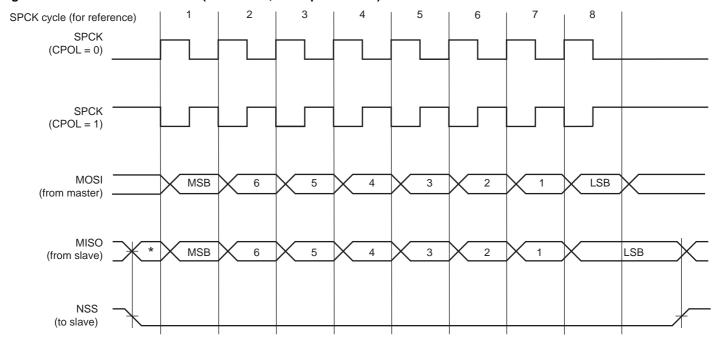

Figure 34-4. SPI Transfer Format (NCPHA = 0, 8 bits per transfer)

\* Not defined.

#### 34.7.3 Master Mode Operations

When configured in Master mode, the SPI operates on the clock generated by the internal programmable baud rate generator. It fully controls the data transfers to and from the slave(s) connected to the SPI bus. The SPI drives the chip select line to the slave and the serial clock signal (SPCK).

The SPI features two holding registers, the Transmit Data Register (SPI\_TDR) and the Receive Data Register (SPI\_RDR), and a single shift register. The holding registers maintain the data flow at a constant rate.

After enabling the SPI, a data transfer starts when the processor writes to the SPI\_TDR. The written data is immediately transferred in the Shift register and the transfer on the SPI bus starts. While the data in the Shift register is shifted on the MOSI line, the MISO line is sampled and shifted in the Shift register. Data cannot be loaded in the SPI\_RDR without transmitting data. If there is no data to transmit, dummy data can be used (SPI\_TDR filled with ones). When the SPI\_MR.WDRBT bit is set, new data cannot be transmitted if the SPI\_RDR has not been read. If Receiving mode is not required, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the SPI Status register (SPI\_SR) can be discarded.

Before writing the SPI\_TDR, the PCS field in the SPI\_MR must be set in order to select a slave.

If new data is written in the SPI\_TDR during the transfer, it is kept in the SPI\_TDR until the current transfer is completed. Then, the received data is transferred from the Shift register to the SPI\_RDR, the data in the SPI\_TDR is loaded in the Shift register and a new transfer starts.

As soon as the SPI\_TDR is written, the Transmit Data Register Empty (TDRE) flag in the SPI\_SR is cleared. When the data written in the SPI\_TDR is loaded into the Shift register, the TDRE flag in the SPI\_SR is set. The TDRE bit is used to trigger the Transmit DMA channel.

See Figure 34-5.

The end of transfer is indicated by the TXEMPTY flag in the SPI\_SR. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

Note: When the SPI is enabled, the TDRE and TXEMPTY flags are set.

Write SPI\_CR.SPIEN =1 Write SPI TDR Write SPI\_TDR Write SPI\_TDR **TDRE** automatic set automatic set TDR loaded TDR loaded automatic set in shifter in shifter TDR loaded in shifter **TXEMPTY** Transfer Transfer Transfer **DLYBCT** DLYBCT **DLYBCT** 

Figure 34-5. TDRE and TXEMPTY flag behavior

The transfer of received data from the Shift register to the SPI\_RDR is indicated by the Receive Data Register Full (RDRF) bit in the SPI\_SR. When the received data is read, the RDRF bit is cleared.

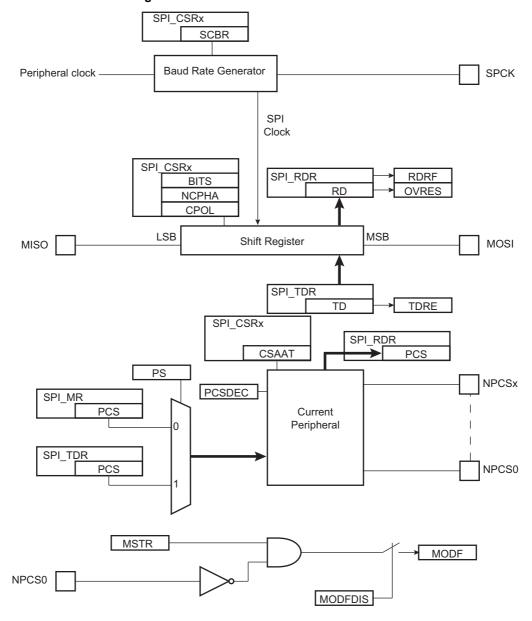

If the SPI\_RDR has not been read before new data is received, the Overrun Error (OVRES) bit in the SPI\_SR is set. As long as this flag is set, data is loaded in the SPI\_RDR. The user has to read the SPI\_SR to clear the OVRES bit.

Figure 34-6 shows a block diagram of the SPI when operating in Master mode. Figure 34-7 shows a flow chart describing how transfers are handled.

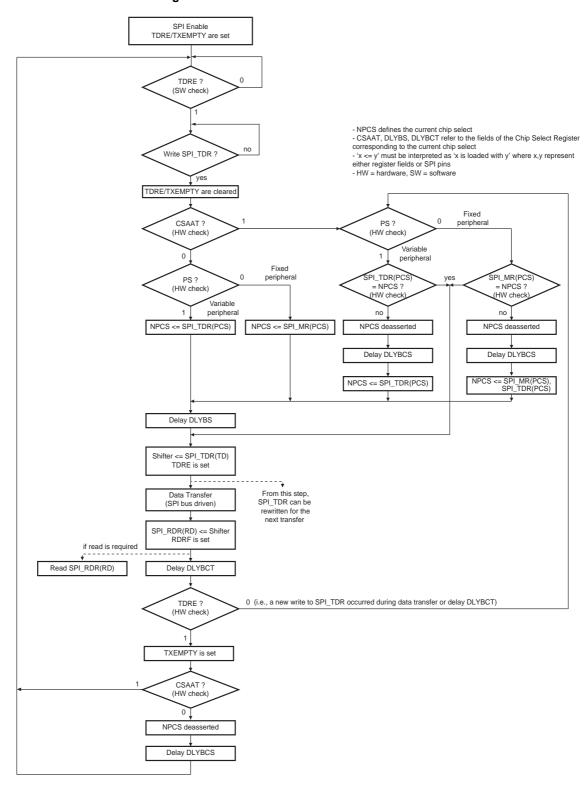

Figure 34-8 shows the behavior of Transmit Data Register Empty (TDRE), Receive Data Register (RDRF) and Transmission Register Empty (TXEMPTY) status flags within the SPI\_SR during an 8-bit data transfer in Fixed mode without the DMA involved.

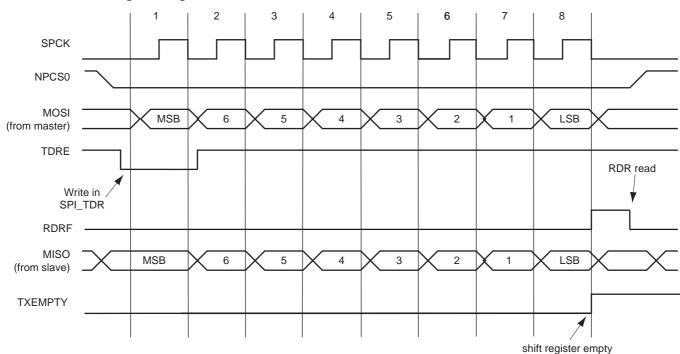

Figure 34-8. Status Register Flags Behavior

#### 34.7.3.3 Clock Generation

The SPI Baud rate clock is generated by dividing the peripheral clock by a value between 1 and 255.

If the SCBR field in the SPI\_CSR is programmed to 1, the operating baud rate is peripheral clock (see the electrical characteristics section for the SPCK maximum frequency). Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

At reset, SCBR is 0 and the user has to program it to a valid value before performing the first transfer.

The divisor can be defined independently for each chip select, as it has to be programmed in the SCBR field. This allows the SPI to automatically adapt the baud rate for each interfaced peripheral without reprogramming.

#### 34.7.3.4 Transfer Delays

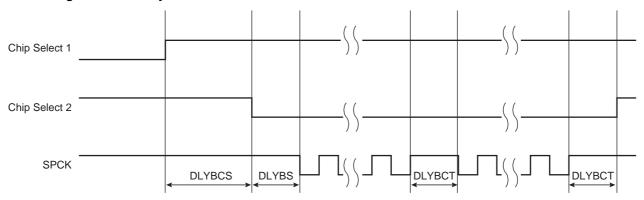

Figure 34-9 shows a chip select transfer change and consecutive transfers on the same chip select. Three delays can be programmed to modify the transfer waveforms:

- Delay between the chip selects—programmable only once for all chip selects by writing the DLYBCS field in the SPI\_MR. The SPI slave device deactivation delay is managed through DLYBCS. If there is only one SPI slave device connected to the master, the DLYBCS field does not need to be configured. If several slave devices are connected to a master, DLYBCS must be configured depending on the highest deactivation delay. Refer to the SPI slave device electrical characteristics.
- Delay before SPCK—independently programmable for each chip select by writing the DLYBS field. The SPI slave device activation delay is managed through DLYBS. Refer to the SPI slave device electrical characteristics to define DLYBS.
- Delay between consecutive transfers—independently programmable for each chip select by writing the DLYBCT field. The time required by the SPI slave device to process received data is managed through DLYBCT. This time depends on the SPI slave system activity.

These delays allow the SPI to be adapted to the interfaced peripherals and their speed and bus release time.

Figure 34-9. Programmable Delays

#### 34.7.3.5 Peripheral Selection

The serial peripherals are selected through the assertion of the NPCS0 to NPCS3 signals. By default, all NPCS signals are high before and after each transfer.

- **Fixed Peripheral Select Mode**: SPI exchanges data with only one peripheral.

  Fixed Peripheral Select mode is enabled by clearing the PS bit in the SPI\_MR. In this case, the current peripheral is defined by the PCS field in the SPI\_MR and the PCS field in the SPI\_TDR has no effect.
- Variable Peripheral Select Mode: Data can be exchanged with more than one peripheral without having to reprogram the NPCS field in the SPI\_MR.
   Variable Peripheral Select mode is enabled by setting the PS bit in the SPI\_MR. The PCS field in the SPI\_TDR is used to select the current peripheral. This means that the peripheral selection can be defined for each new data. The value to write in the SPI\_TDR has the following format:

[xxxxxxx(7-bit) + LASTXFER(1-bit)<sup>(1)</sup>+ xxxx(4-bit) + PCS (4-bit) + DATA (8 to 16-bit)] with PCS equals the chip select to assert, as defined in Section 34.8.4 "SPI Transmit Data Register" and LASTXFER bit at 0 or 1 depending on the CSAAT bit.

Note: 1. Optional

CSAAT, LASTXFER and CSNAAT bits are discussed in Section 34.7.3.9 "Peripheral Deselection with DMA".

If LASTXFER is used, the command must be issued after writing the last character. Instead of LASTXFER, the user can use the SPIDIS command. After the end of the DMA transfer, it is necessary to wait for the TXEMPTY flag and then write SPIDIS into the SPI Control Register (SPI\_CR). This does not change the configuration register values). The NPCS is disabled after the last character transfer. Then, another DMA transfer can be started if the SPIEN has previously been written in the SPI\_CR.

#### 34.7.3.6 SPI Direct Access Memory Controller (DMAC)

In both Fixed and Variable modes, the Direct Memory Access Controller (DMAC) can be used to reduce processor overhead.

The fixed peripheral selection allows buffer transfers with a single peripheral. Using the DMAC is an optimal means, as the size of the data transfer between the memory and the SPI is either 8 bits or 16 bits. However, if the peripheral selection is modified, the SPI\_MR must be reprogrammed.

The variable peripheral selection allows buffer transfers with multiple peripherals without reprogramming the SPI\_MR. Data written in the SPI\_TDR is 32 bits wide and defines the real data to be transmitted and the destination peripheral. Using the DMAC in this mode requires 32-bit wide buffers, with the data in the LSBs and the

PCS and LASTXFER fields in the MSBs. However, the SPI still controls the number of bits (8 to 16) to be transferred through MISO and MOSI lines with the chip select configuration registers. This is not the optimal means in terms of memory size for the buffers, but it provides a very effective means to exchange data with several peripherals without any intervention of the processor.

#### 34.7.3.7 Peripheral Chip Select Decoding

The user can program the SPI to operate with up to 15 slave peripherals by decoding the four chip select lines, NPCS0 to NPCS3 with an external decoder/demultiplexer (refer to Figure 34-10). This can be enabled by setting the PCSDEC bit in the SPI\_MR.

When operating without decoding, the SPI makes sure that in any case only one chip select line is activated, i.e., one NPCS line driven low at a time. If two bits are defined low in a PCS field, only the lowest numbered chip select is driven low.

When operating with decoding, the SPI directly outputs the value defined by the PCS field on the NPCS lines of either SPI\_MR or SPI\_TDR (depending on PS).

As the SPI sets a default value of 0xF on the chip select lines (i.e., all chip select lines at 1) when not processing any transfer, only 15 peripherals can be decoded.

The SPI has four chip select registers (SPI\_CSR0...SPI\_CSR3). As a result, when external decoding is activated, each NPCS chip select defines the characteristics of up to four peripherals. As an example, SPI\_CRS0 defines the characteristics of the externally decoded peripherals 0 to 3, corresponding to the PCS values 0x0 to 0x3. Consequently, the user has to make sure to connect compatible peripherals on the decoded chip select lines 0 to 3, 4 to 7, 8 to 11 and 12 to 14. Figure 34-10 shows this type of implementation.

If the CSAAT bit is used, with or without the DMAC, the Mode Fault detection for NPCS0 line must be disabled. This is not needed for all other chip select lines since Mode Fault detection is only on NPCS0.

#### 34.7.3.8 Peripheral Deselection without DMA

During a transfer of more than one unit of data on a chip select without the DMA, the SPI\_TDR is loaded by the processor, the TDRE flag rises as soon as the content of the SPI\_TDR is transferred into the internal Shift register. When this flag is detected high, the SPI\_TDR can be reloaded. If this reload by the processor occurs before the

end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the chip select is not de-asserted between the two transfers. But depending on the application software handling the SPI status register flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload the SPI\_TDR in time to keep the chip select active (low). A null DLYBCT value (delay between consecutive transfers) in the SPI\_CSR, gives even less time for the processor to reload the SPI\_TDR. With some SPI slave peripherals, if the chip select line must remain active (low) during a full set of transfers, communication errors can occur.

To facilitate interfacing with such devices, the chip select registers [SPI\_CSR0...SPI\_CSR3] can be programmed with the Chip Select Active After Transfer (CSAAT) bit at 1. This allows the chip select lines to remain in their current state (low = active) until a transfer to another chip select is required. Even if the SPI\_TDR is not reloaded, the chip select remains active. To de-assert the chip select line at the end of the transfer, the Last Transfer (LASTXFER) bit in SPI\_CR must be set after writing the last data to transmit into SPI\_TDR.

# 34.7.3.9 Peripheral Deselection with DMA

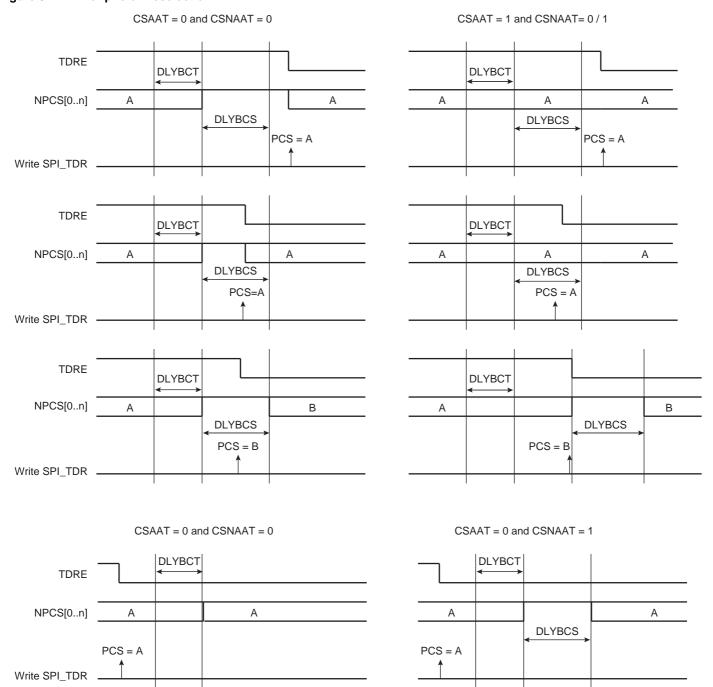

DMA provides faster reloads of the SPI\_TDR compared to software. However, depending on the system activity, it is not guaranteed that the SPI\_TDR is written with the next data before the end of the current transfer. Consequently, data can be lost by the de-assertion of the NPCS line for SPI slave peripherals requiring the chip select line to remain active between two transfers. The only way to guarantee a safe transfer in this case is the use of the CSAAT and LASTXFER bits.

When the CSAAT bit is configured to 0, the NPCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a chip select, the TDRE flag rises as soon as the content of the SPI\_TDR is transferred into the internal shift register. When this flag is detected, the SPI\_TDR can be reloaded. If this reload occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the chip select is not de-asserted between the two transfers. This can lead to difficulties to interface with some serial peripherals requiring the chip select to be de-asserted after each transfer. To facilitate interfacing with such devices, the SPI\_CSR can be programmed with the Chip Select Not Active After Transfer (CSNAAT) bit at 1. This allows the chip select lines to be de-asserted systematically during a time "DLYBCS" (the value of the CSNAAT bit is processed only if the CSAAT bit is configured to 0 for the same chip select).

Figure 34-11 shows different peripheral deselection cases and the effect of the CSAAT and CSNAAT bits.

Figure 34-11. Peripheral Deselection

#### 34.7.3.10 Mode Fault Detection

The SPI has the capability to operate in multi-master environment. Consequently, the NPCS0/NSS line must be monitored. If one of the masters on the SPI bus is currently transmitting, the NPCS0/NSS line is low and the SPI must not transmit any data. A mode fault is detected when the SPI is programmed in Master mode and a low level is driven by an external master on the NPCS0/NSS signal. In multi-master environment, NPCS0, MOSI, MISO and SPCK pins must be configured in open drain (through the PIO controller). When a mode fault is detected, the SPI\_SR.MODF bit is set until SPI\_SR is read and the SPI is automatically disabled until it is re-enabled by setting the SPI\_CR.SPIEN bit.

By default, the mode fault detection is enabled. The user can disable it by setting the SPI MR.MODFDIS bit.

#### 34.7.4 SPI Slave Mode

When operating in Slave mode, the SPI processes data bits on the clock provided on the SPI clock pin (SPCK).

The SPI waits until NSS goes active before receiving the serial clock from an external master. When NSS falls, the clock is validated and the data is loaded in the SPI\_RDR depending on the BITS field configured in SPI\_CSR0. These bits are processed following a phase and a polarity defined respectively by the NCPHA and CPOL bits in SPI\_CSR0. Note that the fileds BITS, CPOL and NCPHA of the other chip select registers (SPI\_CSR1...SPI\_CSR3) have no effect when the SPI is programmed in Slave mode.

The bits are shifted out on the MISO line and sampled on the MOSI line.

Note: For more information on the BITS field, see also the note below the SPI\_CSRx register bitmap (Section 34.8.9 "SPI Chip Select Register").

When all bits are processed, the received data is transferred in the SPI\_RDR and the RDRF bit rises. If the SPI\_RDR has not been read before new data is received, the Overrun Error Status (OVRES) bit in the SPI\_SR is set. As long as this flag is set, data is loaded in the SPI\_RDR. The user must read SPI\_SR to clear the OVRES bit.

When a transfer starts, the data shifted out is the data present in the Shift register. If no data has been written in the SPI\_TDR, the last data received is transferred. If no data has been received since the last reset, all bits are transmitted low, as the Shift register resets to 0.

When a first data is written in the SPI\_TDR, it is transferred immediately in the Shift register and the TDRE flag rises. If new data is written, it remains in the SPI\_TDR until a transfer occurs, i.e., NSS falls and there is a valid clock on the SPCK pin. When the transfer occurs, the last data written in the SPI\_TDR is transferred in the Shift register and the TDRE flag rises. This enables frequent updates of critical variables with single transfers.

Then, new data is loaded in the Shift register from the SPI\_TDR. If no character is ready to be transmitted, i.e., no character has been written in the SPI\_TDR since the last load from the SPI\_TDR to the Shift register, the SPI\_TDR is retransmitted. In this case the Underrun Error Status Flag (UNDES) is set in the SPI\_SR.

Figure 34-12 shows a block diagram of the SPI when operating in Slave mode.

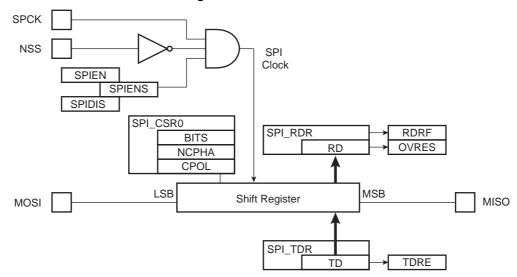

Figure 34-12. Slave Mode Functional Block Diagram

# 34.7.5 Register Write Protection

To prevent any single software error from corrupting SPI behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the SPI Write Protection Mode Register (SPI\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the SPI Write Protection Status Register (SPI\_WPSR) is set and the WPVSRC field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading SPI\_WPSR.

The following registers can be write-protected:

- SPI Mode Register
- SPI Chip Select Register

# 34.8 Serial Peripheral Interface (SPI) User Interface

In the "Offset" column of Table 34-5, 'CS\_number' denotes the chip select number.

Table 34-5. Register Mapping

| SWRST   | _      | _  | _      | _  | _  | SPIDIS | SPIEN    |

#### SPIEN: SPI Enable

0: No effect.

1: Enables the SPI to transfer and receive data.

#### · SPIDIS: SPI Disable

0: No effect.

1: Disables the SPI.

All pins are set in Input mode after completion of the transmission in progress, if any.

If a transfer is in progress when SPIDIS is set, the SPI completes the transmission of the shifter register and does not start any new transfer, even if the SPI\_THR is loaded.

Note: If both SPIEN and SPIDIS are equal to one when the SPI\_CR is written, the SPI is disabled.

# • SWRST: SPI Software Reset

0: No effect.

1: Reset the SPI. A software-triggered hardware reset of the SPI interface is performed.

The SPI is in Slave mode after software reset.

# • REQCLR: Request to Clear the Comparison Trigger

0: No effect.

1: Restarts the comparison trigger to enable SPI\_RDR loading.

# • TXFCLR: Transmit FIFO Clear

0: No effect.

1: Clears the Transmit FIFO, Transmit FIFO will become empty.

#### • RXFCLR: Receive FIFO Clear

0: No effect.

1: Clears the Receive FIFO, Receive FIFO will become empty.

# • LASTXFER: Last Transfer

0: No effect.

1: The current NPCS is de-asserted after the character written in TD has been transferred. When SPI\_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed.

Refer to Section 34.7.3.5 "Peripheral Selection" for more details.

#### • FIFOEN: FIFO Enable

0: No effect.

1: Enables the Transmit and Receive FIFOs

# • FIFODIS: FIFO Disable

0: No effect.

1: Disables the Transmit and Receive FIFOs

# 34.8.2 SPI Mode Register

Name: SPI\_MR

**Address:** 0xF0000004 (0), 0xF0004004 (1)

Access: Read/Write

| LLB | _      | WDRBT | MODFDIS | _   | PCSDEC | PS | MSTR |  |

This register can only be written if the WPEN bit is cleared in the SPI Write Protection Mode Register.

#### MSTR: Master/Slave Mode

0: SPI is in Slave mode

1: SPI is in Master mode

# • PS: Peripheral Select

0: Fixed Peripheral Select

1: Variable Peripheral Select

# • PCSDEC: Chip Select Decode

0: The chip select lines are directly connected to a peripheral device.

1: The four NPCS chip select lines are connected to a 4-bit to 16-bit decoder.

When PCSDEC = 1, up to 15 chip select signals can be generated with the four NPCS lines using an external 4-bit to 16-bit decoder. The chip select registers define the characteristics of the 15 chip selects, with the following rules:

SPI\_CSR0 defines peripheral chip select signals 0 to 3.

SPI\_CSR1 defines peripheral chip select signals 4 to 7.

SPI\_CSR2 defines peripheral chip select signals 8 to 11.

SPI CSR3 defines peripheral chip select signals 12 to 14.

#### MODFDIS: Mode Fault Detection

0: Mode fault detection enabled

1: Mode fault detection disabled

#### • WDRBT: Wait Data Read Before Transfer

0: No Effect. In Master mode, a transfer can be initiated regardless of the SPI\_RDR state.

1: In Master mode, a transfer can start only if the SPI\_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

# • LLB: Local Loopback Enable

0: Local loopback path disabled.

1: Local loopback path enabled.

LLB controls the local loopback on the data shift register for testing in Master mode only (MISO is internally connected on MOSI).

## • PCS: Peripheral Chip Select

This field is only used if fixed peripheral select is active (PS = 0).

If SPI\_MR.PCSDEC = 0:

# • DLYBCS: Delay Between Chip Selects

NPCS[3:0] output signals = PCS.

This field defines the delay between the inactivation and the activation of NPCS. The DLYBCS time guarantees non-over-lapping chip selects and solves bus contentions in case of peripherals having long data float times.

If DLYBCS is lower than 6, six peripheral clock periods are inserted by default.

Otherwise, the following equation determines the delay:

$$Delay \ Between \ Chip \ Selects \ = \ \frac{DLYBCS}{f_{peripheral \ clock}}$$

# 34.8.3 SPI Receive Data Register

Name: SPI\_RDR

**Address:** 0xF0000008 (0), 0xF0004008 (1)

|    |    |    | Т  | D  |    |    |          |

#### • TD: Transmit Data

Data to be transmitted by the SPI Interface is stored in this register. Information to be transmitted must be written to the transmit data register in a right-justified format.

# • PCS: Peripheral Chip Select

This field is only used if variable peripheral select is active (PS = 1).

If SPI\_MR.PCSDEC = 0:

PCS = xxx0 NPCS[3:0] = 1110

PCS = xx01 NPCS[3:0] = 1101

PCS = x011 NPCS[3:0] = 1011

PCS = 1111 forbidden (no peripheral is selected)

(x = don't care)

If SPI MR.PCSDEC = 1:

NPCS[3:0] output signals = PCS.

#### LASTXFER: Last Transfer

0: No effect

1: The current NPCS is de-asserted after the transfer of the character written in TD. When SPI\_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed.

This field is only used if variable peripheral select is active (SPI MR.PS = 1).

## 34.8.5 SPI Status Register

Name: SPI\_SR

**Address:** 0xF0000010 (0), 0xF0004010 (1)

Access: Read-only

| 31 | 30 | 29 | 28 | 27    | 26    | 25      | 24     |
|----|----|----|----|-------|-------|---------|--------|
| _  | 1  | 1  | _  | _     | -     | _       |        |
| 23 | 22 | 21 | 20 | 19    | 18    | 17      | 16     |
| _  | -  | ı  | _  | _     | ı     | _       | SPIENS |
| 15 | 14 | 13 | 12 | 11    | 10    | 9       | 8      |
| _  | ı  | ı  | _  | _     | UNDES | TXEMPTY | NSSR   |
| 7  | 6  | 5  | 4  | 3     | 2     | 1       | 0      |
| _  | _  | _  | _  | OVRES | MODF  | TDRE    | RDRF   |

# RDRF: Receive Data Register Full (cleared by reading SPI\_RDR)

0: No data has been received since the last read of SPI\_RDR.

1: Data has been received and the received data has been transferred from the shift register to SPI\_RDR since the last read of SPI\_RDR.

### • TDRE: Transmit Data Register Empty (cleared by writing SPI\_TDR)

0: Data has been written to SPI\_TDR and not yet transferred to the shift register.

1: The last data written in the SPI\_TDR has been transferred to the shift register.

TDRE equals zero when the SPI is disabled or at reset. The SPI enable command sets this bit to 1.

### . MODF: Mode Fault Error (cleared on read)

0: No mode fault has been detected since the last read of SPI\_SR.

1: A mode fault occurred since the last read of SPI SR.

#### OVRES: Overrun Error Status (cleared on read)

0: No overrun has been detected since the last read of SPI\_SR.

1: An overrun has occurred since the last read of SPI\_SR.

An overrun occurs when SPI\_RDR is loaded at least twice from the shift register since the last read of the SPI\_RDR.

# NSSR: NSS Rising (cleared on read)

0: No rising edge detected on NSS pin since the last read of SPI\_SR.

1: A rising edge occurred on NSS pin since the last read of SPI\_SR.

#### TXEMPTY: Transmission Registers Empty (cleared by writing SPI\_TDR)

0: As soon as data is written in SPI\_TDR.

1: SPI\_TDR and internal shift register are empty. If a transfer delay has been defined, TXEMPTY is set after the end of this delay.

## • UNDES: Underrun Error Status (Slave mode only) (cleared on read)

0: No underrun has been detected since the last read of SPI\_SR.

1: A transfer starts whereas no data has been loaded in SPI TDR.

• SPIENS: SPI Enable Status

0: SPI is disabled.

1: SPI is enabled.

# 34.8.6 SPI Interrupt Enable Register

Name: SPI\_IER

**Address:** 0xF0000014 (0), 0xF0004014 (1)

Access: Write-only

| 31 | 30 | 29 | 28 | 27    | 26    | 25      | 24   |
|----|----|----|----|-------|-------|---------|------|
| _  | _  | 1  |    |       | 1     | 1       | _    |
| 23 | 22 | 21 | 20 | 19    | 18    | 17      | 16   |
| _  | _  | ı  |    |       | ı     | ı       | _    |
| 15 | 14 | 13 | 12 | 11    | 10    | 9       | 8    |

| 7  | 6  | 5  | 4  | 3     | 2     | 1       | 0    |
| _  | _  | -  | _  | OVRES | MODF  | TDRE    | RDRF |

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

• RDRF: Receive Data Register Full Interrupt Enable

• TDRE: SPI Transmit Data Register Empty Interrupt Enable

• MODF: Mode Fault Error Interrupt Enable

• OVRES: Overrun Error Interrupt Enable

• NSSR: NSS Rising Interrupt Enable

• TXEMPTY: Transmission Registers Empty Enable

• UNDES: Underrun Error Interrupt Enable

# 34.8.7 SPI Interrupt Disable Register

Name: SPI\_IDR

**Address:** 0xF0000018 (0), 0xF0004018 (1)

Access: Write-only

| 31 | 30 | 29 | 28 | 27    | 26    | 25      | 24   |
|----|----|----|----|-------|-------|---------|------|
| _  | 1  | 1  |    | _     | 1     | 1       | _    |
| 23 | 22 | 21 | 20 | 19    | 18    | 17      | 16   |
| _  | -  | ı  |    | _     | ı     | ı       | _    |
| 15 | 14 | 13 | 12 | 11    | 10    | 9       | 8    |
| _  | -  | ı  | ı  | _     | UNDES | TXEMPTY | NSSR |
| 7  | 6  | 5  | 4  | 3     | 2     | 1       | 0    |
| _  | _  | -  | _  | OVRES | MODF  | TDRE    | RDRF |

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

• RDRF: Receive Data Register Full Interrupt Disable

• TDRE: SPI Transmit Data Register Empty Interrupt Disable

• MODF: Mode Fault Error Interrupt Disable

• OVRES: Overrun Error Interrupt Disable

• NSSR: NSS Rising Interrupt Disable

• TXEMPTY: Transmission Registers Empty Disable

• UNDES: Underrun Error Interrupt Disable

# 34.8.8 SPI Interrupt Mask Register

Name: SPI\_IMR

**Address:** 0xF000001C (0), 0xF000401C (1)

Access: Read-only

| 31 | 30 | 29 | 28 | 27    | 26    | 25      | 24   |
|----|----|----|----|-------|-------|---------|------|
| _  | _  | 1  |    |       | 1     | 1       | _    |
| 23 | 22 | 21 | 20 | 19    | 18    | 17      | 16   |
| _  | _  | ı  |    |       | ı     | ı       | _    |
| 15 | 14 | 13 | 12 | 11    | 10    | 9       | 8    |
| _  | _  | ı  | ı  | -     | UNDES | TXEMPTY | NSSR |
| 7  | 6  | 5  | 4  | 3     | 2     | 1       | 0    |
| _  | _  | -  | _  | OVRES | MODF  | TDRE    | RDRF |

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

• RDRF: Receive Data Register Full Interrupt Mask

• TDRE: SPI Transmit Data Register Empty Interrupt Mask

• MODF: Mode Fault Error Interrupt Mask

OVRES: Overrun Error Interrupt Mask

• NSSR: NSS Rising Interrupt Mask

• TXEMPTY: Transmission Registers Empty Mask

• UNDES: Underrun Error Interrupt Mask

## 34.8.9 SPI Chip Select Register

Name: SPI\_CSRx [x=0..3]

Address: 0xF0000030 (0), 0xF0004030 (1)

Access: Read/Write

| 31   | 30    | 29 | 28    | 27     | 26    | 25   | 24 |
|------|-------|----|-------|--------|-------|------|----|
|      |       |    | DL    | /BCT   |       |      |    |
| 23   | 22    | 21 | 20    | 19     | 18    | 17   | 16 |
|      | DLYBS |    |       |        |       |      |    |
| 15   | 14    | 13 | 12    | 11     | 10    | 9    | 8  |
|      |       |    | SC    | CBR    |       |      |    |
| 7    | 6     | 5  | 4     | 3      | 2     | 1    | 0  |
| BITS |       |    | CSAAT | CSNAAT | NCPHA | CPOL |    |

This register can only be written if the WPEN bit is cleared in the SPI Write Protection Mode Register.

Note: SPI\_CSRx registers must be written even if the user wants to use the default reset values. The BITS field is not updated with the translated value unless the register is written.

# • CPOL: Clock Polarity

- 0: The inactive state value of SPCK is logic level zero.
- 1: The inactive state value of SPCK is logic level one.

CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with NCPHA to produce the required clock/data relationship between master and slave devices.

#### NCPHA: Clock Phase

- 0: Data is changed on the leading edge of SPCK and captured on the following edge of SPCK.
- 1: Data is captured on the leading edge of SPCK and changed on the following edge of SPCK.

NCPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. NCPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

## CSNAAT: Chip Select Not Active After Transfer (Ignored if CSAAT = 1)

- 0: The Peripheral Chip Select Line does not rise between two transfers if the SPI\_TDR is reloaded before the end of the first transfer and if the two transfers occur on the same chip select.
- 1: The Peripheral Chip Select Line rises systematically after each transfer performed on the same slave. It remains inactive after the end of transfer for a minimal duration of:

 $\frac{DLYBCS}{f_{peripheral clock}}$  (If field DLYBCS is lower than 6, a minimum of six periods is introduced.)

## • CSAAT: Chip Select Active After Transfer

- 0: The Peripheral Chip Select Line rises as soon as the last transfer is achieved.
- 1: The Peripheral Chip Select Line does not rise after the last transfer is achieved. It remains active until a new transfer is requested on a different chip select.

## · BITS: Bits Per Transfer

(See the note below the register bitmap.)

The BITS field determines the number of data bits transferred. Reserved values should not be used.

| Value | Name   | Description          |
|-------|--------|----------------------|
| 0     | 8_BIT  | 8 bits for transfer  |
| 1     | 9_BIT  | 9 bits for transfer  |
| 2     | 10_BIT | 10 bits for transfer |
| 3     | 11_BIT | 11 bits for transfer |
| 4     | 12_BIT | 12 bits for transfer |
| 5     | 13_BIT | 13 bits for transfer |
| 6     | 14_BIT | 14 bits for transfer |
| 7     | 15_BIT | 15 bits for transfer |
| 8     | 16_BIT | 16 bits for transfer |
| 9     | _      | Reserved             |
| 10    | _      | Reserved             |
| 11    | -      | Reserved             |
| 12    | -      | Reserved             |
| 13    | _      | Reserved             |
| 14    | _      | Reserved             |
| 15    | _      | Reserved             |

#### SCBR: Serial Clock Bit Rate

In Master mode, the SPI Interface uses a modulus counter to derive the SPCK bit rate from the peripheral clock. The bit rate is selected by writing a value from 1 to 255 in the SCBR field. The following equation determines the SPCK bit rate:

SCBR = f<sub>peripheral clock</sub> / SPCK Bit Rate

Programming the SCBR field to 0 is forbidden. Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

If BRSRCCLK = 1 in SPI\_MR, SCBR must be programmed with a value greater than 1.

At reset, SCBR is 0 and the user has to program it at a valid value before performing the first transfer.

Note: If one of the SCBR fields in SPI\_CSRx is set to 1, the other SCBR fields in SPI\_CSRx must be set to 1 as well, if they are used to process transfers. If they are not used to transfer data, they can be set at any value.

### DLYBS: Delay Before SPCK

This field defines the delay from NPCS falling edge (activation) to the first valid SPCK transition.

When DLYBS = 0, the delay is half the SPCK clock period.

Otherwise, the following equation determines the delay:

DLYBS = Delay Before SPCK  $\times$  f<sub>peripheral clock</sub>

# • DLYBCT: Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT = 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers.

Otherwise, the following equation determines the delay:

DLYBCT = Delay Between Consecutive Transfers  $\times$  f<sub>peripheral clock</sub> / 32

# 34.8.10 SPI Write Protection Mode Register

Name: SPI\_WPMR

**Address:** 0xF00000E4 (0), 0xF00040E4 (1)

Access: Read/Write.

| 31 | 30    | 29 | 28  | 27  | 26 | 25 | 24   |
|----|-------|----|-----|-----|----|----|------|
|    |       |    | WPI | KEY |    |    |      |
| 23 | 22    | 21 | 20  | 19  | 18 | 17 | 16   |
|    | WPKEY |    |     |     |    |    |      |
| 15 | 14    | 13 | 12  | 11  | 10 | 9  | 8    |
|    |       |    | WPI | KEY |    |    |      |
| 7  | 6     | 5  | 4   | 3   | 2  | 1  | 0    |
| _  | _     | -  | -   |     |    | -  | WPEN |

## • WPEN: Write Protection Enable

0: Disables the write protection if WPKEY corresponds to 0x535049 ("SPI" in ASCII)

1: Enables the write protection if WPKEY corresponds to 0x535049 ("SPI" in ASCII)

See Section 34.7.5 "Register Write Protection" for the list of registers that can be write-protected.

# • WPKEY: Write Protection Key

| Value           | Name | Description   |
|-----------------|------|---|
| 0x535049 PASSWD |      | Writing any other value in this field aborts the write operation of the WPEN bit. |
|                 |      | Always reads as 0.  |

# 34.8.11 SPI Write Protection Status Register

Name: SPI\_WPSR

**Address:** 0xF00000E8 (0), 0xF00040E8 (1)

Access: Read-only

| 31 | 30 | 29 | 28  | 27   | 26 | 25 | 24   |
|----|----|----|-----|------|----|----|------|
| _  | _  | _  | -   |      | 1  | 1  | _    |
| 23 | 22 | 21 | 20  | 19   | 18 | 17 | 16   |
| _  | _  | _  | -   |      | -  | ı  | _    |
| 15 | 14 | 13 | 12  | 11   | 10 | 9  | 8    |
|    |    |    | WPV | 'SRC |    |    |      |
| 7  | 6  | 5  | 4   | 3    | 2  | 1  | 0    |
| _  | _  | _  | ı   | ı    | -  | ı  | WPVS |

#### • WPVS: Write Protection Violation Status

0: No write protection violation has occurred since the last read of SPI\_WPSR.

## • WPVSRC: Write Protection Violation Source

When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

<sup>1:</sup> A write protection violation has occurred since the last read of SPI\_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

# 35. Timer Counter (TC)

# 35.1 Description

A Timer Counter (TC) module includes three identical TC channels. The number of implemented TC modules is device-specific.

Each TC channel can be independently programmed to perform a wide range of functions including frequency measurement, event counting, interval measurement, pulse generation, delay timing and pulse width modulation.

Each channel has three external clock inputs, five internal clock inputs and two multi-purpose input/output signals which can be configured by the user. Each channel drives an internal interrupt signal which can be programmed to generate processor interrupts.

The TC block has two global registers which act upon all TC channels:

- Block Control Register (TC\_BCR)—allows channels to be started simultaneously with the same instruction
- Block Mode Register (TC\_BMR)—defines the external clock inputs for each channel, allowing them to be chained

### 35.2 Embedded Characteristics

- Total number of TC channels: six
- TC channel size: 32-bit
- Wide range of functions including:
  - Frequency measurement
  - Event counting
  - Interval measurement
  - Pulse generation
  - Delay timing
  - Pulse Width Modulation
  - Up/down capabilities
  - 2-bit gray up/down count for stepper motor
- Each channel is user-configurable and contains:
  - Three external clock inputs
  - Five Internal clock inputs
  - Two multi-purpose input/output signals acting as trigger event
- Internal interrupt signal
- Register Write Protection

# 35.3 Block Diagram

Table 35-1. Timer Counter Clock Assignment

| Name         | Definition |
|--------------|------------|
| TIMER_CLOCK1 | MCK/2      |
| TIMER_CLOCK2 | MCK/8      |
| TIMER_CLOCK3 | MCK/32     |
| TIMER_CLOCK4 | MCK/128    |
| TIMER_CLOCK5 | SLCK       |

Note: 1. When SLCK is selected for Peripheral Clock (CSS = 0 in PMC Master Clock Register), SLCK input is equivalent to Peripheral Clock.

| TIOA0-TIOA2 | I/O Line A           | I/O   |
| TIOB0-TIOB2 | I/O Line B           | I/O   |

# 35.5 Product Dependencies

#### 35.5.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the TC pins to their peripheral functions.

Table 35-4. I/O Lines

| Instance | Signal | I/O Line | Peripheral |
|----------|--------|----------|------------|
| TC0      | TCLK0  | PA24     | А          |
| TC0      | TCLK1  | PA25     | Α          |
| TC0      | TCLK2  | PA26     | А          |
| TC0      | TIOA0  | PA21     | Α          |
| TC0      | TIOA1  | PA22     | А          |
| TC0      | TIOA2  | PA23     | А          |
| TC0      | TIOB0  | PA27     | Α          |
| TC0      | TIOB1  | PA28     | Α          |
| TC0      | TIOB2  | PA29     | А          |
| TC1      | TCLK3  | PC4      | С          |
| TC1      | TCLK4  | PC7      | С          |
| TC1      | TCLK5  | PC14     | С          |
| TC1      | TIOA3  | PC2      | С          |
| TC1      | TIOA4  | PC5      | С          |
| TC1      | TIOA5  | PC12     | С          |
| TC1      | TIOB3  | PC3      | С          |
| TC1      | TIOB4  | PC6      | С          |
| TC1      | TIOB5  | PC13     | С          |

## 35.5.2 Power Management

The TC is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the Timer Counter clock.

# 35.5.3 Interrupt Sources

The TC has an interrupt line connected to the interrupt controller. Handling the TC interrupt requires programming the interrupt controller before configuring the TC.

Table 35-5. Peripheral IDs

| Instance | ID |
|----------|----|
| TC0      | 17 |
| TC1      | 17 |

# 35.6 Functional Description

## 35.6.1 Description

All channels of the Timer Counter are independent and identical in operation. The registers for channel programming are listed in Table 35-6 "Register Mapping".

#### 35.6.2 32-bit Counter

Each 32-bit channel is organized around a 32-bit counter. The value of the counter is incremented at each positive edge of the selected clock. When the counter has reached the value 2<sup>32</sup>-1 and passes to zero, an overflow occurs and the COVFS bit in the TC Status Register (TC SR) is set.

The current value of the counter is accessible in real time by reading the TC Counter Value Register (TC\_CV). The counter can be reset by a trigger. In this case, the counter value passes to zero on the next valid edge of the selected clock.

#### 35.6.3 Clock Selection

At block level, input clock signals of each channel can either be connected to the external inputs TCLK0, TCLK1 or TCLK2, or be connected to the internal I/O signals TIOA0, TIOA1 or TIOA2 for chaining by programming the TC Block Mode Register (TC\_BMR). See Figure 35-2.

Each channel can independently select an internal or external clock source for its counter:

- External clock signals<sup>(1)</sup>: XC0, XC1 or XC2
- Internal clock signals: MCK/2, MCK/8, MCK/32, MCK/128, SLCK

This selection is made by the TCCLKS bits in the TC Channel Mode Register (TC CMR).

The selected clock can be inverted with the CLKI bit in the TC\_CMR. This allows counting on the opposite edges of the clock.

The burst function allows the clock to be validated when an external signal is high. The BURST parameter in the TC\_CMR defines this signal (none, XC0, XC1, XC2). See Figure 35-3.

Note: 1. In all cases, if an external clock is used, the duration of each of its levels must be longer than the peripheral clock period. The external clock frequency must be at least 2.5 times lower than the peripheral clock.

Figure 35-2. Clock Chaining Selection

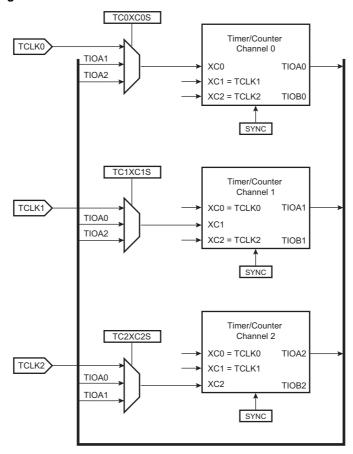

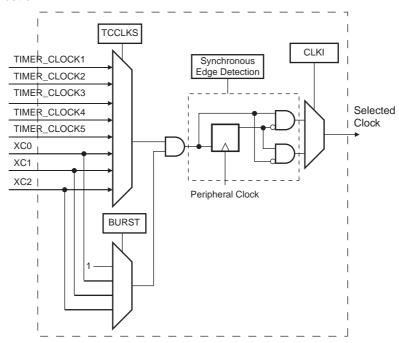

Figure 35-3. Clock Selection

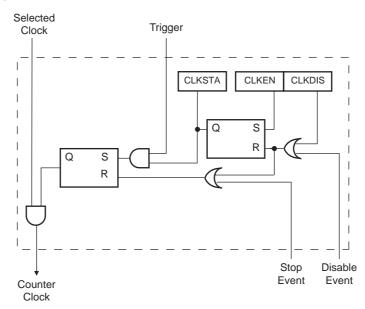

#### 35.6.4 Clock Control

The clock of each counter can be controlled in two different ways: it can be enabled/disabled and started/stopped. See Figure 35-4.

- The clock can be enabled or disabled by the user with the CLKEN and the CLKDIS commands in the TC Channel Control Register (TC\_CCR). In Capture mode it can be disabled by an RB load event if LDBDIS is set to 1 in the TC\_CMR. In Waveform mode, it can be disabled by an RC Compare event if CPCDIS is set to 1 in TC\_CMR. When disabled, the start or the stop actions have no effect: only a CLKEN command in the TC\_CCR can re-enable the clock. When the clock is enabled, the CLKSTA bit is set in the TC\_SR.
- The clock can also be started or stopped: a trigger (software, synchro, external or compare) always starts
  the clock. The clock can be stopped by an RB load event in Capture mode (LDBSTOP = 1 in TC\_CMR) or
  an RC compare event in Waveform mode (CPCSTOP = 1 in TC\_CMR). The start and the stop commands
  are effective only if the clock is enabled.

Figure 35-4. Clock Control

# 35.6.5 Operating Modes

Each channel can operate independently in two different modes:

- Capture mode provides measurement on signals.
- Waveform mode provides wave generation.

The TC operating mode is programmed with the WAVE bit in the TC CMR.

In Capture mode, TIOA and TIOB are configured as inputs.

In Waveform mode, TIOA is always configured to be an output and TIOB is an output if it is not selected to be the external trigger.

#### 35.6.6 Trigger

A trigger resets the counter and starts the counter clock. Three types of triggers are common to both modes, and a fourth external trigger is available to each mode.

Regardless of the trigger used, it will be taken into account at the following active edge of the selected clock. This means that the counter value can be read differently from zero just after a trigger, especially when a low frequency signal is selected as the clock.

The following triggers are common to both modes:

- Software Trigger: Each channel has a software trigger, available by setting SWTRG in TC\_CCR.
- SYNC: Each channel has a synchronization signal SYNC. When asserted, this signal has the same effect as
  a software trigger. The SYNC signals of all channels are asserted simultaneously by writing TC\_BCR (Block
  Control) with SYNC set.
- Compare RC Trigger: RC is implemented in each channel and can provide a trigger when the counter value matches the RC value if CPCTRG is set in the TC\_CMR.

The channel can also be configured to have an external trigger. In Capture mode, the external trigger signal can be selected between TIOA and TIOB. In Waveform mode, an external event can be programmed on one of the following signals: TIOB, XC0, XC1 or XC2. This external event can then be programmed to perform a trigger by setting bit ENETRG in the TC\_CMR.

If an external trigger is used, the duration of the pulses must be longer than the peripheral clock period in order to be detected.

### 35.6.7 Capture Mode

Capture mode is entered by clearing the WAVE bit in the TC\_CMR.

Capture mode allows the TC channel to perform measurements such as pulse timing, frequency, period, duty cycle and phase on TIOA and TIOB signals which are considered as inputs.

Figure 35-5 shows the configuration of the TC channel when programmed in Capture mode.

## 35.6.8 Capture Registers A and B

Registers A and B (RA and RB) are used as capture registers. They can be loaded with the counter value when a programmable event occurs on the signal TIOA.

The LDRA field in the TC\_CMR defines the TIOA selected edge for the loading of register A, and the LDRB field defines the TIOA selected edge for the loading of Register B.

RA is loaded only if it has not been loaded since the last trigger or if RB has been loaded since the last loading of RA.

RB is loaded only if RA has been loaded since the last trigger or the last loading of RB.

Loading RA or RB before the read of the last value loaded sets the Overrun Error Flag (LOVRS bit) in the TC\_SR. In this case, the old value is overwritten.

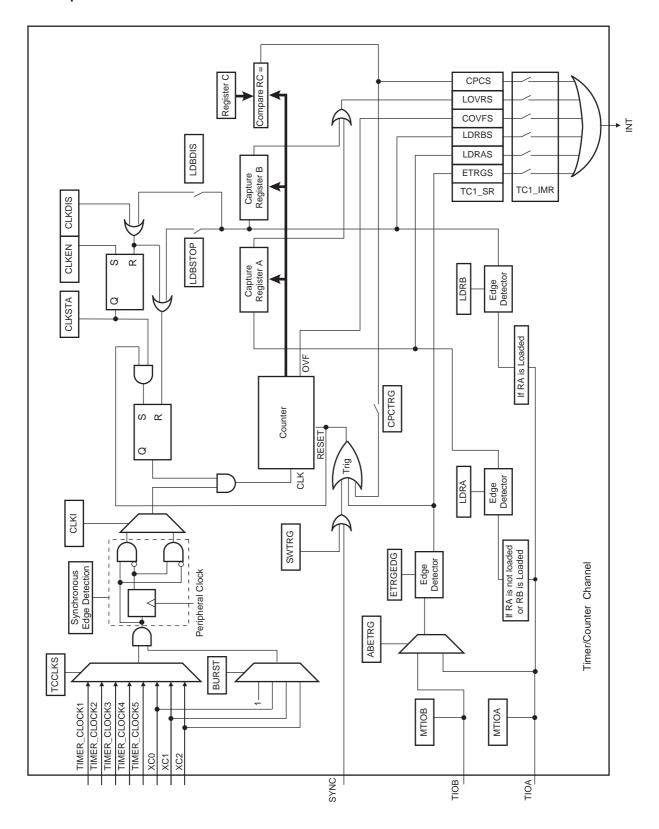

#### 35.6.9 Trigger Conditions

In addition to the SYNC signal, the software trigger and the RC compare trigger, an external trigger can be defined.

The ABETRG bit in the TC\_CMR selects TIOA or TIOB input signal as an external trigger. The External Trigger Edge Selection parameter (ETRGEDG field in TC\_CMR) defines the edge (rising, falling, or both) detected to generate an external trigger. If ETRGEDG = 0 (none), the external trigger is disabled.

Figure 35-5. Capture Mode

## 35.6.10 Waveform Mode

Waveform mode is entered by setting the TC\_CMRx.WAVE bit.

In Waveform mode, the TC channel generates one or two PWM signals with the same frequency and independently programmable duty cycles, or generates different types of one-shot or repetitive pulses.

In this mode, TIOA is configured as an output and TIOB is defined as an output if it is not used as an external event (EEVT parameter in TC CMR).

Figure 35-6 shows the configuration of the TC channel when programmed in Waveform operating mode.

### 35.6.11 Waveform Selection

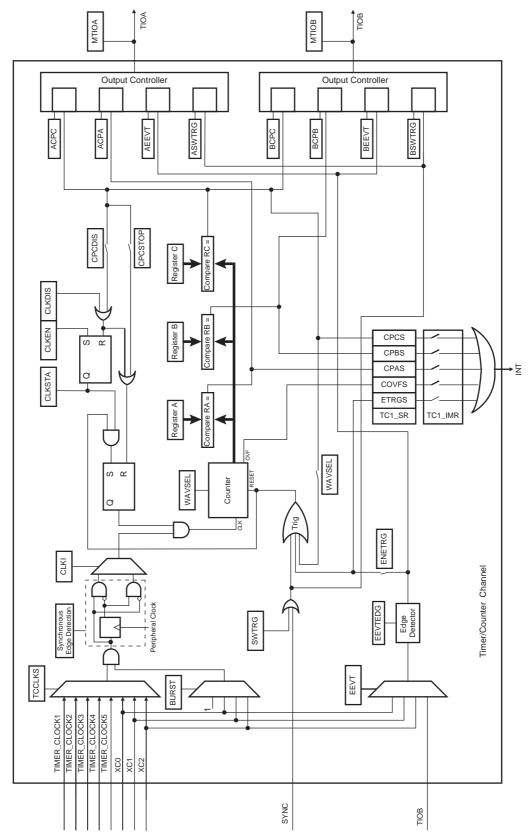

Depending on the WAVSEL parameter in TC CMR, the behavior of TC CV varies.

With any selection, TC\_RA, TC\_RB and TC\_RC can all be used as compare registers.

RA Compare is used to control the TIOA output, RB Compare is used to control the TIOB output (if correctly configured) and RC Compare is used to control TIOA and/or TIOB outputs.

Figure 35-6. Waveform Mode

## 35.6.11.1 WAVSEL = 00

When WAVSEL = 00, the value of TC\_CV is incremented from 0 to  $2^{32}$ -1. Once  $2^{32}$ -1 has been reached, the value of TC\_CV is reset. Incrementation of TC\_CV starts again and the cycle continues. See Figure 35-7.

An external event trigger or a software trigger can reset the value of TC\_CV. It is important to note that the trigger may occur at any time. See Figure 35-8.

RC Compare cannot be programmed to generate a trigger in this configuration. At the same time, RC Compare can stop the counter clock (CPCSTOP = 1 in TC\_CMR) and/or disable the counter clock (CPCDIS = 1 in TC\_CMR).

Figure 35-7. WAVSEL = 00 without Trigger

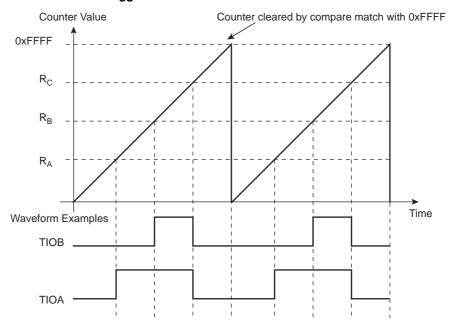

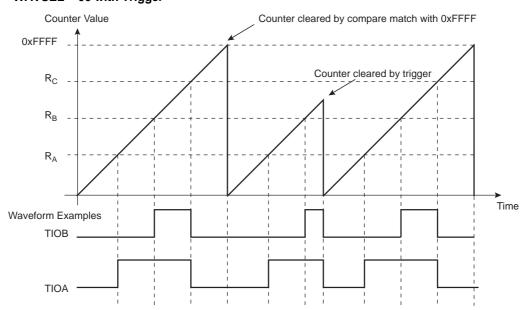

Figure 35-8. WAVSEL = 00 with Trigger

## 35.6.11.2 WAVSEL = 10

When WAVSEL = 10, the value of TC\_CV is incremented from 0 to the value of RC, then automatically reset on a RC Compare. Once the value of TC\_CV has been reset, it is then incremented and so on. See Figure 35-9.

It is important to note that TC\_CV can be reset at any time by an external event or a software trigger if both are programmed correctly. See Figure 35-10.

In addition, RC Compare can stop the counter clock (CPCSTOP = 1 in TC\_CMR) and/or disable the counter clock (CPCDIS = 1 in TC\_CMR).

Figure 35-9. WAVSEL = 10 without Trigger

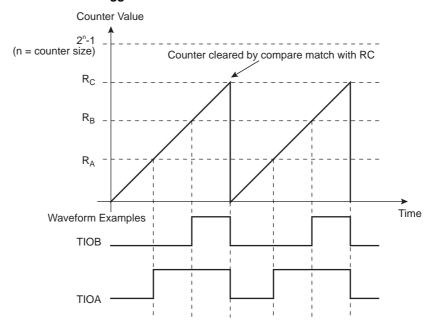

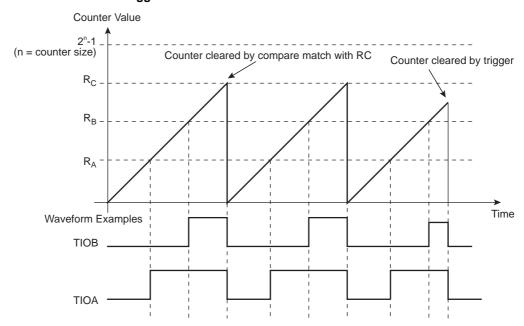

Figure 35-10. WAVSEL = 10 with Trigger

#### 35.6.11.3 WAVSEL = 01

When WAVSEL = 01, the value of TC\_CV is incremented from 0 to  $2^{32}$ -1. Once  $2^{32}$ -1 is reached, the value of TC\_CV is decremented to 0, then re-incremented to  $2^{32}$ -1 and so on. See Figure 35-11.

A trigger such as an external event or a software trigger can modify TC\_CV at any time. If a trigger occurs while TC\_CV is incrementing, TC\_CV then decrements. If a trigger is received while TC\_CV is decrementing, TC\_CV then increments. See Figure 35-12.

RC Compare cannot be programmed to generate a trigger in this configuration.

At the same time, RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

Figure 35-11. WAVSEL = 01 without Trigger

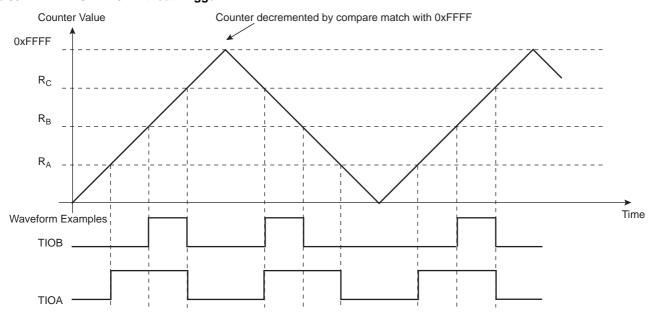

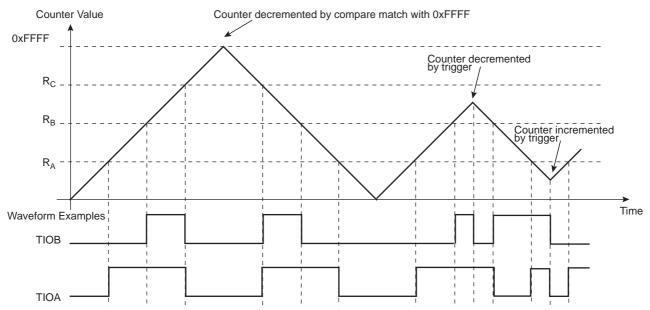

Figure 35-12. WAVSEL = 01 with Trigger

#### 35.6.11.4 WAVSEL = 11

When WAVSEL = 11, the value of TC\_CV is incremented from 0 to RC. Once RC is reached, the value of TC\_CV is decremented to 0, then re-incremented to RC and so on. See Figure 35-13.

A trigger such as an external event or a software trigger can modify TC\_CV at any time. If a trigger occurs while TC\_CV is incrementing, TC\_CV then decrements. If a trigger is received while TC\_CV is decrementing, TC\_CV then increments. See Figure 35-14.

RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

Figure 35-13. WAVSEL = 11 without Trigger

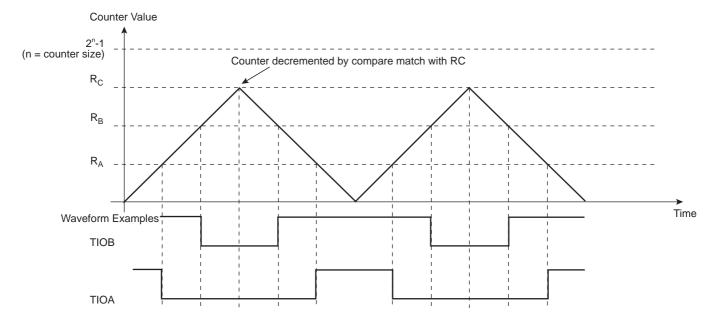

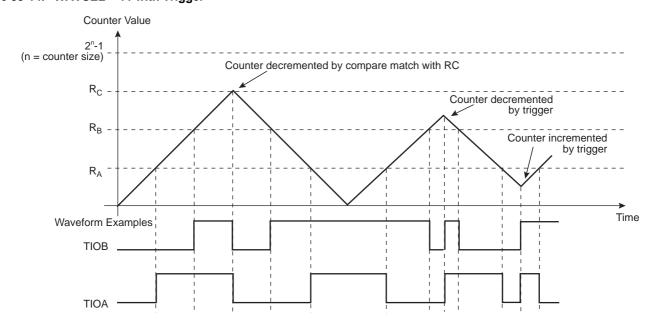

Figure 35-14. WAVSEL = 11 with Trigger

## 35.6.12 External Event/Trigger Conditions

An external event can be programmed to be detected on one of the clock sources (XC0, XC1, XC2) or TIOB. The external event selected can then be used as a trigger.

The EEVT parameter in TC\_CMR selects the external trigger. The EEVTEDG parameter defines the trigger edge for each of the possible external triggers (rising, falling or both). If EEVTEDG is cleared (none), no external event is defined.

If TIOB is defined as an external event signal (EEVT = 0), TIOB is no longer used as an output and the compare register B is not used to generate waveforms and subsequently no IRQs. In this case the TC channel can only generate a waveform on TIOA.

When an external event is defined, it can be used as a trigger by setting bit ENETRG in the TC\_CMR.

As in Capture mode, the SYNC signal and the software trigger are also available as triggers. RC Compare can also be used as a trigger depending on the parameter WAVSEL.

## 35.6.13 Output Controller

The output controller defines the output level changes on TIOA and TIOB following an event. TIOB control is used only if TIOB is defined as output (not as an external event).

The following events control TIOA and TIOB: software trigger, external event and RC compare. RA compare controls TIOA and RB compare controls TIOB. Each of these events can be programmed to set, clear or toggle the output as defined in the corresponding parameter in TC\_CMR.

#### 35.6.14 2-bit Gray Up/Down Counter for Stepper Motor

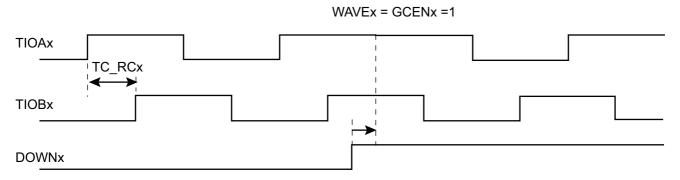

Each channel can be independently configured to generate a 2-bit gray count waveform on corresponding TIOA, TIOB outputs by means of the GCEN bit in TC\_SMMRx.

Up or Down count can be defined by writing bit DOWN in TC\_SMMRx.

It is mandatory to configure the channel in Waveform mode in the TC\_CMR.

The period of the counters can be programmed in TC\_RCx.

Figure 35-15. 2-bit Gray Up/Down Counter

# 35.6.15 Register Write Protection

To prevent any single software error from corrupting TC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the TC Write Protection Mode Register (TC\_WPMR).

The Timer Counter clock of the first channel must be enabled to access TC\_WPMR.

The following registers can be write-protected:

- TC Block Mode Register
- TC Channel Mode Register: Capture Mode
- TC Channel Mode Register: Waveform Mode
- TC Stepper Motor Mode Register
- TC Register A
- TC Register B
- TC Register C

#### Timer Counter (TC) User Interface 35.7

| 3     | TIMER_CLOCK4 | Clock selected: internal MCK/128 clock signal (from PMC) |
| 4     | TIMER_CLOCK5 | Clock selected: internal SLCK clock signal (from PMC)    |
| 5     | XC0          | Clock selected: XC0                                      |
| 6     | XC1          | Clock selected: XC1                                      |
| 7     | XC2          | Clock selected: XC2                                      |

#### • CLKI: Clock Invert

0: Counter is incremented on rising edge of the clock.

1: Counter is incremented on falling edge of the clock.

# • BURST: Burst Signal Selection

| Value | Name | Description                                   |
|-------|------|---|
| 0     | NONE | The clock is not gated by an external signal. |
| 1     | XC0  | XC0 is ANDed with the selected clock.         |
| 2     | XC1  | XC1 is ANDed with the selected clock.         |
| 3     | XC2  | XC2 is ANDed with the selected clock.         |

# • CPCSTOP: Counter Clock Stopped with RC Compare

0: Counter clock is not stopped when counter reaches RC.

1: Counter clock is stopped when counter reaches RC.

# • CPCDIS: Counter Clock Disable with RC Compare

- 0: Counter clock is not disabled when counter reaches RC.
- 1: Counter clock is disabled when counter reaches RC.

## • EEVTEDG: External Event Edge Selection

| Value | Name    | Description  |
|-------|---------|--------------|
| 0     | NONE    | None         |
| 1     | RISING  | Rising edge  |
| 2     | FALLING | Falling edge |
| 3     | EDGE    | Each edge    |

#### • EEVT: External Event Selection

Signal selected as external event.

| Value | Name | Description         | TIOB Direction |
|-------|------|---------------------|----------------|
| 0     | TIOB | TIOB <sup>(1)</sup> | Input          |
| 1     | XC0  | XC0                 | Output         |
| 2     | XC1  | XC1                 | Output         |
| 3     | XC2  | XC2                 | Output         |

Note:

# • ENETRG: External Event Trigger Enable

- 0: The external event has no effect on the counter and its clock.
- 1: The external event resets the counter and starts the counter clock.

Note: Whatever the value programmed in ENETRG, the selected external event only controls the TIOA output and TIOB if not used as input (trigger event input or other input used).

## • WAVSEL: Waveform Selection

| Value | Name      | Description   |
|-------|-----------|---|
| 0     | UP        | UP mode without automatic trigger on RC Compare     |
| 1     | UPDOWN    | UPDOWN mode without automatic trigger on RC Compare |
| 2     | UP_RC     | UP mode with automatic trigger on RC Compare        |
| 3     | UPDOWN_RC | UPDOWN mode with automatic trigger on RC Compare    |

#### WAVE: Waveform Mode

- 0: Waveform mode is disabled (Capture mode is enabled).
- 1: Waveform mode is enabled.

<sup>1.</sup> If TIOB is chosen as the external event signal, it is configured as an input and no longer generates waveforms and subsequently no IRQs.

# • ACPA: RA Compare Effect on TIOA

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

# • ACPC: RC Compare Effect on TIOA

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

## • AEEVT: External Event Effect on TIOA

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

# • ASWTRG: Software Trigger Effect on TIOA

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

# • BCPB: RB Compare Effect on TIOB

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

## • BCPC: RC Compare Effect on TIOB

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

# • BEEVT: External Event Effect on TIOB

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

# • BSWTRG: Software Trigger Effect on TIOB

| Value | Name   | Description |  |
|-------|--------|-------------|--|
| 0     | NONE   | None        |  |
| 1     | SET    | Set         |  |
| 2     | CLEAR  | Clear       |  |
| 3     | TOGGLE | Toggle      |  |

# 35.7.4 TC Stepper Motor Mode Register

| _  | _  | -  | -  | -  | -  | DOWN | GCEN |

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

## • GCEN: Gray Count Enable

0: TIOAx [x=0..2] and TIOBx [x=0..2] are driven by internal counter of channel x.

1: TIOAx [x=0..2] and TIOBx [x=0..2] are driven by a 2-bit gray counter.

#### • DOWN: Down Count

0: Up counter.

1: Down counter.

| ETRGS | LDRBS | LDRAS | CPCS | CPBS | CPAS  | LOVRS | COVFS  |

#### COVFS: Counter Overflow Status (cleared on read)

0: No counter overflow has occurred since the last read of the Status Register.

1: A counter overflow has occurred since the last read of the Status Register.

#### • LOVRS: Load Overrun Status (cleared on read)

0: Load overrun has not occurred since the last read of the Status Register or TC\_CMRx.WAVE = 1.

1: RA or RB have been loaded at least twice without any read of the corresponding register since the last read of the Status Register, if TC\_CMRx.WAVE = 0.

#### CPAS: RA Compare Status (cleared on read)

0: RA Compare has not occurred since the last read of the Status Register or TC CMRx.WAVE = 0.

1: RA Compare has occurred since the last read of the Status Register, if TC CMRx.WAVE = 1.

#### • CPBS: RB Compare Status (cleared on read)

0: RB Compare has not occurred since the last read of the Status Register or TC\_CMRx.WAVE = 0.

1: RB Compare has occurred since the last read of the Status Register, if TC\_CMRx.WAVE = 1.

#### CPCS: RC Compare Status (cleared on read)

0: RC Compare has not occurred since the last read of the Status Register.

1: RC Compare has occurred since the last read of the Status Register.

#### • LDRAS: RA Loading Status (cleared on read)

0: RA Load has not occurred since the last read of the Status Register or TC\_CMRx.WAVE = 1.

1: RA Load has occurred since the last read of the Status Register, if TC CMRx.WAVE = 0.

# LDRBS: RB Loading Status (cleared on read)

0: RB Load has not occurred since the last read of the Status Register or TC\_CMRx.WAVE = 1.

1: RB Load has occurred since the last read of the Status Register, if TC\_CMRx.WAVE = 0.

## • ETRGS: External Trigger Status (cleared on read)

- 0: External trigger has not occurred since the last read of the Status Register.
- 1: External trigger has occurred since the last read of the Status Register.

#### CLKSTA: Clock Enabling Status

- 0: Clock is disabled.
- 1: Clock is enabled.

#### • MTIOA: TIOA Mirror

- 0: TIOA is low. If TC\_CMRx.WAVE = 0, this means that TIOA pin is low. If TC\_CMRx.WAVE = 1, this means that TIOA is driven low.
- 1: TIOA is high. If TC\_CMRx.WAVE = 0, this means that TIOA pin is high. If TC\_CMRx.WAVE = 1, this means that TIOA is driven high.

#### • MTIOB: TIOB Mirror

- 0: TIOB is low. If TC\_CMRx.WAVE = 0, this means that TIOB pin is low. If TC\_CMRx.WAVE = 1, this means that TIOB is driven low.
- 1: TIOB is high. If TC\_CMRx.WAVE = 0, this means that TIOB pin is high. If TC\_CMRx.WAVE = 1, this means that TIOB is driven high.

| 0,544940 | FASSWD | Always reads as 0.  |  |  |

# 36. Pulse Width Modulation Controller (PWM)

## 36.1 Description

The PWM macrocell controls several channels independently. Each channel controls one square output waveform. Characteristics of the output waveform such as period, duty-cycle and polarity are configurable through the user interface. Each channel selects and uses one of the clocks provided by the clock generator. The clock generator provides several clocks resulting from the division of the PWM macrocell master clock.

All PWM macrocell accesses are made through APB mapped registers.

Channels can be synchronized, to generate non overlapped waveforms. All channels integrate a double buffering system in order to prevent an unexpected output waveform while modifying the period or the duty-cycle.

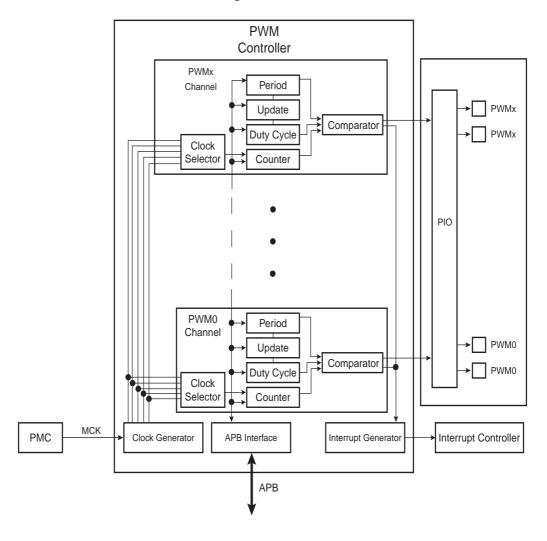

#### 36.2 Embedded characteristics

- 4 Channels
- One 16-bit Counter Per Channel
- Common Clock Generator Providing Thirteen Different Clocks
  - A Modulo n Counter Providing Eleven Clocks
  - Two Independent Linear Dividers Working on Modulo n Counter Outputs
- Independent Channels
  - Independent Enable Disable Command for Each Channel
  - Independent Clock Selection for Each Channel
  - Independent Period and Duty Cycle for Each Channel
  - Double Buffering of Period or Duty Cycle for Each Channel
  - Programmable Selection of The Output Waveform Polarity for Each Channel
  - Programmable Center or Left Aligned Output Waveform for Each Channel Block Diagram

# 36.3 Block Diagram

# 36.4 I/O Lines Description

Each channel outputs one waveform on one external I/O line.

Table 36-1. I/O Line Description

| Name | Description                       | Туре   |
|------|-----------------------------------|--------|
| PWMx | PWM Waveform Output for channel x | Output |

# 36.5 Product Dependencies

#### 36.5.1 I/O Lines

The pins used for interfacing the PWM may be multiplexed with PIO lines. The programmer must first program the PIO controller to assign the desired PWM pins to their peripheral function. If I/O lines of the PWM are not used by the application, they can be used for other purposes by the PIO controller.

All of the PWM outputs may or may not be enabled. If an application requires only four channels, then only four PIO lines will be assigned to PWM outputs.

Table 36-2. I/O Lines

| Instance | Signal | I/O Line | Peripheral |
|----------|--------|----------|------------|
| PWM      | PWM0   | PB11     | В          |
| PWM      | PWM0   | PC10     | С          |
| PWM      | PWM0   | PC18     | С          |

| PWM      | PWM1   | PC11     | С          |
| PWM      | PWM1   | PC19     | С          |
| PWM      | PWM2   | PB13     | В          |
| PWM      | PWM2   | PC20     | С          |
| PWM      | PWM3   | PB14     | В          |
| PWM      | PWM3   | PC21     | С          |

#### 36.5.2 Power Management

The PWM is not continuously clocked. The programmer must first enable the PWM clock in the Power Management Controller (PMC) before using the PWM. However, if the application does not require PWM operations, the PWM clock can be stopped when not needed and be restarted later. In this case, the PWM will resume its operations where it left off.

All the PWM registers except PWM\_CDTY and PWM\_CPRD can be read without the PWM peripheral clock enabled. All the registers can be written without the peripheral clock enabled.

#### 36.5.3 Interrupt Sources

The PWM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the PWM interrupt requires the Interrupt Controller to be programmed first. Note that it is not recommended to use the PWM interrupt line in edge sensitive mode.

Table 36-3. Peripheral IDs

| Instance | ID |  |
|----------|----|--|
| PWM      | 18 |  |

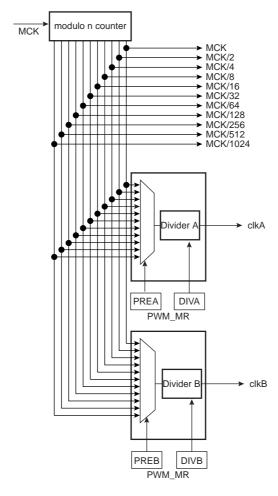

## 36.6 Functional Description

The PWM macrocell is primarily composed of a clock generator module and 4 channels.

- Clocked by the system clock, MCK, the clock generator module provides 13 clocks.
- Each channel can independently choose one of the clock generator outputs.
- Each channel generates an output waveform with attributes that can be defined independently for each channel through the user interface registers.

#### 36.6.1 PWM Clock Generator

Figure 36-2. Functional View of the Clock Generator Block Diagram

**Caution:** Before using the PWM macrocell, the programmer must first enable the PWM clock in the Power Management Controller (PMC).

The PWM macrocell master clock, MCK, is divided in the clock generator module to provide different clocks available for all channels. Each channel can independently select one of the divided clocks.

The clock generator is divided in three blocks:

- A modulo n counter which provides 11 clocks:  $F_{MCK}$ ,  $F_{MCK}$ /2,  $F_{MCK}$ /4,  $F_{MCK}$ /8,  $F_{MCK}$ /16,  $F_{MCK}$ /32,  $F_{MCK}$ /64,  $F_{MCK}$ /128,  $F_{MCK}$ /256,  $F_{MCK}$ /512,  $F_{MCK}$ /1024
- Two linear dividers (1, 1/2, 1/3,... 1/255) that provide two separate clocks: clkA and clkB

Each linear divider can independently divide one of the clocks of the modulo n counter. The selection of the clock to be divided is made according to the PREA (PREB) field of the PWM Mode register (PWM\_MR). The resulting clock clkA (clkB) is the clock selected divided by DIVA (DIVB) field value in the PWM Mode register (PWM\_MR).

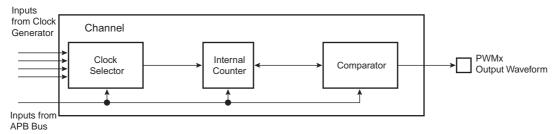

After a reset of the PWM controller, DIVA (DIVB) and PREA (PREB) in the PWM Mode register are set to 0. This implies that after reset clkA (clkB) are turned off.

At reset, all clocks provided by the modulo n counter are turned off except clock "clk". This situation is also true when the PWM master clock is turned off through the Power Management Controller.

#### 36.6.2 PWM Channel

#### 36.6.2.1 Block Diagram

Figure 36-3. Functional View of the Channel Block Diagram

Each of the 4 channels is composed of three blocks:

- A clock selector which selects one of the clocks provided by the clock generator described in Section 36.6.1
   "PWM Clock Generator" on page 742.
- An internal counter clocked by the output of the clock selector. This internal counter is incremented or decremented according to the channel configuration and comparators events. The size of the internal counter is 16 bits.
- A comparator used to generate events according to the internal counter value. It also computes the PWMx output waveform according to the configuration.

#### 36.6.2.2 Waveform Properties

The different properties of output waveforms are:

- The *internal clock selection*. The internal channel counter is clocked by one of the clocks provided by the clock generator described in the previous section. This channel parameter is defined in the CPRE field of the PWM\_CMRx register. This field is reset at 0.
- The **waveform period**. This channel parameter is defined in the CPRD field of the PWM\_CPRDx register.
   If the waveform is left aligned, then the output waveform period depends on the counter source clock and
  - can be calculated:
    By using the Master Clock (MCK) divided by an X given prescaler value
    (with X being 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024), the resulting period formula is:

$$\frac{(X \times CPRD)}{MCK}$$

By using a Master Clock divided by one of both DIVA or DIVB divider, the formula becomes, respectively:

$$\frac{(X*CPRD*DIVA)}{MCK}$$
 or  $\frac{(X*CPRD*DIVB)}{MCK}$ 

If the waveform is center aligned then the output waveform period depends on the counter source clock and can be calculated:

By using the Master Clock (MCK) divided by an X given prescaler value

(with X being 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024), the resulting period formula is:

$$\frac{(2 \times X \times CPRD)}{MCK}$$

By using a Master Clock divided by one of both DIVA or DIVB divider, the formula becomes, respectively:

$$\frac{(2*X*CPRD*DIVA)}{MCK}$$
 or  $\frac{(2*X*CPRD*DIVB)}{MCK}$ 

The waveform duty cycle. This channel parameter is defined in the CDTY field of the PWM\_CDTYx register.

If the waveform is left aligned then:

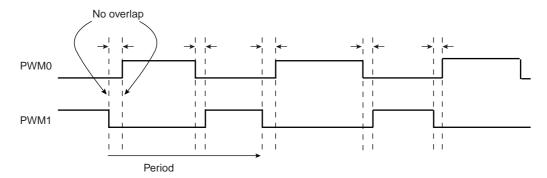

duty cycle = 
$$\frac{(period - 1/ fchannel_x\_clock \times CDTY)}{period}$$

If the waveform is center aligned, then:

duty cycle = 
$$\frac{((period/2) - 1/ \text{ fchannel}_x \text{_clock} \times CDTY))}{(period/2)}$$

- The **waveform polarity**. At the beginning of the period, the signal can be at high or low level. This property is defined in the CPOL field of the PWM\_CMRx register. By default the signal starts by a low level.
- The waveform alignment. The output waveform can be left or center aligned. Center aligned waveforms
  can be used to generate non overlapped waveforms. This property is defined in the CALG field of the
  PWM\_CMRx register. The default mode is left aligned.

Figure 36-4. Non Overlapped Center Aligned Waveforms

Note: See Figure 36-5 on page 746 for a detailed description of center aligned waveforms.

When center aligned, the internal channel counter increases up to CPRD and decreases down to 0. This ends the period.

When left aligned, the internal channel counter increases up to CPRD and is reset. This ends the period.

Thus, for the same CPRD value, the period for a center aligned channel is twice the period for a left aligned channel.

Waveforms are fixed at 0 when:

- CDTY = CPRD and CPOL = 0
- CDTY = 0 and CPOL = 1

Waveforms are fixed at 1 (once the channel is enabled) when:

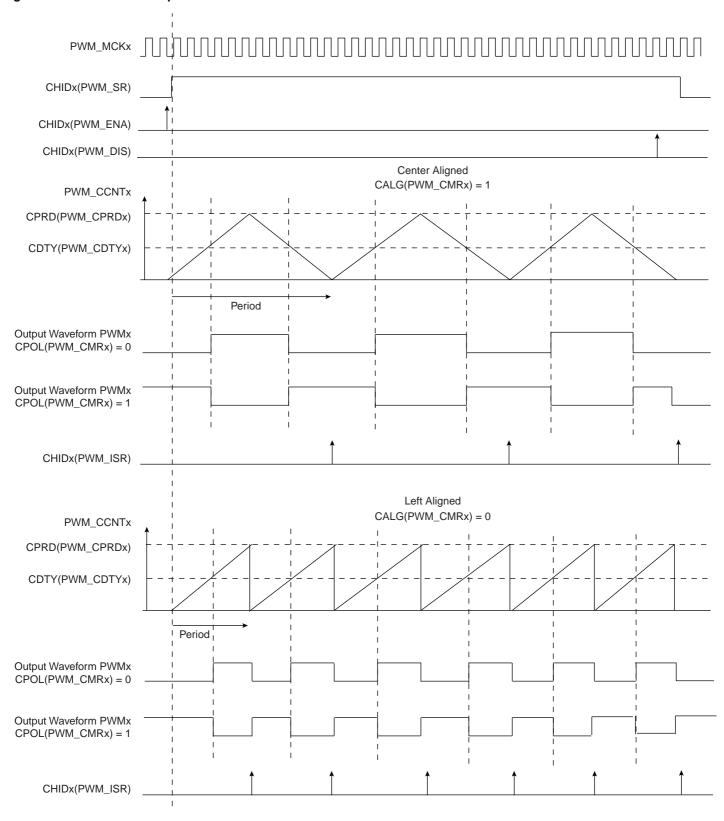

CDTY = 0 and CPOL = 0

CDTY = CPRD and CPOL = 1

The waveform polarity must be set before enabling the channel. This immediately affects the channel output level. Changes on channel polarity are not taken into account while the channel is enabled.

Figure 36-5. Waveform Properties

#### 36.6.3 PWM Controller Operations

#### 36.6.3.1 Initialization

Before enabling the output channel, this channel must have been configured by the software application:

- Configuration of the clock generator if DIVA and DIVB are required
- Selection of the clock for each channel (CPRE field in the PWM\_CMRx register)
- Configuration of the waveform alignment for each channel (CALG field in the PWM CMRx register)
- Configuration of the period for each channel (CPRD in the PWM\_CPRDx register). Writing in PWM\_CPRDx Register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_CUPDx Register to update PWM\_CPRDx as explained below.
- Configuration of the duty cycle for each channel (CDTY in the PWM\_CDTYx register). Writing in PWM\_CDTYx Register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_CUPDx Register to update PWM\_CDTYx as explained below.
- Configuration of the output waveform polarity for each channel (CPOL in the PWM\_CMRx register)
- Enable Interrupts (Writing CHIDx in the PWM\_IER register)
- Enable the PWM channel (Writing CHIDx in the PWM\_ENA register)

It is possible to synchronize different channels by enabling them at the same time by means of writing simultaneously several CHIDx bits in the PWM\_ENA register.

 In such a situation, all channels may have the same clock selector configuration and the same period specified.

#### 36.6.3.2 Source Clock Selection Criteria

The large number of source clocks can make selection difficult. The relationship between the value in the Period Register (PWM\_CPRDx) and the Duty Cycle Register (PWM\_CDTYx) can help the user in choosing. The event number written in the Period Register gives the PWM accuracy. The Duty Cycle quantum cannot be lower than  $1/PWM\_CPRDx$  value. The higher the value of PWM\_CPRDx, the greater the PWM accuracy.

For example, if the user sets 15 (in decimal) in PWM\_CPRDx, the user is able to set a value between 1 up to 14 in PWM\_CDTYx Register. The resulting duty cycle quantum cannot be lower than 1/15 of the PWM period.

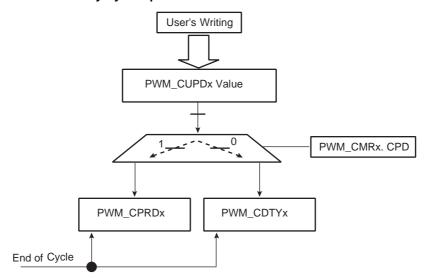

#### 36.6.3.3 Changing the Duty Cycle or the Period

It is possible to modulate the output waveform duty cycle or period.

To prevent unexpected output waveform, the user must use the update register (PWM\_CUPDx) to change waveform parameters while the channel is still enabled. The user can write a new period value or duty cycle value in the update register (PWM\_CUPDx). This register holds the new value until the end of the current cycle and updates the value for the next cycle. Depending on the CPD field in the PWM\_CMRx register, PWM\_CUPDx either updates PWM\_CPRDx or PWM\_CDTYx. Note that even if the update register is used, the period must not be smaller than the duty cycle.

Figure 36-6. Synchronized Period or Duty Cycle Update

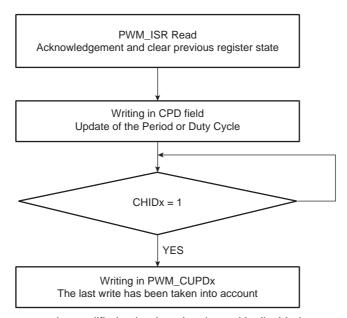

To prevent overwriting the PWM\_CUPDx by software, the user can use status events in order to synchronize his software. Two methods are possible. In both, the user must enable the dedicated interrupt in PWM\_IER at PWM Controller level.

The first method (polling method) consists of reading the relevant status bit in PWM\_ISR Register according to the enabled channel(s). See Figure 36-7.

The second method uses an Interrupt Service Routine associated with the PWM channel.

Note: Reading the PWM\_ISR register automatically clears CHIDx flags.

Figure 36-7. Polling Method

Note: Polarity and alignment can be modified only when the channel is disabled.

#### 36.6.3.4 Interrupts

Depending on the interrupt mask in the PWM\_IMR register, an interrupt is generated at the end of the corresponding channel period. The interrupt remains active until a read operation in the PWM\_ISR register occurs.

A channel interrupt is enabled by setting the corresponding bit in the PWM\_IER register. A channel interrupt is disabled by setting the corresponding bit in the PWM\_IDR register.

| 0011  | MCKDIV8    | Master Clock divided by 8    |
| 0100  | MCKDIV16   | Master Clock divided by 16   |
| 0101  | MCKDIV32   | Master Clock divided by 32   |
| 0110  | MCKDIV64   | Master Clock divided by 64   |
| 0111  | MCKDIV128  | Master Clock divided by 128  |
| 1000  | MCKDIV256  | Master Clock divided by 256  |
| 1001  | MCKDIV512  | Master Clock divided by 512  |
| 1010  | MCKDIV1024 | Master Clock divided by 1024 |
| 1011  | CLKA       | Clock A                      |
| 1100  | CLKB       | Clock B                      |

Values which are not listed in the table must be considered as "reserved".

## • CALG: Channel Alignment

0 = The period is left aligned.

1 = The period is center aligned.

## • CPOL: Channel Polarity

0 = The output waveform starts at a low level.

1 = The output waveform starts at a high level.

## • CPD: Channel Update Period

0 = Writing to the PWM\_CUPDx will modify the duty cycle at the next period start event.

1 = Writing to the PWM\_CUPDx will modify the period at the next period start event.

## 36.7.10 PWM Channel Duty Cycle Register

Name: PWM\_CDTY[0..3]

**Address:** 0xF8034204 [0], 0xF8034224 [1], 0xF8034244 [2], 0xF8034264 [3]

Access: Read/Write

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|----|----|----|----|----|----|----|----|
|    |    |    | CD | TY |    |    |    |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|    |    |    | CD | TY |    |    |    |
| 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|    |    |    | CD | TY |    |    |    |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|    |    |    | CD | TY |    |    |    |

Only the first 16 bits (internal channel counter size) are significant.

## • CDTY: Channel Duty Cycle

Defines the waveform duty cycle. This value must be defined between 0 and CPRD (PWM\_CPRx).

## 36.7.11 PWM Channel Period Register

Name: PWM\_CPRD[0..3]

**Address:** 0xF8034208 [0], 0xF8034228 [1], 0xF8034248 [2], 0xF8034268 [3]

Access: Read/Write

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|----|----|----|----|----|----|----|----|
|    |    |    | CP | RD |    |    |    |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|    |    |    | СР | RD |    |    |    |
| 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|    |    |    | СР | RD |    |    |    |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|    |    |    | CP | RD |    |    |    |

Only the first 16 bits (internal channel counter size) are significant.

### • CPRD: Channel Period

If the waveform is left-aligned, then the output waveform period depends on the counter source clock and can be calculated:

- By using the Master Clock (MCK) divided by an X given prescaler value (with X being 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times CPRD)}{MCK}$$

- By using a Master Clock divided by one of both DIVA or DIVB divider, the formula becomes, respectively:

$$\frac{(CRPD \times DIVA)}{MCK}$$
 or  $\frac{(CRPD \times DIVAB)}{MCK}$ 

If the waveform is center-aligned, then the output waveform period depends on the counter source clock and can be calculated:

- By using the Master Clock (MCK) divided by an X given prescaler value (with X being 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times CPRD)}{MCK}$$

- By using a Master Clock divided by one of both DIVA or DIVB divider, the formula becomes, respectively:

$$\frac{(2 \times \mathit{CPRD} \times \mathit{DIVA})}{\mathit{MCK}}$$
 or  $\frac{(2 \times \mathit{CPRD} \times \mathit{DIVB})}{\mathit{MCK}}$ 

## 36.7.12 PWM Channel Counter Register

Name: PWM\_CCNT[0..3]

**Address:** 0xF803420C [0], 0xF803422C [1], 0xF803424C [2], 0xF803426C [3]

Access: Read-only

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|----|----|----|----|----|----|----|----|
|    |    |    | CI | TV |    |    |    |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|    |    |    | CI | TV |    |    |    |
| 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|    |    |    | Cl | TV |    |    |    |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|    |    |    | CI | NT |    |    |    |

## • CNT: Channel Counter Register

Internal counter value. This register is reset when:

- The channel is enabled (writing CHIDx in the PWM\_ENA register).
- The counter reaches CPRD value defined in the PWM\_CPRDx register if the waveform is left aligned.

## 36.7.13 PWM Channel Update Register

Name: PWM\_CUPD[0..3]

**Address:** 0xF8034210 [0], 0xF8034230 [1], 0xF8034250 [2], 0xF8034270 [3]

Access: Write-only

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|----|----|----|----|----|----|----|----|
|    |    |    | CU | PD |    |    |    |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|    |    |    | CU | PD |    |    |    |
| 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|    |    |    | CU | PD |    |    |    |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|    |    |    | CU | PD |    |    |    |

### **CUPD: Channel Update Register**

This register acts as a double buffer for the period or the duty cycle. This prevents an unexpected waveform when modifying the waveform period or duty-cycle.

Only the first 16 bits (internal channel counter size) are significant.

When CPD field of PWM\_CMRx register = 0, the duty-cycle (CDTY of PWM\_CDTYx register) is updated with the CUPD value at the beginning of the next period.

When CPD field of PWM\_CMRx register = 1, the period (CPRD of PWM\_CPRDx register) is updated with the CUPD value at the beginning of the next period.

# 37. Two-wire Interface (TWI)

## 37.1 Description

The Atmel Two-wire Interface (TWI) interconnects components on a unique two-wire bus, made up of one clock line and one data line with speeds of up to 400 Kbits per second, based on a byte-oriented transfer format. It can be used with any Atmel Two-wire Interface bus Serial EEPROM and I<sup>2</sup>C compatible device such as a Real Time Clock (RTC), Dot Matrix/Graphic LCD Controllers and temperature sensor. The TWI is programmable as a master or a slave with sequential or single-byte access. Multiple master capability is supported.

A configurable baud rate generator permits the output data rate to be adapted to a wide range of core clock frequencies.

Table 37-1 lists the compatibility level of the Atmel Two-wire Interface in Master mode and a full I<sup>2</sup>C compatible device.

Table 37-1. Atmel TWI Compatibility with I<sup>2</sup>C Standard

| I <sup>2</sup> C Standard                     | Atmel TWI     |
|---|---------------|
| Standard Mode Speed (100 kHz)                 | Supported     |
| Fast Mode Speed (400 kHz)                     | Supported     |
| 7- or 10-bit Slave Addressing                 | Supported     |
| START byte <sup>(1)</sup>                     | Not Supported |
| Repeated Start (Sr) Condition                 | Supported     |
| ACK and NACK Management                       | Supported     |
| Slope Control and Input Filtering (Fast mode) | Not Supported |
| Clock Stretching/Synchronization              | Supported     |
| Multi Master Capability                       | Supported     |

Note: 1. START + b000000001 + Ack + Sr

### 37.2 Embedded Characteristics

- Compatible with Atmel Two-wire Interface Serial Memory and I<sup>2</sup>C Compatible Devices<sup>(1)</sup>
- One, Two or Three Bytes for Slave Address
- Sequential Read/Write Operations
- Master, Multi-master and Slave Mode Operation
- Bit Rate: Up to 400 Kbit/s
- General Call Supported in Slave Mode
- Connection to DMA Controller (DMA) Channel Capabilities Optimizes Data Transfers
- Register Write Protection

Note: 1. See Table 37-1 for details on compatibility with I<sup>2</sup>C Standard.

#### 37.3 List of Abbreviations

Table 37-2. Abbreviations

| Abbreviation | Description        |
|--------------|--------------------|
| TWI          | Two-wire Interface |
| A            | Acknowledge        |
| NA           | Non Acknowledge    |

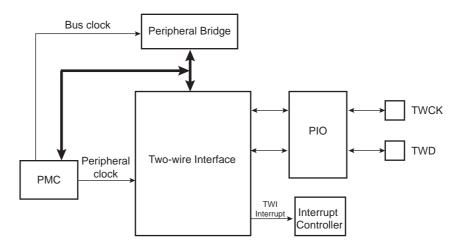

Table 37-2. Abbreviations (Continued)

| Abbreviation | Description             |
|--------------|-------------------------|
| Р            | Stop                    |
| S            | Start                   |
| Sr           | Repeated Start          |
| SADR         | Slave Address           |
| ADR          | Any address except SADR |
| R            | Read                    |

# 37.4 Block Diagram

Figure 37-1. Block Diagram

# 37.5 I/O Lines Description

Table 37-3. I/O Lines Description

| Name | Description   | Туре         |
|------|---|--------------|
| TWD  | Two-wire Serial Data (drives external serial data line – SDA)   | Input/Output |
| TWCK | Two-wire Serial Clock (drives external serial clock line – SCL) | Input/Output |

## 37.6 Product Dependencies

### 37.6.1 I/O Lines

Both TWD and TWCK are bidirectional lines, connected to a positive supply voltage via a current source or pull-up resistor. When the bus is free, both lines are high. The output stages of devices connected to the bus must have an open-drain or open-collector to perform the wired-AND function.

TWD and TWCK pins may be multiplexed with PIO lines. To enable the TWI, the user must program the PIO Controller to dedicate TWD and TWCK as peripheral lines.

The user must not program TWD and TWCK as open-drain. This is already done by the hardware.

Table 37-4. I/O Lines

| Instance | Signal | I/O Line | Peripheral |
|----------|--------|----------|------------|
| TWI0     | TWCK0  | PA31     | Α          |
| TWI0     | TWD0   | PA30     | Α          |
| TWI1     | TWCK1  | PC1      | С          |
| TWI1     | TWD1   | PC0      | С          |
| TWI2     | TWCK2  | PB5      | В          |
| TWI2     | TWD2   | PB4      | В          |

### 37.6.2 Power Management

The TWI may be clocked through the Power Management Controller (PMC), thus the user must first configure the PMC to enable the TWI clock.

### 37.6.3 Interrupt Sources

The TWI has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TWI.

Table 37-5. Peripheral IDs

| Instance | ID |
|----------|----|
| TWI0     | 9  |
| TWI1     | 10 |
| TWI2     | 11 |

## 37.7 Functional Description

### 37.7.1 Transfer Format

The data put on the TWD line must be 8 bits long. Data is transferred MSB first; each byte must be followed by an acknowledgement. The number of bytes per transfer is unlimited (see Figure 37-3).

Each transfer begins with a START condition and terminates with a STOP condition (see Figure 37-2).

- A high-to-low transition on the TWD line while TWCK is high defines the START condition.
- A low-to-high transition on the TWD line while TWCK is high defines the STOP condition.

Figure 37-2. START and STOP Conditions

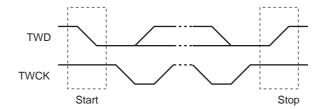

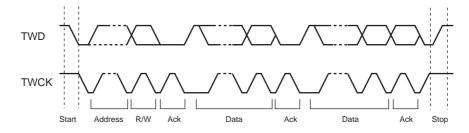

Figure 37-3. Transfer Format

### 37.7.2 Modes of Operation

The TWI has different modes of operations:

- Master transmitter mode
- Master receiver mode
- Multi-master transmitter mode
- Multi-master receiver mode
- Slave transmitter mode
- Slave receiver mode

These modes are described in the following sections.

#### 37.7.3 Master Mode

#### 37.7.3.1 Definition

The master is the device that starts a transfer, generates a clock and stops it.

#### 37.7.3.2 Programming Master Mode

The following fields must be programmed before entering Master mode:

- 1. TWI\_MMR.DADR (+ IADRSZ + IADR if a 10-bit device is addressed): The device address is used to access slave devices in Read or Write mode.
- 2. TWI CWGR.CKDIV + CHDIV + CLDIV: Clock waveform.
- 3. TWI CR.SVDIS: Disables the Slave mode
- 4. TWI\_CR.MSEN: Enables the Master mode

Note: If the TWI is already in Master mode, the device address (DADR) can be configured without disabling the Master mode.

#### 37.7.3.3 Master Transmitter Mode

After the master initiates a START condition when writing into the Transmit Holding register (TWI\_THR), it sends a 7-bit slave address, configured in the Master Mode register (DADR in TWI\_MMR), to notify the slave device. The bit following the slave address indicates the transfer direction—0 in this case (MREAD = 0 in TWI\_MMR).

The TWI transfers require the slave to acknowledge each received byte. During the acknowledge clock pulse (9th pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. If the slave does not acknowledge the byte, then the Not Acknowledge flag (NACK) is set in the TWI Status Register (TWI\_SR) of the master and a STOP condition is sent. The NACK flag must be cleared by reading the TWI Status Register (TWI\_SR) before the next write into the TWI Transmit Holding Register (TWI\_THR). As with the other status bits, an interrupt can be generated if enabled in the Interrupt Enable register (TWI\_IER). If the slave acknowledges the byte, the data written in the TWI\_THR is then shifted in the internal shifter and transferred. When an acknowledge is detected, the TXRDY bit is set until a new write in the TWI\_THR.

When no more data is written into the TWI\_THR, the master generates a STOP condition to end the transfer. A TXCOMP bit value of one in the TWI\_SR indicates that the transfer has completed. See Figure 37-4, Figure 37-5, and Figure 37-6.

To clear the TXRDY flag, first set the bit TWI CR.MSDIS, then set the bit TWI CR.MSEN.

Figure 37-4. Master Write with One Data Byte

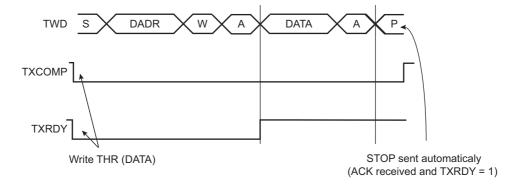

Figure 37-5. Master Write with Multiple Data Byte

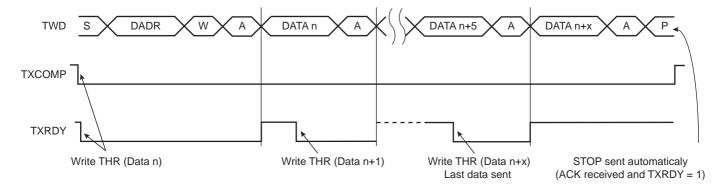

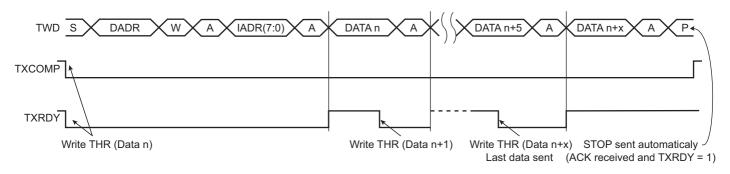

Figure 37-6. Master Write with One Byte Internal Address and Multiple Data Bytes

#### 37.7.3.4 Master Receiver Mode

The read sequence begins by setting the START bit. After the START condition has been sent, the master sends a 7-bit slave address to notify the slave device. The bit following the slave address indicates the transfer direction—1 in this case (MREAD = 1 in TWI\_MMR). During the acknowledge clock pulse (9th pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. The master polls the data line during this clock pulse and sets the NACK bit in the TWI\_SR if the slave does not acknowledge the byte.

If an acknowledge is received, the master is then ready to receive data from the slave. After data has been received, the master sends an acknowledge condition to notify the slave that the data has been received except for the last data. See Figure 37-7. When the RXRDY bit is set in the TWI\_SR, a character has been received in the Receive Holding Register (TWI\_RHR). The RXRDY bit is reset when reading the TWI\_RHR.

When a single data byte read is performed, with or without internal address (IADR), the START and STOP bits must be set at the same time. See Figure 37-7. When a multiple data byte read is performed, with or without internal address (IADR), the STOP bit must be set after the next-to-last data received. See Figure 37-8. For internal address usage, see Section 37.7.3.5.

If the Receive Holding Register (TWI\_RHR) is full (RXRDY high) and the master is receiving data, the serial clock line is tied low before receiving the last bit of the data and until the TWI\_RHR is read. Once the TWI\_RHR is read, the master stops stretching the serial clock line and ends the data reception. See Figure 37-9.

**Warning:** When receiving multiple bytes in Master read mode, if the next-to-last access is not read (the RXRDY flag remains high), the last access is not completed until TWI\_RHR is read. The last access stops on the next-to-last bit. When the TWI\_RHR is read, the STOP bit command must be sent within a period of half a bit only, otherwise another read access might occur (spurious access).

A possible workaround is to set the STOP bit before reading the TWI\_RHR on the next-to-last access (within the interrupt handler).

Figure 37-7. Master Read with One Data Byte

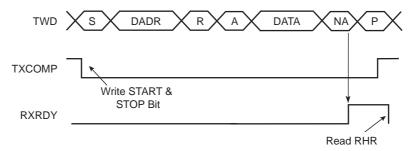

Figure 37-8. Master Read with Multiple Data Bytes

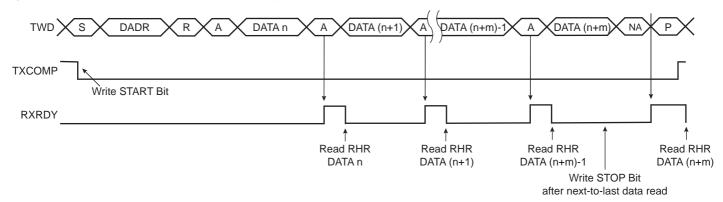

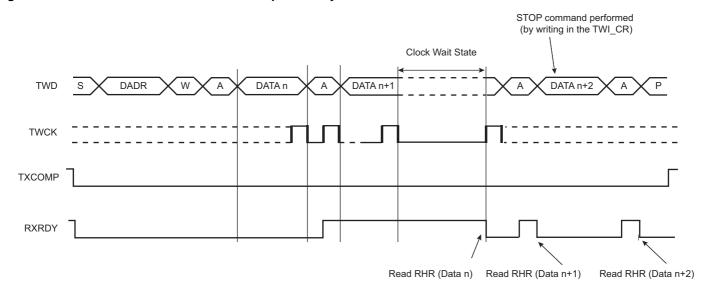

Figure 37-9. Master Read Wait State with Multiple Data Bytes

#### 37.7.3.5 Internal Address

The TWI can perform transfers with 7-bit slave address devices and 10-bit slave address devices.

## 7-bit Slave Addressing

When addressing 7-bit slave devices, the internal address bytes are used to perform random address (read or write) accesses to reach one or more data bytes, e.g. within a memory page location in a serial memory. When performing read operations with an internal address, the TWI performs a write operation to set the internal address into the slave device, and then switch to Master receiver mode. Note that the second START condition (after

sending the IADR) is sometimes called "repeated start" (Sr) in I<sup>2</sup>C fully-compatible devices. See Figure 37-11. See Figure 37-10 and Figure 37-12 for master write operation with internal address.

The three internal address bytes are configurable through the Master Mode register (TWI MMR).

If the slave device supports only a 7-bit address, i.e., no internal address, IADRSZ must be set to 0.

Table 37-6 shows the abbreviations used in Figure 37-10 and Figure 37-11.

Table 37-6. Abbreviations

| Abbreviation | Definition       |
|--------------|------------------|
| S            | Start            |
| Sr           | Repeated Start   |
| Р            | Stop             |
| W            | Write            |
| R            | Read             |
| Α            | Acknowledge      |
| NA           | Not Acknowledge  |
| DADR         | Device Address   |
| IADR         | Internal Address |

Figure 37-10. Master Write with One, Two or Three Bytes Internal Address and One Data Byte

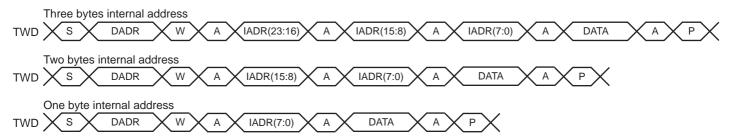

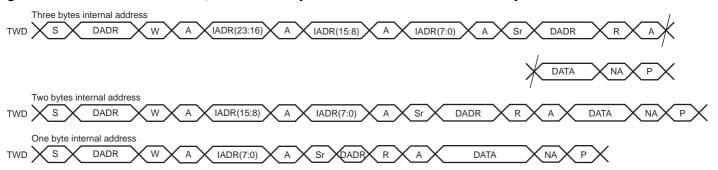

Figure 37-11. Master Read with One, Two or Three Bytes Internal Address and One Data Byte

## 10-bit Slave Addressing

For a slave address higher than seven bits, the user must configure the address size (IADRSZ) and set the other slave address bits in the Internal Address register (TWI\_IADR). The two remaining internal address bytes, IADR[15:8] and IADR[23:16] can be used the same way as in 7-bit slave addressing.

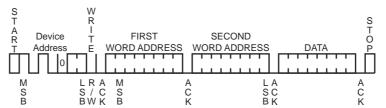

Example: Address a 10-bit device (10-bit device address is b1 b2 b3 b4 b5 b6 b7 b8 b9 b10)

1. Program IADRSZ = 1,

- 2. Program DADR with 1 1 1 1 0 b1 b2 (b1 is the MSB of the 10-bit address, b2, etc.)
- 3. Program TWI\_IADR with b3 b4 b5 b6 b7 b8 b9 b10 (b10 is the LSB of the 10-bit address)

Figure 37-12 below shows a byte write to a memory device. This demonstrates the use of internal addresses to access the device.

Figure 37-12. Internal Address Usage

### 37.7.3.6 Using the DMA Controller

The use of the DMA significantly reduces the CPU load.

To ensure correct implementation, proceed as follows.

### Data Transmit with the DMA

- 1. Initialize the DMA (channels, memory pointers, size -1, etc.).
- 2. Configure the Master mode (DADR, CKDIV, etc.) or Slave mode.
- 3. Enable the DMA.
- 4. Wait for the DMA buffer transfer complete flag.
- 5. Disable the DMA.
- 6. Wait for the TXRDY flag in TWI SR.
- 7. Set the STOP bit in TWI\_CR.
- 8. Write the last character in TWI\_THR.
- (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWI\_SR.

### Data Receive with the DMA

The DMA transfer size must be defined with the buffer size minus 2. The two remaining characters must be managed without DMA to ensure that the exact number of bytes are received whatever the system bus latency conditions encountered during the end of buffer transfer period.

In Slave mode, the number of characters to receive must be known in order to configure the DMA.

- 1. Initialize the DMA (channels, memory pointers, size -2, etc.);
- 2. Configure the Master mode (DADR, CKDIV, etc.) or Slave mode.
- 3. Enable the DMA.
- 4. (Master Only) Write the START bit in the TWI CR to start the transfer.
- 5. Wait for the DMA buffer transfer complete flag.
- 6. Disable the DMA.
- 7. Wait for the RXRDY flag in the TWI\_SR.
- 8. Set the STOP bit in TWI\_CR.
- 9. Read the penultimate character in TWI\_RHR.
- 10. Wait for the RXRDY flag in the TWI\_SR.
- 11. Read the last character in TWI\_RHR.
- 12. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWI\_SR.

### 37.7.3.7 Read/Write Flowcharts

The flowcharts in the following figures provide examples of read and write operations. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable Register (TWI\_IER) be configured first.

Figure 37-13. TWI Write Operation with Single Data Byte without Internal Address

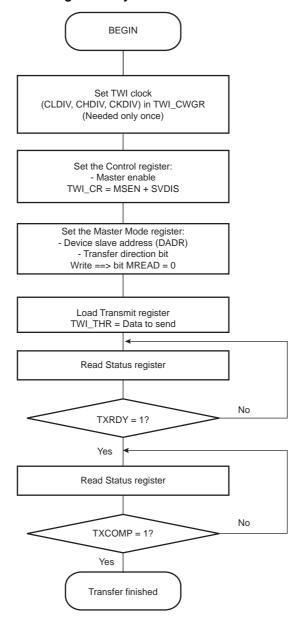

Figure 37-14. TWI Write Operation with Single Data Byte and Internal Address

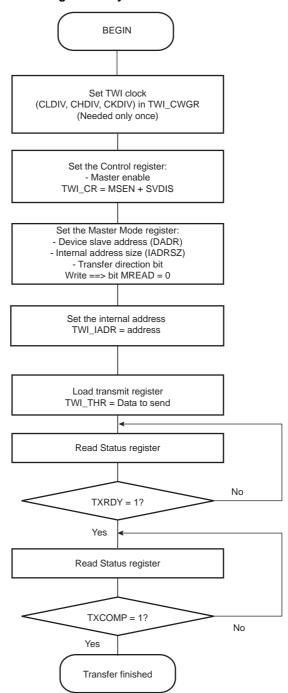

Figure 37-15. TWI Write Operation with Multiple Data Bytes with or without Internal Address

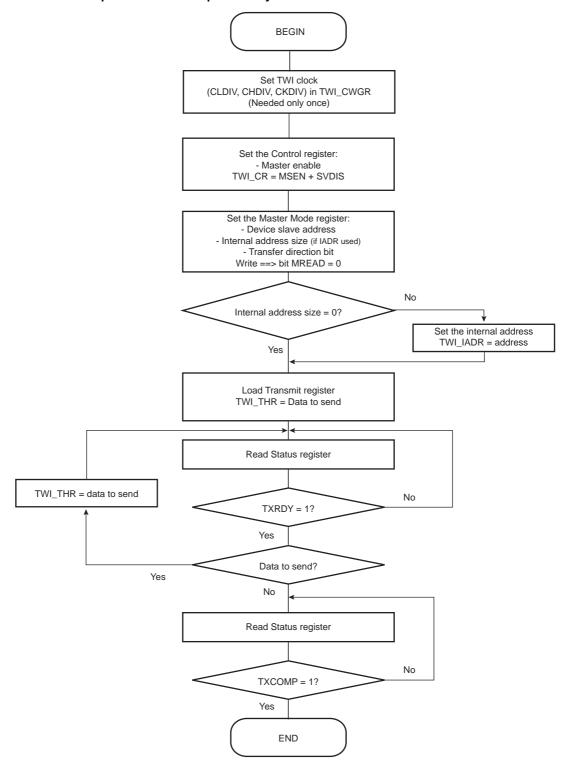

Figure 37-16. TWI Read Operation with Single Data Byte without Internal Address

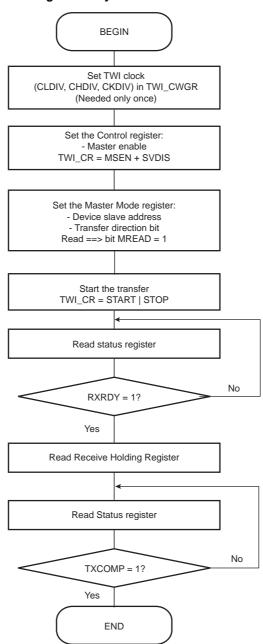

Figure 37-17. TWI Read Operation with Single Data Byte and Internal Address

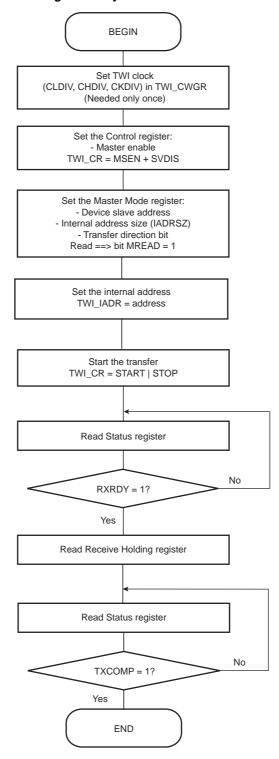

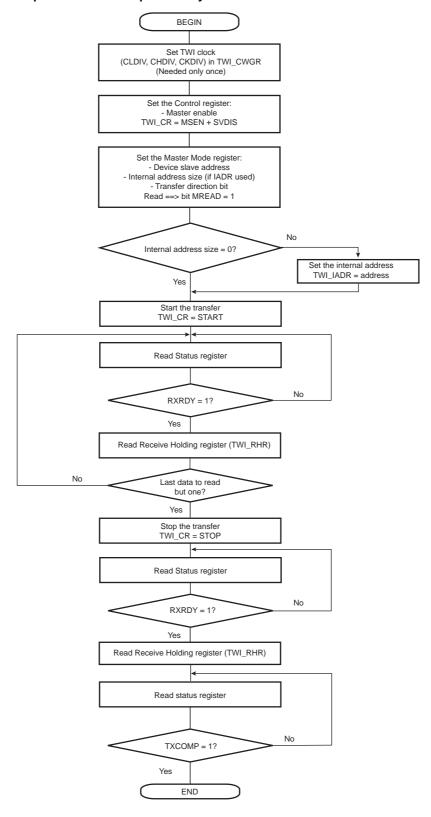

Figure 37-18. TWI Read Operation with Multiple Data Bytes with or without Internal Address

#### 37.7.4 Multi-master Mode

#### 37.7.4.1 Definition

In Multi-master mode, more than one master may handle the bus at the same time without data corruption by using arbitration.

Arbitration starts as soon as two or more masters place information on the bus at the same time, and stops (arbitration is lost) for the master that intends to send a logical one while the other master sends a logical zero.

As soon as a master lose arbitration, it stops sending data and listens to the bus in order to detect a stop. When the stop is detected, the master may put its data on the bus by performing arbitration.

Arbitration is illustrated in Figure 37-20.

#### 37.7.4.2 Two Multi-master Modes

Two Multi-master modes may be distinguished:

- 1. TWI is considered as a master only and will never be addressed.
- 2. TWI may be either a master or a slave and may be addressed.

Note: Arbitration is supported in both Multi-master modes.

### TWI as Master Only

In this mode, TWI is considered as a Master only (MSEN is always one) and must be driven like a Master with the ARBLST (Arbitration Lost) flag in addition.

If arbitration is lost (ARBLST = 1), the user must reinitiate the data transfer.

If the user starts a transfer (ex.: DADR + START + W + Write in THR) and if the bus is busy, the TWI automatically waits for a STOP condition on the bus to initiate the transfer (see Figure 37-19).

Note: The state of the bus (busy or free) is not shown in the user interface.

#### TWI as Master or Slave

The automatic reversal from Master to Slave is not supported in case of a lost arbitration.

Then, in the case where TWI may be either a Master or a Slave, the user must manage the pseudo Multi-master mode described in the steps below.

- 1. Program TWI in Slave mode (SADR + MSDIS + SVEN) and perform a slave access (if TWI is addressed).
- 2. If the TWI has to be set in Master mode, wait until the TXCOMP flag is at 1.
- 3. Program the Master mode (DADR + SVDIS + MSEN) and start the transfer (ex: START + Write in THR).
- 4. As soon as the Master mode is enabled, the TWI scans the bus in order to detect if it is busy or free. When the bus is considered free, TWI initiates the transfer.
- 5. As soon as the transfer is initiated and until a STOP condition is sent, the arbitration becomes relevant and the user must monitor the ARBLST flag.
- 6. If the arbitration is lost (ARBLST is set to 1), the user must program the TWI in Slave mode in case the Master that won the arbitration is required to access the TWI.
- 7. If the TWI has to be set in Slave mode, wait until TXCOMP flag is at 1 and then program the Slave mode.

Note: If the arbitration is lost and the TWI is addressed, the TWI will not acknowledge even if it is programmed in Slave mode as soon as ARBLST is set to 1. Then the Master must repeat SADR.

Figure 37-19. Programmer Sends Data While the Bus is Busy

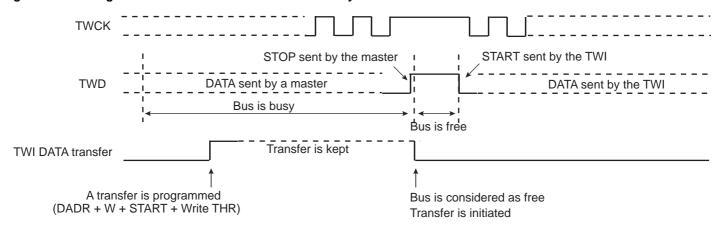

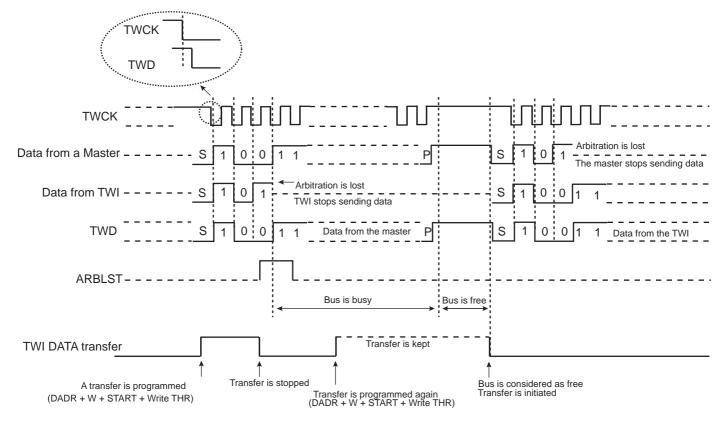

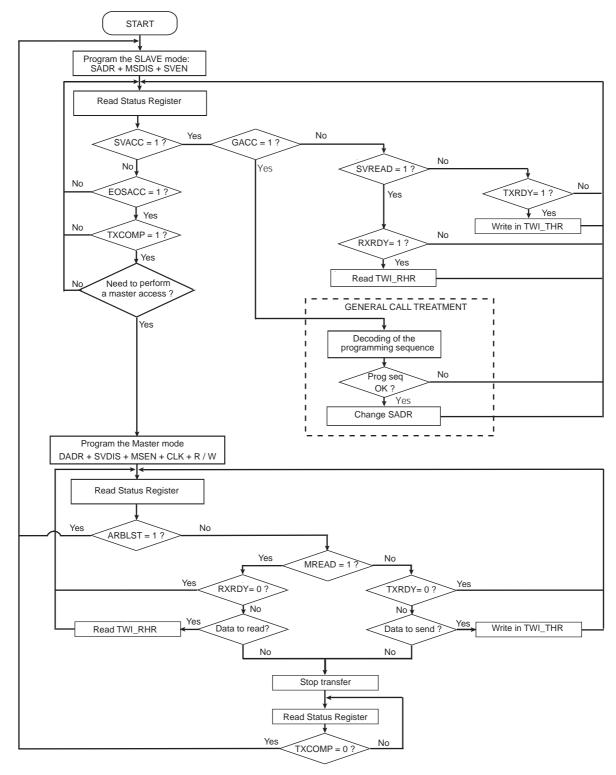

Figure 37-20. Arbitration Cases

The flowchart shown in Figure 37-21 gives an example of read and write operations in Multi-master mode.

Figure 37-21. Multi-master Flowchart

### 37.7.5 Slave Mode

#### 37.7.5.1 Definition

Slave mode is defined as a mode where the device receives the clock and the address from another device called the master.

In this mode, the device never initiates and never completes the transmission (START, REPEATED START and STOP conditions are always provided by the master).

#### 37.7.5.2 Programming Slave Mode

The following fields must be programmed before entering Slave mode:

- TWI\_SMR.SADR: The slave device address is used in order to be accessed by master devices in Read or Write mode.
- 2. TWI CR.MSDIS: Disables the Master mode.
- 3. TWI\_CR.SVEN: Enables the Slave mode.

As the device receives the clock, values written in TWI\_CWGR are ignored.

### 37.7.5.3 Receiving Data

After a START or REPEATED START condition is detected and if the address sent by the Master matches with the Slave address programmed in the SADR (Slave Address) field, SVACC (Slave Access) flag is set and SVREAD (Slave Read) indicates the direction of the transfer.

SVACC remains high until a STOP condition or a repeated START is detected. When such a condition is detected, the EOSACC (End Of Slave Access) flag is set.

### Read Sequence

In the case of a read sequence (SVREAD is high), TWI transfers data written in TWI\_THR (TWI Transmit Holding Register) until a STOP condition or a REPEATED\_START and an address different from SADR is detected. Note that at the end of the read sequence TXCOMP (Transmission Complete) flag is set and SVACC reset.

As soon as data is written in TWI\_THR, the TXRDY (Transmit Holding Register Ready) flag is reset, and it is set when the internal shifter is empty and the sent data acknowledged or not. If the data is not acknowledged, the NACK flag is set.

Note that a STOP or a REPEATED START always follows a NACK.

To clear the TXRDY flag, first set the bit TWI\_CR.SVDIS, then set the bit TWI\_CR.SVEN.

See Figure 37-22.

### Write Sequence

In the case of a write sequence (SVREAD is low), the RXRDY (Receive Holding Register Ready) flag is set as soon as a character has been received in the TWI\_RHR (TWI Receive Holding Register). RXRDY is reset when reading the TWI\_RHR.

TWI continues receiving data until a STOP condition or a REPEATED\_START + an address different from SADR is detected. Note that at the end of the write sequence TXCOMP flag is set and SVACC reset.

See Figure 37-23.

### Clock Synchronization Sequence

If TWI\_RHR is not read in time, the TWI performs a clock synchronization.

Clock synchronization information is given by the bit SCLWS (Clock Wait State).

See Figure 37-26.

### Clock Stretching Sequence

If TWI THR is not written in time, the TWI performs a clock stretching.

Clock stretching information is given by the bit SCLWS (Clock Wait State).

See Figure 37-25.

#### General Call

In the case where a GENERAL CALL is performed, the GACC (General Call Access) flag is set.

After GACC is set, the user must interpret the meaning of the GENERAL CALL and decode the new address programming sequence.

See Figure 37-24.

#### 37.7.5.4 Data Transfer

#### Read Operation

The Read mode is defined as a data requirement from the master.

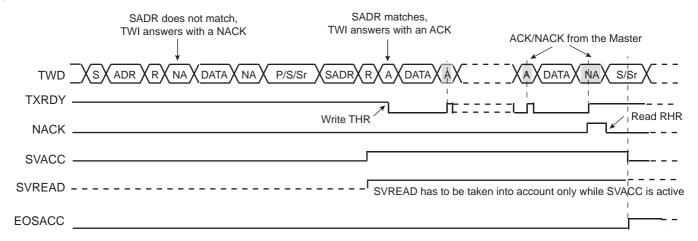

After a START or a REPEATED START condition is detected, the decoding of the address starts. If the slave address (SADR) is decoded, SVACC is set and SVREAD indicates the direction of the transfer.

Until a STOP or REPEATED START condition is detected, TWI continues sending data loaded in the TWI\_THR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

Figure 37-22 describes the write operation.

Figure 37-22. Read Access Ordered by a Master

- Notes: 1. When SVACC is low, the state of SVREAD becomes irrelevant.
  - 2. TXRDY is reset when data has been transmitted from TWI THR to the internal shifter and set when this data has been acknowledged or non acknowledged.

### Write Operation

The Write mode is defined as a data transmission from the master.

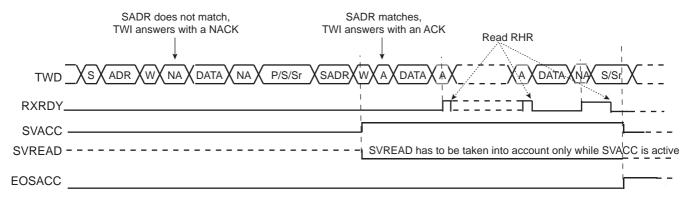

After a START or a REPEATED START, the decoding of the address starts. If the slave address is decoded, SVACC is set and SVREAD indicates the direction of the transfer (SVREAD is low in this case).

Until a STOP or REPEATED START condition is detected, TWI stores the received data in the TWI\_RHR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

Figure 37-23 describes the write operation.

Figure 37-23. Write Access Ordered by a Master

Notes: 1. When SVACC is low, the state of SVREAD becomes irrelevant.

2. RXRDY is set when data has been transmitted from the internal shifter to the TWI\_RHR and reset when this data is read. General Call

The general call is performed in order to change the address of the slave.

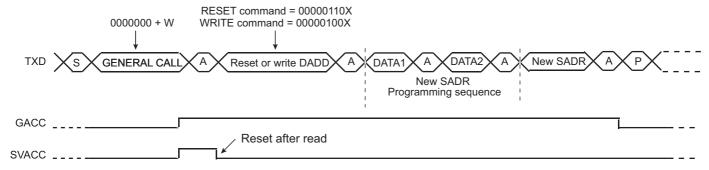

If a GENERAL CALL is detected, GACC is set.

After the detection of GENERAL CALL, it is up to the programmer to decode the commands which come afterwards.

In case of a WRITE command, the programmer has to decode the programming sequence and program a new SADR if the programming sequence matches.

Figure 37-24 describes the GENERAL CALL access.

Figure 37-24. Master Performs a General Call

Note: This method allows the user to create a personal programming sequence by choosing the programming bytes and the number of them. The programming sequence has to be provided to the master.

### Clock Synchronization/Stretching

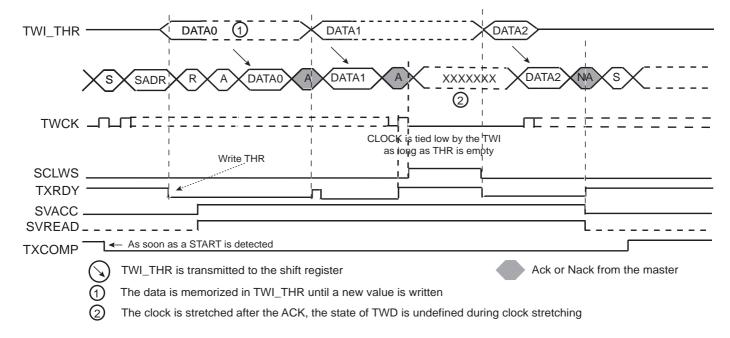

In both Read and Write modes, it may occur that TWI\_THR/TWI\_RHR buffer is not filled /emptied before transmission/reception of a new character. In this case, to avoid sending/receiving undesired data, a clock stretching/synchronization mechanism is implemented.

#### **Clock Stretching in Read Mode**

The clock is tied low during the acknowledge phase if the internal shifter is empty and if a STOP or REPEATED START condition was not detected. It is tied low until the internal shifter is loaded.

Figure 37-25 describes clock stretching in Read mode.

Figure 37-25. Clock Stretching in Read Mode

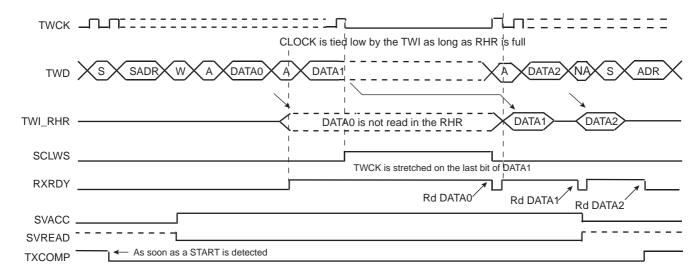

- Notes: 1. TXRDY is reset when data has been written in the TWI\_THR to the internal shifter and set when this data has been acknowledged or non acknowledged.
  - 2. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED\_START + an address different from SADR.
  - 3. SCLWS is automatically set when the clock stretching mechanism is started.

### **Clock Synchronization in Write Mode**

The clock is tied low outside of the acknowledge phase if the internal shifter and the TWI\_RHR is full. If a STOP or REPEATED\_START condition was not detected, it is tied low until TWI\_RHR is read.

Figure 37-26 describes the clock synchronization in Write mode.

Figure 37-26. Clock Synchronization in Write Mode

Notes: 1. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED\_START + an address different from SADR.

2. SCLWS is automatically set when the clock synchronization mechanism is started and automatically reset when the mechanism is finished.

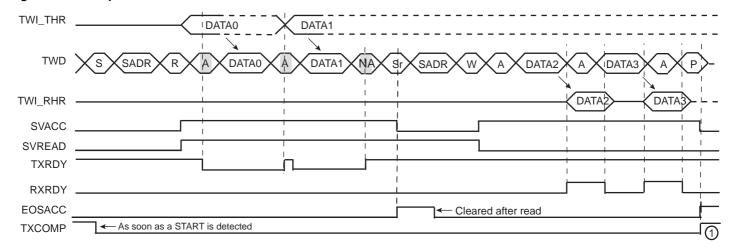

## Reversal After a Repeated Start

#### **Reversal of Read to Write**

The master initiates the communication by a read command and finishes it by a write command.

Figure 37-27 describes the repeated start + reversal from Read to Write mode.

Figure 37-27. Repeated Start + Reversal from Read to Write Mode

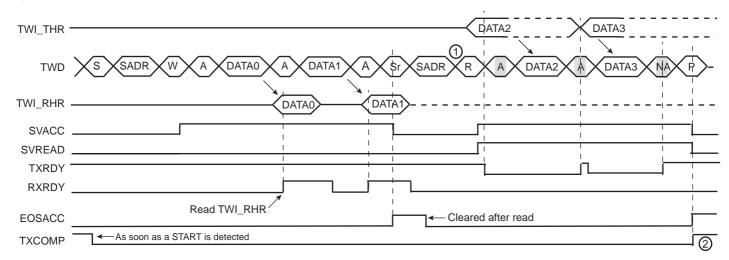

Note: 1. TXCOMP is only set at the end of the transmission because after the repeated start, SADR is detected again.

#### **Reversal of Write to Read**

The master initiates the communication by a write command and finishes it by a read command.

Figure 37-28 describes the repeated start + reversal from Write to Read mode.

Figure 37-28. Repeated Start + Reversal from Write to Read Mode

Notes: 1. In this case, if TWI\_THR has not been written at the end of the read command, the clock is automatically stretched before the ACK

2. TXCOMP is only set at the end of the transmission because after the repeated start, SADR is detected again.

## 37.7.5.5 Using the DMA Controller

The use of the DMA significantly reduces the CPU load.

To ensure correct implementation, proceed as follows.

#### Data Transmit with the DMA

- 1. Initialize the DMA (channels, memory pointers, size, etc.).
- 2. Configure the Slave mode.
- 3. Enable the DMA.
- 4. Wait for the DMA buffer transfer complete flag.
- 5. Disable the DMA.
- 6. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWI\_SR.

#### Data Receive with the DMA

The DMA transfer size must be defined with the buffer size. In Slave mode, the number of characters to be received must be known in order to configure the DMA.

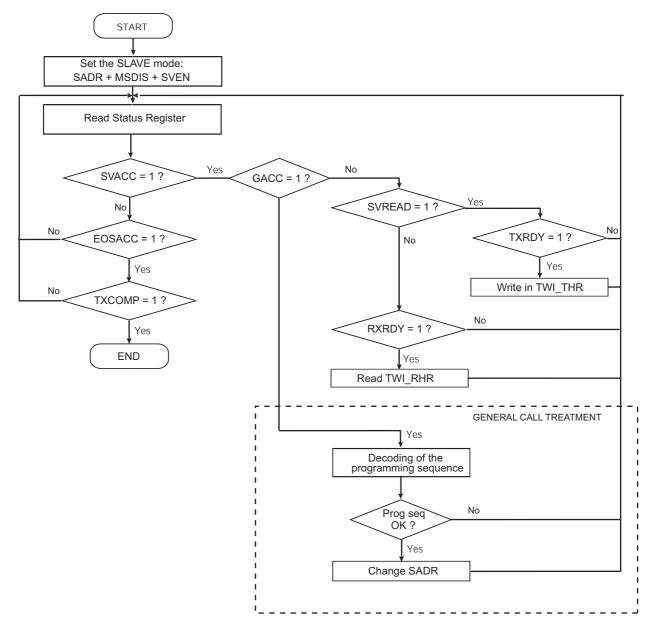

- 1. Initialize the DMA (channels, memory pointers, size, etc.).
- 2. Configure the Slave mode.
- 3. Enable the DMA.
- 4. Wait for the DMA buffer transfer complete flag.
- 5. Disable the DMA.
- 6. (Only if peripheral clock must be disabled) Wait for the TXCOMP flag to be raised in TWI\_SR.

### 37.7.5.6 Read Write Flowcharts

The flowchart shown in Figure 37-29 gives an example of read and write operations in Slave mode. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable Register (TWI\_IER) be configured first.

Figure 37-29. Read Write Flowchart in Slave Mode

## 37.7.6 Register Write Protection

To prevent any single software error from corrupting TWI behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the TWI Write Protection Mode Register (TWI\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the TWI Write Protection Status Register (TWI\_WPSR) is set and the WPVSRC field shows the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the TWI\_WPSR.

The following registers can be write-protected:

- TWI Slave Mode Register
- TWI Clock Waveform Generator Register

# 37.8 Two-wire Interface (TWI) User Interface

Table 37-7. Register Mapping

| Offset    | Register                          | Name     | Access     | Reset      |
|-----------|-----------------------------------|----------|------------|------------|
| 0x00      | Control Register                  | TWI_CR   | Write-only | -          |
| 0x04      | Master Mode Register              | TWI_MMR  | Read/Write | 0x00000000 |
| 0x08      | Slave Mode Register               | TWI_SMR  | Read/Write | 0x00000000 |
| 0x0C      | Internal Address Register         | TWI_IADR | Read/Write | 0x00000000 |
| 0x10      | Clock Waveform Generator Register | TWI_CWGR | Read/Write | 0x00000000 |
| 0x14-0x1C | Reserved                          | _        | _          | _          |
| 0x20      | Status Register                   | TWI_SR   | Read-only  | 0x0000F009 |
| 0x24      | Interrupt Enable Register         | TWI_IER  | Write-only | _          |
| 0x28      | Interrupt Disable Register        | TWI_IDR  | Write-only | _          |
| 0x2C      | Interrupt Mask Register           | TWI_IMR  | Read-only  | 0x00000000 |
| 0x30      | Receive Holding Register          | TWI_RHR  | Read-only  | 0x00000000 |
| 0x34      | Transmit Holding Register         | TWI_THR  | Write-only | _          |
| 0x38-0xE0 | Reserved                          | -        | _          | _          |
| 0xE4      | Write Protection Mode Register    | TWI_WPMR | Read/Write | 0x00000000 |
| 0xE8      | Write Protection Status Register  | TWI_WPSR | Read-only  | 0x00000000 |
| 0xEC-0xFC | Reserved                          | -        | _          | _          |

Note: All unlisted offset values are considered as "reserved".

## 37.8.1 TWI Control Register

Name: TWI\_CR

**Address:** 0xF8010000 (0), 0xF8014000 (1), 0xF8018000 (2)

Access: Write-only

| 31    | 30 | 29    | 28   | 27    | 26   | 25   | 24    |
|-------|----|-------|------|-------|------|------|-------|
| _     | -  | -     | _    | _     | _    | -    | _     |
| 23    | 22 | 21    | 20   | 19    | 18   | 17   | 16    |
| _     | -  | -     | _    | _     | _    | -    | _     |
| 15    | 14 | 13    | 12   | 11    | 10   | 9    | 8     |
| _     | ı  | ı     | _    | _     | _    | ı    | _     |
| 7     | 6  | 5     | 4    | 3     | 2    | 1    | 0     |
| SWRST | 1  | SVDIS | SVEN | MSDIS | MSEN | STOP | START |

#### START: Send a START Condition

0: No effect.

1: A frame beginning with a START bit is transmitted according to the features defined in the TWI Master Mode Register (TWI\_MMR).

This action is necessary for the TWI to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (TWI\_THR).

#### STOP: Send a STOP Condition

0: No effect.

- 1: STOP condition is sent just after completing the current byte transmission in Master read mode.
  - In single data byte master read, the START and STOP must both be set.
  - In multiple data bytes master read, the STOP must be set after the last data received but one.
  - In Master read mode, if a NACK bit is received, the STOP is automatically performed.
  - In multiple data write operation, when both THR and internal shifter are empty, a STOP condition is sent automatically.

#### MSEN: TWI Master Mode Enabled

0: No effect.

1: Enables the Master mode (MSDIS must be written to 0).

Note: Switching from Slave to Master mode is only permitted when TXCOMP = 1.

### • MSDIS: TWI Master Mode Disabled

0: No effect.

1: The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in case of write operation. In read operation, the character being transferred must be completely received before disabling.

## • SVEN: TWI Slave Mode Enabled

0: No effect.

1: Enables the Slave mode (SVDIS must be written to 0)

Note: Switching from master to Slave mode is only permitted when TXCOMP = 1.

## • SVDIS: TWI Slave Mode Disabled

0: No effect.

1: The Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in case of read operation. In write operation, the character being transferred must be completely received before disabling.

# • SWRST: Software Reset

0: No effect.

1: Equivalent to a system reset.

# 37.8.2 TWI Master Mode Register

Name: TWI\_MMR

**Address:** 0xF8010004 (0), 0xF8014004 (1), 0xF8018004 (2)

Access: Read/Write

| 31 | 30 | 29 | 28    | 27   | 26 | 25  | 24  |
|----|----|----|-------|------|----|-----|-----|
| _  | -  | _  | _     | _    | _  | -   | _   |
| 23 | 22 | 21 | 20    | 19   | 18 | 17  | 16  |
| _  |    |    |       | DADR |    |     |     |
| 15 | 14 | 13 | 12    | 11   | 10 | 9   | 8   |
| _  | _  | _  | MREAD | _    | _  | IAD | RSZ |
| 7  | 6  | 5  | 4     | 3    | 2  | 1   | 0   |
| _  | _  | _  | _     | _    | _  | _   | _   |

## • IADRSZ: Internal Device Address Size

| Value | Name   | Description                        |
|-------|--------|------------------------------------|
| 0     | NONE   | No internal device address         |
| 1     | 1_BYTE | One-byte internal device address   |
| 2     | 2_BYTE | Two-byte internal device address   |
| 3     | 3_BYTE | Three-byte internal device address |

# • MREAD: Master Read Direction

0: Master write direction.

1: Master read direction.

## • DADR: Device Address

The device address is used to access slave devices in Read or Write mode. These bits are only used in Master mode.

# 37.8.3 TWI Slave Mode Register

Name: TWI\_SMR

**Address:** 0xF8010008 (0), 0xF8014008 (1), 0xF8018008 (2)

Access: Read/Write

| 31 | 30 | 29 | 28 | 27   | 26 | 25 | 24 |
|----|----|----|----|------|----|----|----|
| _  | _  | _  | _  | _    | _  | _  | _  |
| 23 | 22 | 21 | 20 | 19   | 18 | 17 | 16 |
| _  |    |    |    | SADR |    |    |    |
| 15 | 14 | 13 | 12 | 11   | 10 | 9  | 8  |
| _  | _  | _  | 1  | -    | -  |    |    |
| 7  | 6  | 5  | 4  | 3    | 2  | 1  | 0  |
| _  | _  | _  | 1  | _    | 1  | 1  | _  |

This register can only be written if the WPEN bit is cleared in the TWI Write Protection Mode Register.

## • SADR: Slave Address

The slave device address is used in Slave mode in order to be accessed by master devices in Read or Write mode. SADR must be programmed before enabling the Slave mode or after a general call. Writes at other times have no effect.

# 37.8.4 TWI Internal Address Register

Name: TWI\_IADR

**Address:** 0xF801000C (0), 0xF801400C (1), 0xF801800C (2)

Access: Read/Write

| 31 | 30   | 29 | 28  | 27 | 26 | 25 | 24 |  |  |  |
|----|------|----|-----|----|----|----|----|--|--|--|
| _  | _    | _  | _   | _  | _  | -  | _  |  |  |  |
| 23 | 22   | 21 | 20  | 19 | 18 | 17 | 16 |  |  |  |
|    | IADR |    |     |    |    |    |    |  |  |  |
| 15 | 14   | 13 | 12  | 11 | 10 | 9  | 8  |  |  |  |
|    |      |    | IAI | DR |    |    |    |  |  |  |
| 7  | 6    | 5  | 4   | 3  | 2  | 1  | 0  |  |  |  |
|    | IADR |    |     |    |    |    |    |  |  |  |

# • IADR: Internal Address

0, 1, 2 or 3 bytes depending on IADRSZ.

# 37.8.5 TWI Clock Waveform Generator Register

Name: TWI\_CWGR

**Address:** 0xF8010010 (0), 0xF8014010 (1), 0xF8018010 (2)

Access: Read/Write

| 31 | 30 | 29 | 28  | 27  | 26 | 25    | 24 |
|----|----|----|-----|-----|----|-------|----|
| _  | _  | _  | _   | _   | _  | _     | _  |
| 23 | 22 | 21 | 20  | 19  | 18 | 17    | 16 |
| _  | _  | -  | _   | _   |    | CKDIV |    |
| 15 | 14 | 13 | 12  | 11  | 10 | 9     | 8  |
|    |    |    | СН  | DIV |    |       |    |
| 7  | 6  | 5  | 4   | 3   | 2  | 1     | 0  |
|    |    |    | CLI | DIV | ·  |       |    |

This register can only be written if the WPEN bit is cleared in the TWI Write Protection Mode Register.

TWI\_CWGR is only used in Master mode.

# • CLDIV: Clock Low Divider

The TWCK low period is defined as follows:  $t_{low}$  = ((CLDIV  $\times$  2<sup>CKDIV</sup>) + 4  $\times$   $t_{peripheral clock}$ 

# • CHDIV: Clock High Divider

The TWCK high period is defined as follows:  $t_{high} = ((CHDIV \times 2^{CKDIV}) + 4 \times t_{peripheral clock})$ 

## • CKDIV: Clock Divider

The CKDIV field is used to increase both TWCK high and low periods.

## 37.8.6 TWI Status Register

Name: TWI\_SR

**Address:** 0xF8010020 (0), 0xF8014020 (1), 0xF8018020 (2)

Access: Read-only

|    | -    |      |       |        |       |        |        |
|----|------|------|-------|--------|-------|--------|--------|
| 31 | 30   | 29   | 28    | 27     | 26    | 25     | 24     |
| _  | _    | _    | _     | _      | _     | _      | _      |
|    |      |      |       |        |       |        |        |
| 23 | 22   | 21   | 20    | 19     | 18    | 17     | 16     |
| _  | _    | _    | _     | _      | _     | _      | _      |
|    |      | -    | -     | -      | -     | -      |        |
| 15 | 14   | 13   | 12    | 11     | 10    | 9      | 8      |
| _  | _    | _    | _     | EOSACC | SCLWS | ARBLST | NACK   |
|    |      |      |       |        |       |        |        |
| 7  | 6    | 5    | 4     | 3      | 2     | 1      | 0      |
| _  | OVRE | GACC | SVACC | SVREAD | TXRDY | RXRDY  | TXCOMP |

### • TXCOMP: Transmission Completed (cleared by writing TWI THR)

## TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both holding register and internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in Figure 37-8.

#### TXCOMP used in Slave mode:

0: As soon as a START is detected.

1: After a STOP or a REPEATED START + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in Figure 37-25, Figure 37-26, Figure 37-27 and Figure 37-28.

#### RXRDY: Receive Holding Register Ready (cleared by reading TWI RHR)

0: No character has been received since the last TWI RHR read operation.

1: A byte has been received in the TWI RHR since the last read.

RXRDY behavior in Master mode can be seen in Figure 37-8.

RXRDY behavior in Slave mode can be seen in Figure 37-23, Figure 37-26, Figure 37-27 and Figure 37-28.

#### TXRDY: Transmit Holding Register Ready (cleared by writing TWI\_THR)

# TXRDY used in Master mode:

0: The transmit holding register has not been transferred into internal shifter. Set to 0 when writing into TWI\_THR.

1: As soon as a data byte is transferred from TWI\_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enable TWI).

TXRDY behavior in Master mode can be seen in Figure 37.7.3.3.

#### TXRDY used in Slave mode:

0: As soon as data is written in the TWI\_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: It indicates that the TWI\_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the programmer must not fill TWI\_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in Figure 37-22, Figure 37-25, Figure 37-27 and Figure 37-28.

#### SVREAD: Slave Read

This bit is only used in Slave mode. When SVACC is low (no Slave access has been detected) SVREAD is irrelevant.

- 0: Indicates that a write access is performed by a Master.
- 1: Indicates that a read access is performed by a Master.

SVREAD behavior can be seen in Figure 37-22, Figure 37-23, Figure 37-27 and Figure 37-28.

#### SVACC: Slave Access

This bit is only used in Slave mode.

- 0: TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.
- 1: Indicates that the address decoding sequence has matched (A Master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected.

SVACC behavior can be seen in Figure 37-22, Figure 37-23, Figure 37-27 and Figure 37-28.

#### GACC: General Call Access (cleared on read)

This bit is only used in Slave mode.

- 0: No General Call has been detected.
- 1: A General Call has been detected. After the detection of General Call, if need be, the programmer may acknowledge this access and decode the following bytes and respond according to the value of the bytes.

GACC behavior can be seen in Figure 37-24.

## OVRE: Overrun Error (cleared on read)

This bit is only used in Master mode.

- 0: TWI\_RHR has not been loaded while RXRDY was set
- 1: TWI\_RHR has been loaded while RXRDY was set. Reset by read in TWI\_SR when TXCOMP is set.

#### NACK: Not Acknowledged (cleared on read)

NACK used in Master mode:

- 0: Each data byte has been correctly received by the far-end side TWI slave component.
- 1: A data byte or an address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

## NACK used in Slave Read mode:

- 0: Each data byte has been correctly received by the Master.
- 1: In Read mode, a data byte has not been acknowledged by the Master. When NACK is set, the programmer must not fill TWI THR even if TXRDY is set, because that means that the Master will stop the data transfer or reinitiate it.

Note that in Slave write mode all data are acknowledged by the TWI.

## ARBLST: Arbitration Lost (cleared on read)

This bit is only used in Master mode.

- 0: Arbitration won.
- 1: Arbitration lost. Another master of the TWI bus has won the multi-master arbitration. TXCOMP is set at the same time.

## • SCLWS: Clock Wait State

This bit is only used in Slave mode.

0: The clock is not stretched.

1: The clock is stretched. TWI\_THR / TWI\_RHR buffer is not filled / emptied before transmission / reception of a new character.

SCLWS behavior can be seen in Figure 37-25 and Figure 37-26.

# • EOSACC: End Of Slave Access (cleared on read)

This bit is only used in Slave mode.

0: A slave access is being performed.

1: The Slave access is finished. End Of Slave Access is automatically set as soon as SVACC is reset.

EOSACC behavior can be seen in Figure 37-27 and Figure 37-28.

# 37.8.7 TWI Interrupt Enable Register

Name: TWI\_IER

**Address:** 0xF8010024 (0), 0xF8014024 (1), 0xF8018024 (2)

Access: Write-only

| 31 | 30   | 29   | 28    | 27     | 26     | 25     | 24     |
|----|------|------|-------|--------|--------|--------|--------|
| _  | _    | _    | -     | -      | _      | -      | _      |
| 23 | 22   | 21   | 20    | 19     | 18     | 17     | 16     |
| _  | _    | _    | -     | -      | -      | 1      | _      |
| 15 | 14   | 13   | 12    | 11     | 10     | 9      | 8      |
| _  | _    | _    | 1     | EOSACC | SCL_WS | ARBLST | NACK   |
| 7  | 6    | 5    | 4     | 3      | 2      | 1      | 0      |
| -  | OVRE | GACC | SVACC | -      | TXRDY  | RXRDY  | TXCOMP |

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

• TXCOMP: Transmission Completed Interrupt Enable

• RXRDY: Receive Holding Register Ready Interrupt Enable

• TXRDY: Transmit Holding Register Ready Interrupt Enable

• SVACC: Slave Access Interrupt Enable

• GACC: General Call Access Interrupt Enable

• OVRE: Overrun Error Interrupt Enable

• NACK: Not Acknowledge Interrupt Enable

• ARBLST: Arbitration Lost Interrupt Enable

• SCL\_WS: Clock Wait State Interrupt Enable

• EOSACC: End Of Slave Access Interrupt Enable

SAM9X35 [DATASHEET]

# 37.8.8 TWI Interrupt Disable Register

Name: TWI\_IDR

**Address:** 0xF8010028 (0), 0xF8014028 (1), 0xF8018028 (2)

Access: Write-only

| 31 | 30   | 29   | 28    | 27     | 26     | 25     | 24     |
|----|------|------|-------|--------|--------|--------|--------|
| _  | _    | _    | -     | _      | _      | _      | _      |
| 23 | 22   | 21   | 20    | 19     | 18     | 17     | 16     |
| _  | _    | _    | _     | _      | _      | -      | _      |
| 15 | 14   | 13   | 12    | 11     | 10     | 9      | 8      |
| _  | _    | -    | _     | EOSACC | SCL_WS | ARBLST | NACK   |
| 7  | 6    | 5    | 4     | 3      | 2      | 1      | 0      |
| _  | OVRE | GACC | SVACC | _      | TXRDY  | RXRDY  | TXCOMP |

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

• TXCOMP: Transmission Completed Interrupt Disable

• RXRDY: Receive Holding Register Ready Interrupt Disable

• TXRDY: Transmit Holding Register Ready Interrupt Disable

• SVACC: Slave Access Interrupt Disable

• GACC: General Call Access Interrupt Disable

• OVRE: Overrun Error Interrupt Disable

NACK: Not Acknowledge Interrupt Disable

• ARBLST: Arbitration Lost Interrupt Disable

• SCL\_WS: Clock Wait State Interrupt Disable

• EOSACC: End Of Slave Access Interrupt Disable

# 37.8.9 TWI Interrupt Mask Register

Name: TWI\_IMR

**Address:** 0xF801002C (0), 0xF801402C (1), 0xF801802C (2)

Access: Read-only

| 31 | 30   | 29   | 28    | 27     | 26     | 25     | 24     |
|----|------|------|-------|--------|--------|--------|--------|
| _  | _    | _    | _     | _      | _      | -      | _      |
| 23 | 22   | 21   | 20    | 19     | 18     | 17     | 16     |
| _  | _    | _    | _     | _      | _      | -      | _      |
| 15 | 14   | 13   | 12    | 11     | 10     | 9      | 8      |
| _  | _    | _    | _     | EOSACC | SCL_WS | ARBLST | NACK   |
| 7  | 6    | 5    | 4     | 3      | 2      | 1      | 0      |
| _  | OVRE | GACC | SVACC | _      | TXRDY  | RXRDY  | TXCOMP |

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

• TXCOMP: Transmission Completed Interrupt Mask

#### • WPVS: Write Protection Violation Status

0: No write protection violation has occurred since the last read of the TWI\_WPSR.

#### WPVSRC: Write Protection Violation Source

When WPVS = 1, WPVSRC shows the register address offset at which a write access has been attempted.

<sup>1:</sup> A write protection violation has occurred since the last read of the TWI\_WPSR. If this violation is an unauthorized attempt to write a protected register, the violation is reported into field WPVSRC.

# 38. Universal Synchronous Asynchronous Receiver Transmitter (USART)

# 38.1 Description

The Universal Synchronous Asynchronous Receiver Transceiver (USART) provides one full duplex universal synchronous asynchronous serial link. Data frame format is widely programmable (data length, parity, number of stop bits) to support a maximum of standards. The receiver implements parity error, framing error and overrun error detection. The receiver time-out enables handling variable-length frames and the transmitter timeguard facilitates communications with slow remote devices. Multidrop communications are also supported through address bit handling in reception and transmission.

The USART features three test modes: Remote loopback, Local loopback and Automatic echo.

The USART supports specific operating modes providing interfaces on RS485, LIN, and SPI buses, with ISO7816 T = 0 or T = 1 smart card slots and infrared transceivers. The hardware handshaking feature enables an out-of-band flow control by automatic management of the pins RTS and CTS.

The USART supports the connection to the DMA Controller, which enables data transfers to the transmitter and from the receiver. The DMAC provides chained buffer management without any intervention of the processor.

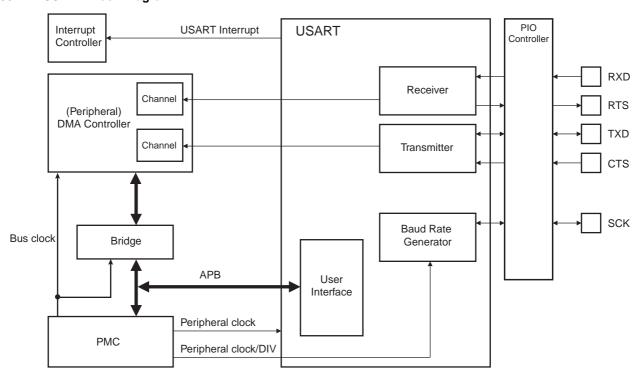

# 38.2 Embedded Characteristics

- Programmable Baud Rate Generator
- 5- to 9-bit Full-duplex Synchronous or Asynchronous Serial Communications
  - 1, 1.5 or 2 Stop Bits in Asynchronous Mode or 1 or 2 Stop Bits in Synchronous Mode
  - Parity Generation and Error Detection
  - Framing Error Detection, Overrun Error Detection
  - Digital Filter on Receive Line
  - MSB- or LSB-first
  - Optional Break Generation and Detection
  - By 8 or by 16 Oversampling Receiver Frequency
  - Optional Hardware Handshaking RTS-CTS
  - Receiver Time-out and Transmitter Timeguard
  - Optional Multidrop Mode with Address Generation and Detection
- RS485 with Driver Control Signal
- ISO7816, T = 0 or T = 1 Protocols for Interfacing with Smart Cards
  - NACK Handling, Error Counter with Repetition and Iteration Limit
- IrDA Modulation and Demodulation
  - Communication at up to 115.2 kbit/s
- SPI Mode
  - Master or Slave
  - Serial Clock Programmable Phase and Polarity
  - SPI Serial Clock (SCK) Frequency up to f<sub>peripheral clock</sub>/6
- LIN Mode
  - Compliant with LIN 1.3 and LIN 2.0 SPECIFICATIONS
  - Master or Slave
  - Processing of Frames with Up to 256 Data Bytes
  - Response Data Length can be Configurable or Defined Automatically by the Identifier
  - Self-synchronization in Slave Node Configuration
  - Automatic Processing and Verification of the "Synch Break" and the "Synch Field"
  - "Synch Break" Detection Even When Partially Superimposed with a Data Byte
  - Automatic Identifier Parity Calculation/Sending and Verification
  - Parity Sending and Verification Can be Disabled
  - Automatic Checksum Calculation/sending and Verification
  - Checksum Sending and Verification Can be Disabled
  - Support Both "Classic" and "Enhanced" Checksum Types
  - Full LIN Error Checking and Reporting
  - Frame Slot Mode: Master Allocates Slots to the Scheduled Frames Automatically
  - Generation of the Wakeup Signal
- Test Modes
  - Remote Loopback, Local Loopback, Automatic Echo
- Supports Connection of:
  - Two DMA Controller Channels (DMAC)
- Offers Buffer Transfer without Processor Intervention
- Register Write Protection

# 38.5 Product Dependencies

#### 38.5.1 I/O Lines

The pins used for interfacing the USART may be multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the desired USART pins to their peripheral function. If I/O lines of the USART are not used by the application, they can be used for other purposes by the PIO Controller.

Table 38-2. I/O Lines

| Instance | Signal | I/O Line | Peripheral |
|----------|--------|----------|------------|
| USART0   | CTS0   | PA3      | А          |
| USART0   | RTS0   | PA2      | Α          |
| USART0   | RXD0   | PA1      | Α          |
| USART0   | SCK0   | PA4      | А          |
| USART0   | TXD0   | PA0      | Α          |
| USART1   | CTS1   | PC28     | С          |
| USART1   | RTS1   | PC27     | С          |
| USART1   | RXD1   | PA6      | Α          |
| USART1   | SCK1   | PC29     | С          |
| USART1   | TXD1   | PA5      | А          |
| USART2   | CTS2   | PB1      | В          |
| USART2   | RTS2   | PB0      | В          |
| USART2   | RXD2   | PA8      | Α          |
| USART2   | SCK2   | PB2      | В          |
| USART2   | TXD2   | PA7      | А          |

## 38.5.2 Power Management

The USART is not continuously clocked. The programmer must first enable the USART clock in the Power Management Controller (PMC) before using the USART. However, if the application does not require USART operations, the USART clock can be stopped when not needed and be restarted later. In this case, the USART will resume its operations where it left off.

## 38.5.3 Interrupt Sources

The USART interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the USART interrupt requires the Interrupt Controller to be programmed first.

Table 38-3. Peripheral IDs

| Instance | ID |
|----------|----|
| USART0   | 5  |
| USART1   | 6  |
| USART2   | 7  |

# 38.6 Functional Description

#### 38.6.1 Baud Rate Generator

The baud rate generator provides the bit period clock, also named the baud rate clock, to both the receiver and the transmitter.

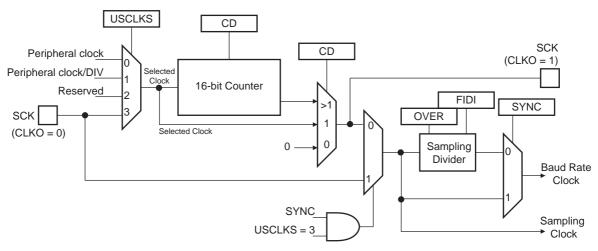

The baud rate generator clock source is selected by configuring the USCLKS field in the USART Mode Register (US\_MR) to one of the following:

- The peripheral clock
- A division of the peripheral clock, where the divider is product-dependent, but generally set to 8
- The external clock, available on the SCK pin

The baud rate generator is based upon a 16-bit divider, which is programmed with the CD field of the Baud Rate Generator register (US\_BRGR). If a 0 is written to CD, the baud rate generator does not generate any clock. If a 1 is written to CD, the divider is bypassed and becomes inactive.

If the external SCK clock is selected, the duration of the low and high levels of the signal provided on the SCK pin must be longer than a peripheral clock period. The frequency of the signal provided on SCK must be at least 3 times lower than the frequency provided on the peripheral clock in USART mode (field USART\_MODE differs from 0xE or 0xF), or 6 times lower in SPI mode (field USART\_MODE equals 0xE or 0xF).

Figure 38-2. Baud Rate Generator

# 38.6.1.1 Baud Rate in Asynchronous Mode

If the USART is programmed to operate in Asynchronous mode, the selected clock is first divided by CD, which is field programmed in the US\_BRGR. The resulting clock is provided to the receiver as a sampling clock and then divided by 16 or 8, depending on how the OVER bit in the US\_MR is programmed.

If OVER is set, the receiver sampling is eight times higher than the baud rate clock. If OVER is cleared, the sampling is performed at 16 times the baud rate clock.

The baud rate is calculated as per the following formula:

Baud Rate = 
$$\frac{\text{Selected Clock}}{(8(2 - OVER)CD)}$$

This gives a maximum baud rate of peripheral clock divided by 8, assuming that the peripheral clock is the highest possible clock and that the OVER bit is set.

## Baud Rate Calculation Example

Table 38-4 shows calculations of CD to obtain a baud rate at 38,400 bit/s for different source clock frequencies. This table also shows the actual resulting baud rate and the error.

Table 38-4. Baud Rate Example (OVER = 0)

| Source Clock<br>(MHz) | Expected Baud Rate (bit/s) | Calculation Result | CD | Actual Baud Rate (bit/s) | Error |
|-----------------------|----------------------------|--------------------|----|--------------------------|-------|
| 3,686,400             | 38,400                     | 6.00               | 6  | 38,400.00                | 0.00% |

| 18,432,000            | 38,400                     | 30.00              | 30 | 38,400.00                | 0.00% |
| 24,000,000            | 38,400                     | 39.06              | 39 | 38,461.54                | 0.16% |
| 24,576,000            | 38,400                     | 40.00              | 40 | 38,400.00                | 0.00% |
| 25,000,000            | 38,400                     | 40.69              | 40 | 38,109.76                | 0.76% |
| 32,000,000            | 38,400                     | 52.08              | 52 | 38,461.54                | 0.16% |
| 32,768,000            | 38,400                     | 53.33              | 53 | 38,641.51                | 0.63% |
| 33,000,000            | 38,400                     | 53.71              | 54 | 38,194.44                | 0.54% |
| 40,000,000            | 38,400                     | 65.10              | 65 | 38,461.54                | 0.16% |
| 50,000,000            | 38,400                     | 81.38              | 81 | 38,580.25                | 0.47% |

In this example, the baud rate is calculated with the following formula:

Baud Rate = Selected Clock/ 
$$CD \times 16$$

The baud rate error is calculated with the following formula. It is not recommended to work with an error higher than 5%.

$$Error = 1 - \left(\frac{\text{Expected Baud Rate}}{\text{Actual Baud Rate}}\right)$$

#### 38.6.1.2 Fractional Baud Rate in Asynchronous Mode

The baud rate generator is subject to the following limitation: the output frequency changes only by integer multiples of the reference frequency. An approach to this problem is to integrate a fractional N clock generator that has a high resolution. The generator architecture is modified to obtain baud rate changes by a fraction of the reference source clock. This fractional part is programmed with the FP field in the US\_BRGR. If FP is not 0, the

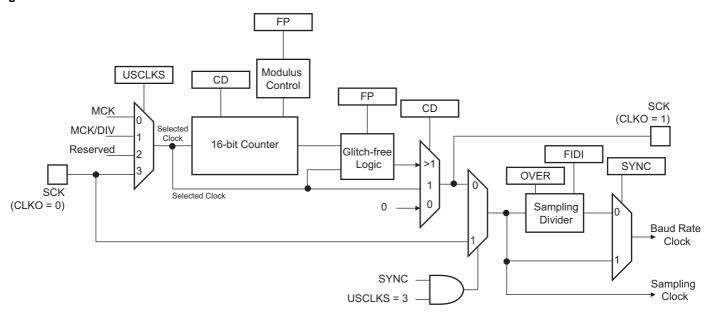

fractional part is activated. The resolution is one eighth of the clock divider. This feature is only available when using USART normal mode. The fractional baud rate is calculated using the following formula:

Baud Rate = 
$$\frac{\text{Selected Clock}}{\left(8(2 - OVER)\left(CD + \frac{FP}{8}\right)\right)}$$

The modified architecture is presented in the following Figure 38-3.

Figure 38-3. Fractional Baud Rate Generator

## 38.6.1.3 Baud Rate in Synchronous Mode or SPI Mode

If the USART is programmed to operate in Synchronous mode, the selected clock is simply divided by the field CD in the US\_BRGR.

Baud Rate = 
$$\frac{\text{Selected Clock}}{CD}$$

In Synchronous mode, if the external clock is selected (USCLKS = 3), the clock is provided directly by the signal on the USART SCK pin. No division is active. The value written in US\_BRGR has no effect. The external clock frequency must be at least 3 times lower than the system clock. In Synchronous mode master (USCLKS = 0 or 1, CLKO set to 1), the receive part limits the SCK maximum frequency to Selected Clock/3 in USART mode, or Selected Clock/6 in SPI mode.

When either the external clock SCK or the internal clock divided (peripheral clock/DIV) is selected, the value programmed in CD must be even if the user has to ensure a 50:50 mark/space ratio on the SCK pin. When the peripheral clock is selected, the baud rate generator ensures a 50:50 duty cycle on the SCK pin, even if the value programmed in CD is odd.

#### 38.6.1.4 Baud Rate in ISO 7816 Mode

The ISO7816 specification defines the bit rate with the following formula:

$$B = \frac{Di}{Fi} \times f$$

#### where:

- B is the bit rate
- Di is the bit-rate adjustment factor
- Fi is the clock frequency division factor
- f is the ISO7816 clock frequency (Hz)

Di is a binary value encoded on a 4-bit field, named DI, as represented in Table 38-5.

Table 38-5. Binary and Decimal Values for Di

| DI field     | 0001 | 0010 | 0011 | 0100 | 0101 | 0110 | 1000 | 1001 |
|--------------|------|------|------|------|------|------|------|------|
| Di (decimal) | 1    | 2    | 4    | 8    | 16   | 32   | 12   | 20   |

Fi is a binary value encoded on a 4-bit field, named FI, as represented in Table 38-6.

Table 38-6. Binary and Decimal Values for Fi

| FI field     | 0000 | 0001 | 0010 | 0011 | 0100 | 0101 | 0110 | 1001 | 1010 | 1011 | 1100 | 1101 |
|--------------|------|------|------|------|------|------|------|------|------|------|------|------|
| Fi (decimal) | 372  | 372  | 558  | 744  | 1116 | 1488 | 1860 | 512  | 768  | 1024 | 1536 | 2048 |

Table 38-7 shows the resulting Fi/Di ratio, which is the ratio between the ISO7816 clock and the baud rate clock.

Table 38-7. Possible Values for the Fi/Di Ratio

| Fi/Di | 372   | 558   | 744   | 1116  | 1488 | 1806  | 512   | 768  | 1024  | 1536 | 2048  |
|-------|-------|-------|-------|-------|------|-------|-------|------|-------|------|-------|
| 1     | 372   | 558   | 744   | 1116  | 1488 | 1860  | 512   | 768  | 1024  | 1536 | 2048  |
| 2     | 186   | 279   | 372   | 558   | 744  | 930   | 256   | 384  | 512   | 768  | 1024  |
| 4     | 93    | 139.5 | 186   | 279   | 372  | 465   | 128   | 192  | 256   | 384  | 512   |
| 8     | 46.5  | 69.75 | 93    | 139.5 | 186  | 232.5 | 64    | 96   | 128   | 192  | 256   |
| 16    | 23.25 | 34.87 | 46.5  | 69.75 | 93   | 116.2 | 32    | 48   | 64    | 96   | 128   |
| 32    | 11.62 | 17.43 | 23.25 | 34.87 | 46.5 | 58.13 | 16    | 24   | 32    | 48   | 64    |
| 12    | 31    | 46.5  | 62    | 93    | 124  | 155   | 42.66 | 64   | 85.33 | 128  | 170.6 |
| 20    | 18.6  | 27.9  | 37.2  | 55.8  | 74.4 | 93    | 25.6  | 38.4 | 51.2  | 76.8 | 102.4 |

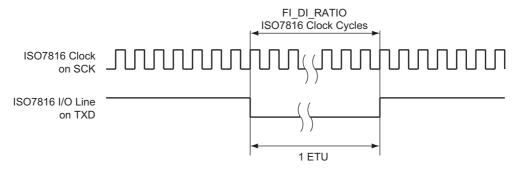

If the USART is configured in ISO7816 mode, the clock selected by the USCLKS field in US\_MR is first divided by the value programmed in the field CD in the US\_BRGR. The resulting clock can be provided to the SCK pin to feed the smart card clock inputs. This means that the CLKO bit can be set in US\_MR.

This clock is then divided by the value programmed in the FI\_DI\_RATIO field in the FI\_DI\_Ratio register (US\_FIDI). This is performed by the Sampling Divider, which performs a division by up to 2047 in ISO7816 mode. The non-integer values of the Fi/Di Ratio are not supported and the user must program the FI\_DI\_RATIO field to a value as close as possible to the expected value.

The FI\_DI\_RATIO field resets to the value 0x174 (372 in decimal) and is the most common divider between the ISO7816 clock and the bit rate (Fi = 372, Di = 1).

Figure 38-4 shows the relation between the Elementary Time Unit, corresponding to a bit time, and the ISO 7816 clock.

Figure 38-4. Elementary Time Unit (ETU)

#### 38.6.2 Receiver and Transmitter Control

After reset, the receiver is disabled. The user must enable the receiver by setting the RXEN bit in the Control register (US\_CR). However, the receiver registers can be programmed before the receiver clock is enabled.

After reset, the transmitter is disabled. The user must enable it by setting the TXEN bit in the US\_CR. However, the transmitter registers can be programmed before being enabled.

The receiver and the transmitter can be enabled together or independently.

At any time, the software can perform a reset on the receiver or the transmitter of the USART by setting the corresponding bit, RSTRX and RSTTX respectively, in the US\_CR. The software resets clear the status flag and reset internal state machines but the user interface configuration registers hold the value configured prior to software reset. Regardless of what the receiver or the transmitter is performing, the communication is immediately stopped.

The user can also independently disable the receiver or the transmitter by setting RXDIS and TXDIS respectively in the US\_CR. If the receiver is disabled during a character reception, the USART waits until the end of reception of the current character, then the reception is stopped. If the transmitter is disabled while it is operating, the USART waits the end of transmission of both the current character and character being stored in the Transmit Holding register (US\_THR). If a timeguard is programmed, it is handled normally.

## 38.6.3 Synchronous and Asynchronous Modes

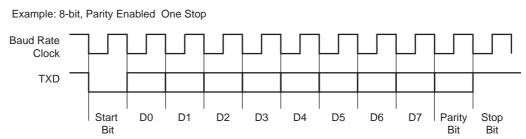

# 38.6.3.1 Transmitter Operations

The transmitter performs the same in both Synchronous and Asynchronous operating modes (SYNC = 0 or SYNC = 1). One start bit, up to 9 data bits, one optional parity bit and up to two stop bits are successively shifted out on the TXD pin at each falling edge of the programmed serial clock.

The number of data bits is selected by the CHRL field and the MODE 9 bit in US\_MR. Nine bits are selected by setting the MODE 9 bit regardless of the CHRL field. The parity bit is set according to the PAR field in US\_MR. The even, odd, space, marked or none parity bit can be configured. The MSBF field in the US\_MR configures which data bit is sent first. If written to 1, the most significant bit is sent first. If written to 0, the less significant bit is sent first. The number of stop bits is selected by the NBSTOP field in the US\_MR. The 1.5 stop bit is supported in Asynchronous mode only.

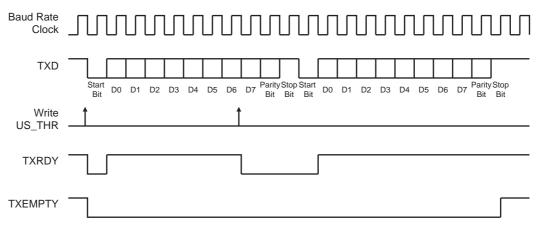

Figure 38-5. Character Transmit

The characters are sent by writing in the Transmit Holding register (US\_THR). The transmitter reports two status bits in the Channel Status register (US\_CSR): TXRDY (Transmitter Ready), which indicates that US\_THR is empty and TXEMPTY, which indicates that all the characters written in US\_THR have been processed. When the current character processing is completed, the last character written in US\_THR is transferred into the Shift register of the transmitter and US\_THR becomes empty, thus TXRDY rises.

Both TXRDY and TXEMPTY bits are low when the transmitter is disabled. Writing a character in US\_THR while TXRDY is low has no effect and the written character is lost.

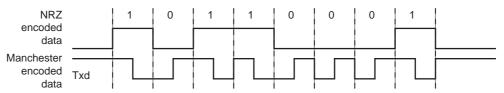

Figure 38-6. Transmitter Status

#### 38.6.3.2 Manchester Encoder

When the Manchester encoder is in use, characters transmitted through the USART are encoded based on biphase Manchester II format. To enable this mode, set the MAN bit in the US\_MR to 1. Depending on polarity configuration, a logic level (zero or one), is transmitted as a coded signal one-to-zero or zero-to-one. Thus, a transition always occurs at the midpoint of each bit time. It consumes more bandwidth than the original NRZ signal (2x) but the receiver has more error control since the expected input must show a change at the center of a bit cell. An example of Manchester encoded sequence is: the byte 0xB1 or 10110001 encodes to 10 01 10 10 01 01 10, assuming the default polarity of the encoder. Figure 38-7 illustrates this coding scheme.

Figure 38-7. NRZ to Manchester Encoding

The Manchester encoded character can also be encapsulated by adding both a configurable preamble and a start frame delimiter pattern. Depending on the configuration, the preamble is a training sequence, composed of a

predefined pattern with a programmable length from 1 to 15 bit times. If the preamble length is set to 0, the preamble waveform is not generated prior to any character. The preamble pattern is chosen among the following sequences: ALL\_ONE, ALL\_ZERO, ONE\_ZERO or ZERO\_ONE, writing the field TX\_PP in the US\_MAN register, the field TX\_PL is used to configure the preamble length. Figure 38-8 illustrates and defines the valid patterns. To improve flexibility, the encoding scheme can be configured using the TX\_MPOL field in the US\_MAN register. If the TX\_MPOL field is set to zero (default), a logic zero is encoded with a zero-to-one transition and a logic one is encoded with a one-to-zero transition and a logic zero is encoded with a zero-to-one transition.

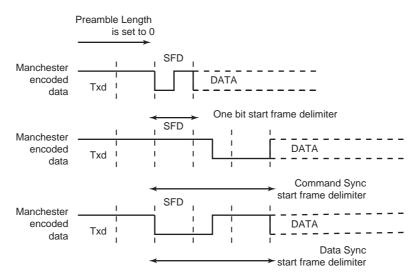

Manchester encoded SFD DATA data 8-bit width "ALL\_ONE" Preamble Manchester encoded DATA SFD Txd data 8-bit width "ALL\_ZERO" Preamble Manchester encoded SFD DATA Txd data 8-bit width "ZERO\_ONE" Preamble Manchester encoded DATA SFD Txd data 8-bit width "ONE\_ZERO" Preamble

Figure 38-8. Preamble Patterns, Default Polarity Assumed

A start frame delimiter is to be configured using the ONEBIT bit in the US\_MR. It consists of a user-defined pattern that indicates the beginning of a valid data. Figure 38-9 illustrates these patterns. If the start frame delimiter, also known as the start bit, is one bit, (ONEBIT = 1), a logic zero is Manchester encoded and indicates that a new character is being sent serially on the line. If the start frame delimiter is a synchronization pattern also referred to as sync (ONEBIT to 0), a sequence of three bit times is sent serially on the line to indicate the start of a new character. The sync waveform is in itself an invalid Manchester waveform as the transition occurs at the middle of the second bit time. Two distinct sync patterns are used: the command sync and the data sync. The command sync has a logic one level for one and a half bit times, then a transition to logic zero for the second one and a half bit times. If the MODSYNC bit in the US\_MR is set to 1, the next character is a command. If it is set to 0, the next character is a data. When direct memory access is used, the MODSYNC field can be immediately updated with a modified character located in memory. To enable this mode, VAR\_SYNC bit in US\_MR must be set to 1. In this case, the MODSYNC bit in the US\_MR is bypassed and the sync configuration is held in the TXSYNH in the US\_THR. The USART character format is modified and includes sync information.

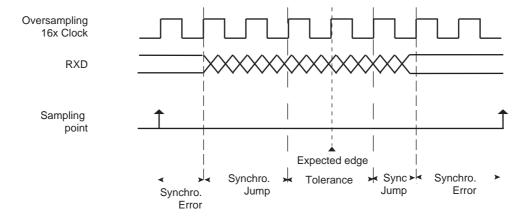

Figure 38-9. Start Frame Delimiter

#### **Drift Compensation**

Drift compensation is available only in 16X oversampling mode. An hardware recovery system allows a larger clock drift. To enable the hardware system, the bit in the USART\_MAN register must be set. If the RXD edge is one 16X clock cycle from the expected edge, this is considered as normal jitter and no corrective actions is taken. If the RXD event is between 4 and 2 clock cycles before the expected edge, then the current period is shortened by one clock cycle. If the RXD event is between 2 and 3 clock cycles after the expected edge, then the current period is lengthened by one clock cycle. These intervals are considered to be drift and so corrective actions are automatically taken.

Figure 38-10. Bit Resynchronization

#### 38.6.3.3 Asynchronous Receiver

If the USART is programmed in Asynchronous operating mode (SYNC = 0), the receiver oversamples the RXD input line. The oversampling is either 16 or 8 times the baud rate clock, depending on the OVER bit in the US\_MR.

The receiver samples the RXD line. If the line is sampled during one half of a bit time to 0, a start bit is detected and data, parity and stop bits are successively sampled on the bit rate clock.

If the oversampling is 16 (OVER = 0), a start is detected at the eighth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 16 oversampling clock cycles. If the oversampling is 8 (OVER = 1), a start bit is detected at the fourth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 8 oversampling clock cycles.

The number of data bits, first bit sent and Parity mode are selected by the same fields and bits as the transmitter, i.e., respectively CHRL, MODE9, MSBF and PAR. For the synchronization mechanism **only**, the number of stop bits has no effect on the receiver as it considers only one stop bit, regardless of the field NBSTOP, so that resynchronization between the receiver and the transmitter can occur. Moreover, as soon as the stop bit is sampled, the receiver starts looking for a new start bit so that resynchronization can also be accomplished when the transmitter is operating with one stop bit.

Figure 38-11 and Figure 38-12 illustrate start detection and character reception when USART operates in Asynchronous mode.

Figure 38-11. Asynchronous Start Detection

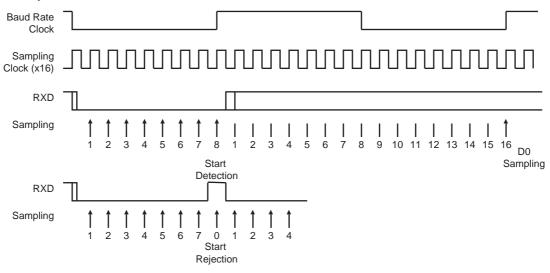

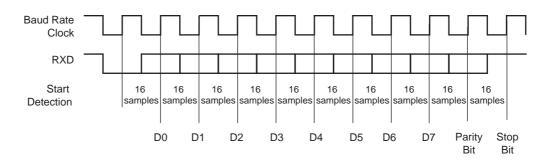

Figure 38-12. Asynchronous Character Reception

Example: 8-bit, Parity Enabled

#### 38.6.3.4 Manchester Decoder

When the MAN bit in the US\_MR is set to 1, the Manchester decoder is enabled. The decoder performs both preamble and start frame delimiter detection. One input line is dedicated to Manchester encoded input data.

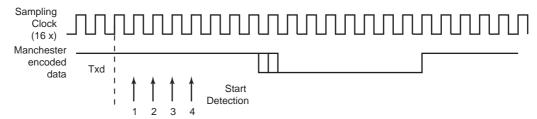

An optional preamble sequence can be defined, its length is user-defined and totally independent of the emitter side. Use RX\_PL in US\_MAN register to configure the length of the preamble sequence. If the length is set to 0, no preamble is detected and the function is disabled. In addition, the polarity of the input stream is programmable with RX\_MPOL bit in US\_MAN register. Depending on the desired application the preamble pattern matching is to be defined via the RX\_PP field in US\_MAN. See Figure 38-8 for available preamble patterns.

Unlike preamble, the start frame delimiter is shared between Manchester Encoder and Decoder. So, if ONEBIT field is set to 1, only a zero encoded Manchester can be detected as a valid start frame delimiter. If ONEBIT is set

to 0, only a sync pattern is detected as a valid start frame delimiter. Decoder operates by detecting transition on incoming stream. If RXD is sampled during one quarter of a bit time to zero, a start bit is detected. See Figure 38-13. The sample pulse rejection mechanism applies.

Figure 38-13. Asynchronous Start Bit Detection

The receiver is activated and starts preamble and frame delimiter detection, sampling the data at one quarter and then three quarters. If a valid preamble pattern or start frame delimiter is detected, the receiver continues decoding with the same synchronization. If the stream does not match a valid pattern or a valid start frame delimiter, the receiver resynchronizes on the next valid edge. The minimum time threshold to estimate the bit value is three quarters of a bit time.

If a valid preamble (if used) followed with a valid start frame delimiter is detected, the incoming stream is decoded into NRZ data and passed to USART for processing. Figure 38-14 illustrates Manchester pattern mismatch. When incoming data stream is passed to the USART, the receiver is also able to detect Manchester code violation. A code violation is a lack of transition in the middle of a bit cell. In this case, MANE flag in the US\_CSR is raised. It is cleared by writing a 1 to the RSTSTA in the US\_CR. See Figure 38-15 for an example of Manchester error detection during data phase.

Figure 38-14. Preamble Pattern Mismatch

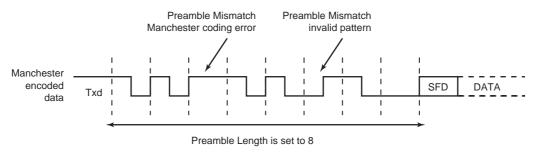

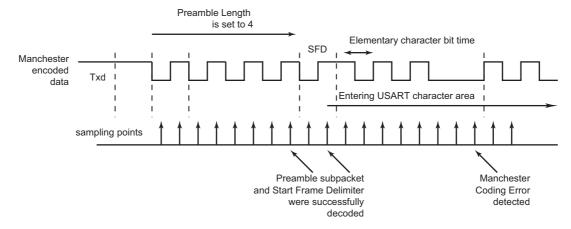

Figure 38-15. Manchester Error Flag

When the start frame delimiter is a sync pattern (ONEBIT field to 0), both command and data delimiter are supported. If a valid sync is detected, the received character is written as RXCHR field in the US\_RHR and the RXSYNH is updated. RXCHR is set to 1 when the received character is a command, and it is set to 0 if the received character is a data. This mechanism alleviates and simplifies the direct memory access as the character contains its own sync field in the same register.

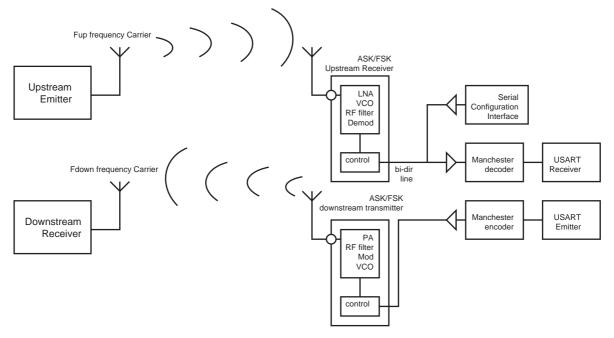

As the decoder is setup to be used in Unipolar mode, the first bit of the frame has to be a zero-to-one transition.

### 38.6.3.5 Radio Interface: Manchester Encoded USART Application

This section describes low data rate RF transmission systems and their integration with a Manchester encoded USART. These systems are based on transmitter and receiver ICs that support ASK and FSK modulation schemes.

The goal is to perform full duplex radio transmission of characters using two different frequency carriers. See the configuration in Figure 38-16.

Figure 38-16. Manchester Encoded Characters RF Transmission

The USART peripheral is configured as a Manchester encoder/decoder. Looking at the downstream communication channel, Manchester encoded characters are serially sent to the RF emitter. This may also include a user defined preamble and a start frame delimiter. Mostly, preamble is used in the RF receiver to distinguish between a valid data from a transmitter and signals due to noise. The Manchester stream is then modulated. See Figure 38-17 for an example of ASK modulation scheme. When a logic one is sent to the ASK modulator, the power amplifier, referred to as PA, is enabled and transmits an RF signal at downstream frequency. When a logic zero is transmitted, the RF signal is turned off. If the FSK modulator is activated, two different frequencies are used to transmit data. When a logic 1 is sent, the modulator outputs an RF signal at frequency F0 and switches to F1 if the data sent is a 0. See Figure 38-18.

From the receiver side, another carrier frequency is used. The RF receiver performs a bit check operation examining demodulated data stream. If a valid pattern is detected, the receiver switches to Receiving mode. The demodulated stream is sent to the Manchester decoder. Because of bit checking inside RF IC, the data transferred to the microcontroller is reduced by a user-defined number of bits. The Manchester preamble length is to be defined in accordance with the RF IC configuration.

Figure 38-17. ASK Modulator Output

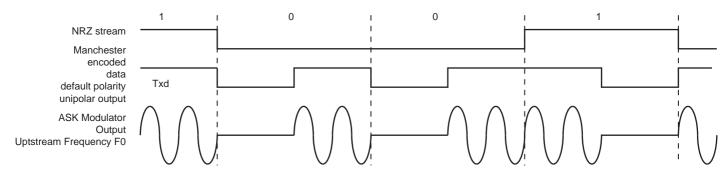

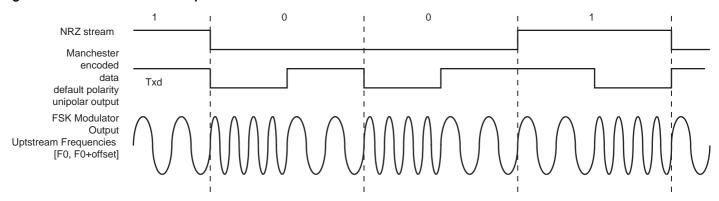

Figure 38-18. FSK Modulator Output

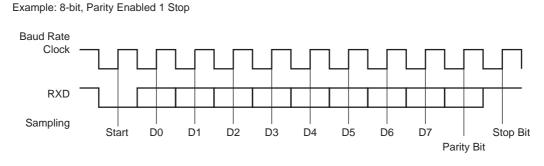

#### 38.6.3.6 Synchronous Receiver

In Synchronous mode (SYNC = 1), the receiver samples the RXD signal on each rising edge of the baud rate clock. If a low level is detected, it is considered as a start. All data bits, the parity bit and the stop bits are sampled and the receiver waits for the next start bit. Synchronous mode operations provide a high-speed transfer capability.

Configuration fields and bits are the same as in Asynchronous mode.

Figure 38-19 illustrates a character reception in Synchronous mode.

Figure 38-19. Synchronous Mode Character Reception

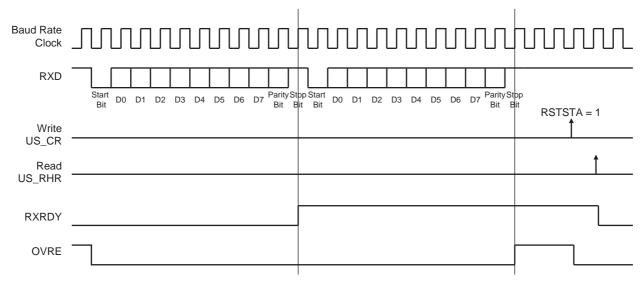

#### 38.6.3.7 Receiver Operations

When a character reception is completed, it is transferred to the Receive Holding register (US\_RHR) and the RXRDY bit in US\_CSR rises. If a character is completed while the RXRDY is set, the OVRE (Overrun Error) bit is set. The last character is transferred into US\_RHR and overwrites the previous one. The OVRE bit is cleared by writing a 1 to the RSTSTA (Reset Status) bit in the US\_CR.

Figure 38-20. Receiver Status

#### 38.6.3.8 Parity

The USART supports five Parity modes that are selected by writing to the PAR field in the US\_MR. The PAR field also enables the Multidrop mode, see Section 38.6.3.9 "Multidrop Mode". Even and odd parity bit generation and error detection are supported.

If even parity is selected, the parity generator of the transmitter drives the parity bit to 0 if a number of 1s in the character data bit is even, and to 1 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If odd parity is selected, the parity generator of the transmitter drives the parity bit to 1 if a number of 1s in the character data bit is even, and to 0 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If the mark parity is used, the parity generator of the transmitter drives the parity bit to 1 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 0. If the space parity is used, the parity generator of the transmitter drives the parity bit to 0 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 1. If parity is disabled, the transmitter does not generate any parity bit and the receiver does not report any parity error.

Table 38-8 shows an example of the parity bit for the character 0x41 (character ASCII "A") depending on the configuration of the USART. Because there are two bits set to 1 in the character value, the parity bit is set to 1 when the parity is odd, or configured to 0 when the parity is even.

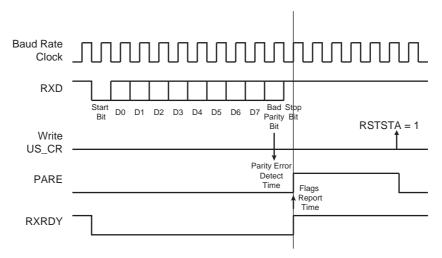

Table 38-8. Parity Bit Examples

| Character | Hexadecimal | Binary    | Parity Bit | Parity Mode |
|-----------|-------------|-----------|------------|-------------|
| А         | 0x41        | 0100 0001 | 1          | Odd         |
| А         | 0x41        | 0100 0001 | 0          | Even        |
| А         | 0x41        | 0100 0001 | 1          | Mark        |
| А         | 0x41        | 0100 0001 | 0          | Space       |
| А         | 0x41        | 0100 0001 | None       | None        |

When the receiver detects a parity error, it sets the PARE (Parity Error) bit in the US\_CSR. The PARE bit can be cleared by writing a 1 to the RSTSTA bit the US\_CR. Figure 38-21 illustrates the parity bit status setting and clearing.

Figure 38-21. Parity Error

#### 38.6.3.9 Multidrop Mode

If the value 0x6 or 0x07 is written to the PAR field in the US\_MR, the USART runs in Multidrop mode. This mode differentiates the data characters and the address characters. Data is transmitted with the parity bit at 0 and addresses are transmitted with the parity bit at 1.

If the USART is configured in Multidrop mode, the receiver sets the PARE parity error bit when the parity bit is high and the transmitter is able to send a character with the parity bit high when a 1 is written to the SENTA bit in the US CR.

To handle parity error, the PARE bit is cleared when a 1 is written to the RSTSTA bit in the US\_CR.

The transmitter sends an address byte (parity bit set) when SENDA is written to in the US\_CR. In this case, the next byte written to the US\_THR is transmitted as an address. Any character written in the US\_THR without having written the command SENDA is transmitted normally with the parity at 0.

#### 38.6.3.10 Transmitter Timeguard

The timeguard feature enables the USART interface with slow remote devices.

The timeguard function enables the transmitter to insert an idle state on the TXD line between two characters. This idle state actually acts as a long stop bit.

The duration of the idle state is programmed in the TG field of the Transmitter Timeguard register (US\_TTGR). When this field is written to zero no timeguard is generated. Otherwise, the transmitter holds a high level on TXD after each transmitted byte during the number of bit periods programmed in TG in addition to the number of stop bits.

As illustrated in Figure 38-22, the behavior of TXRDY and TXEMPTY status bits is modified by the programming of a timeguard. TXRDY rises only when the start bit of the next character is sent, and thus remains to 0 during the timeguard transmission if a character has been written in US\_THR. TXEMPTY remains low until the timeguard transmission is completed as the timeguard is part of the current character being transmitted.

Figure 38-22. Timeguard Operations

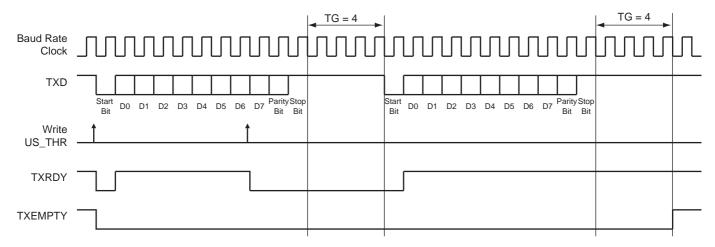

Table 38-9 indicates the maximum length of a timeguard period that the transmitter can handle in relation to the function of the baud rate.

Table 38-9. Maximum Timeguard Length Depending on Baud Rate

| Baud Rate (bit/s) | Bit Time (μs) | Timeguard (ms) |
|-------------------|---------------|----------------|
| 1,200             | 833           | 212.50         |
| 9,600             | 104           | 26.56          |
| 14,400            | 69.4          | 17.71          |
| 19,200            | 52.1          | 13.28          |
| 28,800            | 34.7          | 8.85           |
| 38,400            | 26            | 6.63           |
| 56,000            | 17.9          | 4.55           |
| 57,600            | 17.4          | 4.43           |
| 115,200           | 8.7           | 2.21           |

#### 38.6.3.11 Receiver Time-out

The Receiver Time-out provides support in handling variable-length frames. This feature detects an idle condition on the RXD line. When a time-out is detected, the bit TIMEOUT in the US\_CSR rises and can generate an interrupt, thus indicating to the driver an end of frame.

The time-out delay period (during which the receiver waits for a new character) is programmed in the TO field of the Receiver Time-out register (US\_RTOR). If the TO field is written to 0, the Receiver Time-out is disabled and no time-out is detected. The TIMEOUT bit in the US\_CSR remains at 0. Otherwise, the receiver loads a 16-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the TIMEOUT bit in US\_CSR rises. Then, the user can either:

- Stop the counter clock until a new character is received. This is performed by writing a 1 to the STTTO (Start Time-out) bit in the US\_CR. In this case, the idle state on RXD before a new character is received will not provide a time-out. This prevents having to handle an interrupt before a character is received and allows waiting for the next idle state on RXD after a frame is received.
- Obtain an interrupt while no character is received. This is performed by writing a 1 to the RETTO (Reload
  and Start Time-out) bit in the US\_CR. If RETTO is performed, the counter starts counting down immediately
  from the value TO. This enables generation of a periodic interrupt so that a user time-out can be handled, for
  example when no key is pressed on a keyboard.

If STTTO is performed, the counter clock is stopped until a first character is received. The idle state on RXD before the start of the frame does not provide a time-out. This prevents having to obtain a periodic interrupt and enables a wait of the end of frame when the idle state on RXD is detected.

If RETTO is performed, the counter starts counting down immediately from the value TO. This enables generation of a periodic interrupt so that a user time-out can be handled, for example when no key is pressed on a keyboard.

Figure 38-23 shows the block diagram of the Receiver Time-out feature.

Figure 38-23. Receiver Time-out Block Diagram

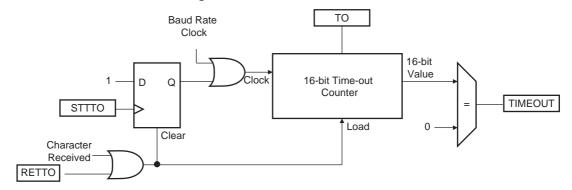

Table 38-10 gives the maximum time-out period for some standard baud rates.

Table 38-10. Maximum Time-out Period

| Baud Rate (bit/s) | Bit Time (µs) | Time-out (ms) |
|-------------------|---------------|---------------|
| 600               | 1,667         | 109,225       |
| 1,200             | 833           | 54,613        |
| 2,400             | 417           | 27,306        |
| 4,800             | 208           | 13,653        |
| 9,600             | 104           | 6,827         |
| 14,400            | 69            | 4,551         |
| 19,200            | 52            | 3,413         |
| 28,800            | 35            | 2,276         |
| 38,400            | 26            | 1,704         |
| 56,000            | 18            | 1,170         |
| 57,600            | 17            | 1,138         |
| 200,000           | 5             | 328           |

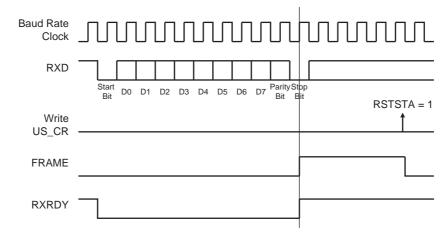

#### 38.6.3.12 Framing Error

The receiver is capable of detecting framing errors. A framing error happens when the stop bit of a received character is detected at level 0. This can occur if the receiver and the transmitter are fully desynchronized.

A framing error is reported on the FRAME bit of US\_CSR. The FRAME bit is asserted in the middle of the stop bit as soon as the framing error is detected. It is cleared by writing a 1 to the RSTSTA bit in the US\_CR.

Figure 38-24. Framing Error Status

#### 38.6.3.13 Transmit Break

The user can request the transmitter to generate a break condition on the TXD line. A break condition drives the TXD line low during at least one complete character. It appears the same as a 0x00 character sent with the parity and the stop bits at 0. However, the transmitter holds the TXD line at least during one character until the user requests the break condition to be removed.

A break is transmitted by writing a 1 to the STTBRK bit in the US\_CR. This can be performed at any time, either while the transmitter is empty (no character in either the Shift register or in US\_THR) or when a character is being transmitted. If a break is requested while a character is being shifted out, the character is first completed before the TXD line is held low.

Once STTBRK command is requested further STTBRK commands are ignored until the end of the break is completed.

The break condition is removed by writing a 1 to the STPBRK bit in the US\_CR. If the STPBRK is requested before the end of the minimum break duration (one character, including start, data, parity and stop bits), the transmitter ensures that the break condition completes.

The transmitter considers the break as though it is a character, i.e., the STTBRK and STPBRK commands are processed only if the TXRDY bit in US\_CSR is to 1 and the start of the break condition clears the TXRDY and TXEMPTY bits as if a character is processed.

Writing US\_CR with both STTBRK and STPBRK bits to 1 can lead to an unpredictable result. All STPBRK commands requested without a previous STTBRK command are ignored. A byte written into the Transmit Holding register while a break is pending, but not started, is ignored.

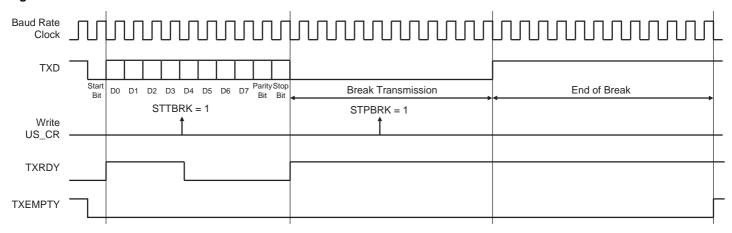

After the break condition, the transmitter returns the TXD line to 1 for a minimum of 12 bit times. Thus, the transmitter ensures that the remote receiver detects correctly the end of break and the start of the next character. If the timeguard is programmed with a value higher than 12, the TXD line is held high for the timeguard period.

After holding the TXD line for this period, the transmitter resumes normal operations.

Figure 38-25 illustrates the effect of both the Start Break (STTBRK) and Stop Break (STPBRK) commands on the TXD line.

Figure 38-25. Break Transmission

#### 38.6.3.14 Receive Break

The receiver detects a break condition when all data, parity and stop bits are low. This corresponds to detecting a framing error with data to 0x00, but FRAME remains low.

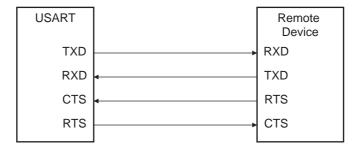

When the low stop bit is detected, the receiver asserts the RXBRK bit in US\_CSR. This bit may be cleared by writing a 1 to the RSTSTA bit in the US\_CR.

An end of receive break is detected by a high level for at least 2/16 of a bit period in Asynchronous operating mode or one sample at high level in Synchronous operating mode. The end of break detection also asserts the RXBRK bit.

### 38.6.3.15 Hardware Handshaking

The USART features a hardware handshaking out-of-band flow control. The RTS and CTS pins are used to connect with the remote device, as shown in Figure 38-26.

Figure 38-26. Connection with a Remote Device for Hardware Handshaking

Setting the USART to operate with hardware handshaking is performed by writing the USART\_MODE field in US\_MR to the value 0x2.

The USART behavior when hardware handshaking is enabled is the same as the behavior in standard Synchronous or Asynchronous mode, except that the receiver drives the RTS pin as described below and the level on the CTS pin modifies the behavior of the transmitter as described below. Using this mode requires using the DMA channel for reception. The transmitter can handle hardware handshaking in any case.

Figure 38-27 shows how the receiver operates if hardware handshaking is enabled. The RTS pin is driven high if the receiver is disabled or if the DMA status flag indicates that the buffer transfer is completed. Normally, the remote device does not start transmitting while its CTS pin (driven by RTS) is high. As soon as the receiver is enabled, the RTS falls, indicating to the remote device that it can start transmitting. Defining a new transfer descriptor in the DMA clears the status flag and, as a result, asserts the pin RTS low.

Figure 38-27. Receiver Behavior when Operating with Hardware Handshaking

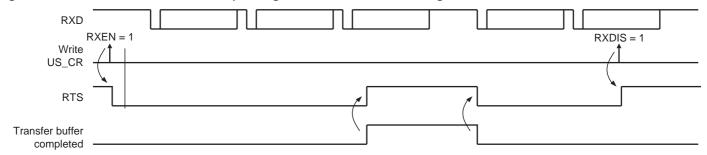

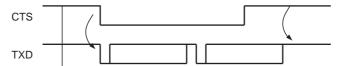

Figure 38-28 shows how the transmitter operates if hardware handshaking is enabled. The CTS pin disables the transmitter. If a character is being processed, the transmitter is disabled only after the completion of the current character and transmission of the next character happens as soon as the pin CTS falls.

Figure 38-28. Transmitter Behavior when Operating with Hardware Handshaking

### 38.6.4 ISO7816 Mode

The USART features an ISO7816-compatible operating mode. This mode permits interfacing with smart cards and Security Access Modules (SAM) communicating through an ISO7816 link. Both T = 0 and T = 1 protocols defined by the ISO7816 specification are supported.

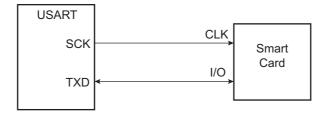

Setting the USART in ISO7816 mode is performed by writing the USART\_MODE field in US\_MR to the value 0x4 for protocol T = 0 and to the value 0x5 for protocol T = 1.

#### 38.6.4.1 ISO7816 Mode Overview

The ISO7816 is a half duplex communication on only one bidirectional line. The baud rate is determined by a division of the clock provided to the remote device (see Section 38-2 "Baud Rate Generator").

The USART connects to a smart card as shown in Figure 38-29. The TXD line becomes bidirectional and the baud rate generator feeds the ISO7816 clock on the SCK pin. As the TXD pin becomes bidirectional, its output remains driven by the output of the transmitter but only when the transmitter is active while its input is directed to the input of the receiver. The USART is considered as the master of the communication as it generates the clock.

Figure 38-29. Connection of a Smart Card to the USART

When operating in ISO7816, either in T = 0 or T = 1 modes, the character format is fixed. The configuration is 8 data bits, even parity and 1 or 2 stop bits, regardless of the values programmed in the CHRL, MODE9, PAR and CHMODE fields. MSBF can be used to transmit LSB or MSB first. Parity Bit (PAR) can be used to transmit in normal or inverse mode. Refer to Section 38.7.3 "USART Mode Register" and "PAR: Parity Type".

The USART cannot operate concurrently in both Receiver and Transmitter modes as the communication is unidirectional at a time. It has to be configured according to the required mode by enabling or disabling either the receiver or the transmitter as desired. Enabling both the receiver and the transmitter at the same time in ISO7816 mode may lead to unpredictable results.

The ISO7816 specification defines an inverse transmission format. Data bits of the character must be transmitted on the I/O line at their negative value.

#### 38.6.4.2 Protocol T = 0

In T = 0 protocol, a character is made up of one start bit, eight data bits, one parity bit and one guard time, which lasts two bit times. The transmitter shifts out the bits and does not drive the I/O line during the guard time.

If no parity error is detected, the I/O line remains at 1 during the guard time and the transmitter can continue with the transmission of the next character, as shown in Figure 38-30.

If a parity error is detected by the receiver, it drives the I/O line to 0 during the guard time, as shown in Figure 38-31. This error bit is also named NACK, for Non Acknowledge. In this case, the character lasts 1 bit time more, as the guard time length is the same and is added to the error bit time which lasts 1 bit time.

When the USART is the receiver and it detects an error, it does not load the erroneous character in the Receive Holding register (US\_RHR). It appropriately sets the PARE bit in the Status register (US\_SR) so that the software can handle the error.

Figure 38-30. T = 0 Protocol without Parity Error

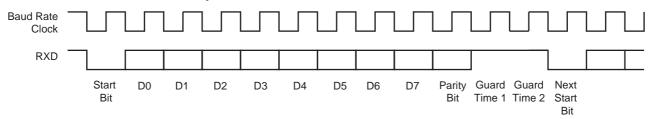

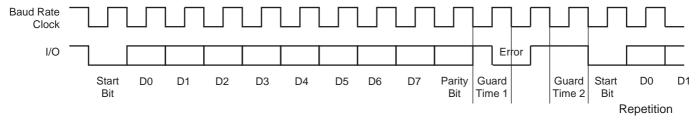

Figure 38-31. T = 0 Protocol with Parity Error

#### Receive Error Counter

The USART receiver also records the total number of errors. This can be read in the Number of Error (US\_NER) register. The NB\_ERRORS field can record up to 255 errors. Reading US\_NER automatically clears the NB ERRORS field.

## Receive NACK Inhibit

The USART can also be configured to inhibit an error. This can be achieved by setting the INACK bit in US\_MR. If INACK is to 1, no error signal is driven on the I/O line even if a parity bit is detected.

Moreover, if INACK is set, the erroneous received character is stored in the Receive Holding register, as if no error occurred and the RXRDY bit does rise.

## Transmit Character Repetition

When the USART is transmitting a character and gets a NACK, it can automatically repeat the character before moving on to the next one. Repetition is enabled by writing the MAX\_ITERATION field in the US\_MR at a value higher than 0. Each character can be transmitted up to eight times; the first transmission plus seven repetitions.

If MAX\_ITERATION does not equal zero, the USART repeats the character as many times as the value loaded in MAX\_ITERATION.

When the USART repetition number reaches MAX\_ITERATION and the last repeated character is not acknowledged, the ITER bit is set in US\_CSR. If the repetition of the character is acknowledged by the receiver, the repetitions are stopped and the iteration counter is cleared.

The ITER bit in US\_CSR can be cleared by writing a 1 to the RSTIT bit in the US\_CR.

#### Disable Successive Receive NACK

The receiver can limit the number of successive NACKs sent back to the remote transmitter. This is programmed by setting the bit DSNACK in the US\_MR. The maximum number of NACKs transmitted is programmed in the MAX\_ITERATION field. As soon as MAX\_ITERATION is reached, no error signal is driven on the I/O line and the ITER bit in the US\_CSR is set.

#### 38.6.4.3 Protocol T = 1

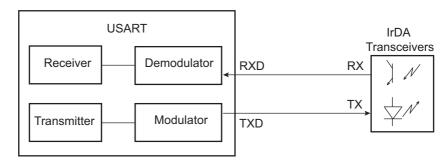

When operating in ISO7816 protocol T = 1, the transmission is similar to an asynchronous format with only one stop bit. The parity is generated when transmitting and checked when receiving. Parity error detection sets the PARE bit in the US\_CSR.

## 38.6.5 IrDA Mode

The USART features an IrDA mode supplying half-duplex point-to-point wireless communication. It embeds the modulator and demodulator which allows a glueless connection to the infrared transceivers, as shown in Figure 38-32. The modulator and demodulator are compliant with the IrDA specification version 1.1 and support data transfer speeds ranging from 2.4 kbit/s to 115.2 kbit/s.

The IrDA mode is enabled by setting the USART\_MODE field in US\_MR to the value 0x8. The IrDA Filter register (US\_IF) is used to configure the demodulator filter. The USART transmitter and receiver operate in a normal Asynchronous mode and all parameters are accessible. Note that the modulator and the demodulator are activated.

Figure 38-32. Connection to IrDA Transceivers

The receiver and the transmitter must be enabled or disabled depending on the direction of the transmission to be managed.

To receive IrDA signals, the following needs to be done:

- Disable TX and Enable RX
- Configure the TXD pin as PIO and set it as an output to 0 (to avoid LED emission). Disable the internal pull-up (better for power consumption).
- Receive data

### 38.6.5.1 IrDA Modulation

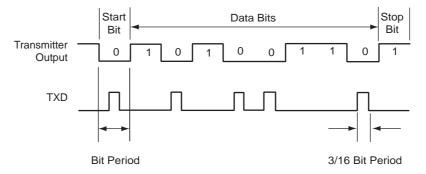

For baud rates up to and including 115.2 kbit/s, the RZI modulation scheme is used. "0" is represented by a light pulse of 3/16th of a bit time. Some examples of signal pulse duration are shown in Table 38-11.

Table 38-11. IrDA Pulse Duration

| Baud Rate    | Pulse Duration (3/16) |
|--------------|-----------------------|
| 2.4 kbit/s   | 78.13 µs              |
| 9.6 kbit/s   | 19.53 µs              |
| 19.2 kbit/s  | 9.77 µs               |
| 38.4 kbit/s  | 4.88 µs               |
| 57.6 kbit/s  | 3.26 µs               |
| 115.2 kbit/s | 1.63 µs               |

Figure 38-33 shows an example of character transmission.

Figure 38-33. IrDA Modulation

## 38.6.5.2 IrDA Baud Rate

Table 38-12 gives some examples of CD values, baud rate error and pulse duration. Note that the requirement on the maximum acceptable error of ±1.87% must be met.

Table 38-12. IrDA Baud Rate Error

| Peripheral Clock | Baud Rate (bit/s) | CD  | Baud Rate Error | Pulse Time (µs) |
|------------------|-------------------|-----|-----------------|-----------------|
| 3,686,400        | 115,200           | 2   | 0.00%           | 1.63            |
| 20,000,000       | 115,200           | 11  | 1.38%           | 1.63            |
| 32,768,000       | 115,200           | 18  | 1.25%           | 1.63            |
| 40,000,000       | 115,200           | 22  | 1.38%           | 1.63            |
| 3,686,400        | 57,600            | 4   | 0.00%           | 3.26            |
| 20,000,000       | 57,600            | 22  | 1.38%           | 3.26            |
| 32,768,000       | 57,600            | 36  | 1.25%           | 3.26            |
| 40,000,000       | 57,600            | 43  | 0.93%           | 3.26            |
| 3,686,400        | 38,400            | 6   | 0.00%           | 4.88            |
| 20,000,000       | 38,400            | 33  | 1.38%           | 4.88            |
| 32,768,000       | 38,400            | 53  | 0.63%           | 4.88            |
| 40,000,000       | 38,400            | 65  | 0.16%           | 4.88            |
| 3,686,400        | 19,200            | 12  | 0.00%           | 9.77            |
| 20,000,000       | 19,200            | 65  | 0.16%           | 9.77            |
| 32,768,000       | 19,200            | 107 | 0.31%           | 9.77            |
| 40,000,000       | 19,200            | 130 | 0.16%           | 9.77            |
| 3,686,400        | 9,600             | 24  | 0.00%           | 19.53           |
| 20,000,000       | 9,600             | 130 | 0.16%           | 19.53           |
| 32,768,000       | 9,600             | 213 | 0.16%           | 19.53           |
| 40,000,000       | 9,600             | 260 | 0.16%           | 19.53           |
| 3,686,400        | 2,400             | 96  | 0.00%           | 78.13           |
| 20,000,000       | 2,400             | 521 | 0.03%           | 78.13           |
| 32,768,000       | 2,400             | 853 | 0.04%           | 78.13           |

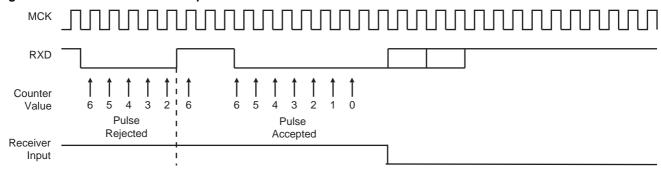

### 38.6.5.3 IrDA Demodulator

The demodulator is based on the IrDA Receive filter comprised of an 8-bit down counter which is loaded with the value programmed in US\_IF. When a falling edge is detected on the RXD pin, the Filter Counter starts counting down at the peripheral clock speed. If a rising edge is detected on the RXD pin, the counter stops and is reloaded with US\_IF. If no rising edge is detected when the counter reaches 0, the input of the receiver is driven low during one bit time.

Figure 38-34 illustrates the operations of the IrDA demodulator.

Figure 38-34. IrDA Demodulator Operations

The programmed value in the US\_IF register must always meet the following criteria:

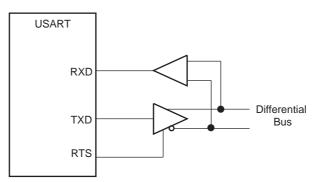

$$t_{peripheral clock} \times (IRDA\_FILTER + 3) < 1.41 \ \mu s$$

As the IrDA mode uses the same logic as the ISO7816, note that the FI\_DI\_RATIO field in US\_FIDI must be set to a value higher than 0 in order to make sure IrDA communications operate correctly.

### 38.6.6 RS485 Mode

The USART features the RS485 mode to enable line driver control. While operating in RS485 mode, the USART behaves as though in Asynchronous or Synchronous mode and configuration of all the parameters is possible. The difference is that the RTS pin is driven high when the transmitter is operating. The behavior of the RTS pin is controlled by the TXEMPTY bit. A typical connection of the USART to an RS485 bus is shown in Figure 38-35.

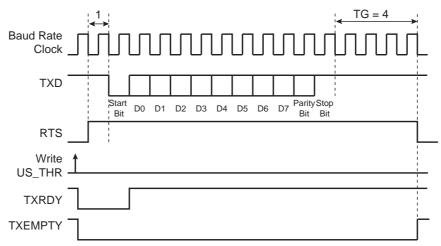

Figure 38-35. Typical Connection to a RS485 Bus

The USART is set in RS485 mode by writing the value 0x1 to the USART\_MODE field in US\_MR.

The RTS pin is at a level inverse to the TXEMPTY bit. Significantly, the RTS pin remains high when a timeguard is programmed so that the line can remain driven after the last character completion. Figure 38-36 gives an example of the RTS waveform during a character transmission when the timeguard is enabled.

Figure 38-36. Example of RTS Drive with Timeguard

#### 38.6.7 SPI Mode

The Serial Peripheral Interface (SPI) mode is a synchronous serial data link that provides communication with external devices in Master or Slave mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the "master" which controls the data flow, while the other devices act as "slaves" which have data shifted into and out by the master. Different CPUs can take turns being masters and one master may simultaneously shift data into multiple slaves. (Multiple master protocol is the opposite of single master protocol, where one CPU is always the master while all of the others are always slaves.) However, only one slave may drive its output to write data back to the master at any given time.

A slave device is selected when its NSS signal is asserted by the master. The USART in SPI Master mode can address only one SPI slave because it can generate only one NSS signal.

The SPI system consists of two data lines and two control lines:

- Master Out Slave In (MOSI): This data line supplies the output data from the master shifted into the input of the slave.
- Master In Slave Out (MISO): This data line supplies the output data from a slave to the input of the master.
- Serial Clock (SCK): This control line is driven by the master and regulates the flow of the data bits. The
  master may transmit data at a variety of baud rates. The SCK line cycles once for each bit that is
  transmitted.
- Slave Select (NSS): This control line allows the master to select or deselect the slave.

## 38.6.7.1 Modes of Operation

The USART can operate in SPI Master mode or in SPI Slave mode.

Operation in SPI Master mode is programmed by writing 0xE to the USART\_MODE field in US\_MR. In this case the SPI lines must be connected as described below:

- The MOSI line is driven by the output pin TXD
- The MISO line drives the input pin RXD
- The SCK line is driven by the output pin SCK
- The NSS line is driven by the output pin RTS

Operation in SPI Slave mode is programmed by writing to 0xF the USART\_MODE field in US\_MR. In this case the SPI lines must be connected as described below:

- The MOSI line drives the input pin RXD
- The MISO line is driven by the output pin TXD
- The SCK line drives the input pin SCK
- The NSS line drives the input pin CTS

In order to avoid unpredictable behavior, any change of the SPI mode must be followed by a software reset of the transmitter and of the receiver (except the initial configuration after a hardware reset). (See Section 38.6.7.4).

#### 38.6.7.2 Baud Rate

In SPI mode, the baud rate generator operates in the same way as in USART Synchronous mode. See Section 38.6.1.3 "Baud Rate in Synchronous Mode or SPI Mode". However, there are some restrictions:

### In SPI Master mode:

- The external clock SCK must not be selected (USCLKS ≠ 0x3), and the bit CLKO must be set to 1 in the US\_MR, in order to generate correctly the serial clock on the SCK pin.
- To obtain correct behavior of the receiver and the transmitter, the value programmed in CD must be superior or equal to 6.
- If the divided peripheral clock is selected, the value programmed in CD must be even to ensure a 50:50 mark/space ratio on the SCK pin, this value can be odd if the peripheral clock is selected.

#### In SPI Slave mode:

- The external clock (SCK) selection is forced regardless of the value of the USCLKS field in the US\_MR.
   Likewise, the value written in US\_BRGR has no effect, because the clock is provided directly by the signal on the USART SCK pin.
- To obtain correct behavior of the receiver and the transmitter, the external clock (SCK) frequency must be at least 6 times lower than the system clock.

#### 38.6.7.3 Data Transfer

Up to nine data bits are successively shifted out on the TXD pin at each rising or falling edge (depending of CPOL and CPHA) of the programmed serial clock. There is no Start bit, no Parity bit and no Stop bit.

The number of data bits is selected by the CHRL field and the MODE 9 bit in the US\_MR. The nine bits are selected by setting the MODE 9 bit regardless of the CHRL field. The MSB data bit is always sent first in SPI mode (Master or Slave).

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the US\_MR. The clock phase is programmed with the CPHA bit. These two parameters determine the edges of the clock signal upon which data is driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Thus, a master/slave pair must use the same parameter pair values to communicate. If multiple slaves are used and fixed in different configurations, the master must reconfigure itself each time it needs to communicate with a different slave.

Table 38-13. SPI Bus Protocol Mode

| SPI Bus Protocol Mode | CPOL | СРНА |
|-----------------------|------|------|
| 0                     | 0    | 1    |
| 1                     | 0    | 0    |
| 2                     | 1    | 1    |
| 3                     | 1    | 0    |

Figure 38-37. SPI Transfer Format (CPHA = 1, 8 bits per transfer)

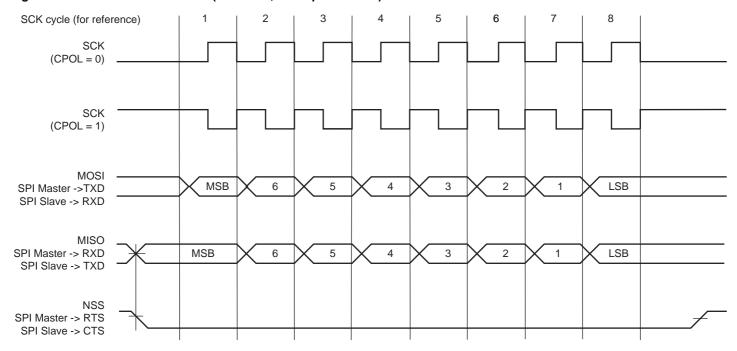

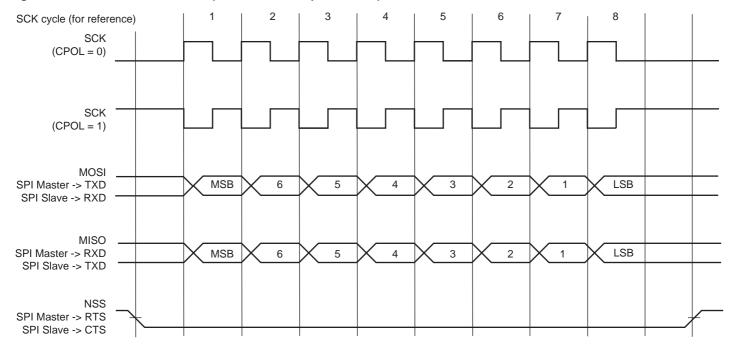

Figure 38-38. SPI Transfer Format (CPHA = 0, 8 bits per transfer)

38.6.7.4 Receiver and Transmitter Control

See Section 38.6.2 "Receiver and Transmitter Control"

#### 38.6.7.5 Character Transmission

The characters are sent by writing in the Transmit Holding register (US\_THR). An additional condition for transmitting a character can be added when the USART is configured in SPI Master mode. In the USART Mode Register (SPI\_MODE) (USART\_MR), the value configured on the bit WRDBT can prevent any character transmission (even if US\_THR has been written) while the receiver side is not ready (character not read). When WRDBT equals 0, the character is transmitted whatever the receiver status. If WRDBT is set to 1, the transmitter waits for the Receive Holding register (US\_RHR) to be read before transmitting the character (RXRDY flag cleared), thus preventing any overflow (character loss) on the receiver side.

The chip select line is de-asserted for a period equivalent to three bits between the transmission of two data.

The transmitter reports two status bits in US\_CSR: TXRDY (Transmitter Ready), which indicates that US\_THR is empty and TXEMPTY, which indicates that all the characters written in US\_THR have been processed. When the current character processing is completed, the last character written in US\_THR is transferred into the Shift register of the transmitter and US\_THR becomes empty, thus TXRDY rises.

Both TXRDY and TXEMPTY bits are low when the transmitter is disabled. Writing a character in US\_THR while TXRDY is low has no effect and the written character is lost.

If the USART is in SPI Slave mode and if a character must be sent while the US\_THR is empty, the UNRE (Underrun Error) bit is set. The TXD transmission line stays at high level during all this time. The UNRE bit is cleared by writing a 1 to the RSTSTA (Reset Status) bit in US\_CR.

In SPI Master mode, the slave select line (NSS) is asserted at low level one  $t_{bit}$  ( $t_{bit}$  being the nominal time required to transmit a bit) before the transmission of the MSB bit and released at high level one  $t_{bit}$  after the transmission of the LSB bit. So, the slave select line (NSS) is always released between each character transmission and a minimum delay of three  $t_{bit}$  always inserted. However, in order to address slave devices supporting the CSAAT mode (Chip Select Active After Transfer), the slave select line (NSS) can be forced at low level by writing a 1 to the RTSEN bit in the US\_CR. The slave select line (NSS) can be released at high level only by writing a 1 to the RTSDIS bit in the US\_CR (for example, when all data have been transferred to the slave device).

In SPI Slave mode, the transmitter does not require a falling edge of the slave select line (NSS) to initiate a character transmission but only a low level. However, this low level must be present on the slave select line (NSS) at least one  $t_{\rm hit}$  before the first serial clock cycle corresponding to the MSB bit.

#### 38.6.7.6 Character Reception

When a character reception is completed, it is transferred to the Receive Holding register (US\_RHR) and the RXRDY bit in the Status register (US\_CSR) rises. If a character is completed while RXRDY is set, the OVRE (Overrun Error) bit is set. The last character is transferred into US\_RHR and overwrites the previous one. The OVRE bit is cleared by writing a 1 to the RSTSTA (Reset Status) bit in the US\_CR.

To ensure correct behavior of the receiver in SPI Slave mode, the master device sending the frame must ensure a minimum delay of one  $t_{\rm bit}$  between each character transmission. The receiver does not require a falling edge of the slave select line (NSS) to initiate a character reception but only a low level. However, this low level must be present on the slave select line (NSS) at least one  $t_{\rm bit}$  before the first serial clock cycle corresponding to the MSB bit.

## 38.6.7.7 Receiver Timeout

Because the receiver baud rate clock is active only during data transfers in SPI mode, a receiver timeout is impossible in this mode, whatever the time-out value is (field TO) in the US\_RTOR.

### 38.6.8 LIN Mode

The LIN mode provides master node and slave node connectivity on a LIN bus.

The LIN (Local Interconnect Network) is a serial communication protocol which efficiently supports the control of mechatronic nodes in distributed automotive applications.

The main properties of the LIN bus are:

- Single master/multiple slaves concept
- Low-cost silicon implementation based on common UART/SCI interface hardware, an equivalent in software, or as a pure state machine.
- Self synchronization without quartz or ceramic resonator in the slave nodes
- Deterministic signal transmission
- Low cost single-wire implementation
- Speed up to 20 kbit/s

LIN provides cost efficient bus communication where the bandwidth and versatility of CAN are not required.

The LIN mode enables processing LIN frames with a minimum of action from the microprocessor.

### 38.6.8.1 Modes of Operation

The USART can act either as a LIN master node or as a LIN slave node.

The node configuration is chosen by setting the USART\_MODE field in the USART Mode register (US\_MR):

- LIN master node (USART\_MODE = 0xA)
- LIN slave node (USART\_MODE = 0xB)

In order to avoid unpredictable behavior, any change of the LIN node configuration must be followed by a software reset of the transmitter and of the receiver (except the initial node configuration after a hardware reset). (See Section 38.6.8.3.)

### 38.6.8.2 Baud Rate Configuration

See Section 38.6.1.1 "Baud Rate in Asynchronous Mode"

The baud rate is configured in US\_BRGR.

#### 38.6.8.3 Receiver and Transmitter Control

See Section 38.6.2 "Receiver and Transmitter Control"

### 38.6.8.4 Character Transmission

See Section 38.6.3.1 "Transmitter Operations".

### 38.6.8.5 Character Reception

See Section 38.6.3.7 "Receiver Operations".

## 38.6.8.6 Header Transmission (Master Node Configuration)

All the LIN frames start with a header which is sent by the master node and consists of a Synch Break Field, Synch Field and Identifier Field.

So in master node configuration, the frame handling starts with the sending of the header.

The header is transmitted as soon as the identifier is written in the LIN Identifier register (US\_LINIR). At this moment the flag TXRDY falls.

The Break Field, the Synch Field and the Identifier Field are sent automatically one after the other.

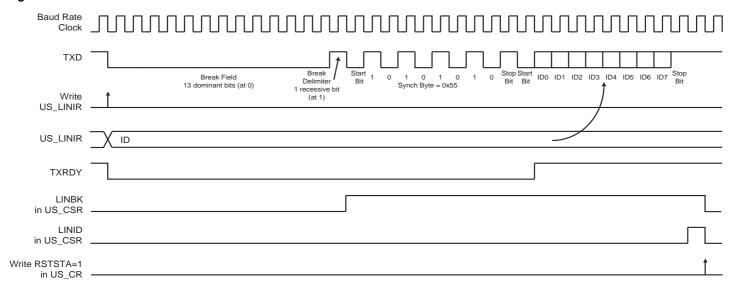

The Break Field consists of 13 dominant bits and 1 recessive bit, the Synch Field is the character 0x55 and the Identifier corresponds to the character written in the LIN Identifier register (US\_LINIR). The Identifier parity bits can be automatically computed and sent (see Section 38.6.8.9 "Identifier Parity").

The flag TXRDY rises when the identifier character is transferred into the Shift register of the transmitter.

As soon as the Synch Break Field is transmitted, the flag LINBK in US\_CSR is set to 1. Likewise, as soon as the Identifier Field is sent, the flag bit LINID in the US\_CSR is set to 1. These flags are reset by writing a 1 to the bit RSTSTA in US\_CR.

#### Figure 38-39. Header Transmission

## 38.6.8.7 Header Reception (Slave Node Configuration)

All the LIN frames start with a header which is sent by the master node and consists of a Synch Break Field, Synch Field and Identifier Field.

In slave node configuration, the frame handling starts with the reception of the header.

The USART uses a break detection threshold of 11 nominal bit times at the actual baud rate. At any time, if 11 consecutive recessive bits are detected on the bus, the USART detects a Break Field. As long as a Break Field has not been detected, the USART stays idle and the received data are not taken in account.

When a Break Field has been detected, the flag LINBK in US\_CSR is set to 1 and the USART expects the Synch Field character to be 0x55. This field is used to update the actual baud rate in order to stay synchronized (see Section 38.6.8.8 "Slave Node Synchronization"). If the received Synch character is not 0x55, an Inconsistent Synch Field error is generated (see Section 38.6.8.14 "LIN Errors").

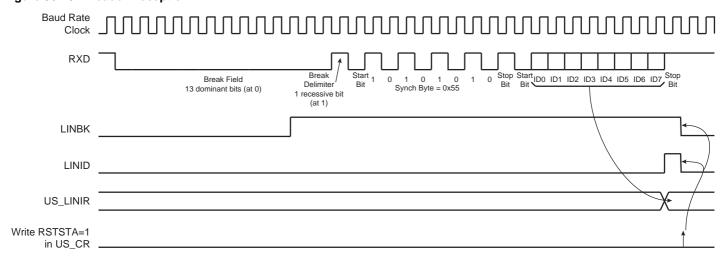

After receiving the Synch Field, the USART expects to receive the Identifier Field.

When the Identifier Field has been received, the flag bit LINID in the US\_CSR is set to 1. At this moment the field IDCHR in the LIN Identifier register (US\_LINIR) is updated with the received character. The Identifier parity bits can be automatically computed and checked (see Section 38.6.8.9 "Identifier Parity").

The flag bits LINID and LINBK are reset by writing a 1 to the bit RSTSTA in US\_CR.

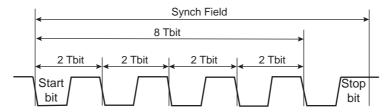

## Figure 38-40. Header Reception

### 38.6.8.8 Slave Node Synchronization

The synchronization is done only in slave node configuration. The procedure is based on time measurement between falling edges of the Synch Field. The falling edges are available in distances of 2, 4, 6 and 8 bit times.

Figure 38-41. Synch Field

The time measurement is made by a 19-bit counter clocked by the sampling clock (see Section 38.6.1 "Baud Rate Generator").

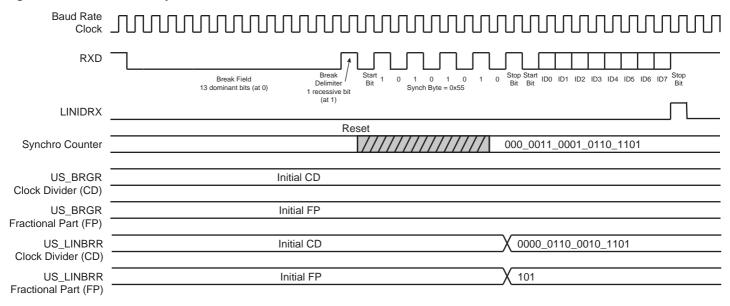

When the start bit of the Synch Field is detected, the counter is reset. Then during the next eight  $t_{bit}$  of the Synch Field, the counter is incremented. At the end of these eight  $t_{bit}$ , the counter is stopped. At this moment, the 16 most significant bits of the counter (value divided by 8) give the new clock divider (LINCD) and the three least significant bits of this value (the remainder) give the new fractional part (LINFP).

When the Synch Field has been received, the clock divider (CD) and the fractional part (FP) are updated in US\_BRGR.

If it appears that the sampled Synch character is not equal to 0x55, then the error flag LINISFE in US\_CSR is set to 1. It is reset by writing bit RSTSTA to 1 in US\_CR.

Figure 38-42. Slave Node Synchronization

The accuracy of the synchronization depends on several parameters:

- Nominal clock frequency (f<sub>Nom</sub>) (the theoretical slave node clock frequency)
- Baud Rate
- Oversampling (OVER = 0 => 16X or OVER = 0 => 8X)

The following formula is used to compute the deviation of the slave bit rate relative to the master bit rate after synchronization ( $f_{SLAVF}$  is the real slave node clock frequency):

$$\begin{aligned} \text{Baudrate\_deviation} &= \left(100 \times \frac{\left[\alpha \times 8 \times (2 - \text{OVER}) + \beta\right] \times \text{Baudrate}}{8 \times f_{\text{SLAVE}}}\right) \% \\ \text{Baudrate\_deviation} &= \left(100 \times \frac{\left[\alpha \times 8 \times (2 - \text{OVER}) + \beta\right] \times \text{Baudrate}}{8 \times \left(\frac{f_{\text{TOL\_UNSYNCH}}}{100}\right) \times f_{\text{Nom}}}\right) \% \\ &-0.5 \leq \!\! \alpha \leq \!\! +0.5 \quad -1 < \beta < \!\! +1 \end{aligned}$$

 $f_{TOL\_UNSYNCH}$  is the deviation of the real slave node clock from the nominal clock frequency. The LIN Standard imposes that it must not exceed  $\pm 15\%$ . The LIN Standard imposes also that for communication between two nodes, their bit rate must not differ by more than  $\pm 2\%$ . This means that the baudrate\_deviation must not exceed  $\pm 1\%$ .

It follows from that, a minimum value for the nominal clock frequency:

$$f_{\text{Nom}}(\text{min}) = \left(100 \times \frac{[0.5 \times 8 \times (2 - \text{OVER}) + 1] \times \text{Baudrate}}{8 \times (\frac{-15}{100} + 1) \times 1\%}\right) \text{Hz}$$

Examples:

- Baud rate = 20 kbit/s, OVER = 0 (Oversampling 16X) => f<sub>Nom</sub>(min) = 2.64 MHz
- Baud rate = 20 kbit/s, OVER = 1 (Oversampling 8X) => f<sub>Nom</sub>(min) = 1.47 MHz
- Baud rate = 1 kbit/s, OVER = 0 (Oversampling 16X) => f<sub>Nom</sub>(min) = 132 kHz
- Baud rate = 1 kbit/s, OVER = 1 (Oversampling 8X) => f<sub>Nom</sub>(min) = 74 kHz

## 38.6.8.9 Identifier Parity

A protected identifier consists of two subfields: the identifier and the identifier parity. Bits 0 to 5 are assigned to the identifier and bits 6 and 7 are assigned to the parity.

The USART interface can generate/check these parity bits, but this feature can also be disabled. The user can choose between two modes by the PARDIS bit of US\_LINMR:

- PARDIS = 0:
  - During header transmission, the parity bits are computed and sent with the six least significant bits of the IDCHR field of the LIN Identifier register (US\_LINIR). The bits 6 and 7 of this register are discarded.
  - During header reception, the parity bits of the identifier are checked. If the parity bits are wrong, an Identifier Parity error occurs (see Section 38.6.3.8). Only the six least significant bits of the IDCHR field are updated with the received Identifier. The bits 6 and 7 are stuck to 0.
- PARDIS = 1:
  - During header transmission, all the bits of the IDCHR field of the LIN Identifier register (US\_LINIR) are sent on the bus.
  - During header reception, all the bits of the IDCHR field are updated with the received Identifier.

### 38.6.8.10 Node Action

Depending on the identifier, the node is affected – or not – by the LIN response. Consequently, after sending or receiving the identifier, the USART must be configured. There are three possible configurations:

- PUBLISH: the node sends the response.
- SUBSCRIBE: the node receives the response.
- IGNORE: the node is not concerned by the response, it does not send and does not receive the response.

This configuration is made by the field Node Action (NACT) in the US\_LINMR (see Section 38.7.26).

Example: a LIN cluster that contains a master and two slaves:

Data transfer from the master to the slave1 and to the slave2:

NACT(master)=PUBLISH

NACT(slave1)=SUBSCRIBE

NACT(slave2)=SUBSCRIBE

Data transfer from the master to the slave1 only:

NACT(master)=PUBLISH

NACT(slave1)=SUBSCRIBE

NACT(slave2)=IGNORE

Data transfer from the slave1 to the master:

NACT(master)=SUBSCRIBE

NACT(slave1)=PUBLISH

NACT(slave2)=IGNORE

Data transfer from the slave1 to the slave2:

NACT(master)=IGNORE

NACT(slave1)=PUBLISH

NACT(slave2)=SUBSCRIBE

Data transfer from the slave2 to the master and to the slave1:

NACT(master)=SUBSCRIBE

NACT(slave1)=SUBSCRIBE NACT(slave2)=PUBLISH

#### 38.6.8.11 Response Data Length

The LIN response data length is the number of data fields (bytes) of the response excluding the checksum.

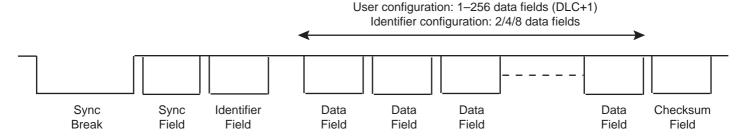

The response data length can either be configured by the user or be defined automatically by bits 4 and 5 of the Identifier (compatibility to LIN Specification 1.1). The user can choose between these two modes by the DLM bit of US LINMR:

- DLM = 0: The response data length is configured by the user via the DLC field of US\_LINMR. The response data length is equal to (DLC + 1) bytes. DLC can be programmed from 0 to 255, so the response can contain from 1 data byte up to 256 data bytes.
- DLM = 1: The response data length is defined by the Identifier (IDCHR in US\_LINIR) according to the table below. The DLC field of US\_LINMR is discarded. The response can contain 2 or 4 or 8 data bytes.

Table 38-14. Response Data Length if DLM = 1

| IDCHR[5] | IDCHR[4] | Response Data Length [Bytes] |
|----------|----------|------------------------------|
| 0        | 0        | 2                            |
| 0        | 1        | 2                            |
| 1        | 0        | 4                            |
| 1        | 1        | 8                            |

Figure 38-43. Response Data Length

#### 38.6.8.12 Checksum

The last field of a frame is the checksum. The checksum contains the inverted 8-bit sum with carry, over all data bytes or all data bytes and the protected identifier. Checksum calculation over the data bytes only is called classic checksum and it is used for communication with LIN 1.3 slaves. Checksum calculation over the data bytes and the protected identifier byte is called enhanced checksum and it is used for communication with LIN 2.0 slaves.

The USART can be configured to:

- Send/Check an Enhanced checksum automatically (CHKDIS = 0 & CHKTYP = 0)
- Send/Check a Classic checksum automatically (CHKDIS = 0 & CHKTYP = 1)
- Not send/check a checksum (CHKDIS = 1)

This configuration is made by the Checksum Type (CHKTYP) and Checksum Disable (CHKDIS) fields of US\_LINMR.

If the checksum feature is disabled, the user can send it manually all the same, by considering the checksum as a normal data byte and by adding 1 to the response data length (see Section 38.6.8.11).

#### 38.6.8.13 Frame Slot Mode

This mode is useful only for master nodes. It complies with the following rule: each frame slot should be longer than or equal to  $t_{Frame\ Maximum}$ .

If the Frame slot mode is enabled (FSDIS = 0) and a frame transfer has been completed, the TXRDY flag is set again only after  $t_{\text{Frame\_Maximum}}$  delay, from the start of frame. So the master node cannot send a new header if the frame slot duration of the previous frame is inferior to  $t_{\text{Frame\_Maximum}}$ .

If the Frame slot mode is disabled (FSDIS = 1) and a frame transfer has been completed, the TXRDY flag is set again immediately.

The t<sub>Frame Maximum</sub> is calculated as below:

If the Checksum is sent (CHKDIS = 0):

$$t_{\text{Header\_Nominal}} = 34 \times t_{\text{bit}}$$

$$t_{Response\_Nominal} = 10 \times (NData + 1) \times t_{bit}$$

$$t_{\text{Frame Maximum}} = 1.4 \times (t_{\text{Header Nominal}} + t_{\text{Response Nominal}} + 1)^{(1)}$$

$$t_{Frame\ Maximum} = 1.4 \times (34 + 10 \times (DLC + 1 + 1) + 1) \times t_{bit}$$

$$t_{Frame\ Maximum} = (77 + 14 \times DLC) \times t_{bit}$$

If the Checksum is not sent (CHKDIS = 1):

$$t_{\text{Header Nominal}} = 34 \times t_{\text{bit}}$$

$$t_{Response\ Nominal} = 10 \times NData \times t_{bit}$$

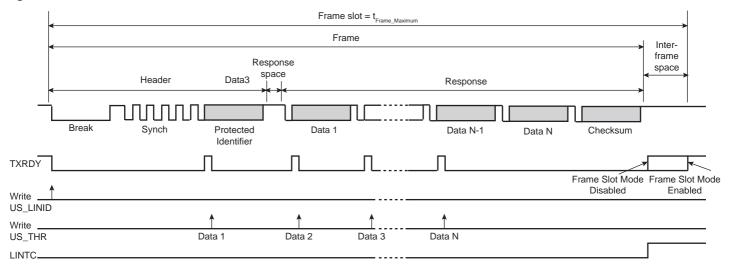

$$t_{\text{Frame\_Maximum}} = 1.4 \times (t_{\text{Header\_Nominal}} + t_{\text{Response\_Nominal}} + 1)^{(1)}$$

$$t_{\text{Frame Maximum}} = 1.4 \times (34 + 10 \times (DLC + 1) + 1) \times t_{\text{bit}}$$

$$t_{Frame\_Maximum} = (63 + 14 \times DLC) \times t_{bit}$$

Note: 1. The term "+1" leads to an integer result for t<sub>Frame Maximum</sub> (LIN Specification 1.3).

Figure 38-44. Frame Slot Mode

#### 38.6.8.14 LIN Errors

Bit Error

This error is generated in master of slave node configuration, when the USART is transmitting and if the transmitted value on the Tx line is different from the value sampled on the Rx line. If a bit error is detected, the transmission is aborted at the next byte border.

This error is reported by flag LINBE in US\_CSR.

### Inconsistent Synch Field Error

This error is generated in slave node configuration, if the Synch Field character received is other than 0x55.

This error is reported by flag LINISFE in the US\_CSR.

## Identifier Parity Error

This error is generated in slave node configuration, if the parity of the identifier is wrong. This error can be generated only if the parity feature is enabled (PARDIS = 0).

This error is reported by flag LINIPE in the US\_CSR.

#### Checksum Error

This error is generated in master of slave node configuration, if the received checksum is wrong. This flag can be set to 1 only if the checksum feature is enabled (CHKDIS = 0).

This error is reported by flag LINCE in the US\_CSR.

## Slave Not Responding Error

This error is generated in master of slave node configuration, when the USART expects a response from another node (NACT = SUBSCRIBE) but no valid message appears on the bus within the time given by the maximum length of the message frame,  $t_{Frame\_Maximum}$  (see Section 38.6.8.13). This error is disabled if the USART does not expect any message (NACT = PUBLISH or NACT = IGNORE).

This error is reported by flag LINSNRE in the US\_CSR.

## 38.6.8.15 LIN Frame Handling

## Master Node Configuration

- Write TXEN and RXEN in US\_CR to enable both the transmitter and the receiver.
- Write USART MODE in US MR to select the LIN mode and the master node configuration.
- Write CD and FP in US BRGR to configure the baud rate.
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM, FSDIS and DLC in US\_LINMR to configure the frame transfer.
- Check that TXRDY in US CSR is set to 1
- Write IDCHR in US LINIR to send the header

What comes next depends on the NACT configuration:

- Case 1: NACT = PUBLISH, the USART sends the response
  - Wait until TXRDY in US CSR rises
  - Write TCHR in US THR to send a byte
  - If all the data have not been written, redo the two previous steps
  - Wait until LINTC in US\_CSR rises
  - Check the LIN errors
- Case 2: NACT = SUBSCRIBE, the USART receives the response
  - Wait until RXRDY in US\_CSR rises
  - Read RCHR in US RHR
  - If all the data have not been read, redo the two previous steps
  - Wait until LINTC in US CSR rises
  - Check the LIN errors
- Case 3: NACT = IGNORE, the USART is not concerned by the response
  - Wait until LINTC in US CSR rises
  - Check the LIN errors

Figure 38-45. Master Node Configuration, NACT = PUBLISH

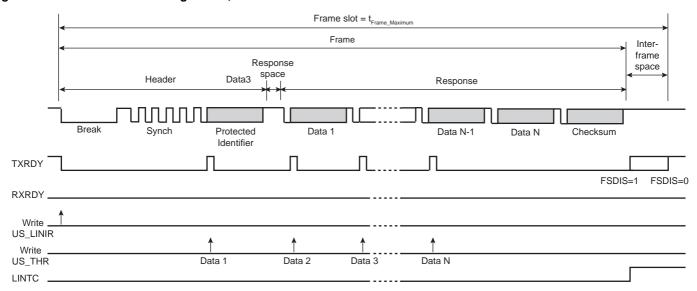

Figure 38-46. Master Node Configuration, NACT = SUBSCRIBE

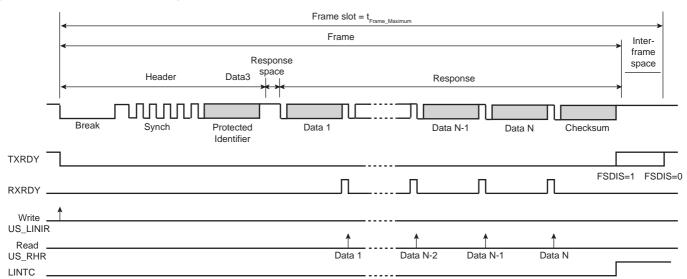

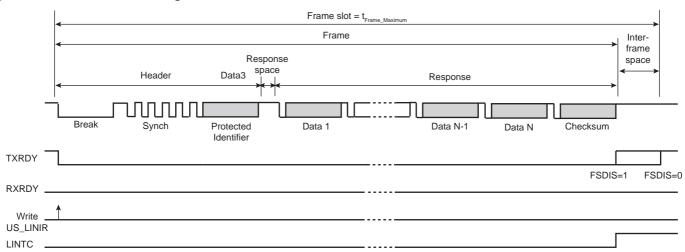

Figure 38-47. Master Node Configuration, NACT = IGNORE

## Slave Node Configuration

- Write TXEN and RXEN in US\_CR to enable both the transmitter and the receiver.
- Write USART\_MODE in US\_MR to select the LIN mode and the slave node configuration.
- Write CD and FP in US\_BRGR to configure the baud rate.
- Wait until LINID in US\_CSR rises
- Check LINISFE and LINPE errors
- Read IDCHR in US RHR
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM and DLC in US\_LINMR to configure the frame transfer.

<u>IMPORTANT</u>: If the NACT configuration for this frame is PUBLISH, the US\_LINMR must be written with NACT = PUBLISH even if this field is already correctly configured, in order to set the TXREADY flag and the corresponding write transfer request.

What comes next depends on the NACT configuration:

- Case 1: NACT = PUBLISH, the LIN controller sends the response
  - Wait until TXRDY in US CSR rises
  - Write TCHR in US THR to send a byte
  - If all the data have not been written, redo the two previous steps
  - Wait until LINTC in US\_CSR rises
  - Check the LIN errors
- Case 2: NACT = SUBSCRIBE, the USART receives the response
  - Wait until RXRDY in US CSR rises
  - Read RCHR in US RHR
  - If all the data have not been read, redo the two previous steps
  - Wait until LINTC in US CSR rises
  - Check the LIN errors
- Case 3: NACT = IGNORE, the USART is not concerned by the response
  - Wait until LINTC in US CSR rises
  - Check the LIN errors

Figure 38-48. Slave Node Configuration, NACT = PUBLISH

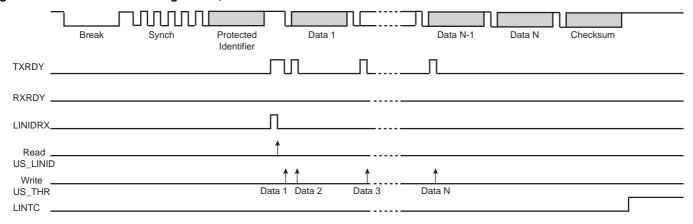

Figure 38-49. Slave Node Configuration, NACT = SUBSCRIBE

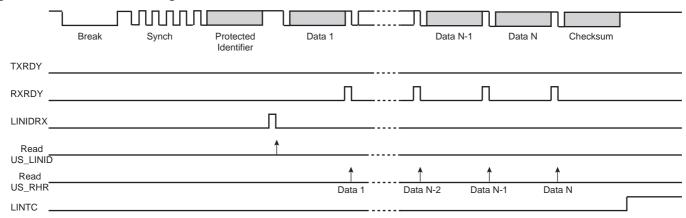

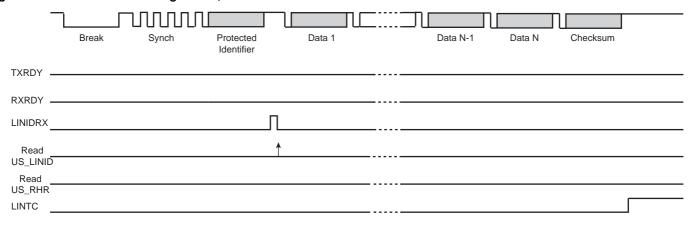

Figure 38-50. Slave Node Configuration, NACT = IGNORE

## 38.6.8.16 LIN Frame Handling with the DMAC

The USART can be used in association with the DMAC in order to transfer data directly into/from the on- and offchip memories without any processor intervention.

The DMAC uses the trigger flags, TXRDY and RXRDY, to write or read into the USART. The DMAC always writes in the Transmit Holding register (US\_THR) and it always reads in the Receive Holding register (US\_RHR). The size of the data written or read by the DMAC in the USART is always a byte.

## Master Node Configuration

The user can choose between two DMAC modes by the PDCM bit in the US\_LINMR:

- PDCM = 1: the LIN configuration is stored in the WRITE buffer and it is written by the DMAC in the Transmit Holding register US\_THR (instead of the LIN Mode register US\_LINMR). Because the DMAC transfer size is limited to a byte, the transfer is split into two accesses. During the first access the bits, NACT, PARDIS, CHKDIS, CHKTYP, DLM and FSDIS are written. During the second access the 8-bit DLC field is written.
- PDCM = 0: the LIN configuration is not stored in the WRITE buffer and it must be written by the user in US LINMR.

The WRITE buffer also contains the Identifier and the DATA, if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the DATA if the USART receives the response (NACT = SUBSCRIBE).

Figure 38-51. Master Node with DMAC (PDCM = 1)

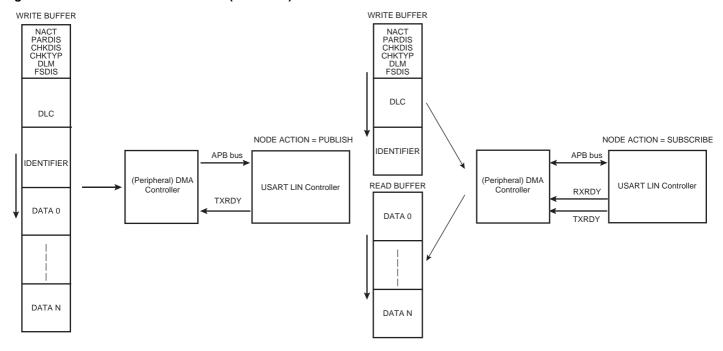

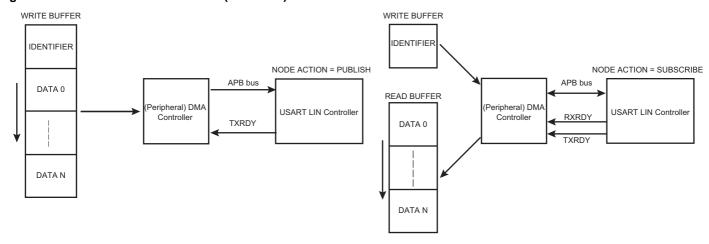

Figure 38-52. Master Node with DMAC (PDCM = 0)

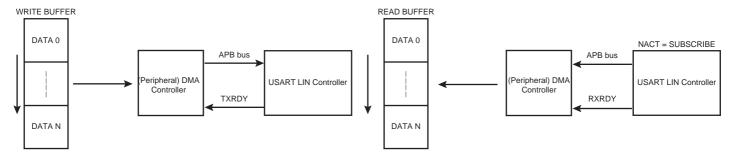

## Slave Node Configuration

In this configuration, the DMAC transfers only the DATA. The Identifier must be read by the user in the LIN Identifier register (US\_LINIR). The LIN mode must be written by the user in US\_LINMR.

The WRITE buffer contains the DATA if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the DATA if the USART receives the response (NACT = SUBSCRIBE).

Figure 38-53. Slave Node with DMAC

### 38.6.8.17 Wake-up Request

Any node in a sleeping LIN cluster may request a wake-up.

In the LIN 2.0 specification, the wakeup request is issued by forcing the bus to the dominant state from 250 µs to 5 ms. For this, it is necessary to send the character 0xF0 in order to impose five successive dominant bits. Whatever the baud rate is, this character complies with the specified timings.

- Baud rate min = 1 kbit/s -> t<sub>bit</sub> = 1 ms -> 5 t<sub>bit</sub> = 5 ms
- Baud rate max = 20 kbit/s ->  $t_{bit}$  = 50  $\mu$ s -> 5  $t_{bit}$  = 250  $\mu$ s

In the LIN 1.3 specification, the wakeup request should be generated with the character 0x80 in order to impose eight successive dominant bits.

The user can choose by the WKUPTYP bit in US\_LINMR either to send a LIN 2.0 wakeup request (WKUPTYP = 0) or to send a LIN 1.3 wakeup request (WKUPTYP = 1).

A wake-up request is transmitted by writing a 1 to the LINWKUP bit in the US\_CR. Once the transfer is completed, the LINTC flag is asserted in the Status register (US\_SR). It is cleared by writing a 1 to the RSTSTA bit in the US\_CR.

#### 38.6.8.18 Bus Idle Time-out

If the LIN bus is inactive for a certain duration, the slave nodes shall automatically enter in Sleep mode. In the LIN 2.0 specification, this time-out is fixed at 4 seconds. In the LIN 1.3 specification, it is fixed at 25,000  $t_{bit}$ .

In slave Node configuration, the receiver time-out detects an idle condition on the RXD line. When a time-out is detected, the bit TIMEOUT in US\_CSR rises and can generate an interrupt, thus indicating to the driver to go into Sleep mode.

The time-out delay period (during which the receiver waits for a new character) is programmed in the TO field of US\_RTOR. If a 0 is written to the TO field, the Receiver Time-out is disabled and no time-out is detected. The TIMEOUT bit in US\_CSR remains at 0. Otherwise, the receiver loads a 17-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the TIMEOUT bit in the US\_CSR rises.

If STTTO is performed, the counter clock is stopped until a first character is received.

If RETTO is performed, the counter starts counting down immediately from the value TO.

Table 38-15. Receiver Time-out Programming

| LIN Specification | Baud Rate       | Time-out period         | US_RTOR.TO |
|-------------------|-----------------|-------------------------|------------|
|                   | 1,000 bit/s     |                         | 4,000      |
|                   | 2,400 bit/s     |                         | 9,600      |
| 2.0               | 9,600 bit/s 4 s |                         | 38,400     |
|                   | 19,200 bit/s    |                         | 76,800     |
|                   | 20,000 bit/s    |                         | 80,000     |
| 1.3               | _               | 25,000 t <sub>bit</sub> | 25,000     |

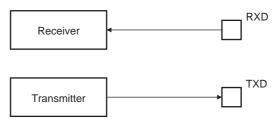

#### 38.6.9 Test Modes

The USART can be programmed to operate in three different test modes. The internal loopback capability allows on-board diagnostics. In Loopback mode, the USART interface pins are disconnected or not and reconfigured for loopback internally or externally.

#### 38.6.9.1 Normal Mode

Normal mode connects the RXD pin on the receiver input and the transmitter output on the TXD pin.

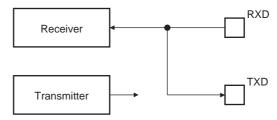

Figure 38-54. Normal Mode Configuration

#### 38.6.9.2 Automatic Echo Mode

Automatic echo mode allows bit-by-bit retransmission. When a bit is received on the RXD pin, it is sent to the TXD pin, as shown in Figure 38-55. Programming the transmitter has no effect on the TXD pin. The RXD pin is still connected to the receiver input, thus the receiver remains active.

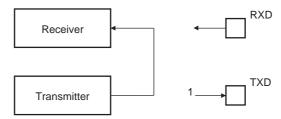

Figure 38-55. Automatic Echo Mode Configuration

## 38.6.9.3 Local Loopback Mode

Local loopback mode connects the output of the transmitter directly to the input of the receiver, as shown in Figure 38-56. The TXD and RXD pins are not used. The RXD pin has no effect on the receiver and the TXD pin is continuously driven high, as in idle state.

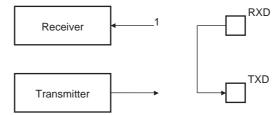

Figure 38-56. Local Loopback Mode Configuration

## 38.6.9.4 Remote Loopback Mode

Remote loopback mode directly connects the RXD pin to the TXD pin, as shown in Figure 38-57. The transmitter and the receiver are disabled and have no effect. This mode allows bit-by-bit retransmission.

Figure 38-57. Remote Loopback Mode Configuration

## 38.6.10 Register Write Protection

To prevent any single software error from corrupting USART behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the USART Write Protection Mode Register (US\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the USART Write Protection Status Register (US\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the US\_WPSR.

The following registers can be write-protected:

- USART Mode Register
- USART Baud Rate Generator Register
- USART Receiver Time-out Register
- USART Transmitter Timeguard Register
- USART FI DI RATIO Register
- USART IrDA Filter Register
- USART Manchester Configuration Register

# 38.7 Universal Synchronous Asynchronous Receiver Transmitter (USART) User Interface

Table 38-16. Register Mapping

| Offset        | Register                          | Name      | Access                    | Reset      |
|---------------|-----------------------------------|-----------|---------------------------|------------|
| 0x0000        | Control Register                  | US_CR     | Write-only                | _          |
| 0x0004        | Mode Register                     | US_MR     | Read/Write                | 0x0        |
| 0x0008        | Interrupt Enable Register         | US_IER    | Write-only                | _          |
| 0x000C        | Interrupt Disable Register        | US_IDR    | Write-only                | _          |
| 0x0010        | Interrupt Mask Register           | US_IMR    | Read-only                 | 0x0        |

Notes: 1. Write is possible only in LIN master node configuration.

# 38.7.1 USART Control Register

Name: US\_CR

**Address:** 0xF801C000 (0), 0xF8020000 (1), 0xF8024000 (2)

Access: Write-only

| 31    | 30      | 29      | 28     | 27     | 26     | 25     | 24     |
|-------|---------|---------|--------|--------|--------|--------|--------|
| _     | _       | _       | 1      | _      | _      | ı      | _      |
| 23    | 22      | 21      | 20     | 19     | 18     | 17     | 16     |
| _     | _       | LINWKUP | LINABT | RTSDIS | RTSEN  | _      | _      |
| 15    | 14      | 13      | 12     | 11     | 10     | 9      | 8      |
| RETTO | RSTNACK | RSTIT   | SENDA  | STTTO  | STPBRK | STTBRK | RSTSTA |
| 7     | 6       | 5       | 4      | 3      | 2      | 1      | 0      |
| TXDIS | TXEN    | RXDIS   | RXEN   | RSTTX  | RSTRX  | _      | -      |

For SPI control, see Section 38.7.2 "USART Control Register (SPI\_MODE)".

## • RSTRX: Reset Receiver

0: No effect.

1: Resets the receiver.

### RSTTX: Reset Transmitter

0: No effect.

1: Resets the transmitter.

## • RXEN: Receiver Enable

0: No effect.

1: Enables the receiver, if RXDIS is 0.

## • RXDIS: Receiver Disable

0: No effect.

1: Disables the receiver.

### • TXEN: Transmitter Enable

0: No effect.

1: Enables the transmitter if TXDIS is 0.

## • TXDIS: Transmitter Disable

0: No effect.

1: Disables the transmitter.

### • RSTSTA: Reset Status Bits

0: No effect.

1: Resets the status bits PARE, FRAME, OVRE, MANERR, LINBE, LINISFE, LINIPE, LINCE, LINSNRE, LINID, LINTC, LINBK and RXBRK in US\_CSR.

### • STTBRK: Start Break

0: No effect.

1: Starts transmission of a break after the characters present in US\_THR and the Transmit Shift Register have been transmitted. No effect if a break is already being transmitted.

## • STPBRK: Stop Break

0: No effect.

1: Stops transmission of the break after a minimum of one character length and transmits a high level during 12-bit periods. No effect if no break is being transmitted.

## STTTO: Clear TIMEOUT Flag and Start Time-out After Next Character Received

0: No effect.

1: Starts waiting for a character before enabling the time-out counter. Immediately disables a time-out period in progress. Resets the status bit TIMEOUT in US CSR.

### SENDA: Send Address

0: No effect.

1: In Multidrop mode only, the next character written to the US\_THR is sent with the address bit set.

#### RSTIT: Reset Iterations

0: No effect.

1: Resets ITER in US\_CSR. No effect if the ISO7816 is not enabled.

### RSTNACK: Reset Non Acknowledge

0: No effect

1: Resets NACK in US CSR.

## . RETTO: Start Time-out Immediately

0: No effect

1: Immediately restarts time-out period.

### RTSEN: Request to Send Pin Control

0: No effect.

1: Drives RTS pin to 1 if US\_MR.USART\_MODE field = 2, else drives RTS pin to 0 if US\_MR.USART\_MODE field = 0.

### • RTSDIS: Request to Send Pin Control

0: No effect.

1: Drives RTS pin to 0 if US\_MR.USART\_MODE field = 2, else drives RTS pin to 1 if US\_MR.USART\_MODE field = 0.

## • LINABT: Abort LIN Transmission

0: No effect.

1: Abort the current LIN transmission.

## LINWKUP: Send LIN Wakeup Signal

0: No effect.

1: Sends a wakeup signal on the LIN bus.

# 38.7.2 USART Control Register (SPI\_MODE)

Name: US\_CR (SPI\_MODE)

**Address:** 0xF801C000 (0), 0xF8020000 (1), 0xF8024000 (2)

Access: Write-only

| 31    | 30   | 29    | 28   | 27    | 26    | 25 | 24     |
|-------|------|-------|------|-------|-------|----|--------|
| _     | _    | _     | _    | _     | _     | -  | _      |
| 23    | 22   | 21    | 20   | 19    | 18    | 17 | 16     |
| _     | _    | _     | -    | RCS   | FCS   | ı  | _      |
| 15    | 14   | 13    | 12   | 11    | 10    | 9  | 8      |
| -     | -    | -     | -    | _     | -     | _  | RSTSTA |
|       |      |       |      |       |       |    |        |
| 7     | 6    | 5     | 4    | 3     | 2     | 1  | 0      |
| TXDIS | TXEN | RXDIS | RXEN | RSTTX | RSTRX | _  | _      |

This configuration is relevant only if USART\_MODE = 0xE or 0xF in the USART Mode Register.

## • RSTRX: Reset Receiver

0: No effect.

1: Resets the receiver.

### RSTTX: Reset Transmitter

0: No effect.

1: Resets the transmitter.

## • RXEN: Receiver Enable

0: No effect.

1: Enables the receiver, if RXDIS is 0.

## • RXDIS: Receiver Disable

0: No effect.

1: Disables the receiver.

### • TXEN: Transmitter Enable

0: No effect.

1: Enables the transmitter if TXDIS is 0.

## • TXDIS: Transmitter Disable

0: No effect.

1: Disables the transmitter.

## • RSTSTA: Reset Status Bits

0: No effect.

1: Resets the status bits OVRE, UNRE in US\_CSR.

# • FCS: Force SPI Chip Select

Applicable if USART operates in SPI master mode (USART\_MODE = 0xE):

0: No effect.

1: Forces the Slave Select Line NSS (RTS pin) to 0, even if USART is not transmitting, in order to address SPI slave devices supporting the CSAAT mode (Chip Select Active After Transfer).

## • RCS: Release SPI Chip Select

Applicable if USART operates in SPI master mode (USART\_MODE = 0xE):

0: No effect.

1: Releases the Slave Select Line NSS (RTS pin).

# 38.7.3 USART Mode Register

Name: US\_MR

**Address:** 0xF801C004 (0), 0xF8020004 (1), 0xF8024004 (2)

Access: Read/Write

| 31      | 30       | 29     | 28           | 27           | 26   | 25            | 24   |

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

For SPI configuration, see Section 38.7.4 "USART Mode Register (SPI\_MODE)".

# • USART\_MODE: USART Mode of Operation

| Value | Name           | Description             |
|-------|----------------|-------------------------|
| 0x0   | NORMAL         | Normal mode             |
| 0x1   | RS485          | RS485                   |
| 0x2   | HW_HANDSHAKING | Hardware Handshaking    |
| 0x3   | _              | Reserved                |
| 0x4   | IS07816_T_0    | IS07816 Protocol: T = 0 |
| 0x6   | IS07816_T_1    | IS07816 Protocol: T = 1 |
| 0x8   | IRDA           | IrDA                    |
| 0xA   | LIN_MASTER     | LIN master              |
| 0xB   | LIN_SLAVE      | LIN Slave               |
| 0xE   | SPI_MASTER     | SPI master              |
| 0xF   | SPI_SLAVE      | SPI Slave               |

## • USCLKS: Clock Selection

| Value                              | Name | Description                                  |  |
|------------------------------------|------|--|--|
| 0 MCK Peripheral clock is selected |      | Peripheral clock is selected                 |  |
| 1                                  | DIV  | Peripheral clock divided (DIV=8) is selected |  |
| 2                                  | _    | Reserved                                     |  |
| 3                                  | SCK  | Serial clock (SCK) is selected               |  |

• CHRL: Character Length

| Value | Name  | Description                |
|-------|-------|----------------------------|
| 0     | 5_BIT | Character length is 5 bits |
| 1     | 6_BIT | Character length is 6 bits |
| 2     | 7_BIT | Character length is 7 bits |
| 3     | 8_BIT | Character length is 8 bits |

# • SYNC: Synchronous Mode Select

0: USART operates in Asynchronous mode.

1: USART operates in Synchronous mode.

PAR: Parity Type

| Value | Name      | Description                |
|-------|-----------|----------------------------|
| 0     | EVEN      | Even parity                |
| 1     | ODD       | Odd parity                 |
| 2     | SPACE     | Parity forced to 0 (Space) |
| 3     | MARK      | Parity forced to 1 (Mark)  |
| 4     | NO        | No parity                  |
| 6     | MULTIDROP | Multidrop mode             |

• NBSTOP: Number of Stop Bits

| Value | Name    | Description                                    |  |
|-------|---------|--|--|
| 0     | 1_BIT   | 1 stop bit                                     |  |
| 1     | 1_5_BIT | 1.5 stop bit (SYNC = 0) or reserved (SYNC = 1) |  |
| 2     | 2_BIT   | 2 stop bits                                    |  |

### CHMODE: Channel Mode

| Value | Name            | Description  |
|-------|-----------------|--|
| 0     | NORMAL          | Normal mode  |
| 1     | AUTOMATIC       | Automatic Echo. Receiver input is connected to the TXD pin.            |
| 2     | LOCAL_LOOPBACK  | Local Loopback. Transmitter output is connected to the Receiver Input. |
| 3     | REMOTE_LOOPBACK | Remote Loopback. RXD pin is internally connected to the TXD pin.       |

## • MSBF: Bit Order

0: Least significant bit is sent/received first.

1: Most significant bit is sent/received first.

# • MODE9: 9-bit Character Length

0: CHRL defines character length

1: 9-bit character length

## • CLKO: Clock Output Select

0: The USART does not drive the SCK pin.

1: The USART drives the SCK pin if USCLKS does not select the external clock SCK.

## OVER: Oversampling Mode

0: 16 x Oversampling

1: 8 x Oversampling

## INACK: Inhibit Non Acknowledge

0: The NACK is generated.

1: The NACK is not generated.

### DSNACK: Disable Successive NACK

0: NACK is sent on the ISO line as soon as a parity error occurs in the received character (unless INACK is set).

1: Successive parity errors are counted up to the value specified in the MAX\_ITERATION field. These parity errors generate a NACK on the ISO line. As soon as this value is reached, no additional NACK is sent on the ISO line. The flag ITER is asserted.

Note: MAX\_ITERATION field must be set to 0 if DSNACK is cleared.

#### INVDATA: Inverted Data

0: The data field transmitted on TXD line is the same as the one written in US\_THR or the content read in US\_RHR is the same as RXD line. Normal mode of operation.

1: The data field transmitted on TXD line is inverted (voltage polarity only) compared to the value written on US\_THR or the content read in US\_RHR is inverted compared to what is received on RXD line (or ISO7816 IO line). Inverted mode of operation, useful for contactless card application. To be used with configuration bit MSBF.

### VAR\_SYNC: Variable Synchronization of Command/Data Sync Start Frame Delimiter

0: User defined configuration of command or data sync field depending on MODSYNC value.

1: The sync field is updated when a character is written into US THR.

### MAX ITERATION: Maximum Number of Automatic Iteration

0-7: Defines the maximum number of iterations in mode ISO7816, protocol T = 0.

#### FILTER: Receive Line Filter

0: The USART does not filter the receive line.

1: The USART filters the receive line using a three-sample filter (1/16-bit clock) (2 over 3 majority).

# • MAN: Manchester Encoder/Decoder Enable

0: Manchester encoder/decoder are disabled.

1: Manchester encoder/decoder are enabled.

### MODSYNC: Manchester Synchronization Mode

0:The Manchester start bit is a 0 to 1 transition

1: The Manchester start bit is a 1 to 0 transition.

# • ONEBIT: Start Frame Delimiter Selector

0: Start frame delimiter is COMMAND or DATA SYNC.

1: Start frame delimiter is one bit.

# 38.7.4 USART Mode Register (SPI\_MODE)

Name: US\_MR (SPI\_MODE)

**Address:** 0xF801C004 (0), 0xF8020004 (1), 0xF8024004 (2)

Access: Read/Write

| 31          | 30 | 29   | 28    | 27    | 26    | 25 | 24   |
|-------------|----|------|-------|-------|-------|----|------|
| _           | _  | _    | _     | _     | 1     | _  | _    |
| 23          | 22 | 21   | 20    | 19    | 18    | 17 | 16   |
| _           | _  | _    | WRDBT | _     | CLKO  | _  | CPOL |
| 15          | 14 | 13   | 12    | 11    | 10    | 9  | 8    |
| -           | -  | -    | _     | -     | -     | -  | CPHA |
| 7           | 6  | 5    | 4     | 3     | 2     | 1  | 0    |
| CHRL USCLKS |    | CLKS |       | USART | _MODE |    |      |

This configuration is relevant only if USART\_MODE = 0xE or 0xF in the USART Mode Register.

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

# • USART\_MODE: USART Mode of Operation

| Value | Name       | Description |
|-------|------------|-------------|
| 0xE   | SPI_MASTER | SPI master  |
| 0xF   | SPI_SLAVE  | SPI Slave   |

#### USCLKS: Clock Selection

| Value | Name | Description                                  |
|-------|------|--|
| 0     | MCK  | Peripheral clock is selected                 |
| 1     | DIV  | Peripheral clock divided (DIV=8) is selected |
| 3     | SCK  | Serial Clock SLK is selected                 |

### . CHRL: Character Length

| ſ | Value | Name  | Description                |
|---|-------|-------|----------------------------|
| Ī | 3     | 8_BIT | Character length is 8 bits |

#### · CPHA: SPI Clock Phase

– Applicable if USART operates in SPI mode (USART\_MODE = 0xE or 0xF):

0: Data is changed on the leading edge of SPCK and captured on the following edge of SPCK.

1: Data is captured on the leading edge of SPCK and changed on the following edge of SPCK.

CPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. CPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

# • CPOL: SPI Clock Polarity

Applicable if USART operates in SPI mode (slave or master, USART\_MODE = 0xE or 0xF):

- 0: The inactive state value of SPCK is logic level zero.
- 1: The inactive state value of SPCK is logic level one.

CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with CPHA to produce the required clock/data relationship between master and slave devices.

### • CLKO: Clock Output Select

- 0: The USART does not drive the SCK pin.
- 1: The USART drives the SCK pin if USCLKS does not select the external clock SCK.

#### • WRDBT: Wait Read Data Before Transfer

- 0: The character transmission starts as soon as a character is written into US\_THR (assuming TXRDY was set).
- 1: The character transmission starts when a character is written and only if RXRDY flag is cleared (Receive Holding Register has been read).

# 38.7.5 USART Interrupt Enable Register

Name: US\_IER

**Address:** 0xF801C008 (0), 0xF8020008 (1), 0xF8024008 (2)

Access: Write-only

| PARE | FRAME | OVRE | _  | _     | RXBRK | TXRDY   | RXRDY   |

For SPI specific configuration, see Section 38.7.6 "USART Interrupt Enable Register (SPI\_MODE)".

For LIN specific configuration, see Section 38.7.7 "USART Interrupt Enable Register (LIN\_MODE)".

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

RXRDY: RXRDY Interrupt Enable

TXRDY: TXRDY Interrupt Enable

RXBRK: Receiver Break Interrupt Enable

OVRE: Overrun Error Interrupt Enable

• FRAME: Framing Error Interrupt Enable

PARE: Parity Error Interrupt Enable

TIMEOUT: Time-out Interrupt Enable

• TXEMPTY: TXEMPTY Interrupt Enable

ITER: Max number of Repetitions Reached Interrupt Enable

NACK: Non Acknowledge Interrupt Enable

CTSIC: Clear to Send Input Change Interrupt Enable

MANE: Manchester Error Interrupt Enable

# 38.7.6 USART Interrupt Enable Register (SPI\_MODE)

Name: US\_IER (SPI\_MODE)

**Address:** 0xF801C008 (0), 0xF8020008 (1), 0xF8024008 (2)

Access: Write-only

For SPI specific configuration, see Section 38.7.15 "USART Channel Status Register (SPI\_MODE)".

For LIN specific configuration, see Section 38.7.16 "USART Channel Status Register (LIN MODE)".

#### RXRDY: Receiver Ready (cleared by reading US\_RHR)

0: No complete character has been received since the last read of US\_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.

1: At least one complete character has been received and US\_RHR has not yet been read.

## TXRDY: Transmitter Ready (cleared by writing US\_THR)

0: A character is in the US\_THR waiting to be transferred to the Transmit Shift Register, or an STTBRK command has been requested, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.

1: There is no character in the US\_THR.

### RXBRK: Break Received/End of Break (cleared by writing a one to bit US\_CR.RSTSTA)

0: No break received or end of break detected since the last RSTSTA.

1: Break received or end of break detected since the last RSTSTA.

## OVRE: Overrun Error (cleared by writing a one to bit US\_CR.RSTSTA)

0: No overrun error has occurred since the last RSTSTA.

1: At least one overrun error has occurred since the last RSTSTA.

#### • FRAME: Framing Error (cleared by writing a one to bit US\_CR.RSTSTA)

0: No stop bit has been detected low since the last RSTSTA.

1: At least one stop bit has been detected low since the last RSTSTA.

# PARE: Parity Error (cleared by writing a one to bit US\_CR.RSTSTA)

0: No parity error has been detected since the last RSTSTA.

1: At least one parity error has been detected since the last RSTSTA.

- TIMEOUT: Receiver Time-out (cleared by writing a one to bit US\_CR.STTTO)
- 0: There has not been a time-out since the last Start Time-out command (STTTO in US\_CR) or the Time-out Register is 0.
- 1: There has been a time-out since the last Start Time-out command (STTTO in US\_CR).
- TXEMPTY: Transmitter Empty (cleared by writing US\_THR)
- 0: There are characters in either US\_THR or the Transmit Shift Register, or the transmitter is disabled.
- 1: There are no characters in US\_THR, nor in the Transmit Shift Register.
- ITER: Max Number of Repetitions Reached (cleared by writing a one to bit US\_CR.RSTIT)
- 0: Maximum number of repetitions has not been reached since the last RSTIT.
- 1: Maximum number of repetitions has been reached since the last RSTIT.
- NACK: Non Acknowledge Interrupt (cleared by writing a one to bit US\_CR.RSTNACK)
- 0: Non acknowledge has not been detected since the last RSTNACK.
- 1: At least one non acknowledge has been detected since the last RSTNACK.
- CTSIC: Clear to Send Input Change Flag (cleared on read)
- 0: No input change has been detected on the CTS pin since the last read of US\_CSR.
- 1: At least one input change has been detected on the CTS pin since the last read of US\_CSR.
- . CTS: Image of CTS Input
- 0: CTS input is driven low.
- 1: CTS input is driven high.
- MANERR: Manchester Error (cleared by writing a one to the bit US\_CR.RSTSTA)
- 0: No Manchester error has been detected since the last RSTSTA.
- 1: At least one Manchester error has been detected since the last RSTSTA.

## 38.7.15 USART Channel Status Register (SPI\_MODE)

Name: US\_CSR (SPI\_MODE)

**Address:** 0xF801C014 (0), 0xF8020014 (1), 0xF8024014 (2)

Access: Read-only

| 31  | 30 | 29   | 28 | 27   | 26   | 25      | 24    |
|-----|----|------|----|------|------|---------|-------|
| _   | _  | _    | _  | _    | _    | _       | _     |
| 23  | 22 | 21   | 20 | 19   | 18   | 17      | 16    |
| NSS | -  | _    | _  | NSSE | ı    | -       | _     |
| 45  |    | 40   | 40 |      |      |         |       |
| 15  | 14 | 13   | 12 | 11   | 10   | 9       | 8     |
| _   | ı  | _    | _  | ı    | UNRE | TXEMPTY | _     |
|     |    |      |    |      |      |         | _     |
| 7   | 6  | 5    | 4  | 3    | 2    | 1       | 0     |
| _   | _  | OVRE | _  | -    | _    | TXRDY   | RXRDY |

This configuration is relevant only if USART\_MODE = 0xE or 0xF in the USART Mode Register.

### RXRDY: Receiver Ready (cleared by reading US\_RHR)

0: No complete character has been received since the last read of US\_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.

1: At least one complete character has been received and US RHR has not yet been read.

## • TXRDY: Transmitter Ready (cleared by writing US\_THR)

0: A character is in the US\_THR waiting to be transferred to the Transmit Shift Register or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.

1: There is no character in the US THR.

# • OVRE: Overrun Error (cleared by writing a one to bit US\_CR.RSTSTA)

0: No overrun error has occurred since the last RSTSTA.

1: At least one overrun error has occurred since the last RSTSTA.

#### TXEMPTY: Transmitter Empty (cleared by writing US\_THR)

0: There are characters in either US THR or the Transmit Shift Register, or the transmitter is disabled.

1: There are no characters in US\_THR, nor in the Transmit Shift Register.

#### UNRE: Underrun Error (cleared by writing a one to bit US CR.RSTSTA)

0: No SPI underrun error has occurred since the last RSTSTA.

1: At least one SPI underrun error has occurred since the last RSTSTA.

### NSSE: NSS Line (Driving CTS Pin) Rising or Falling Edge Event (cleared on read)

0: No NSS line event has been detected since the last read of US\_CSR.

1: A rising or falling edge event has been detected on NSS line since the last read of US\_CSR .

# • NSS: Image of NSS Line

0: NSS line is driven low (if NSSE = 1, falling edge occurred on NSS line).

1: NSS line is driven high (if NSSE = 1, rising edge occurred on NSS line).

## 38.7.16 USART Channel Status Register (LIN\_MODE)

Name: US\_CSR (LIN\_MODE)

**Address:** 0xF801C014 (0), 0xF8020014 (1), 0xF8024014 (2)

Access: Read-only

| 31     | 30    | 29      | 28    | 27     | 26      | 25      | 24      |
|--------|-------|---------|-------|--------|---------|---------|---------|
| _      | _     | LINSNRE | LINCE | LINIPE | LINISFE | LINBE   | _       |
| 23     | 22    | 21      | 20    | 19     | 18      | 17      | 16      |
| LINBLS | _     | _       | _     | _      | _       | _       | -       |
| 15     | 14    | 13      | 12    | 11     | 10      | 9       | 8       |
| LINTC  | LINID | LINBK   | _     | _      | _       | TXEMPTY | TIMEOUT |
| 7      | 6     | 5       | 4     | 3      | 2       | 1       | 0       |
| PARE   | FRAME | OVRE    | _     | _      | _       | TXRDY   | RXRDY   |

This configuration is relevant only if USART\_MODE = 0xA or 0xB in the USART Mode Register.

### RXRDY: Receiver Ready (cleared by reading US\_THR)

0: No complete character has been received since the last read of US\_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.

1: At least one complete character has been received and US RHR has not yet been read.

#### TXRDY: Transmitter Ready (cleared by writing US\_THR)

0: A character is in the US\_THR waiting to be transferred to the Transmit Shift Register or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.

1: There is no character in the US THR.

# • OVRE: Overrun Error (cleared by writing a one to bit US\_CR.RSTSTA)

0: No overrun error has occurred since the last RSTSTA.

1: At least one overrun error has occurred since the last RSTSTA.

#### FRAME: Framing Error (cleared by writing a one to bit US\_CR.RSTSTA)

0: No stop bit has been detected low since the last RSTSTA.

1: At least one stop bit has been detected low since the last RSTSTA.

#### PARE: Parity Error (cleared by writing a one to bit US CR.RSTSTA)

0: No parity error has been detected since the last RSTSTA.

1: At least one parity error has been detected since the last RSTSTA.

## TIMEOUT: Receiver Time-out (cleared by writing a one to bit US\_CR.RSTSTA)

0: There has not been a time-out since the last start time-out command (STTTO in US\_CR) or the Time-out Register is 0.

1: There has been a time-out since the last start time-out command (STTTO in US CR).

## TXEMPTY: Transmitter Empty (cleared by writing US\_THR)

0: There are characters in either US\_THR or the Transmit Shift Register, or the transmitter is disabled.

1: There are no characters in US\_THR, nor in the Transmit Shift Register.

## LINBK: LIN Break Sent or LIN Break Received (cleared by writing a one to bit US\_CR.RSTSTA)

Applicable if USART operates in LIN master mode (USART\_MODE = 0xA):

0: No LIN break has been sent since the last RSTSTA.

1:At least one LIN break has been sent since the last RSTSTA

If USART operates in LIN slave mode (USART\_MODE = 0xB):

0: No LIN break has received sent since the last RSTSTA.

1:At least one LIN break has been received since the last RSTSTA.

### • LINID: LIN Identifier Sent or LIN Identifier Received (cleared by writing a one to bit US\_CR.RSTSTA)

If USART operates in LIN master mode (USART\_MODE = 0xA):

0: No LIN identifier has been sent since the last RSTSTA.

1:At least one LIN identifier has been sent since the last RSTSTA.

If USART operates in LIN slave mode (USART\_MODE = 0xB):

0: No LIN identifier has been received since the last RSTSTA.

1:At least one LIN identifier has been received since the last RSTSTA

#### LINTC: LIN Transfer Completed (cleared by writing a one to bit US\_CR.RSTSTA)

0: The USART is idle or a LIN transfer is ongoing.

1: A LIN transfer has been completed since the last RSTSTA.

#### LINBLS: LIN Bus Line Status

0: LIN bus line is set to 0.

1: LIN bus line is set to 1.

### LINBE: LIN Bit Error (cleared by writing a one to bit US\_CR.RSTSTA)

0: No bit error has been detected since the last RSTSTA.

1: A bit error has been detected since the last RSTSTA.

#### LINISFE: LIN Inconsistent Synch Field Error (cleared by writing a one to bit US\_CR.RSTSTA)

0: No LIN inconsistent synch field error has been detected since the last RSTSTA

1: The USART is configured as a slave node and a LIN Inconsistent synch field error has been detected since the last RSTSTA.

#### LINIPE: LIN Identifier Parity Error (cleared by writing a one to bit US\_CR.RSTSTA)

0: No LIN identifier parity error has been detected since the last RSTSTA.

1: A LIN identifier parity error has been detected since the last RSTSTA.

### LINCE: LIN Checksum Error (cleared by writing a one to bit US\_CR.RSTSTA)

0: No LIN checksum error has been detected since the last RSTSTA.

1: A LIN checksum error has been detected since the last RSTSTA.

- LINSNRE: LIN Slave Not Responding Error (cleared by writing a one to bit US\_CR.RSTSTA)
- 0: No LIN slave not responding error has been detected since the last RSTSTA.
- 1: A LIN slave not responding error has been detected since the last RSTSTA.

# 38.7.17 USART Receive Holding Register

Name: US\_RHR

**Address:** 0xF801C018 (0), 0xF8020018 (1), 0xF8024018 (2)

Access: Read-only

| 31     | 30    | 29 | 28 | 27 | 26 | 25 | 24    |  |  |  |
|--------|-------|----|----|----|----|----|-------|--|--|--|
| _      | _     | _  | _  | _  | _  | _  | _     |  |  |  |
| 23     | 22    | 21 | 20 | 19 | 18 | 17 | 16    |  |  |  |
| _      | _     | _  | _  | _  | -  | -  | _     |  |  |  |
| 15     | 14    | 13 | 12 | 11 | 10 | 9  | 8     |  |  |  |
| RXSYNH | -     | -  | _  | _  | _  | -  | RXCHR |  |  |  |
| 7      | 6     | 5  | 4  | 3  | 2  | 1  | 0     |  |  |  |
|        | RXCHR |    |    |    |    |    |       |  |  |  |

### • RXCHR: Received Character

Last character received if RXRDY is set.

# • RXSYNH: Received Sync

0: Last character received is a data.

1: Last character received is a command.

# 38.7.18 USART Transmit Holding Register

Name: US\_THR

**Address:** 0xF801C01C (0), 0xF802001C (1), 0xF802401C (2)

Access: Write-only

| 31     | 30 | 29 | 28  | 27  | 26 | 25 | 24    |
|--------|----|----|-----|-----|----|----|-------|
| _      | _  | -  | -   | _   | _  | _  | _     |
| 23     | 22 | 21 | 20  | 19  | 18 | 17 | 16    |
| _      | _  | _  | _   | _   | _  | _  | _     |
| 15     | 14 | 13 | 12  | 11  | 10 | 9  | 8     |
| TXSYNH | _  | _  | _   | _   | _  | _  | TXCHR |
| 7      | 6  | 5  | 4   | 3   | 2  | 1  | 0     |
|        | ·  | ·  | TXC | CHR | ·  | ·  |       |

#### • TXCHR: Character to be Transmitted

Next character to be transmitted after the current character if TXRDY is not set.

# • TXSYNH: Sync Field to be Transmitted

0: The next character sent is encoded as a data. Start frame delimiter is DATA SYNC.

1: The next character sent is encoded as a command. Start frame delimiter is COMMAND SYNC.

# 38.7.19 USART Baud Rate Generator Register

Name: US\_BRGR

**Address:** 0xF801C020 (0), 0xF8020020 (1), 0xF8024020 (2)

Access: Read/Write

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|----|----|----|----|----|----|----|----|
| _  | _  | _  | _  | _  | _  | _  | _  |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| _  | _  | _  | _  | _  |    | FP |    |
| 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|    |    |    | С  | D  |    |    |    |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|    |    | ·  | С  | D  | ·  |    |    |

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

### • CD: Clock Divider

|            |   | USART_MODE ≠ ISO7816                  |   |   |  |  |  |  |
|------------|---|---------------------------------------|---|---|--|--|--|--|
|            | SYN                                       | C = 0                                 | SYNC = 1                                    | USART_MODE = ISO7816                            |  |  |  |  |
| CD         | OVER = 0                                  | OVER = 1                              | or<br>USART_MODE = SPI<br>(Master or Slave) |   |  |  |  |  |
| 0          |   | Baud Rate Clo                         | ock Disabled                                |   |  |  |  |  |
| 1 to 65535 | CD = Selected Clock /<br>(16 × Baud Rate) | CD = Selected Clock / (8 × Baud Rate) | CD = Selected Clock /<br>Baud Rate          | CD = Selected Clock / (FI_DI_RATIO × Baud Rate) |  |  |  |  |

# • FP: Fractional Part

0: Fractional divider is disabled.

1–7: Baud rate resolution, defined by FP  $\times$  1/8.

# 38.7.20 USART Receiver Time-out Register

Name: US\_RTOR

**Address:** 0xF801C024 (0), 0xF8020024 (1), 0xF8024024 (2)

Access: Read/Write

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|----|----|----|----|----|----|----|----|
| _  | _  | _  | -  | -  | -  | _  | _  |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| _  | _  | _  | -  | -  | _  | _  | TO |
| 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|    |    |    | Т  | 0  |    |    |    |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|    |    |    | Т  | 0  |    |    |    |

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

# • TO: Time-out Value

0: The receiver time-out is disabled.

1–131071: The receiver time-out is enabled and TO is Time-out Delay / Bit Period.

# 38.7.21 USART Transmitter Timeguard Register

Name: US\_TTGR

**Address:** 0xF801C028 (0), 0xF8020028 (1), 0xF8024028 (2)

Access: Read/Write

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|----|----|----|----|----|----|----|----|
| _  | _  | _  | _  | _  | _  | ı  | _  |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| _  | _  | _  | _  | _  | -  | ı  | _  |
| 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
| _  | _  | _  | _  | _  | 1  | I  | _  |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|    |    | •  | Т  | G  | •  | •  |    |

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

# • TG: Timeguard Value

0: The transmitter timeguard is disabled.

1–255: The transmitter timeguard is enabled and TG is Timeguard Delay / Bit Period.

# 38.7.22 USART FI DI RATIO Register

Name: US\_FIDI

**Address:** 0xF801C040 (0), 0xF8020040 (1), 0xF8024040 (2)

Access: Read/Write

| 31 | 30          | 29 | 28 | 27 | 26          | 25 | 24 |  |  |  |
|----|-------------|----|----|----|-------------|----|----|--|--|--|
| _  | _           | -  | _  | _  | _           | -  | _  |  |  |  |
| 23 | 22          | 21 | 20 | 19 | 18          | 17 | 16 |  |  |  |
| _  | _           | ı  | _  | _  | -           | 1  | _  |  |  |  |
| 15 | 14          | 13 | 12 | 11 | 10          | 9  | 8  |  |  |  |
| _  | _           | -  | _  | _  | FI_DI_RATIO |    |    |  |  |  |
| 7  | 6           | 5  | 4  | 3  | 2           | 1  | 0  |  |  |  |
|    | FI_DI_RATIO |    |    |    |             |    |    |  |  |  |

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

# • FI\_DI\_RATIO: FI Over DI Ratio Value

0: If ISO7816 mode is selected, the baud rate generator generates no signal.

1-2: Do not use.

3–2047: If ISO7816 mode is selected, the baud rate is the clock provided on SCK divided by FI\_DI\_RATIO.

# 38.7.23 USART Number of Errors Register

Name: US\_NER

**Address:** 0xF801C044 (0), 0xF8020044 (1), 0xF8024044 (2)

Access: Read-only

|    | -  |    |       |       |    |    |    |
|----|----|----|-------|-------|----|----|----|
| 31 | 30 | 29 | 28    | 27    | 26 | 25 | 24 |
| _  | -  | -  | -     | _     | _  | _  | -  |
| 23 | 22 | 21 | 20    | 19    | 18 | 17 | 16 |
| _  | _  | _  | _     | _     | _  | -  | _  |
| 15 | 14 | 13 | 12    | 11    | 10 | 9  | 8  |
| _  | _  | _  | _     | _     | -  | ı  | _  |
| 7  | 6  | 5  | 4     | 3     | 2  | 1  | 0  |
|    |    |    | NB_EF | RRORS |    |    |    |

This register is relevant only if USART\_MODE = 0x4 or 0x6 in the USART Mode Register.

# • NB\_ERRORS: Number of Errors

Total number of errors that occurred during an ISO7816 transfer. This register automatically clears when read.

# 38.7.24 USART IrDA Filter Register

Name: US\_IF

**Address:** 0xF801C04C (0), 0xF802004C (1), 0xF802404C (2)

Access: Read/Write

| 31 | 30          | 29 | 28 | 27 | 26 | 25 | 24 |  |
|----|-------------|----|----|----|----|----|----|--|
| _  | _           | _  | _  | _  | _  | _  | _  |  |
| 23 | 22          | 21 | 20 | 19 | 18 | 17 | 16 |  |
| _  | _           | _  | _  | _  | _  | -  | _  |  |
| 15 | 14          | 13 | 12 | 11 | 10 | 9  | 8  |  |
| _  | _           | 1  | _  | _  | -  | ı  | _  |  |
| 7  | 6           | 5  | 4  | 3  | 2  | 1  | 0  |  |
|    | IRDA_FILTER |    |    |    |    |    |    |  |

This register is relevant only if USART\_MODE = 0x8 in the USART Mode Register.

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

### • IRDA\_FILTER: IrDA Filter

The IRDA\_FILTER value must be defined to meet the following criteria:

 $t_{peripheral\ clock} imes\ (IRDA\_FILTER$  + 3) < 1.41  $\mu s$ 

# 38.7.25 USART Manchester Configuration Register

Name: US\_MAN

**Address:** 0xF801C050 (0), 0xF8020050 (1), 0xF8024050 (2)

Access: Read/Write

| 31 | 30    | 29  | 28      | 27 | 26  | 25  | 24  |
|----|-------|-----|---------|----|-----|-----|-----|
| _  | DRIFT | ONE | RX_MPOL | _  | _   | RX_ | _PP |

| 15 | 14    | 13  | 12      | 11 | 10  | 9   | 8   |
| _  | _     | _   | TX_MPOL | _  | _   | TX_ | _PP |
|    |       |     |         | _  | _   | _   |     |
| 7  | 6     | 5   | 4       | 3  | 2   | 1   | 0   |
| _  | _     | _   | _       |    | TX_ | PL  |     |

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

# • TX\_PL: Transmitter Preamble Length

0: The transmitter preamble pattern generation is disabled

1–15: The preamble length is  $TX_PL \times Bit Period$ 

# • TX\_PP: Transmitter Preamble Pattern

The following values assume that TX\_MPOL field is not set:

| Value | Name     | Description                       |  |  |  |
|-------|----------|-----------------------------------|--|--|--|
| 0     | ALL_ONE  | The preamble is composed of '1's  |  |  |  |
| 1     | ALL_ZERO | The preamble is composed of '0's  |  |  |  |
| 2     | ZERO_ONE | The preamble is composed of '01's |  |  |  |
| 3     | ONE_ZERO | The preamble is composed of '10's |  |  |  |

#### • TX\_MPOL: Transmitter Manchester Polarity

0: Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition.

1: Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition.

# • RX\_PL: Receiver Preamble Length

0: The receiver preamble pattern detection is disabled

1–15: The detected preamble length is RX\_PL  $\times$  Bit Period

### • RX\_PP: Receiver Preamble Pattern detected

The following values assume that RX\_MPOL field is not set:

| Value | Name     | Description                       |  |  |  |
|-------|----------|-----------------------------------|--|--|--|
| 00    | ALL_ONE  | The preamble is composed of '1's  |  |  |  |
| 01    | ALL_ZERO | The preamble is composed of '0's  |  |  |  |
| 10    | ZERO_ONE | The preamble is composed of '01's |  |  |  |
| 11    | ONE_ZERO | The preamble is composed of '10's |  |  |  |

# • RX\_MPOL: Receiver Manchester Polarity

0: Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition.

1: Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition.

### • ONE: Must Be Set to 1

Bit 29 must always be set to 1 when programming the US\_MAN register.

# • DRIFT: Drift Compensation

0: The USART cannot recover from an important clock drift

1: The USART can recover from clock drift. The 16X clock mode must be enabled.

### 38.7.26 USART LIN Mode Register

Name: US\_LINMR

**Address:** 0xF801C054 (0), 0xF8020054 (1), 0xF8024054 (2)

Access: Read/Write

| 31      | 30    | 29  | 28     | 27     | 26     | 25 | 24   |
|---------|-------|-----|--------|--------|--------|----|------|
| _       | _     | _   | _      | _      | _      | _  | _    |
| 23      | 22    | 21  | 20     | 19     | 18     | 17 | 16   |
| _       | _     | _   | _      | _      | -      | ı  | PDCM |
| 15      | 14    | 13  | 12     | 11     | 10     | 9  | 8    |
|         |       |     | D      | LC     |        |    |      |
| 7       | 6     | 5   | 4      | 3      | 2      | 1  | 0    |
| WKUPTYP | FSDIS | DLM | CHKTYP | CHKDIS | PARDIS | N/ | ACT  |

This register is relevant only if USART\_MODE = 0xA or 0xB in the USART Mode Register.

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

#### NACT: LIN Node Action

| Value | Name      | Description  |  |  |  |
|-------|-----------|--|--|--|--|
| 00    | PUBLISH   | The USART transmits the response.                              |  |  |  |
| 01    | SUBSCRIBE | The USART receives the response.                               |  |  |  |
| 10    | IGNORE    | The USART does not transmit and does not receive the response. |  |  |  |

Values which are not listed in the table must be considered as "reserved".

#### • PARDIS: Parity Disable

0: In master node configuration, the identifier parity is computed and sent automatically. In master node and slave node configuration, the parity is checked automatically.

1: Whatever the node configuration is, the Identifier parity is not computed/sent and it is not checked.

#### CHKDIS: Checksum Disable

0: In master node configuration, the checksum is computed and sent automatically. In slave node configuration, the checksum is checked automatically.

1: Whatever the node configuration is, the checksum is not computed/sent and it is not checked.

#### CHKTYP: Checksum Type

0: LIN 2.0 "enhanced" checksum

1: LIN 1.3 "classic" checksum

### • DLM: Data Length Mode

0: The response data length is defined by field DLC of this register.

1: The response data length is defined by bits 5 and 6 of the identifier (IDCHR in US\_LINIR).

### • FSDIS: Frame Slot Mode Disable

- 0: The Frame slot mode is enabled.
- 1: The Frame slot mode is disabled.

# • WKUPTYP: Wakeup Signal Type

- 0: Setting the bit LINWKUP in the control register sends a LIN 2.0 wakeup signal.
- 1: Setting the bit LINWKUP in the control register sends a LIN 1.3 wakeup signal.

### • DLC: Data Length Control

0–255: Defines the response data length if DLM = 0,in that case the response data length is equal to DLC+1 bytes.

#### PDCM: DMAC Mode

- 0: The LIN mode register US\_LINMR is not written by the DMAC.
- 1: The LIN mode register US\_LINMR (excepting that flag) is written by the DMAC.

# 38.7.27 USART LIN Identifier Register

Name: US\_LINIR

**Address:** 0xF801C058 (0), 0xF8020058 (1), 0xF8024058 (2)

Access: Read/Write or Read-only

| 31 | 30    | 29 | 28 | 27 | 26 | 25 | 24 |  |
|----|-------|----|----|----|----|----|----|--|
| _  | _     | _  | -  | -  | _  | _  | _  |  |
| 23 | 22    | 21 | 20 | 19 | 18 | 17 | 16 |  |
| _  | _     | _  | _  | _  | _  | -  | _  |  |
| 15 | 14    | 13 | 12 | 11 | 10 | 9  | 8  |  |
| _  | _     | 1  | _  | _  | -  | ı  | _  |  |
| 7  | 6     | 5  | 4  | 3  | 2  | 1  | 0  |  |
|    | IDCHR |    |    |    |    |    |    |  |

This register is relevant only if USART\_MODE = 0xA or 0xB in the USART Mode Register.

# • IDCHR: Identifier Character

If USART\_MODE = 0xA (master node configuration):

IDCHR is Read/Write and its value is the identifier character to be transmitted.

If USART\_MODE = 0xB (slave node configuration):

IDCHR is Read-only and its value is the last identifier character that has been received.

# 38.7.28 USART LIN Baud Rate Register

Name: US\_LINBRR

**Address:** 0xF801C05C (0), 0xF802005C (1), 0xF802405C (2)

Access: Read-only

| 31 | 30 | 29 | 28  | 27  | 26 | 25    | 24 |
|----|----|----|-----|-----|----|-------|----|
| _  | _  | _  | _   | _   | _  | 1     | _  |

|    |    |    | LIN | CD  |    |       |    |

This register is relevant only if USART\_MODE = 0xA or 0xB in the USART Mode Register.

Returns the baud rate value after the synchronization process completion.

• LINCD: Clock Divider after Synchronization

• LINFP: Fractional Part after Synchronization

# 38.7.29 USART Write Protection Mode Register

Name: US\_WPMR

**Address:** 0xF801C0E4 (0), 0xF80200E4 (1), 0xF80240E4 (2)

Access: Read/Write

| 31 | 30    | 29 | 28 | 27  | 26 | 25 | 24   |
|----|-------|----|----|-----|----|----|------|
|    |       |    | WP | KEY |    |    |      |
| 23 | 22    | 21 | 20 | 19  | 18 | 17 | 16   |
|    | WPKEY |    |    |     |    |    |      |
| 15 | 14    | 13 | 12 | 11  | 10 | 9  | 8    |
|    |       |    | WP | KEY |    |    |      |
| 7  | 6     | 5  | 4  | 3   | 2  | 1  | 0    |
| _  | _     | _  | _  | _   | _  | -  | WPEN |

### • WPEN: Write Protection Enable

0: Disables the write protection if WPKEY corresponds to 0x555341 ("USA" in ASCII).

1: Enables the write protection if WPKEY corresponds to 0x555341 ("USA" in ASCII).

See Section 38.6.10 "Register Write Protection" for the list of registers that can be write-protected.

# • WPKEY: Write Protection Key

| Value    | Name   | Description  |
|----------|--------|--|
| 0x555341 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

# 38.7.30 USART Write Protection Status Register

Name: US\_WPSR

**Address:** 0xF801C0E8 (0), 0xF80200E8 (1), 0xF80240E8 (2)

Access: Read-only

|    | •      |    |     |      |    |    |      |  |
|----|--------|----|-----|------|----|----|------|--|
| 31 | 30     | 29 | 28  | 27   | 26 | 25 | 24   |  |
| _  | _      | _  | -   | _    | _  | _  | _    |  |
| 23 | 22     | 21 | 20  | 19   | 18 | 17 | 16   |  |
|    | WPVSRC |    |     |      |    |    |      |  |
| 15 | 14     | 13 | 12  | 11   | 10 | 9  | 8    |  |
|    |        |    | WPV | /SRC |    |    |      |  |
| 7  | 6      | 5  | 4   | 3    | 2  | 1  | 0    |  |
| _  | _      | _  | _   | _    | _  | _  | WPVS |  |

#### • WPVS: Write Protection Violation Status

0: No write protection violation has occurred since the last read of the US\_WPSR.

#### • WPVSRC: Write Protection Violation Source

When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

<sup>1:</sup> A write protection violation has occurred since the last read of the US\_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

# 39. Universal Asynchronous Receiver Transmitter (UART)

# 39.1 Description

The Universal Asynchronous Receiver Transmitter (UART) features a two-pin UART that can be used for communication and trace purposes and offers an ideal medium for in-situ programming solutions.

Moreover, the association with a DMA controller permits packet handling for these tasks with processor time reduced to a minimum.

#### 39.2 Embedded Characteristics

- Two-pin UART
  - Independent Receiver and Transmitter with a Common Programmable Baud Rate Generator
  - Even, Odd, Mark or Space Parity Generation
  - Parity, Framing and Overrun Error Detection
  - Automatic Echo, Local Loopback and Remote Loopback Channel Modes
  - Interrupt Generation
  - Support for Two DMA Channels with Connection to Receiver and Transmitter

# 39.3 Block Diagram

Figure 39-1. UART Block Diagram

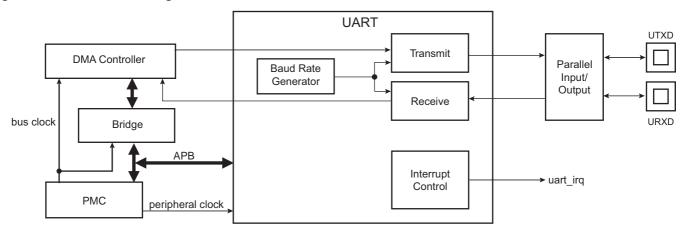

Table 39-1. UART Pin Description

| Pin Name | Description        | Туре   |
|----------|--------------------|--------|
| URXD     | UART Receive Data  | Input  |
| UTXD     | UART Transmit Data | Output |

# 39.4 Product Dependencies

### 39.4.1 I/O Lines

The UART pins are multiplexed with PIO lines. The user must first configure the corresponding PIO Controller to enable I/O line operations of the UART.

Table 39-2. I/O Lines

| Instance | Signal | I/O Line | Peripheral |
|----------|--------|----------|------------|
| UART0    | URXD0  | PC9      | O          |
| UART0    | UTXD0  | PC8      | O          |
| UART1    | URXD1  | PC17     | O          |
| UART1    | UTXD1  | PC16     | С          |

# 39.4.2 Power Management

The UART clock can be controlled through the Power Management Controller (PMC). In this case, the user must first configure the PMC to enable the UART clock. Usually, the peripheral identifier used for this purpose is 1.

## 39.4.3 Interrupt Sources

The UART interrupt line is connected to one of the interrupt sources of the Interrupt Controller. Interrupt handling requires programming of the Interrupt Controller before configuring the UART.

Table 39-3. Peripheral IDs

| Instance | ID |
|----------|----|
| UART0    | 15 |
| UART1    | 16 |

# 39.5 Functional Description

The UART operates in Asynchronous mode only and supports only 8-bit character handling (with parity). It has no clock pin.

The UART is made up of a receiver and a transmitter that operate independently, and a common baud rate generator. Receiver timeout and transmitter time guard are not implemented. However, all the implemented features are compatible with those of a standard USART.

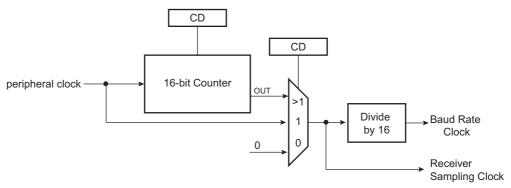

### 39.5.1 Baud Rate Generator

The baud rate generator provides the bit period clock named baud rate clock to both the receiver and the transmitter.

The baud rate clock is the peripheral clock divided by 16 times the clock divisor (CD) value written in the Baud Rate Generator register (UART\_BRGR). If UART\_BRGR is set to 0, the baud rate clock is disabled and the UART remains inactive. The maximum allowable baud rate is peripheral clock divided by 16. The minimum allowable baud rate is peripheral clock divided by (16 x 65536).

Figure 39-2. Baud Rate Generator

### 39.5.2 Receiver

# 39.5.2.1 Receiver Reset, Enable and Disable

After device reset, the UART receiver is disabled and must be enabled before being used. The receiver can be enabled by writing the Control Register (UART\_CR) with the bit RXEN at 1. At this command, the receiver starts looking for a start bit.

The programmer can disable the receiver by writing UART\_CR with the bit RXDIS at 1. If the receiver is waiting for a start bit, it is immediately stopped. However, if the receiver has already detected a start bit and is receiving the data, it waits for the stop bit before actually stopping its operation.

The receiver can be put in reset state by writing UART\_CR with the bit RSTRX at 1. In this case, the receiver immediately stops its current operations and is disabled, whatever its current state. If RSTRX is applied when data is being processed, this data is lost.

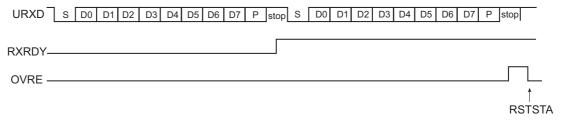

### 39.5.2.2 Start Detection and Data Sampling

The UART only supports asynchronous operations, and this affects only its receiver. The UART receiver detects the start of a received character by sampling the URXD signal until it detects a valid start bit. A low level (space) on URXD is interpreted as a valid start bit if it is detected for more than seven cycles of the sampling clock, which is 16 times the baud rate. Hence, a space that is longer than 7/16 of the bit period is detected as a valid start bit. A space which is 7/16 of a bit period or shorter is ignored and the receiver continues to wait for a valid start bit.

When a valid start bit has been detected, the receiver samples the URXD at the theoretical midpoint of each bit. It is assumed that each bit lasts 16 cycles of the sampling clock (1-bit period) so the bit sampling point is eight cycles (0.5-bit period) after the start of the bit. The first sampling point is therefore 24 cycles (1.5-bit periods) after detecting the falling edge of the start bit.

Each subsequent bit is sampled 16 cycles (1-bit period) after the previous one.

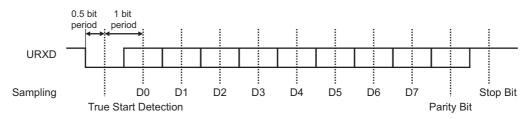

Figure 39-3. Start Bit Detection

## Figure 39-4. Character Reception

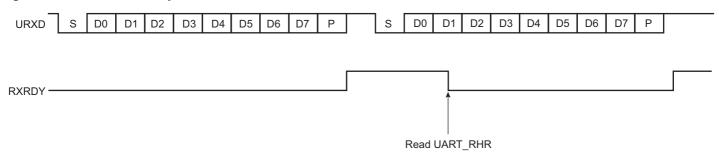

Example: 8-bit, parity enabled 1 stop

### 39.5.2.3 Receiver Ready

When a complete character is received, it is transferred to the Receive Holding Register (UART\_RHR) and the RXRDY status bit in the Status Register (UART\_SR) is set. The bit RXRDY is automatically cleared when UART\_RHR is read.

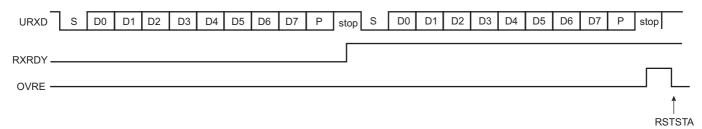

# Figure 39-5. Receiver Ready

### 39.5.2.4 Receiver Overrun

The OVRE status bit in UART\_SR is set if UART\_RHR has not been read by the software (or the DMA Controller) since the last transfer, the RXRDY bit is still set and a new character is received. OVRE is cleared when the software writes a 1 to the bit RSTSTA (Reset Status) in UART\_CR.

### Figure 39-6. Receiver Overrun

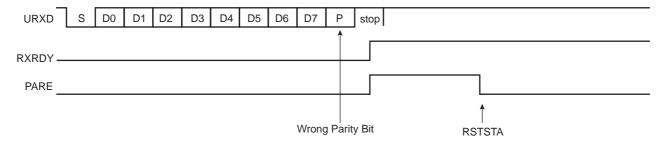

### 39.5.2.5 Parity Error

Each time a character is received, the receiver calculates the parity of the received data bits, in accordance with the field PAR in the Mode Register (UART\_MR). It then compares the result with the received parity bit. If different, the parity error bit PARE in UART\_SR is set at the same time RXRDY is set. The parity bit is cleared when UART\_CR is written with the bit RSTSTA (Reset Status) at 1. If a new character is received before the reset status command is written, the PARE bit remains at 1.

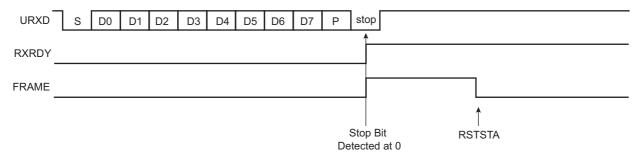

Figure 39-7. Parity Error

### 39.5.2.6 Receiver Framing Error

When a start bit is detected, it generates a character reception when all the data bits have been sampled. The stop bit is also sampled and when it is detected at 0, the FRAME (Framing Error) bit in UART\_SR is set at the same time the RXRDY bit is set. The FRAME bit remains high until the Control Register (UART\_CR) is written with the bit RSTSTA at 1.

Figure 39-8. Receiver Framing Error

#### 39.5.3 Transmitter

### 39.5.3.1 Transmitter Reset, Enable and Disable

After device reset, the UART transmitter is disabled and must be enabled before being used. The transmitter is enabled by writing UART\_CR with the bit TXEN at 1. From this command, the transmitter waits for a character to be written in the Transmit Holding Register (UART\_THR) before actually starting the transmission.

The programmer can disable the transmitter by writing UART\_CR with the bit TXDIS at 1. If the transmitter is not operating, it is immediately stopped. However, if a character is being processed into the internal shift register and/or a character has been written in the UART\_THR, the characters are completed before the transmitter is actually stopped.

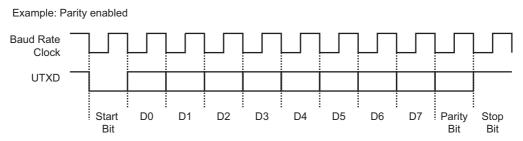

The programmer can also put the transmitter in its reset state by writing the UART\_CR with the bit RSTTX at 1. This immediately stops the transmitter, whether or not it is processing characters.

### 39.5.3.2 Transmit Format

The UART transmitter drives the pin UTXD at the baud rate clock speed. The line is driven depending on the format defined in UART\_MR and the data stored in the internal shift register. One start bit at level 0, then the 8 data bits, from the lowest to the highest bit, one optional parity bit and one stop bit at 1 are consecutively shifted out as shown in the following figure. The field PARE in UART\_MR defines whether or not a parity bit is shifted out. When a parity bit is enabled, it can be selected between an odd parity, an even parity, or a fixed space or mark bit.

Figure 39-9. Character Transmission

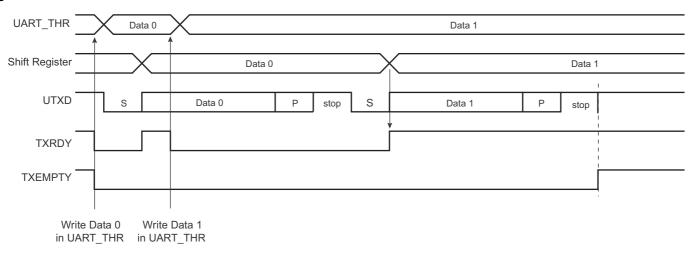

### 39.5.3.3 Transmitter Control

When the transmitter is enabled, the bit TXRDY (Transmitter Ready) is set in UART\_SR. The transmission starts when the programmer writes in the UART\_THR, and after the written character is transferred from UART\_THR to the internal shift register. The TXRDY bit remains high until a second character is written in UART\_THR. As soon as the first character is completed, the last character written in UART\_THR is transferred into the internal shift register and TXRDY rises again, showing that the holding register is empty.

When both the internal shift register and UART\_THR are empty, i.e., all the characters written in UART\_THR have been processed, the TXEMPTY bit rises after the last stop bit has been completed.

Figure 39-10. Transmitter Control

### 39.5.4 DMA Support

Both the receiver and the transmitter of the UART are connected to a DMA Controller (DMAC) channel.

The DMA Controller channels are programmed via registers that are mapped within the DMAC user interface.

### 39.5.5 Test Modes

The UART supports three test modes. These modes of operation are programmed by using the CHMODE field in UART MR.

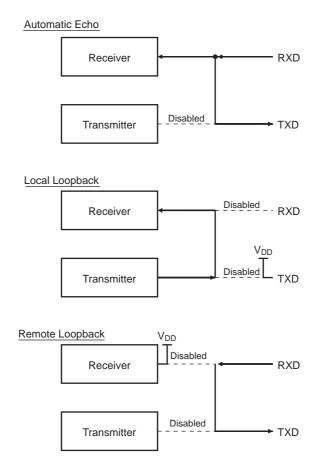

The Automatic echo mode allows a bit-by-bit retransmission. When a bit is received on the URXD line, it is sent to the UTXD line. The transmitter operates normally, but has no effect on the UTXD line.

The Local loopback mode allows the transmitted characters to be received. UTXD and URXD pins are not used and the output of the transmitter is internally connected to the input of the receiver. The URXD pin level has no effect and the UTXD line is held high, as in idle state.

The Remote loopback mode directly connects the URXD pin to the UTXD line. The transmitter and the receiver are disabled and have no effect. This mode allows a bit-by-bit retransmission.

Figure 39-11. Test Modes

# 39.6 Universal Asynchronous Receiver Transmitter (UART) User Interface

Table 39-4. Register Mapping

| Offset        | Register                     | Name      | Access     | Reset |

| TXDIS | TXEN | RXDIS | RXEN | RSTTX | RSTRX | _  | _      |

### RSTRX: Reset Receiver

0: No effect.

1: The receiver logic is reset and disabled. If a character is being received, the reception is aborted.

### RSTTX: Reset Transmitter

0: No effect.

1: The transmitter logic is reset and disabled. If a character is being transmitted, the transmission is aborted.

### • RXEN: Receiver Enable

0: No effect.

1: The receiver is enabled if RXDIS is 0.

### RXDIS: Receiver Disable

0: No effect.

1: The receiver is disabled. If a character is being processed and RSTRX is not set, the character is completed before the receiver is stopped.

### • TXEN: Transmitter Enable

0: No effect.

1: The transmitter is enabled if TXDIS is 0.

### • TXDIS: Transmitter Disable

0: No effect.

1: The transmitter is disabled. If a character is being processed and a character has been written in the UART\_THR and RSTTX is not set, both characters are completed before the transmitter is stopped.

### RSTSTA: Reset Status

0: No effect.

1: Resets the status bits PARE, FRAME and OVRE in the UART\_SR.

# 39.6.2 UART Mode Register

# 40. Controller Area Network (CAN)

# 40.1 Description

The CAN controller provides all the features required to implement the serial communication protocol CAN defined by Robert Bosch GmbH, the CAN specification as referred to by ISO/11898A (2.0 Part A and 2.0 Part B) for high speeds and ISO/11519-2 for low speeds. The CAN Controller is able to handle all types of frames (Data, Remote, Error and Overload) and achieves a bitrate of 1 Mbit/s.

CAN controller accesses are made through configuration registers. 8 independent message objects (mailboxes) are implemented.

Any mailbox can be programmed as a reception buffer block (even non-consecutive buffers). For the reception of defined messages, one or several message objects can be masked without participating in the buffer feature. An interrupt is generated when the buffer is full. According to the mailbox configuration, the first message received can be locked in the CAN controller registers until the application acknowledges it, or this message can be discarded by new received messages.

Any mailbox can be programmed for transmission. Several transmission mailboxes can be enabled in the same time. A priority can be defined for each mailbox independently.

An internal 16-bit timer is used to stamp each received and sent message. This timer starts counting as soon as the CAN controller is enabled. This counter can be reset by the application or automatically after a reception in the last mailbox in Time Triggered Mode.

The CAN controller offers optimized features to support the Time Triggered Communication (TTC) protocol.

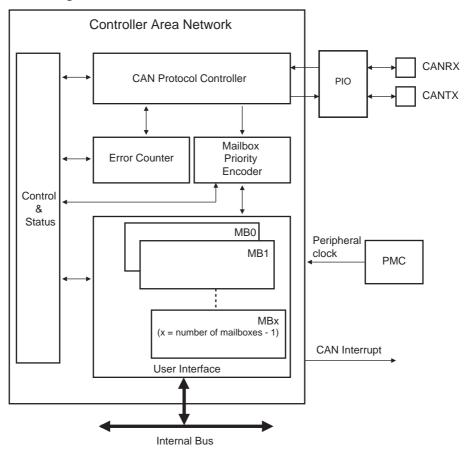

# 40.2 Embedded Characteristics

- Fully Compliant with CAN 2.0 Part A and 2.0 Part B
- Bit Rates up to 1 Mbit/s
- 8 Object Oriented Mailboxes with the Following Properties:
  - CAN Specification 2.0 Part A or 2.0 Part B Programmable for Each Message
  - Object Configurable in Receive (with Overwrite or Not) or Transmit Modes
  - Independent 29-bit Identifier and Mask Defined for Each Mailbox
  - 32-bit Access to Data Registers for Each Mailbox Data Object
  - Uses a 16-bit Timestamp on Receive and Transmit Messages
  - Hardware Concatenation of ID Masked Bitfields To Speed Up Family ID Processing
- 16-bit Internal Timer for Timestamping and Network Synchronization
- Programmable Reception Buffer Length up to 8 Mailbox Objects
- Priority Management between Transmission Mailboxes
- Autobaud and Listening Mode
- Low-power Mode and Programmable Wake-up on Bus Activity or by the Application
- Data, Remote, Error and Overload Frame Handling
- Register Write Protection

# 40.5 I/O Lines Description

Table 40-1. I/O Lines Description

| Name  | Description              | Туре   |
|-------|--------------------------|--------|
| CANRX | CAN Receive Serial Data  | Input  |
| CANTX | CAN Transmit Serial Data | Output |

# 40.6 Product Dependencies

### 40.6.1 I/O Lines

The pins used for interfacing the CAN may be multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the desired CAN pins to their peripheral function. If I/O lines of the CAN are not used by the application, they can be used for other purposes by the PIO Controller.

Table 40-2. I/O Lines

| Instance | Signal | I/O Line | Peripheral |
|----------|--------|----------|------------|
| CAN0     | CANRX0 | PA9      | В          |
| CAN0     | CANTX0 | PA10     | В          |
| CAN1     | CANRX1 | PA6      | В          |
| CAN1     | CANTX1 | PA5      | В          |

## 40.6.2 Power Management

The programmer must first enable the CAN clock in the Power Management Controller (PMC) before using the CAN.

A Low-power mode is defined for the CAN controller. If the application does not require CAN operations, the CAN clock can be stopped when not needed and be restarted later. Before stopping the clock, the CAN Controller must be in Low-power mode to complete the current transfer. After restarting the clock, the application must disable the Low-power mode of the CAN controller.

## 40.6.3 Interrupt Sources

The CAN interrupt line is connected on one of the internal sources of the Advanced Interrupt Controller. Using the CAN interrupt requires the interrupt controller to be programmed first. Note that it is not recommended to use the CAN interrupt line in edge-sensitive mode.

Table 40-3. Peripheral IDs

| Instance | ID |
|----------|----|
| CAN0     | 29 |
| CAN1     | 30 |

## 40.7 CAN Controller Features

### 40.7.1 CAN Protocol Overview

The Controller Area Network (CAN) is a multi-master serial communication protocol that efficiently supports real-time control with a very high level of security with bit rates up to 1 Mbit/s.

The CAN protocol supports four different frame types:

- Data frames: They carry data from a transmitter node to the receiver nodes. The overall maximum data frame length is 108 bits for a standard frame and 128 bits for an extended frame.
- Remote frames: A destination node can request data from the source by sending a remote frame with an
  identifier that matches the identifier of the required data frame. The appropriate data source node then
  sends a data frame as a response to this node request.
- Error frames: An error frame is generated by any node that detects a bus error.
- Overload frames: They provide an extra delay between the preceding and the successive data frames or remote frames.

The Atmel CAN controller provides the CPU with full functionality of the CAN protocol V2.0 Part A and V2.0 Part B. It minimizes the CPU load in communication overhead. The Data Link Layer and part of the physical layer are automatically handled by the CAN controller itself.

The CPU reads or writes data or messages via the CAN controller mailboxes. An identifier is assigned to each mailbox. The CAN controller encapsulates or decodes data messages to build or to decode bus data frames. Remote frames, error frames and overload frames are automatically handled by the CAN controller under supervision of the software application.

# 40.7.2 Mailbox Organization

The CAN module has 8 buffers, also called channels or mailboxes. An identifier that corresponds to the CAN identifier is defined for each active mailbox. Message identifiers can match the standard frame identifier or the extended frame identifier. This identifier is defined for the first time during the CAN initialization, but can be dynamically reconfigured later so that the mailbox can handle a new message family. Several mailboxes can be configured with the same ID.

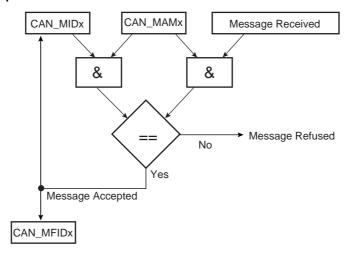

Each mailbox can be configured in receive or in transmit mode independently. The mailbox object type is defined in the MOT field of the CAN\_MMRx.

## 40.7.2.1 Message Acceptance Procedure

If the MIDE field in the CAN\_MIDx register is set, the mailbox can handle the extended format identifier; otherwise, the mailbox handles the standard format identifier. Once a new message is received, its ID is masked with the CAN\_MAMx value and compared with the CAN\_MIDx value. If accepted, the message ID is copied to the CAN\_MIDx register.

Figure 40-3. Message Acceptance Procedure

If a mailbox is dedicated to receiving several messages (a family of messages) with different IDs, the acceptance mask defined in the CAN\_MAMx register must mask the variable part of the ID family. Once a message is received, the application must decode the masked bits in the CAN\_MIDx. To speed up the decoding, masked bits are grouped in the family ID register (CAN\_MFIDx).

For example, if the following message IDs are handled by the same mailbox:

```
ID0 1010001001001001000100 0 11 00b
ID1 101000100100100100100 0 11 01b
ID2 1010001001001001000100 0 11 10b
ID3 1010001001001001000100 0 11 11b
ID4 1010001001001001000100 1 11 00b
ID5 1010001001001001000100 1 11 10b
ID6 1010001001001001000100 1 11 10b
ID7 1010001001001001000100 1 11 11b
```

The CAN\_MIDx and CAN\_MAMx of Mailbox x must be initialized to the corresponding values:

```
CAN_MIDx = 001 10100010010010010000100 x 11 xxb
CAN_MAMx = 001 111111111111111111111 0 11 00b
```

If Mailbox x receives a message with ID6, then CAN MIDx and CAN MFIDx are set:

```
CAN_MIDx = 001 10100010010010010000100 1 11 10b
CAN MFIDx = 0000000000000000000000000000110b
```

If the application associates a handler for each message ID, it may define an array of pointers to functions:

```
void (*pHandler[8])(void);
```

When a message is received, the corresponding handler can be invoked using CAN\_MFIDx register and there is no need to check masked bits:

```
unsigned int MFIDO_register;
MFIDO_register = Get_CAN_MFIDO_Register();
// Get_CAN_MFIDO_Register() returns the value of the CAN_MFIDO register
pHandler[MFIDO_register]();
```

### 40.7.2.2 Receive Mailbox

When the CAN module receives a message, it looks for the first available mailbox with the lowest number and compares the received message ID with the mailbox ID. If such a mailbox is found, then the message is stored in its data registers. Depending on the configuration, the mailbox is disabled as long as the message has not been acknowledged by the application (Receive only), or, if new messages with the same ID are received, then they overwrite the previous ones (Receive with overwrite).

It is also possible to configure a mailbox in Consumer Mode. In this mode, after each transfer request, a remote frame is automatically sent. The first answer received is stored in the corresponding mailbox data registers.

Several mailboxes can be chained to receive a buffer. They must be configured with the same ID in Receive Mode, except for the last one, which can be configured in Receive with Overwrite Mode. The last mailbox can be used to detect a buffer overflow.

Table 40-4. Receive Mailbox Objects

| Object Type            | Description   |
|------------------------|---|
| Receive                | The first message received is stored in mailbox data registers. Data remain available until the next transfer request.  |
| Receive with overwrite | The last message received is stored in mailbox data register. The next message always overwrites the previous one. The application has to check whether a new message has not overwritten the current one while reading the data registers. |
| Consumer               | A remote frame is sent by the mailbox. The answer received is stored in mailbox data register. This extends Receive mailbox features. Data remain available until the next transfer request.  |

#### 40.7.2.3 Transmit Mailbox

When transmitting a message, the message length and data are written to the transmit mailbox with the correct identifier. For each transmit mailbox, a priority is assigned. The controller automatically sends the message with the highest priority first (set with the field PRIOR in CAN\_MMRx).

It is also possible to configure a mailbox in Producer Mode. In this mode, when a remote frame is received, the mailbox data are sent automatically. By enabling this mode, a producer can be done using only one mailbox instead of two: one to detect the remote frame and one to send the answer.

Table 40-5. Transmit Mailbox Objects

| Object Type | Description  |
|-------------|--|
| Transmit    | The message stored in the mailbox data registers will try to win the bus arbitration immediately or later according to or not the Time Management Unit configuration (see Section 40.7.3). |
|             | The application is notified that the message has been sent or aborted.   |
| Producer    | The message prepared in the mailbox data registers will be sent after receiving the next remote frame. This extends transmit mailbox features.   |

### 40.7.3 Time Management Unit

The CAN Controller integrates a free-running 16-bit internal timer. The counter is driven by the bit clock of the CAN bus line. It is enabled when the CAN controller is enabled (CANEN set in the CAN\_MR). It is automatically cleared in the following cases:

- after a reset
- when the CAN controller is in Low-power mode is enabled (LPM bit set in the CAN\_MR and SLEEP bit set in the CAN\_SR)
- after a reset of the CAN controller (CANEN bit in the CAN\_MR)
- in Time-triggered Mode, when a message is accepted by the last mailbox (rising edge of the MRDY signal in the CAN\_MSR<sub>last mailbox number</sub> register).

The application can also reset the internal timer by setting TIMRST in the CAN\_TCR. The current value of the internal timer is always accessible by reading the CAN\_TIM register.

When the timer rolls-over from FFFFh to 0000h, TOVF (Timer Overflow) signal in the CAN\_SR is set. TOVF bit in the CAN\_SR is cleared by reading the CAN\_SR. Depending on the corresponding interrupt mask in the CAN\_IMR, an interrupt is generated while TOVF is set.

In a CAN network, some CAN devices may have a larger counter. In this case, the application can also decide to freeze the internal counter when the timer reaches FFFFh and to wait for a restart condition from another device. This feature is enabled by setting TIMFRZ in the CAN\_MR. The CAN\_TIM register is frozen to the FFFFh value. A clear condition described above restarts the timer. A timer overflow (TOVF) interrupt is triggered.

To monitor the CAN bus activity, the CAN\_TIM register is copied to the CAN \_TIMESTP register after each start of frame or end of frame and a TSTP interrupt is triggered. If TEOF bit in the CAN\_MR is set, the value is captured at each End Of Frame, else it is captured at each Start Of Frame. Depending on the corresponding mask in the CAN\_IMR, an interrupt is generated while TSTP is set in the CAN\_SR. TSTP bit is cleared by reading the CAN\_SR.

The time management unit can operate in one of the two following modes:

- Timestamping mode: The value of the internal timer is captured at each Start Of Frame or each End Of Frame
- Time Triggered mode: A mailbox transfer operation is triggered when the internal timer reaches the mailbox trigger.

Timestamping Mode is enabled by clearing TTM field in the CAN\_MR. Time Triggered Mode is enabled by setting TTM field in the CAN\_MR.

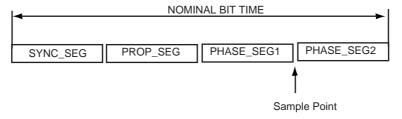

## 40.7.4 CAN 2.0 Standard Features

## 40.7.4.1 CAN Bit Timing Configuration

All controllers on a CAN bus must have the same bit rate and bit length. At different clock frequencies of the individual controllers, the bit rate has to be adjusted by the time segments.

The CAN protocol specification partitions the nominal bit time into four different segments.

Figure 40-4. Partition of the CAN Bit Time

SYNC SEG: SYNChronization Segment

This part of the bit time is used to synchronize the various nodes on the bus. An edge is expected to lie within this segment. It is one TQ long.

PROP SEG: PROPagation Segment

This part of the bit time is used to compensate for the physical delay times within the network. It is twice the sum of the signal's propagation time on the bus line, the input comparator delay, and the output driver delay. It is programmable to be 1,2,..., 8 TQ long.

This parameter is defined in the PROPAG field of the "CAN Baudrate Register".

PHASE SEG1, PHASE SEG2: PHASE Segment 1 and 2

The Phase-Buffer-Segments are used to compensate for edge phase errors. These segments can be lengthened (PHASE SEG1) or shortened (PHASE SEG2) by resynchronization.

Phase Segment 1 is programmable to be 1, 2, ..., 8 TQ long.

Phase Segment 2 length has to be at least as long as the Information Processing Time (IPT) and may not be more than the length of Phase Segment 1.

These parameters are defined in the PHASE1 and PHASE2 fields of the "CAN Baudrate Register".

### TIME QUANTUM

The TIME QUANTUM (TQ) is a fixed unit of time derived from the peripheral clock period. The total number of TIME QUANTA in a bit time is programmable from 8 to 25.

### INFORMATION PROCESSING TIME

The Information Processing Time (IPT) is the time required for the logic to determine the bit level of a sampled bit. The IPT begins at the sample point, is measured in TQ and **is fixed at two TQ for the Atmel CAN**. Since Phase Segment 2 also begins at the sample point and is the last segment in the bit time, PHASE SEG2 shall not be less than the IPT.

### SAMPLE POINT

The SAMPLE POINT is the point in time at which the bus level is read and interpreted as the value of that respective bit. Its location is at the end of PHASE SEG1.

SJW: ReSynchronization Jump Width

The ReSynchronization Jump Width defines the limit to the amount of lengthening or shortening of the phase segments.

SJW is programmable to be the minimum of PHASE SEG1 and four TQ.

If the SMP field in the CAN\_BR is set, then the incoming bit stream is sampled three times with a period of half a CAN clock period, centered on sample point.

In the CAN controller, the length of a bit on the CAN bus is determined by the parameters (BRP, PROPAG, PHASE1 and PHASE2).

$$t_{BIT} = t_{CSC} + t_{PRS} + t_{PHS1} + t_{PHS2}$$

The time quantum is calculated as follows:

$$t_{CSC} = (BRP + 1) / t_{peripheral clock}$$

Note: The BRP field must be within the range [1, 0x7F], i.e., BRP = 0 is not authorized.

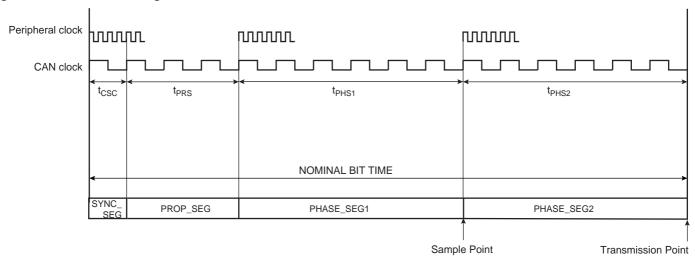

$$t_{PRS} = t_{CSC} \times (PROPAG + 1)$$
  
 $t_{PHS1} = t_{CSC} \times (PHASE1 + 1)$   
 $t_{PHS2} = t_{CSC} \times (PHASE2 + 1)$ 

To compensate for phase shifts between clock oscillators of different controllers on the bus, the CAN controller must resynchronize on any relevant signal edge of the current transmission. The resynchronization shortens or lengthens the bit time so that the position of the sample point is shifted with regard to the detected edge. The resynchronization jump width (SJW) defines the maximum of time by which a bit period may be shortened or lengthened by resynchronization.

$$t_{SJW} = t_{CSC} \times (SJW + 1)$$

## Figure 40-5. CAN Bit Timing

Example of bit timing determination for CAN baudrate of 500 kbit/s:

$$f_{Peripheral clock} = 48 \text{ MHz}$$

CAN baudrate = 500 kbit/s => bit time =  $2 \mu s$ 

Delay of the bus driver: 50 ns Delay of the receiver: 30 ns

Delay of the bus line (20 m): 110 ns

The total number of time quanta in a bit time must be comprised between 8 and 25. If we fix the bit time to 16 time quanta:

$$t_{CSC} = 1$$
 time quanta = bit time / 16 = 125 ns

$$=>$$
 BRP =  $(t_{CSC} \times f_{peripheral clock}) - 1 = 5$ 

The propagation segment time is equal to twice the sum of the signal's propagation time on the bus line, the receiver delay and the output driver delay:

$$t_{PRS} = 2 * (50+30+110) \text{ ns} = 380 \text{ ns} = 3 t_{CSC}$$

$$\Rightarrow$$
 PROPAG =  $t_{PRS}/t_{CSC}$  - 1 = 2

The remaining time for the two phase segments is:

$$t_{PHS}1 + t_{PHS}2 = bit time - t_{CSC} - t_{PRS} = (16 - 1 - 3)t_{CSC}$$

$$t_{PHS}1 + t_{PHS}2 = 12 t_{CSC}$$

Because this number is even, we choose  $t_{PHS}2 = t_{PHS}1$  (else we would choose  $t_{PHS}2 = t_{PHS}1 + t_{CSC}$ ).

$$t_{PHS}1 = t_{PHS}2 = (12/2) t_{CSC} = 6 t_{CSC}$$

$$\Rightarrow$$
 PHASE1 = PHASE2 =  $t_{PHS}1/t_{CSC}$  - 1 = 5

The resynchronization jump width must comprise between one  $t_{CSC}$  and the minimum of four  $t_{CSC}$  and  $t_{PHS}1$ . We choose its maximum value:

$$t_{SJW} = Min(4 t_{CSC}, t_{PHS}1) = 4 t_{CSC}$$

$$=> SJW = t_{SJW}/t_{CSC} - 1 = 3$$

Finally:  $CAN_BR = 0x00053255$ 

# CAN Bus Synchronization

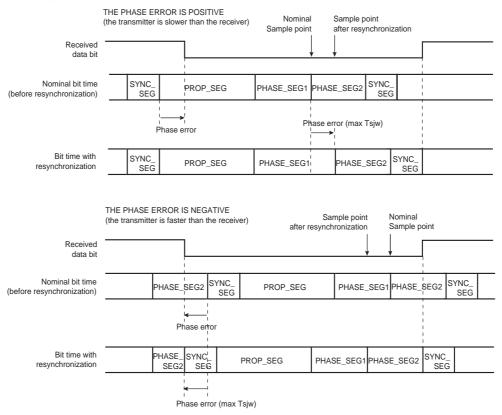

Two types of synchronization are distinguished: "hard synchronization" at the start of a frame and "resynchronization" inside a frame. After a hard synchronization, the bit time is restarted with the end of the SYNC\_SEG segment, regardless of the phase error. Resynchronization causes a reduction or increase in the bit time so that the position of the sample point is shifted with respect to the detected edge.

The effect of resynchronization is the same as that of hard synchronization when the magnitude of the phase error of the edge causing the resynchronization is less than or equal to the programmed value of the resynchronization jump width  $(t_{S,IW})$ .

When the magnitude of the phase error is larger than the resynchronization jump width and

- the phase error is positive, then PHASE\_SEG1 is lengthened by an amount equal to the resynchronization jump width.
- the phase error is negative, then PHASE\_SEG2 is shortened by an amount equal to the resynchronization jump width.

Figure 40-6. CAN Resynchronization

### Autobaud Mode

The autobaud feature is enabled by setting the ABM field in the CAN\_MR. In this mode, the CAN controller is only listening to the line without acknowledging the received messages. It can not send any message. The errors flags are updated. The bit timing can be adjusted until no error occurs (good configuration found). In this mode, the error counters are frozen. To go back to the standard mode, the ABM bit must be cleared in the CAN\_MR.

### 40.7.4.2 Error Detection

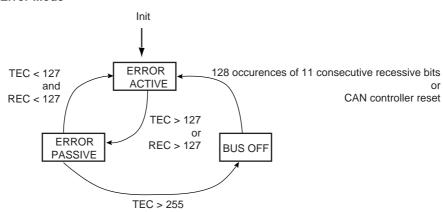

There are five different error types that are not mutually exclusive. Each error concerns only specific fields of the CAN data frame (refer to the Bosch CAN specification for their correspondence):

- CRC error (CERR bit in the CAN\_SR): With the CRC, the transmitter calculates a checksum for the CRC bit sequence from the Start of Frame bit until the end of the Data Field. This CRC sequence is transmitted in the CRC field of the Data or Remote Frame.
- Bit-stuffing error (SERR bit in the CAN\_SR): If a node detects a sixth consecutive equal bit level during the bit-stuffing area of a frame, it generates an Error Frame starting with the next bit-time.
- Bit error (BERR bit in CAN\_SR): A bit error occurs if a transmitter sends a dominant bit but detects a
  recessive bit on the bus line, or if it sends a recessive bit but detects a dominant bit on the bus line. An error
  frame is generated and starts with the next bit time.
- Form Error (FERR bit in the CAN\_SR): If a transmitter detects a dominant bit in one of the fix-formatted segments CRC Delimiter, ACK Delimiter or End of Frame, a form error has occurred and an error frame is generated.
- Acknowledgment error (AERR bit in the CAN\_SR): The transmitter checks the Acknowledge Slot, which is
  transmitted by the transmitting node as a recessive bit, contains a dominant bit. If this is the case, at least
  one other node has received the frame correctly. If not, an Acknowledge Error has occurred and the
  transmitter will start in the next bit-time an Error Frame transmission.

### Fault Confinement

To distinguish between temporary and permanent failures, every CAN controller has two error counters: REC (Receive Error Counter) and TEC (Transmit Error Counter). The two counters are incremented upon detected errors and are decremented upon correct transmissions or receptions, respectively. Depending on the counter values, the state of the node changes: the initial state of the CAN controller is Error Active, meaning that the controller can send Error Active flags. The controller changes to the Error Passive state if there is an accumulation of errors. If the CAN controller fails or if there is an extreme accumulation of errors, there is a state transition to Bus Off.

Figure 40-7. Line Error Mode

An error active unit takes part in bus communication and sends an active error frame when the CAN controller detects an error.

An error passive unit cannot send an active error frame. It takes part in bus communication, but when an error is detected, a passive error frame is sent. Also, after a transmission, an error passive unit waits before initiating further transmission.

A bus off unit is not allowed to have any influence on the bus.

For fault confinement, two errors counters (TEC and REC) are implemented. These counters are accessible via the CAN\_ECR. The state of the CAN controller is automatically updated according to these counter values. If the CAN controller enters Error Active state, then the ERRA bit is set in the CAN\_SR. The corresponding interrupt is pending while the interrupt is not masked in the CAN\_IMR. If the CAN controller enters Error Passive Mode, then the ERRP bit is set in the CAN\_SR and an interrupt remains pending while the ERRP bit is set in the CAN\_IMR. If the CAN enters Bus Off Mode, then the BOFF bit is set in the CAN\_SR. As for ERRP and ERRA, an interrupt is pending while the BOFF bit is set in the CAN\_IMR.

When one of the error counters values exceeds 96, an increased error rate is indicated to the controller through the WARN bit in CAN\_SR, but the node remains error active. The corresponding interrupt is pending while the interrupt is set in the CAN\_IMR.

Refer to the Bosch CAN specification v2.0 for details on fault confinement.

## Error Interrupt Handler

ERRA, WARN, ERRP and BOFF (CAN\_SR) store the key transitions of the CAN bus status as defined in Figure 40-7 on page 927. The transitions depend on the TEC and REC (CAN\_ECR) values as described in Section "Fault Confinement" on page 927.

These flags are latched to keep from triggering a spurious interrupt in case these bits are used as the source of an interrupt. Thus, these flags may not reflect the current status of the CAN bus.

The current CAN bus state can be determined by reading the TEC and REC fields of CAN\_ECR.

#### 40.7.4.3 Overload

The overload frame is provided to request a delay of the next data or remote frame by the receiver node ("Request overload frame") or to signal certain error conditions ("Reactive overload frame") related to the intermission field respectively.

Reactive overload frames are transmitted after detection of the following error conditions:

- Detection of a dominant bit during the first two bits of the intermission field
- Detection of a dominant bit in the last bit of EOF by a receiver, or detection of a dominant bit by a receiver or a transmitter at the last bit of an error or overload frame delimiter

The CAN controller can generate a request overload frame automatically after each message sent to one of the CAN controller mailboxes. This feature is enabled by setting the OVL bit in the CAN\_MR.

Reactive overload frames are automatically handled by the CAN controller even if the OVL bit in the CAN\_MR is not set. An overload flag is generated in the same way as an error flag, but error counters do not increment.

## 40.7.5 Low-power Mode

In Low-power mode, the CAN controller cannot send or receive messages. All mailboxes are inactive.

In Low-power mode, the SLEEP signal in the CAN\_SR is set; otherwise, the WAKEUP signal in the CAN\_SR is set. These two bits are exclusive except after a CAN controller reset (WAKEUP and SLEEP are stuck at 0 after a reset). After power-up reset, the Low-power mode is disabled and the WAKEUP bit is set in the CAN\_SR only after detection of 11 consecutive recessive bits on the bus.

### 40.7.5.1 Enabling Low-power Mode

A software application can enable Low-power mode by setting the LPM bit in the CAN\_MR global register. The CAN controller enters Low-power mode once all pending transmit messages are sent.

When the CAN controller enters Low-power mode, the SLEEP signal in the CAN\_SR is set. Depending on the corresponding mask in the CAN\_IMR, an interrupt is generated while SLEEP is set.

The SLEEP signal in the CAN\_SR is automatically cleared once WAKEUP is set. The WAKEUP signal is automatically cleared once SLEEP is set.

Reception is disabled while the SLEEP signal is set to one in the CAN\_SR. It is important to note that those messages with higher priority than the last message transmitted can be received between the LPM command and entry in Low-power mode.

Once in Low-power mode, the CAN controller clock can be switched off by programming the chip's Power Management Controller (PMC). The CAN controller drains only the static current.

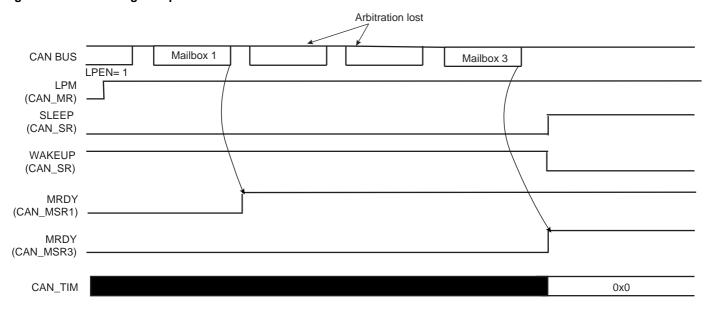

Error counters are disabled while the SLEEP signal is set to one.

Thus, to enter Low-power mode, the software application must:

- Set LPM field in the CAN MR
- Wait for SLEEP signal rising

Now the CAN Controller clock can be disabled. This is done by programming the Power Management Controller (PMC).

Figure 40-8. Enabling Low-power Mode

# 40.7.5.2 Disabling Low-power Mode

The CAN controller can be awake after detecting a CAN bus activity. Bus activity detection is done by an external module that may be embedded in the chip. When it is notified of a CAN bus activity, the software application disables Low-power mode by programming the CAN controller.

To disable Low-power mode, the software application must:

- Enable the CAN Controller clock. This is done by programming the Power Management Controller (PMC).
- Clear the LPM field in the CAN MR

The CAN controller synchronizes itself with the bus activity by checking for eleven consecutive "recessive" bits. Once synchronized, the WAKEUP signal in the CAN SR is set.

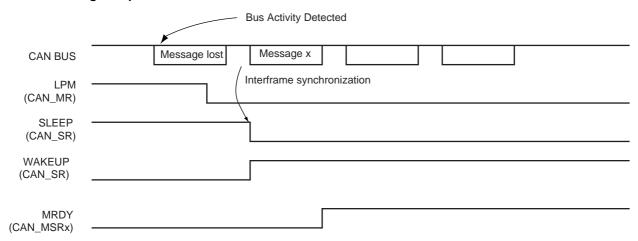

Depending on the corresponding mask in the CAN\_IMR, an interrupt is generated while WAKEUP is set. The SLEEP signal in the CAN\_SR is automatically cleared once WAKEUP is set. WAKEUP signal is automatically cleared once SLEEP is set.

If no message is being sent on the bus, then the CAN controller is able to send a message eleven bit times after disabling Low-power mode.

If there is bus activity when Low-power mode is disabled, the CAN controller is synchronized with the bus activity in the next interframe. The previous message is lost (see Figure 40-9).

Figure 40-9. Disabling Low-power Mode

# 40.8 Functional Description

### 40.8.1 CAN Controller Initialization

After power-up reset, the CAN controller is disabled. The CAN controller clock must be activated by the Power Management Controller (PMC) and the CAN controller interrupt line must be enabled by the interrupt controller.

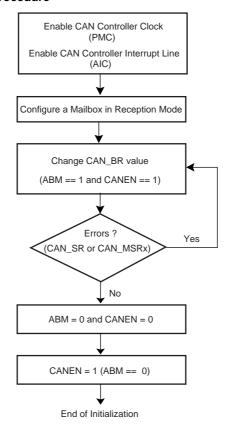

The CAN controller must be initialized with the CAN network parameters. The CAN\_BR defines the sampling point in the bit time period. CAN\_BR must be set before the CAN controller is enabled.

The CAN controller is enabled by setting the CANEN bit in the CAN\_MR. At this stage, the internal CAN controller state machine is reset, error counters are reset to 0, and error flags are reset to 0.

Once the CAN controller is enabled, bus synchronization is done automatically by scanning eleven recessive bits. The WAKEUP bit in the CAN\_SR is automatically set to 1 when the CAN controller is synchronized (WAKEUP and SLEEP are stuck at 0 after a reset).

The CAN controller can start listening to the network in Autobaud Mode. In this case, the error counters are locked and a mailbox may be configured in Receive Mode. By scanning error flags, the CAN\_BR values synchronized with the network. Once no error has been detected, the application disables the Autobaud Mode, clearing the ABM bit in the CAN\_MR.

Figure 40-10. Possible Initialization Procedure

## 40.8.2 CAN Controller Interrupt Handling

There are two different types of interrupts. One type of interrupt is a message-object related interrupt, the other is a system interrupt that handles errors or system-related interrupt sources.

All interrupt sources can be masked by writing the corresponding field in the CAN\_IDR. They can be unmasked by writing to the CAN\_IER. After a power-up reset, all interrupt sources are disabled (masked). The current mask status can be checked by reading the CAN\_IMR.

The CAN\_SR gives all interrupt source states.

The following events may initiate one of the two interrupts:

- Message object interrupt
  - Data registers in the mailbox object are available to the application. In Receive Mode, a new message was received. In Transmit Mode, a message was transmitted successfully.
  - A sent transmission was aborted.

### System interrupts

- Bus off interrupt: The CAN module enters the bus off state.
- Error passive interrupt: The CAN module enters Error Passive Mode.
- Error Active Mode: The CAN module is neither in Error Passive Mode nor in Bus Off mode.
- Warn Limit interrupt: The CAN module is in Error-active Mode, but at least one of its error counter value exceeds 96.
- Wake-up interrupt: This interrupt is generated after a wake-up and a bus synchronization.
- Sleep interrupt: This interrupt is generated after a Low-power mode enable once all pending messages in transmission have been sent.
- Internal timer counter overflow interrupt: This interrupt is generated when the internal timer rolls over.
- Timestamp interrupt: This interrupt is generated after the reception or the transmission of a start of frame or an end of frame. The value of the internal counter is copied in the CAN\_TIMESTP register.

All interrupts are cleared by clearing the interrupt source except for the internal timer counter overflow interrupt and the timestamp interrupt. These interrupts are cleared by reading the CAN\_SR.

## 40.8.3 CAN Controller Message Handling

### 40.8.3.1 Receive Handling

Two modes are available to configure a mailbox to receive messages. In Receive Mode, the first message received is stored in the mailbox data register. In Receive with Overwrite Mode, the last message received is stored in the mailbox.

### Simple Receive Mailbox

A mailbox is in Receive Mode once the MOT field in the CAN\_MMRx has been configured. Message ID and Message Acceptance Mask must be set before the Receive Mode is enabled.

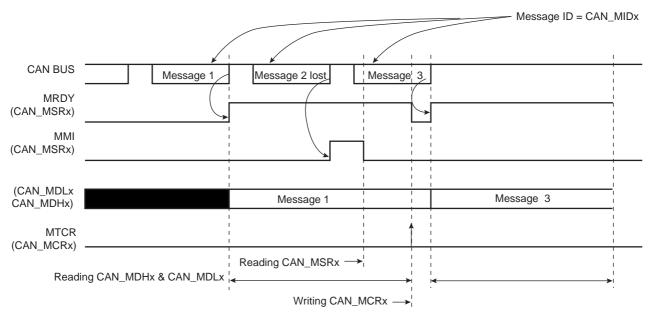

After Receive Mode is enabled, the MRDY flag in the CAN\_MSR is automatically cleared until the first message is received. When the first message has been accepted by the mailbox, the MRDY flag is set. An interrupt is pending for the mailbox while the MRDY flag is set. This interrupt can be masked depending on the mailbox flag in the CAN\_IMR global register.

Message data are stored in the mailbox data register until the software application notifies that data processing has ended. This is done by asking for a new transfer command, setting the MTCR flag in the CAN\_MCRx. This automatically clears the MRDY signal.

The MMI flag in the CAN\_MSRx notifies the software that a message has been lost by the mailbox. This flag is set when messages are received while MRDY is set in the CAN\_MSRx. This flag is cleared by reading the CAN\_MSRs register. A receive mailbox prevents from overwriting the first message by new ones while MRDY flag is set in the CAN\_MSRx. See Figure 40-11.

Figure 40-11. Receive Mailbox

Note: In the case of ARM architecture, CAN\_MSRx, CAN\_MDLx, CAN\_MDHx can be read using an optimized Idm assembler instruction.

### Receive with Overwrite Mailbox

A mailbox is in Receive with Overwrite Mode once the MOT field in the CAN\_MMRx has been configured. Message ID and Message Acceptance masks must be set before Receive Mode is enabled.

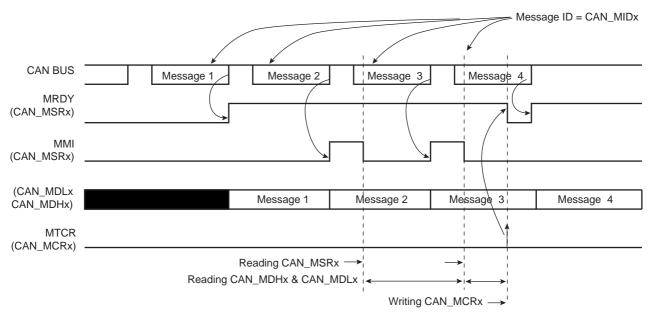

After Receive Mode is enabled, the MRDY flag in the CAN\_MSR is automatically cleared until the first message is received. When the first message has been accepted by the mailbox, the MRDY flag is set. An interrupt is pending for the mailbox while the MRDY flag is set. This interrupt is masked depending on the mailbox flag in the CAN\_IMR global register.

If a new message is received while the MRDY flag is set, this new message is stored in the mailbox data register, overwriting the previous message. The MMI flag in the CAN\_MSRx notifies the software that a message has been dropped by the mailbox. This flag is cleared when reading the CAN\_MSRx.

The CAN controller may store a new message in the CAN data registers while the application reads them. To check that CAN\_MDHx and CAN\_MDLx do not belong to different messages, the application must check the MMI bit in the CAN\_MSRx before and after reading CAN\_MDHx and CAN\_MDLx. If the MMI flag is set again after the data registers have been read, the software application has to re-read CAN\_MDHx and CAN\_MDLx (see Figure 40-12).

Figure 40-12. Receive with Overwrite Mailbox

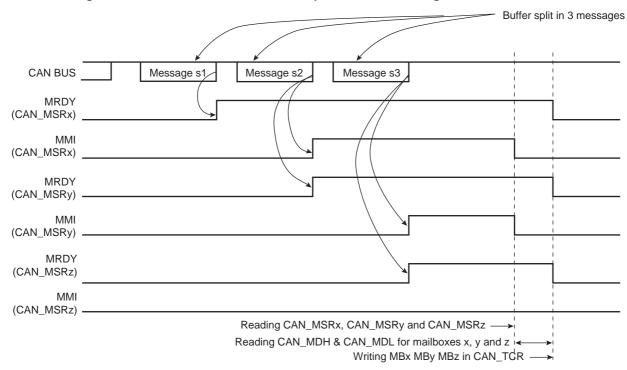

# Chaining Mailboxes

Several mailboxes may be used to receive a buffer split into several messages with the same ID. In this case, the mailbox with the lowest number is serviced first. In the receive and receive with overwrite modes, the field PRIOR in the CAN\_MMRx has no effect. If Mailbox 0 and Mailbox 5 accept messages with the same ID, the first message is received by Mailbox 0 and the second message is received by Mailbox 5. Mailbox 0 must be configured in Receive Mode (i.e., the first message received is considered) and Mailbox 5 must be configured in Receive with Overwrite Mode. Mailbox 0 cannot be configured in Receive with Overwrite Mode; otherwise, all messages are accepted by this mailbox and Mailbox 5 is never serviced.

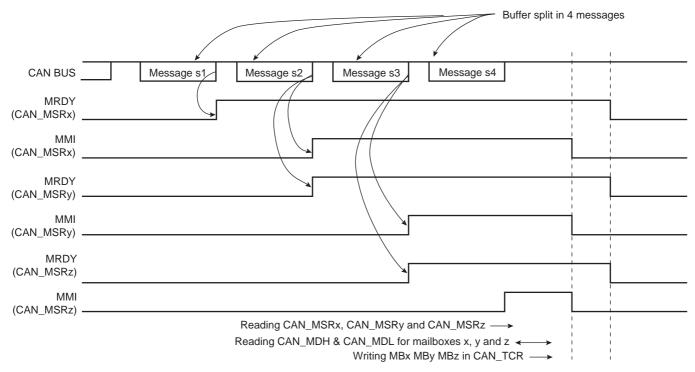

If several mailboxes are chained to receive a buffer split into several messages, all mailboxes except the last one (with the highest number) must be configured in Receive Mode. The first message received is handled by the first mailbox, the second one is refused by the first mailbox and accepted by the second mailbox, the last message is accepted by the last mailbox and refused by previous ones (see Figure 40-13).

Figure 40-13. Chaining Three Mailboxes to Receive a Buffer Split into Three Messages

If the number of mailboxes is not sufficient (the MMI flag of the last mailbox raises), the user must read each data received on the last mailbox in order to retrieve all the messages of the buffer split (see Figure 40-14).

Figure 40-14. Chaining Three Mailboxes to Receive a Buffer Split into Four Messages

### 40.8.3.2 Transmission Handling

A mailbox is in Transmit Mode once the MOT field in the CAN\_MMRx has been configured. Message ID and Message Acceptance mask must be set before Receive Mode is enabled.

After Transmit Mode is enabled, the MRDY flag in the CAN\_MSR is automatically set until the first command is sent. When the MRDY flag is set, the software application can prepare a message to be sent by writing to the CAN\_MDx registers. The message is sent once the software asks for a transfer command setting the MTCR bit and the message data length in the CAN\_MCRx.

The MRDY flag remains at zero as long as the message has not been sent or aborted. It is important to note that no access to the mailbox data register is allowed while the MRDY flag is cleared. An interrupt is pending for the mailbox while the MRDY flag is set. This interrupt can be masked depending on the mailbox flag in the CAN\_IMR global register.

It is also possible to send a remote frame setting the MRTR bit instead of setting the MDLC field. The answer to the remote frame is handled by another reception mailbox. In this case, the device acts as a consumer but with the help of two mailboxes. It is possible to handle the remote frame emission and the answer reception using only one mailbox configured in Consumer Mode. Refer to the section "Remote Frame Handling" on page 937.

Several messages can try to win the bus arbitration in the same time. The message with the highest priority is sent first. Several transfer request commands can be generated at the same time by setting MBx bits in the CAN\_TCR. The priority is set in the PRIOR field of the CAN\_MMRx. Priority 0 is the highest priority, priority 15 is the lowest priority. Thus it is possible to use a part of the message ID to set the PRIOR field. If two mailboxes have the same priority, the message of the mailbox with the lowest number is sent first. Thus if mailbox 0 and mailbox 5 have the same priority and have a message to send at the same time, then the message of the mailbox 0 is sent first.

Setting the MACR bit in the CAN\_MCRx aborts the transmission. Transmission for several mailboxes can be aborted by writing MBx fields in the CAN\_MACR. If the message is being sent when the abort command is set, then the application is notified by the MRDY bit set and not the MABT in the CAN\_MSRx. Otherwise, if the message has not been sent, then the MRDY and the MABT are set in the CAN\_MSR.

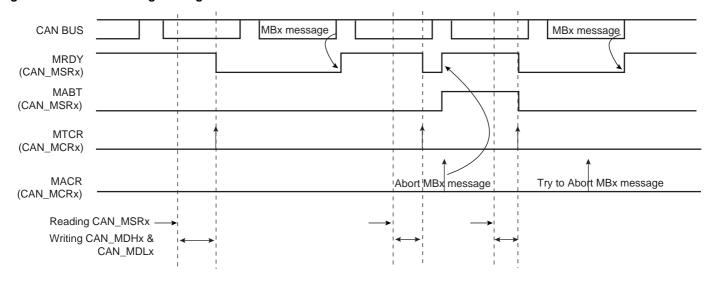

When the bus arbitration is lost by a mailbox message, the CAN controller tries to win the next bus arbitration with the same message if this one still has the highest priority. Messages to be sent are re-tried automatically until they win the bus arbitration. This feature can be disabled by setting the bit DRPT in the CAN\_MR. In this case if the message was not sent the first time it was transmitted to the CAN transceiver, it is automatically aborted. The MABT flag is set in the CAN\_MSRx until the next transfer command.

Figure 40-15 shows three MBx message attempts being made (MRDY of MBx set to 0).

The first MBx message is sent, the second is aborted and the last one is trying to be aborted but too late because it has already been transmitted to the CAN transceiver.

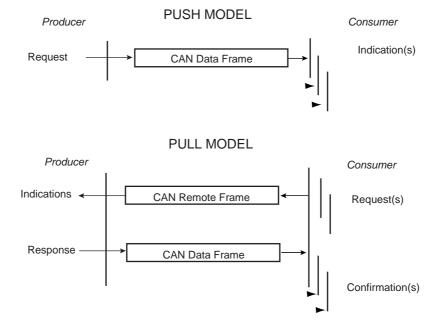

Figure 40-15. Transmitting Messages

#### 40.8.3.3 Remote Frame Handling

Producer/consumer model is an efficient means of handling broadcasted messages. The push model allows a producer to broadcast messages; the pull model allows a customer to ask for messages.

Figure 40-16. Producer / Consumer Model

In Pull Mode, a consumer transmits a remote frame to the producer. When the producer receives a remote frame, it sends the answer accepted by one or many consumers. Using transmit and receive mailboxes, a consumer must dedicate two mailboxes, one in Transmit Mode to send remote frames, and at least one in Receive Mode to capture the producer's answer. The same structure is applicable to a producer: one reception mailbox is required to get the remote frame and one transmit mailbox to answer.

Mailboxes can be configured in Producer or Consumer Mode. A lonely mailbox can handle the remote frame and the answer. With 8 mailboxes, the CAN controller can handle 8 independent producers/consumers.

## Producer Configuration

A mailbox is in Producer Mode once the MOT field in the CAN\_MMRx has been configured. Message ID and Message Acceptance masks must be set before Receive Mode is enabled.

After Producer Mode is enabled, the MRDY flag in the CAN\_MSR is automatically set until the first transfer command. The software application prepares data to be sent by writing to the CAN\_MDHx and the CAN\_MDLx registers, then by setting the MTCR bit in the CAN\_MCRx. Data is sent after the reception of a remote frame as soon as it wins the bus arbitration.

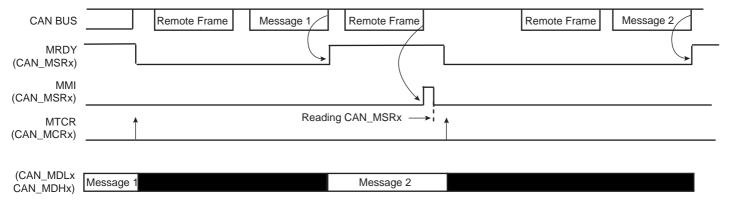

The MRDY flag remains at zero as long as the message has not been sent or aborted. No access to the mailbox data register can be done while MRDY flag is cleared. An interrupt is pending for the mailbox while the MRDY flag is set. This interrupt can be masked according to the mailbox flag in the CAN\_IMR global register.

If a remote frame is received while no data are ready to be sent (signal MRDY set in the CAN\_MSRx), then the MMI signal is set in the CAN\_MSRx. This bit is cleared by reading the CAN\_MSRx.

The MRTR field in the CAN\_MSRx has no meaning. This field is used only when using Receive and Receive with Overwrite modes.

After a remote frame has been received, the mailbox functions like a transmit mailbox. The message with the highest priority is sent first. The transmitted message may be aborted by setting the MACR bit in the CAN\_MCR. Please refer to the section "Transmission Handling" on page 936.

Figure 40-17. Producer Handling

#### Consumer Configuration

A mailbox is in Consumer Mode once the MOT field in the CAN\_MMRx has been configured. Message ID and Message Acceptance masks must be set before Receive Mode is enabled.

After Consumer Mode is enabled, the MRDY flag in the CAN\_MSR is automatically cleared until the first transfer request command. The software application sends a remote frame by setting the MTCR bit in the CAN\_MCRx or the MBx bit in the global CAN\_TCR. The application is notified of the answer by the MRDY flag set in the CAN\_MSRx. The application can read the data contents in the CAN\_MDHx and CAN\_MDLx registers. An interrupt is pending for the mailbox while the MRDY flag is set. This interrupt can be masked according to the mailbox flag in the CAN\_IMR global register.

The MRTR bit in the CAN\_MCRx has no effect. This field is used only when using Transmit Mode.

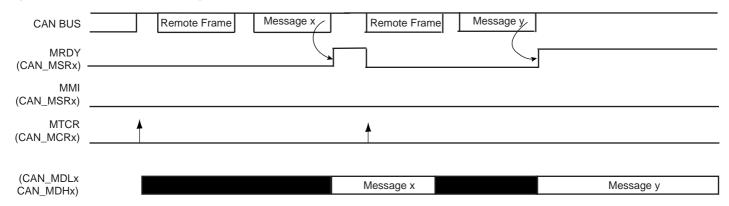

After a remote frame has been sent, the consumer mailbox functions as a reception mailbox. The first message received is stored in the mailbox data registers. If other messages intended for this mailbox have been sent while the MRDY flag is set in the CAN\_MSRx, they will be lost. The application is notified by reading the MMI bit in the CAN\_MSRx. The read operation automatically clears the MMI flag.

If several messages are answered by the Producer, the CAN controller may have one mailbox in consumer configuration, zero or several mailboxes in Receive Mode and one mailbox in Receive with Overwrite Mode. In this

case, the consumer mailbox must have a lower number than the Receive with Overwrite mailbox. The transfer command can be triggered for all mailboxes at the same time by setting several MBx fields in the CAN\_TCR.

Figure 40-18. Consumer Handling

#### 40.8.4 CAN Controller Timing Modes

Using the free running 16-bit internal timer, the CAN controller can be set in one of the two following timing modes:

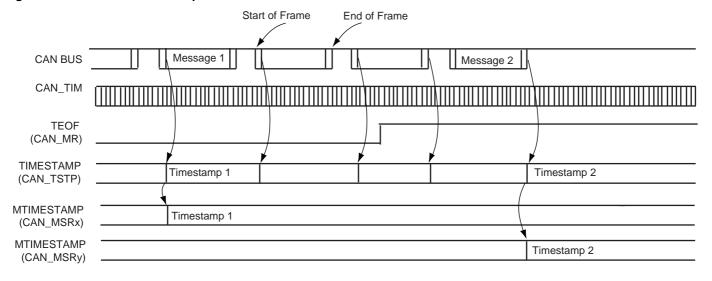

- Timestamping Mode: The value of the internal timer is captured at each Start Of Frame or each End Of Frame.
- Time Triggered Mode: The mailbox transfer operation is triggered when the internal timer reaches the mailbox trigger.

Timestamping Mode is enabled by clearing the TTM bit in the CAN\_MR. Time Triggered Mode is enabled by setting the TTM bit in the CAN\_MR.

#### 40.8.4.1 Timestamping Mode

Each mailbox has its own timestamp value. Each time a message is sent or received by a mailbox, the 16-bit value MTIMESTAMP of the CAN\_TIMESTP register is transferred to the LSB bits of the CAN\_MSRx. The value read in the CAN\_MSRx corresponds to the internal timer value at the Start Of Frame or the End Of Frame of the message handled by the mailbox.

Figure 40-19. Mailbox Timestamp

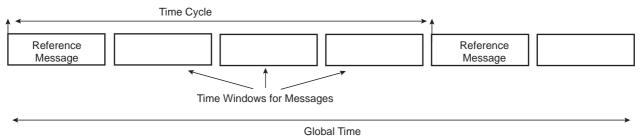

#### 40.8.4.2 Time Triggered Mode

In Time Triggered Mode, basic cycles can be split into several time windows. A basic cycle starts with a reference message. Each time a window is defined from the reference message, a transmit operation should occur within a pre-defined time window. A mailbox must not win the arbitration in a previous time window, and it must not be retried if the arbitration is lost in the time window.

Figure 40-20. Time Triggered Principle

Time Trigger Mode is enabled by setting the TTM field in the CAN\_MR. In Time Triggered Mode, as in Timestamp Mode, the CAN\_TIMESTP field captures the values of the internal counter, but the MTIMESTAMP fields in the CAN MSRx registers are not active and are read at 0.

#### Synchronization by a Reference Message

In Time Triggered Mode, the internal timer counter is automatically reset when a new message is received in the last mailbox. This reset occurs after the reception of the End Of Frame on the rising edge of the MRDY signal in the CAN\_MSRx. This allows synchronization of the internal timer counter with the reception of a reference message and the start a new time window.

### Transmitting within a Time Window

A time mark is defined for each mailbox. It is defined in the 16-bit MTIMEMARK field of the CAN\_MMRx. At each internal timer clock cycle, the value of the CAN\_TIM is compared with each mailbox time mark. When the internal timer counter reaches the MTIMEMARK value, an internal timer event for the mailbox is generated for the mailbox.

In Time Triggered Mode, transmit operations are delayed until the internal timer event for the mailbox. The application prepares a message to be sent by setting the MTCR in the CAN\_MCRx. The message is not sent until the CAN\_TIM value is less than the MTIMEMARK value defined in the CAN\_MMRx.

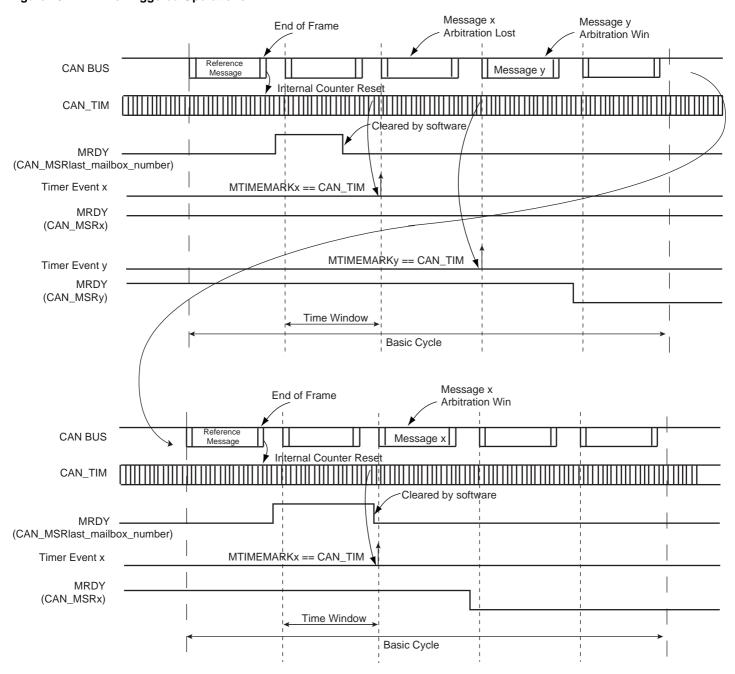

If the transmit operation is failed, i.e., the message loses the bus arbitration and the next transmit attempt is delayed until the next internal time trigger event. This prevents overlapping the next time window, but the message is still pending and is retried in the next time window when CAN\_TIM value equals the MTIMEMARK value. It is also possible to prevent a retry by setting the DRPT field in the CAN\_MR.

#### Freezing the Internal Timer Counter

The internal counter can be frozen by setting TIMFRZ in the CAN\_MR. This prevents an unexpected roll-over when the counter reaches FFFFh. When this occurs, it automatically freezes until a new reset is issued, either due to a message received in the last mailbox or any other reset counter operations. The TOVF bit in the CAN\_SR is set when the counter is frozen. The TOVF bit in the CAN\_SR is cleared by reading the CAN\_SR. Depending on the corresponding interrupt mask in the CAN\_IMR, an interrupt is generated when TOVF is set.

Figure 40-21. Time Triggered Operations

# 40.8.5 Register Write Protection

To prevent any single software error that may corrupt CAN behavior, the registers listed below can be write-protected by setting the WPEN bit in the CAN Write Protection Mode Register (CAN\_WPMR).

If a write access in a write-protected register is detected, then the WPVS flag in the CAN Write Protection Status Register (CAN\_WPSR) is set and the field WPVSRC indicates in which register the write access has been attempted.

The WPVS flag is automatically reset after reading the CAN\_WPSR.

The following registers can be write-protected:

- CAN Mode Register
- CAN Baudrate Register
- CAN Message Mode Register
- CAN Message Acceptance Mask Register
- CAN Message ID Register

# 40.9 Controller Area Network (CAN) User Interface

Table 40-6. Register Mapping

| Offset                    | Register                                    | Name        | Access         | Reset |

## 40.9.1 CAN Mode Register

Name: CAN\_MR

Address: 0xF8000000 (0), 0xF8004000 (1)

Access: Read/Write

| 31   | 30     | 29  | 28   | 27  | 26  | 25  | 24    |
|------|--------|-----|------|-----|-----|-----|-------|
| _    | _      | _   | _    | _   | _   | _   | _     |
| 23   | 22     | 21  | 20   | 19  | 18  | 17  | 16    |
| _    | _      | _   | _    | _   | _   | _   | _     |
| 15   | 14     | 13  | 12   | 11  | 10  | 9   | 8     |
| _    | _      | _   | _    | _   | _   | _   | _     |
| 7    | 6      | 5   | 4    | 3   | 2   | 1   | 0     |
| DRPT | TIMFRZ | TTM | TEOF | OVL | ABM | LPM | CANEN |

This register can only be written if the WPEN bit is cleared in the CAN Write Protection Mode Register.

## • CANEN: CAN Controller Enable

0: The CAN Controller is disabled.

1: The CAN Controller is enabled.

#### • LPM: Disable/Enable Low-power Mode

0: Disable Low-power mode.

1: Enable Low-power mode.

CAN controller enters Low-power mode once all pending messages have been transmitted.

## • ABM: Disable/Enable Autobaud/Listen mode

0: Disable Autobaud/listen mode.

1: Enable Autobaud/listen mode.

#### OVL: Disable/Enable Overload Frame

0: No overload frame is generated.

1: An overload frame is generated after each successful reception for mailboxes configured in Receive with/without overwrite Mode. Producer and Consumer.

## • TEOF: Timestamp messages at each end of Frame

0: The value of CAN\_TIM is captured in the CAN\_TIMESTP register at each Start Of Frame.

1: The value of CAN\_TIM is captured in the CAN\_TIMESTP register at each End Of Frame.

## • TTM: Disable/Enable Time Triggered Mode

0: Time Triggered Mode is disabled.

1: Time Triggered Mode is enabled.

#### • TIMFRZ: Enable Timer Freeze

0: The internal timer continues to be incremented after it reached 0xFFFF.

1: The internal timer stops incrementing after reaching 0xFFFF. It is restarted after a timer reset. See "Freezing the Internal Timer Counter" on page 940.

# • DRPT: Disable Repeat

0: When a transmit mailbox loses the bus arbitration, the transfer request remains pending.

1: When a transmit mailbox loses the bus arbitration, the transfer request is automatically aborted. It automatically raises the MABT and MRDT flags in the corresponding CAN\_MSRx.

# 40.9.2 CAN Interrupt Enable Register

Name: CAN\_IER

Address: 0xF8000004 (0), 0xF8004004 (1)

Access: Write-only

| 31   | 30   | 29     | 28    | 27   | 26   | 25   | 24   |

| MB7  | MB6  | MB5    | MB4   | MB3  | MB2  | MB1  | MB0  |

## • MBx: Mailbox x Interrupt Enable

0: No effect.

1: Enable Mailbox x interrupt.

## • ERRA: Error Active Mode Interrupt Enable

0: No effect.

1: Enable ERRA interrupt.

# • WARN: Warning Limit Interrupt Enable

0: No effect.

1: Enable WARN interrupt.

## • ERRP: Error Passive Mode Interrupt Enable

0: No effect.

1: Enable ERRP interrupt.

## • BOFF: Bus Off Mode Interrupt Enable

0: No effect.

1: Enable BOFF interrupt.

# • SLEEP: Sleep Interrupt Enable

0: No effect.

1: Enable SLEEP interrupt.

# • WAKEUP: Wakeup Interrupt Enable

0: No effect.

1: Enable SLEEP interrupt.

## • TOVF: Timer Overflow Interrupt Enable

0: No effect.

1: Enable TOVF interrupt.

- TSTP: TimeStamp Interrupt Enable
- 0: No effect.
- 1: Enable TSTP interrupt.
- CERR: CRC Error Interrupt Enable
- 0: No effect.
- 1: Enable CRC Error interrupt.
- SERR: Stuffing Error Interrupt Enable
- 0: No effect.
- 1: Enable Stuffing Error interrupt.
- AERR: Acknowledgment Error Interrupt Enable
- 0: No effect.
- 1: Enable Acknowledgment Error interrupt.
- FERR: Form Error Interrupt Enable
- 0: No effect.
- 1: Enable Form Error interrupt.
- BERR: Bit Error Interrupt Enable
- 0: No effect.
- 1: Enable Bit Error interrupt.

# 40.9.3 CAN Interrupt Disable Register

Name: CAN\_IDR

**Address:** 0xF8000008 (0), 0xF8004008 (1)

Access: Write-only

## • MBx: Mailbox x Interrupt Mask

0: Mailbox x interrupt is disabled.

1: Mailbox x interrupt is enabled.

## ERRA: Error Active Mode Interrupt Mask

0: ERRA interrupt is disabled.

1: ERRA interrupt is enabled.

# WARN: Warning Limit Interrupt Mask

0: Warning Limit interrupt is disabled.

1: Warning Limit interrupt is enabled.

## • ERRP: Error Passive Mode Interrupt Mask

0: ERRP interrupt is disabled.

1: ERRP interrupt is enabled.

## • BOFF: Bus Off Mode Interrupt Mask

0: BOFF interrupt is disabled.

1: BOFF interrupt is enabled.

# • SLEEP: Sleep Interrupt Mask

0: SLEEP interrupt is disabled.

1: SLEEP interrupt is enabled.

# • WAKEUP: Wakeup Interrupt Mask

0: WAKEUP interrupt is disabled.

1: WAKEUP interrupt is enabled.

## • TOVF: Timer Overflow Interrupt Mask

0: TOVF interrupt is disabled.

1: TOVF interrupt is enabled.

# • TSTP: Timestamp Interrupt Mask

- 0: TSTP interrupt is disabled.
- 1: TSTP interrupt is enabled.

## • CERR: CRC Error Interrupt Mask

- 0: CRC Error interrupt is disabled.
- 1: CRC Error interrupt is enabled.

## • SERR: Stuffing Error Interrupt Mask

- 0: Bit Stuffing Error interrupt is disabled.
- 1: Bit Stuffing Error interrupt is enabled.

## AERR: Acknowledgment Error Interrupt Mask

- 0: Acknowledgment Error interrupt is disabled.
- 1: Acknowledgment Error interrupt is enabled.

# • FERR: Form Error Interrupt Mask

- 0: Form Error interrupt is disabled.
- 1: Form Error interrupt is enabled.

## • BERR: Bit Error Interrupt Mask

- 0: Bit Error interrupt is disabled.
- 1: Bit Error interrupt is enabled.

## 40.9.5 CAN Status Register

Name: CAN\_SR

**Address:** 0xF8000010 (0), 0xF8004010 (1)

Access: Read-only

| 31    | 30   | 29     | 28    | 27   | 26   | 25   | 24   |
|-------|------|--------|-------|------|------|------|------|
| OVLSY | TBSY | RBSY   | BERR  | FERR | AERR | SERR | CERR |
| 23    | 22   | 21     | 20    | 19   | 18   | 17   | 16   |
| TSTP  | TOVF | WAKEUP | SLEEP | BOFF | ERRP | WARN | ERRA |
| 15    | 14   | 13     | 12    | 11   | 10   | 9    | 8    |
| -     | _    | _      | _     | _    | _    | _    | _    |
| 7     | 6    | 5      | 4     | 3    | 2    | 1    | 0    |
| MB7   | MB6  | MB5    | MB4   | MB3  | MB2  | MB1  | MB0  |

#### . MBx: Mailbox x Event

0: No event occurred on Mailbox x.

1: An event occurred on Mailbox x.

An event corresponds to MRDY, MABT bits in the CAN\_MSRx.

#### ERRA: Error Active Mode (automatically cleared by reading CAN\_SR)

0: CAN controller has not reached Error Active Mode since the last read of CAN SR.

1: CAN controller has reached Error Active Mode since the last read of CAN\_SR.

This flag is set depending on TEC and REC counter values. It is set when a node is neither in Error Passive Mode nor in Bus Off Mode.

## WARN: Warning Limit (automatically cleared by reading CAN\_SR)

0: CAN controller Warning Limit has not been reached since the last read of CAN\_SR.

1: CAN controller Warning Limit has been reached since the last read of CAN\_SR.

This flag is set depending on TEC and REC counter values. It is set when at least one of the counter values has reached a value greater or equal to 96.

#### ERRP: Error Passive Mode (automatically cleared by reading CAN SR)

0: CAN controller has not reached Error Passive Mode since the last read of CAN\_SR.

1: CAN controller has reached Error Passive Mode since the last read of CAN\_SR.

This flag is set depending on TEC and REC counters values.

A node is in error passive state when TEC counter is greater or equal to 128 (decimal) or when the REC counter is greater or equal to 128 (decimal).

#### BOFF: Bus Off Mode (automatically cleared by reading CAN\_SR)

0: CAN controller has not reached Bus Off Mode.

1: CAN controller has reached Bus Off Mode since the last read of CAN\_SR.

This flag is set depending on TEC counter value. A node is in bus off state when TEC counter is greater or equal to 256 (decimal).

## • SLEEP: CAN Controller in Low-power Mode

- 0: CAN controller is not in Low-power mode.
- 1: CAN controller is in Low-power mode.

This flag is automatically reset when Low-power mode is disabled

#### WAKEUP: CAN Controller is not in Low-power Mode

- 0: CAN controller is in Low-power mode.
- 1: CAN controller is not in Low-power mode.

When a WAKEUP event occurs, the CAN controller is synchronized with the bus activity. Messages can be transmitted or received. The CAN controller clock must be available when a WAKEUP event occurs. This flag is automatically reset when the CAN Controller enters Low-power mode.

## TOVF: Timer Overflow (automatically cleared by reading CAN\_SR)

- 0: The timer has not rolled-over FFFFh to 0000h.
- 1: The timer rolls-over FFFFh to 0000h.

## TSTP: Timestamp (automatically cleared by reading CAN\_SR)

- 0: No bus activity has been detected.
- 1: A start of frame or an end of frame has been detected (according to the TEOF field in the CAN MR).

### CERR: Mailbox CRC Error (automatically cleared by reading CAN\_SR)

- 0: No CRC error occurred during a previous transfer.
- 1: A CRC error occurred during a previous transfer.
- A CRC error has been detected during last reception.

#### SERR: Mailbox Stuffing Error (automatically cleared by reading CAN\_SR)

- 0: No stuffing error occurred during a previous transfer.
- 1: A stuffing error occurred during a previous transfer.

A form error results from the detection of more than five consecutive bit with the same polarity.

## AERR: Acknowledgment Error (automatically cleared by reading CAN\_SR)

- 0: No acknowledgment error occurred during a previous transfer.
- 1: An acknowledgment error occurred during a previous transfer.

An acknowledgment error is detected when no detection of the dominant bit in the acknowledge slot occurs.

## • FERR: Form Error (automatically cleared by reading CAN\_SR)

- 0: No form error occurred during a previous transfer
- 1: A form error occurred during a previous transfer

A form error results from violations on one or more of the fixed form of the following bit fields:

- CRC delimiter
- ACK delimiter
- End of frame
- Error delimiter
- Overload delimiter

## BERR: Bit Error (automatically cleared by reading CAN\_SR)

- 0: No bit error occurred during a previous transfer.
- 1: A bit error occurred during a previous transfer.

A bit error is set when the bit value monitored on the line is different from the bit value sent.

#### RBSY: Receiver busy

- 0: CAN receiver is not receiving a frame.
- 1: CAN receiver is receiving a frame.

Receiver busy. This status bit is set by hardware while CAN receiver is acquiring or monitoring a frame (remote, data, overload or error frame). It is automatically reset when CAN is not receiving.

## TBSY: Transmitter busy

- 0: CAN transmitter is not transmitting a frame.
- 1: CAN transmitter is transmitting a frame.

Transmitter busy. This status bit is set by hardware while CAN transmitter is generating a frame (remote, data, overload or error frame). It is automatically reset when CAN is not transmitting.

### OVLSY: Overload busy

- 0: CAN transmitter is not transmitting an overload frame.
- 1: CAN transmitter is transmitting a overload frame.

It is automatically reset when the bus is not transmitting an overload frame.

## 40.9.6 CAN Baudrate Register

Name: CAN\_BR

**Address:** 0xF8000014 (0), 0xF8004014 (1)

Access: Read/Write

| 31 | 30 | 29     | 28  | 27 | 26     | 25     | 24  |  |
|----|----|--------|-----|----|--------|--------|-----|--|
| _  | _  | _      | _   | _  | _      | _      | SMP |  |
| 23 | 22 | 21     | 20  | 19 | 18     | 17     | 16  |  |
| _  |    |        | BRP |    |        |        |     |  |
| 15 | 14 | 13     | 12  | 11 | 10     | 9      | 8   |  |
| _  | _  | Su     | JW  | _  | PROPAG |        |     |  |
| 7  | 6  | 5      | 4   | 3  | 2      | 1      | 0   |  |
| _  |    | PHASE1 |     | -  |        | PHASE2 |     |  |

This register can only be written if the WPEN bit is cleared in the CAN Write Protection Mode Register.

Any modification on one of the fields of the CAN BR must be done while CAN module is disabled.

To compute the different bit timings, please refer to the Section 40.7.4.1 "CAN Bit Timing Configuration" on page 923.

#### • PHASE2: Phase 2 Segment

This phase is used to compensate the edge phase error.

$$t_{PHS2} = t_{CSC} \times (PHASE2 + 1)$$

Warning: PHASE2 value must be different from 0.

## • PHASE1: Phase 1 Segment

This phase is used to compensate for edge phase error.

$$t_{PHS1} = t_{CSC} \times (PHASE1 + 1)$$

### • PROPAG: Programming Time Segment

This part of the bit time is used to compensate for the physical delay times within the network.

$$t_{PRS} = t_{CSC} \times (PROPAG + 1)$$

## • SJW: Re-synchronization Jump Width

To compensate for phase shifts between clock oscillators of different controllers on bus. The controller must re-synchronize on any relevant signal edge of the current transmission. The synchronization jump width defines the maximum of clock cycles a bit period may be shortened or lengthened by re-synchronization.

$$t_{SIW} = t_{CSC} \times (SJW + 1)$$

#### • BRP: Baudrate Prescaler

This field allows user to program the period of the CAN system clock to determine the individual bit timing.

$$t_{CSC} = (BRP + 1) / t_{peripheral clock}$$

The BRP field must be within the range [1, 0x7F], i.e., BRP = 0 is not authorized.

#### SMP: Sampling Mode

0 (ONCE): The incoming bit stream is sampled once at sample point.

1 (THREE): The incoming bit stream is sampled three times with a period of a peripheral clock, centered on sample point. SMP Sampling Mode is automatically disabled if BRP = 0.

# 40.9.7 CAN Timer Register

Name: CAN\_TIM

Address: 0xF8000018 (0), 0xF8004018 (1)

Access: Read-only

| 31 | 30 | 29 | 28  | 27  | 26 | 25 | 24 |
|----|----|----|-----|-----|----|----|----|
| _  | _  | _  | _   | _   | -  | _  | _  |
| 23 | 22 | 21 | 20  | 19  | 18 | 17 | 16 |
| _  | _  | _  | -   | _   | _  | _  | -  |
| 15 | 14 | 13 | 12  | 11  | 10 | 9  | 8  |
|    |    |    | TIM | IER |    |    |    |
| 7  | 6  | 5  | 4   | 3   | 2  | 1  | 0  |
|    |    |    | TIM | IER |    |    |    |

# • TIMER: Timer

This field represents the internal CAN controller 16-bit timer value.

# 40.9.8 CAN Timestamp Register

Name: CAN\_TIMESTP

Address: 0xF800001C (0), 0xF800401C (1)

Access: Read-only

| 31 | 30 | 29 | 28     | 27    | 26 | 25 | 24 |
|----|----|----|--------|-------|----|----|----|
| _  | _  | _  | _      | _     | _  | _  | _  |
| 23 | 22 | 21 | 20     | 19    | 18 | 17 | 16 |
| _  | _  | _  | -      | _     | -  | _  | _  |
| 15 | 14 | 13 | 12     | 11    | 10 | 9  | 8  |
|    |    |    | MTIMES | STAMP |    |    |    |
| 7  | 6  | 5  | 4      | 3     | 2  | 1  | 0  |
|    |    |    | MTIMES | STAMP |    |    |    |

# • MTIMESTAMP: Timestamp

This field carries the value of the internal CAN controller 16-bit timer value at the start or end of frame.

If the TEOF bit is cleared in the CAN\_MR, the internal Timer Counter value is captured in the MTIMESTAMP field at each start of frame else the value is captured at each end of frame. When the value is captured, the TSTP flag is set in the CAN\_SR. If the TSTP mask in the CAN\_IMR is set, an interrupt is generated while TSTP flag is set in the CAN\_SR. The TSTP flag is cleared by reading the CAN\_SR.

Note: The CAN\_TIMESTP register is reset when the CAN is disabled then enabled via the CANEN bit in the CAN\_MR.

## 40.9.9 CAN Error Counter Register

Name: CAN ECR

**Address:** 0xF8000020 (0), 0xF8004020 (1)

Access: Read-only

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24  |
|----|----|----|----|----|----|----|-----|
| _  | _  | _  | _  | _  | _  | _  | TEC |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16  |
|    |    |    | TE | C  |    |    |     |
| 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8   |
| _  | _  | _  | _  | _  | -  | _  | _   |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0   |
|    |    |    | RE | C  |    |    |     |

#### • REC: Receive Error Counter

When a receiver detects an error, REC will be increased by one, except when the detected error is a BIT ERROR while sending an ACTIVE ERROR FLAG or an OVERLOAD FLAG.

When a receiver detects a dominant bit as the first bit after sending an ERROR FLAG, REC is increased by 8.

When a receiver detects a BIT ERROR while sending an ACTIVE ERROR FLAG, REC is increased by 8.

Any node tolerates up to 7 consecutive dominant bits after sending an ACTIVE ERROR FLAG, PASSIVE ERROR FLAG or OVERLOAD FLAG. After detecting the 14th consecutive dominant bit (in case of an ACTIVE ERROR FLAG or an OVERLOAD FLAG) or after detecting the 8th consecutive dominant bit following a PASSIVE ERROR FLAG, and after each sequence of additional eight consecutive dominant bits, each receiver increases its REC by 8.

After successful reception of a message, REC is decreased by 1 if it was between 1 and 127. If REC was 0, it stays 0, and if it was greater than 127, then it is set to a value between 119 and 127.

#### • TEC: Transmit Error Counter

When a transmitter sends an ERROR FLAG, TEC is increased by 8 except when

- the transmitter is error passive and detects an ACKNOWLEDGMENT ERROR because of not detecting a dominant ACK and does not detect a dominant bit while sending its PASSIVE ERROR FLAG.
- the transmitter sends an ERROR FLAG because a STUFF ERROR occurred during arbitration and should have been recessive and has been sent as recessive but monitored as dominant.

When a transmitter detects a BIT ERROR while sending an ACTIVE ERROR FLAG or an OVERLOAD FLAG, the TEC will be increased by 8.

Any node tolerates up to 7 consecutive dominant bits after sending an ACTIVE ERROR FLAG, PASSIVE ERROR FLAG or OVERLOAD FLAG. After detecting the 14th consecutive dominant bit (in case of an ACTIVE ERROR FLAG or an OVERLOAD FLAG) or after detecting the 8th consecutive dominant bit following a PASSIVE ERROR FLAG, and after each sequence of additional eight consecutive dominant bits every transmitter increases its TEC by 8.

After a successful transmission the TEC is decreased by 1 unless it was already 0.

# 40.9.10 CAN Transfer Command Register

Name: CAN\_TCR

**Address:** 0xF8000024 (0), 0xF8004024 (1)

Access: Write-only

| 31     | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|--------|-----|-----|-----|-----|-----|-----|-----|
| TIMRST | _   | _   | _   | _   | _   | _   | _   |
| 23     | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| _      | _   | _   | _   | _   | _   | _   | _   |
| 15     | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| _      | _   | _   | _   | _   | _   | _   | _   |
| 7      | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| MB7    | MB6 | MB5 | MB4 | MB3 | MB2 | MB1 | MB0 |

This register initializes several transfer requests at the same time.

#### MBx: Transfer Request for Mailbox x

| Mailbox Object Type    | Description  |
|------------------------|--|
| Receive                | It receives the next message.  |
| Receive with overwrite | This triggers a new reception.   |
| Transmit               | Sends data prepared in the mailbox as soon as possible.                            |
| Consumer               | Sends a remote frame.  |
| Producer               | Sends data prepared in the mailbox after receiving a remote frame from a consumer. |

This flag clears the MRDY and MABT flags in the corresponding CAN\_MSRx.

When several mailboxes are requested to be transmitted simultaneously, they are transmitted in turn, starting with the mailbox with the highest priority. If several mailboxes have the same priority, then the mailbox with the lowest number is sent first (i.e., MB0 will be transferred before MB1).

#### • TIMRST: Timer Reset

Resets the internal timer counter. If the internal timer counter is frozen, this command automatically re-enables it. This command is useful in Time Triggered mode.

# 40.9.11 CAN Abort Command Register

Name: CAN\_ACR

**Address:** 0xF8000028 (0), 0xF8004028 (1)

Access: Write-only

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|-----|-----|-----|-----|-----|-----|-----|-----|
| _   | _   | _   | _   | _   | _   | _   | _   |
| 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| _   | _   | _   | _   | _   | _   | _   | _   |
| 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| _   | _   | _   | _   | _   | _   | _   | _   |
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| MB7 | MB6 | MB5 | MB4 | MB3 | MB2 | MB1 | MB0 |

This register initializes several abort requests at the same time.

## • MBx: Abort Request for Mailbox x

| Mailbox Object Type    | Description  |
|------------------------|--|
| Receive                | No action  |
| Receive with overwrite | No action  |
| Transmit               | Cancels transfer request if the message has not been transmitted to the CAN transceiver. |
| Consumer               | Cancels the current transfer before the remote frame has been sent.                      |
| Producer               | Cancels the current transfer. The next remote frame is not serviced.                     |

It is possible to set the MACR field (in the CAN\_MCRx) for each mailbox.

# 40.9.12 CAN Write Protection Mode Register

Name: CAN\_WPMR

**Address:** 0xF80000E4 (0), 0xF80040E4 (1)

Access: Read/Write

| 31 | 30 | 29 | 28 | 27  | 26 | 25 | 24   |
|----|----|----|----|-----|----|----|------|
|    |    |    | WP | KEY |    |    |      |
| 23 | 22 | 21 | 20 | 19  | 18 | 17 | 16   |
|    |    |    | WP | KEY |    |    |      |
| 15 | 14 | 13 | 12 | 11  | 10 | 9  | 8    |
|    |    |    | WP | KEY |    |    |      |
| 7  | 6  | 5  | 4  | 3   | 2  | 1  | 0    |
| _  | _  | _  | _  | _   | _  | _  | WPEN |

## • WPEN: Write Protection Enable

0: Disables the write protection if WPKEY corresponds to 0x43414E ("CAN" written in ASCII)

1: Enables the write protection if WPKEY corresponds to 0x43414E ("CAN" written in ASCII)

See Section 40.8.5 "Register Write Protection" for the list of registers that can be write-protected.

# • WPKEY: Write Protection Key Password

| Value    | Name   | Description   |  |  |  |
|----------|--------|---|--|--|--|
| 0x43414E | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. |  |  |  |
| 0X43414E | PASSWD | Always reads as 0   |  |  |  |

# 40.9.13 CAN Write Protection Status Register

Name: CAN\_WPSR

**Address:** 0xF80000E8 (0), 0xF80040E8 (1)

Access: Read-only

| 31 | 30 | 29 | 28  | 27   | 26 | 25 | 24   |
|----|----|----|-----|------|----|----|------|
| _  | _  | _  |     | _    | _  | -  | _    |
| 23 | 22 | 21 | 20  | 19   | 18 | 17 | 16   |
| _  | _  | _  | -   | _    | _  | -  | _    |
| 15 | 14 | 13 | 12  | 11   | 10 | 9  | 8    |
|    |    |    | WPV | 'SRC |    |    |      |
| 7  | 6  | 5  | 4   | 3    | 2  | 1  | 0    |
| _  | _  | _  | -   | _    |    | 1  | WPVS |

#### • WPVS: Write Protection Violation Status

0: No write protection violation has occurred since the last read of the CAN\_WPSR.

#### WPVSRC: Write Protection Violation Source

When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

<sup>1:</sup> A write protection violation has occurred since the last read of the CAN\_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

## 40.9.14 CAN Message Mode Register

Name: CAN\_MMRx [x=0..7]

**Address:** 0xF8000200 (0)[0], 0xF8000220 (0)[1], 0xF8000240 (0)[2], 0xF8000260 (0)[3], 0xF8000280 (0)[4],

0xF80002A0 (0)[5], 0xF80002C0 (0)[6], 0xF80002E0 (0)[7], 0xF8004200 (1)[0], 0xF8004220 (1)[1], 0xF8004240 (1)[2], 0xF8004260 (1)[3], 0xF8004280 (1)[4], 0xF80042A0 (1)[5], 0xF80042C0 (1)[6],

0xF80042E0 (1)[7]

Access: Read/Write

| 31 | 30 | 29 | 28    | 27   | 26  | 25  | 24 |
|----|----|----|-------|------|-----|-----|----|
| _  | _  | _  | _     | _    |     | MOT |    |
| 23 | 22 | 21 | 20    | 19   | 18  | 17  | 16 |
| _  | _  | _  | _     |      | PRI | OR  |    |
| 15 | 14 | 13 | 12    | 11   | 10  | 9   | 8  |
|    |    |    | MTIME | MARK |     |     |    |
| 7  | 6  | 5  | 4     | 3    | 2   | 1   | 0  |
|    |    |    | MTIME | MARK |     |     |    |

This register can only be written if the WPEN bit is cleared in the CAN Write Protection Mode Register.

## • MTIMEMARK: Mailbox Timemark

This field is active in Time Triggered Mode. Transmit operations are allowed when the internal timer counter reaches the Mailbox Timemark. See "Transmitting within a Time Window" on page 940.

In Timestamp Mode, MTIMEMARK is set to 0.

#### PRIOR: Mailbox Priority

This field has no effect in receive and receive with overwrite modes. In these modes, the mailbox with the lowest number is serviced first.

When several mailboxes try to transmit a message at the same time, the mailbox with the highest priority is serviced first. If several mailboxes have the same priority, the mailbox with the lowest number is serviced first (i.e., MBx0 is serviced before MBx 15 if they have the same priority).

#### MOT: Mailbox Object Type

This field allows the user to define the type of the mailbox. All mailboxes are independently configurable. Five different types are possible for each mailbox.

| Value | Name            | Description  |
|-------|-----------------|--|
| 0     | MB_DISABLED     | Mailbox is disabled. This prevents receiving or transmitting any messages with this mailbox.   |
| 1     | MB_RX           | Reception Mailbox. Mailbox is configured for reception. If a message is received while the mailbox data register is full, it is discarded.                               |
| 2     | MB_RX_OVERWRITE | Reception mailbox with overwrite. Mailbox is configured for reception. If a message is received while the mailbox is full, it overwrites the previous message.           |
| 3     | MB_TX           | Transmit mailbox. Mailbox is configured for transmission.  |
| 4     | MB_CONSUMER     | Consumer Mailbox. Mailbox is configured in reception but behaves as a Transmit Mailbox, i.e., it sends a remote frame and waits for an answer.                           |
| 5     | MB_PRODUCER     | Producer Mailbox. Mailbox is configured in transmission but also behaves like a reception mailbox, i.e., it waits to receive a Remote Frame before sending its contents. |
| 6     | _               | Reserved   |

## 40.9.15 CAN Message Acceptance Mask Register

Name: CAN\_MAMx [x=0..7]

**Address:** 0xF8000204 (0)[0], 0xF8000224 (0)[1], 0xF8000244 (0)[2], 0xF8000264 (0)[3], 0xF8000284 (0)[4],

0xF80002A4 (0)[5], 0xF80002C4 (0)[6], 0xF80002E4 (0)[7], 0xF8004204 (1)[0], 0xF8004224 (1)[1], 0xF8004244 (1)[2], 0xF8004264 (1)[3], 0xF8004284 (1)[4], 0xF80042A4 (1)[5], 0xF80042C4 (1)[6],

0xF80042E4 (1)[7]

Access: Read/Write

| 31 | 30 | 29   | 28  | 27  | 26    | 25  | 24  |
|----|----|------|-----|-----|-------|-----|-----|
| _  | _  | MIDE |     |     | MIDvA |     |     |
| 23 | 22 | 21   | 20  | 19  | 18    | 17  | 16  |
|    |    | MIE  | DvA |     |       | MII | DvB |
| 15 | 14 | 13   | 12  | 11  | 10    | 9   | 8   |
|    |    |      | MI  | DvB |       |     |     |
| 7  | 6  | 5    | 4   | 3   | 2     | 1   | 0   |
|    |    |      | MI  | DvB |       |     |     |

This register can only be written if the WPEN bit is cleared in the CAN Write Protection Mode Register.

To prevent concurrent access with the internal CAN core, the application must disable the mailbox before writing to CAN\_MAMx registers.

#### . MIDvB: Complementary bits for identifier in extended frame mode

Acceptance mask for corresponding field of the message IDvB register of the mailbox.

#### . MIDvA: Identifier for standard frame mode

Acceptance mask for corresponding field of the message IDvA register of the mailbox.

#### • MIDE: Identifier Version

0: Compares IDvA from the received frame with the CAN\_MIDx register masked with CAN\_MAMx register.

1: Compares IDvA and IDvB from the received frame with the CAN\_MIDx register masked with CAN\_MAMx register.

# 40.9.16 CAN Message ID Register

Name: CAN\_MIDx [x=0..7]

**Address:** 0xF8000208 (0)[0], 0xF8000228 (0)[1], 0xF8000248 (0)[2], 0xF8000268 (0)[3], 0xF8000288 (0)[4],

0xF80002A8 (0)[5], 0xF80002C8 (0)[6], 0xF80002E8 (0)[7], 0xF8004208 (1)[0], 0xF8004228 (1)[1], 0xF8004248 (1)[2], 0xF8004268 (1)[3], 0xF8004288 (1)[4], 0xF80042A8 (1)[5], 0xF80042C8 (1)[6],

0xF80042E8 (1)[7]

Access: Read/Write

| 31 | 30 | 29   | 28  | 27  | 26    | 25  | 24  |
|----|----|------|-----|-----|-------|-----|-----|
| _  | _  | MIDE |     |     | MIDvA |     |     |
| 23 | 22 | 21   | 20  | 19  | 18    | 17  | 16  |
|    |    | MIC  | ΟνΑ |     |       | MII | OvB |
| 15 | 14 | 13   | 12  | 11  | 10    | 9   | 8   |
|    |    |      | MI  | DvB |       |     |     |
| 7  | 6  | 5    | 4   | 3   | 2     | 1   | 0   |
|    |    |      | MI  | DvB |       |     |     |

This register can only be written if the WPEN bit is cleared in the CAN Write Protection Mode Register.

To prevent concurrent access with the internal CAN core, the application must disable the mailbox before writing to CAN\_MIDx registers.

# MIDvB: Complementary bits for identifier in extended frame mode

If MIDE is cleared, MIDvB value is 0.

#### • MIDE: Identifier Version

This bit allows the user to define the version of messages processed by the mailbox. If set, mailbox is dealing with version 2.0 Part B messages; otherwise, mailbox is dealing with version 2.0 Part A messages.

#### MIDvA: Identifier for standard frame mode

# 40.9.17 CAN Message Family ID Register

Name: CAN\_MFIDx [x=0..7]

Address: 0xF800020C (0)[0], 0xF800022C (0)[1], 0xF800024C (0)[2], 0xF800026C (0)[3], 0xF800028C (0)[4],

## • MFID: Family ID

This field contains the concatenation of CAN\_MIDx register bits masked by the CAN\_MAMx register. This field is useful to speed up message ID decoding. The message acceptance procedure is described below.

As an example:

CAN\_MIDx = 0x305A4321 CAN\_MAMx = 0x3FF0F0FF CAN\_MFIDx = 0x000000A3

# 40.9.18 CAN Message Status Register

Name: CAN\_MSRx [x=0..7]

**Address:** 0xF8000210 (0)[0], 0xF8000230 (0)[1], 0xF8000250 (0)[2], 0xF8000270 (0)[3], 0xF8000290 (0)[4],

0xF80002B0 (0)[5], 0xF80002D0 (0)[6], 0xF80002F0 (0)[7], 0xF8004210 (1)[0], 0xF8004230 (1)[1], 0xF8004250 (1)[2], 0xF8004270 (1)[3], 0xF8004290 (1)[4], 0xF80042B0 (1)[5], 0xF80042D0 (1)[6],

0xF80042F0 (1)[7]

Access: Read-only

| 31   | 30   | 29 | 28    | 27    | 26 | 25 | 24  |
|------|------|----|-------|-------|----|----|-----|
| _    | _    | _  | _     | _     | _  | _  | MMI |
| 23   | 22   | 21 | 20    | 19    | 18 | 17 | 16  |
| MRDY | MABT | _  | MRTR  |       | MD | LC |     |
| 15   | 14   | 13 | 12    | 11    | 10 | 9  | 8   |
|      |      |    | MTIME | STAMP |    |    |     |
| 7    | 6    | 5  | 4     | 3     | 2  | 1  | 0   |
|      |      |    | MTIME | STAMP |    |    |     |

These register fields are updated each time a message transfer is received or aborted.

Warning: MRTR and MDLC state depends partly on the mailbox object type.

#### • MTIMESTAMP: Timer value

This field is updated only when time-triggered operations are disabled (TTM cleared in CAN\_MR). If the field CAN\_MR.TEOF is cleared, TIMESTAMP is the internal timer value at the start of frame of the last message received or sent by the mailbox. If the field CAN\_MR.TEOF is set, TIMESTAMP is the internal timer value at the end of frame of the last message received or sent by the mailbox.

In Time Triggered Mode, MTIMESTAMP is set to 0.

#### MDLC: Mailbox Data Length Code

| Mailbox Object Type    | Description   |
|------------------------|---|
| Receive                | Length of the first mailbox message received                              |
| Receive with overwrite | Length of the last mailbox message received                               |
| Transmit               | No action   |
| Consumer               | Length of the mailbox message received                                    |
| Producer               | Length of the mailbox message to be sent after the remote frame reception |

## • MRTR: Mailbox Remote Transmission Request

| Mailbox Object Type    | Description   |  |
|------------------------|---|--|
| Receive                | e first frame received has the RTR bit set.                               |  |
| Receive with overwrite | ast frame received has the RTR bit set.                                   |  |
| Transmit               | Reserved  |  |
| Consumer               | Reserved. After setting the MOT field in the CAN_MMR, MRTR is reset to 1. |  |
| Producer               | Reserved. After setting the MOT field in the CAN_MMR, MRTR is reset to 0. |  |

# • MABT: Mailbox Message Abort (cleared by writing MTCR or MACR in the CAN\_MCRx)

An interrupt is triggered when MABT is set.

0: Previous transfer is not aborted.

1: Previous transfer has been aborted.

| Mailbox Object Type    | Description   |  |
|------------------------|---|--|
| Receive                | eserved   |  |
| Receive with overwrite | erved   |  |
| Transmit               | revious transfer has been aborted                           |  |
| Consumer               | The remote frame transfer request has been aborted.         |  |
| Producer               | The response to the remote frame transfer has been aborted. |  |

## MRDY: Mailbox Ready (cleared by writing MTCR or MACR in the CAN\_MCRx)

An interrupt is triggered when MRDY is set.

0: Mailbox data registers can not be read/written by the software application. CAN\_MDx are locked by the CAN\_MDx.

1: Mailbox data registers can be read/written by the software application.

| Mailbox Object Type    | Description   |
|------------------------|---|
| Receive                | At least one message has been received since the last mailbox transfer order. Data from the first frame received can be read in the CAN_MDxx registers.   |
|                        | After setting the MOT field in the CAN_MMR, MRDY is reset to 0.   |
| Receive with overwrite | At least one frame has been received since the last mailbox transfer order. Data from the last frame received can be read in the CAN_MDxx registers.      |
|                        | After setting the MOT field in the CAN_MMR, MRDY is reset to 0.   |
| Transmit               | Mailbox data have been transmitted.   |
| Transmit               | After setting the MOT field in the CAN_MMR, MRDY is reset to 1.   |
| Consumer               | At least one message has been received since the last mailbox transfer order. Data from the first message received can be read in the CAN_MDxx registers. |
|                        | After setting the MOT field in the CAN_MMR, MRDY is reset to 0.   |
| Droducer               | A remote frame has been received, mailbox data have been transmitted.   |
| Producer               | After setting the MOT field in the CAN_MMR, MRDY is reset to 1.   |

# MMI: Mailbox Message Ignored (cleared by reading CAN\_MSRx)

0: No message has been ignored during the previous transfer

1: At least one message has been ignored during the previous transfer

| Mailbox Object Type    | Description  |
|------------------------|--|
| Receive                | Set when at least two messages intended for the mailbox have been sent. The first one is available in the mailbox data register. Others have been ignored. A mailbox with a lower priority may have accepted the message.                    |
| Receive with overwrite | Set when at least two messages intended for the mailbox have been sent. The last one is available in the mailbox data register. Previous ones have been lost.  |
| Transmit               | Reserved   |
| Consumer               | A remote frame has been sent by the mailbox but several messages have been received. The first one is available in the mailbox data register. Others have been ignored. Another mailbox with a lower priority may have accepted the message. |
| Producer               | A remote frame has been received, but no data are available to be sent.  |

## 40.9.19 CAN Message Data Low Register

|    | MDL |    |    |    |    |    |    |  |

#### • MDL: Message Data Low Value

When MRDY bit is set in the CAN\_MSRx, the lower 32 bits of a received message can be read or written by the software application. Otherwise, the MDL value is locked by the CAN controller to send/receive a new message.

In Receive with overwrite, the CAN controller may modify MDL value while the software application reads MDH and MDL registers. To check that MDH and MDL do not belong to different messages, the application has to check the MMI bit in the CAN\_MSRx. In this mode, the software application must re-read CAN\_MDH and CAN\_MDL, while the MMI bit in the CAN\_MSRx is set.

Bytes are received/sent on the bus in the following order:

- 1. CAN\_MDL[7:0]
- 2. CAN\_MDL[15:8]
- 3. CAN\_MDL[23:16]
- 4. CAN\_MDL[31:24]
- CAN\_MDH[7:0]
- 6. CAN\_MDH[15:8]
- 7. CAN\_MDH[23:16]
- 8. CAN\_MDH[31:24]

# 40.9.20 CAN Message Data High Register

Name: CAN\_MDHx [x=0..7]

**Address:** 0xF8000218 (0)[0], 0xF8000238 (0)[1], 0xF8000258 (0)[2], 0xF8000278 (0)[3], 0xF8000298 (0)[4],

0xF80002B8 (0)[5], 0xF80002D8 (0)[6], 0xF80002F8 (0)[7], 0xF8004218 (1)[0], 0xF8004238 (1)[1], 0xF8004258 (1)[2], 0xF8004278 (1)[3], 0xF8004298 (1)[4], 0xF80042B8 (1)[5], 0xF80042D8 (1)[6],

0xF80042F8 (1)[7]

Access: Read/Write

| 31 | 30  | 29 | 28 | 27 | 26 | 25 | 24 |
|----|-----|----|----|----|----|----|----|
|    | MDH |    |    |    |    |    |    |
| 23 | 22  | 21 | 20 | 19 | 18 | 17 | 16 |
|    | MDH |    |    |    |    |    |    |
| 15 | 14  | 13 | 12 | 11 | 10 | 9  | 8  |
|    |     |    | MI | DH |    |    |    |
| 7  | 6   | 5  | 4  | 3  | 2  | 1  | 0  |
|    | MDH |    |    |    |    |    |    |

#### • MDH: Message Data High Value

When MRDY bit is set in the CAN\_MSRx, the upper 32 bits of a received message are read or written by the software application. Otherwise, the MDH value is locked by the CAN controller to send/receive a new message.

In Receive with overwrite, the CAN controller may modify MDH value while the software application reads MDH and MDL registers. To check that MDH and MDL do not belong to different messages, the application has to check the MMI bit in the CAN\_MSRx. In this mode, the software application must re-read CAN\_MDH and CAN\_MDL, while the MMI bit in the CAN\_MSRx is set.

Bytes are received/sent on the bus in the following order:

- 1. CAN\_MDL[7:0]
- 2. CAN\_MDL[15:8]
- 3. CAN\_MDL[23:16]
- 4. CAN\_MDL[31:24]
- 5. CAN\_MDH[7:0]
- 6. CAN\_MDH[15:8]
- 7. CAN\_MDH[23:16]
- 8. CAN\_MDH[31:24]

# 40.9.21 CAN Message Control Register

## • MDLC: Mailbox Data Length Code

| Mailbox Object Type    | Description  |
|------------------------|--|
| Receive                | No action.   |
| Receive with overwrite | No action.   |
| Transmit               | Length of the mailbox message.   |
| Consumer               | No action.   |
| Producer               | Length of the mailbox message to be sent after the remote frame reception. |

#### MRTR: Mailbox Remote Transmission Request

| Mailbox Object Type    | Description   |  |  |  |
|------------------------|---|--|--|--|
| Receive                | No action   |  |  |  |
| Receive with overwrite | No action   |  |  |  |
| Transmit               | Set the RTR bit in the sent frame                             |  |  |  |
| Consumer               | No action, the RTR bit in the sent frame is set automatically |  |  |  |
| Producer               | No action   |  |  |  |

Consumer situations can be handled automatically by setting the mailbox object type in Consumer. This requires only one mailbox.

It can also be handled using two mailboxes, one in reception, the other in transmission. The MRTR and the MTCR bits must be set in the same time.

# • MACR: Abort Request for Mailbox x

| Mailbox Object Type    | Description  |
|------------------------|--|
| Receive                | No action  |
| Receive with overwrite | No action  |
| Transmit               | Cancels transfer request if the message has not been transmitted to the CAN transceiver. |
| Consumer               | Cancels the current transfer before the remote frame has been sent.                      |
| Producer               | Cancels the current transfer. The next remote frame will not be serviced.                |

This flag clears the MRDY and MABT flags in the CAN\_MSRx.

It is possible to set the MACR field for several mailboxes in the same time, setting several bits to the CAN\_ACR.

#### • MTCR: Mailbox Transfer Command

| Mailbox Object Type                               | Description  |
|---|--|
| Receive Allows the reception of the next message. |  |
| Receive with overwrite                            | Triggers a new reception.  |
| Transmit  | Sends data prepared in the mailbox as soon as possible.                            |
| Consumer  | Sends a remote transmission frame.   |
| Producer  | Sends data prepared in the mailbox after receiving a remote frame from a Consumer. |

This flag clears the MRDY and MABT flags in the CAN\_MSRx.

When several mailboxes are requested to be transmitted simultaneously, they are transmitted in turn. The mailbox with the highest priority is serviced first. If several mailboxes have the same priority, the mailbox with the lowest number is serviced first (i.e., MBx0 will be serviced before MBx 15 if they have the same priority).

It is possible to set MTCR for several mailboxes at the same time by writing to the CAN\_TCR.

# 41. Analog-to-Digital Converter (ADC)

# 41.1 Description

The ADC is based on a 10-bit Analog-to-Digital Converter (ADC) managed by an ADC Controller. Refer to Figure 41-1 "Analog-to-Digital Converter Block Diagram with Touchscreen Mode". It also integrates a 12-to-1 analog multiplexer, making possible the analog-to-digital conversions of 12 analog lines. The conversions extend from 0V to the voltage carried on pin ADVREF.

The ADC digital controller embeds circuitry to reduce the resolution down to 8 bits. The 8-bit resolution mode prevents using 16-bit Peripheral DMA transfer into memory when only 8-bit resolution is required by the application. Note that using this low resolution mode does not increase the conversion rate.

Conversion results are reported in a common register for all channels, as well as in a channel-dedicated register.

Software trigger, external trigger on rising edge of the ADTRG pin or internal triggers from Timer Counter output(s) are configurable.

The comparison circuitry allows automatic detection of values below a threshold, higher than a threshold, in a given range or outside the range, thresholds and ranges being fully configurable.

The ADC also integrates a Sleep mode and a conversion sequencer and connects with a DMA channel. These features reduce both power consumption and processor intervention.

Finally, the user can configure ADC timings, such as startup time and tracking time.

This ADC Controller includes a Resistive Touchscreen Controller. It supports 4-wire and 5-wire technologies.

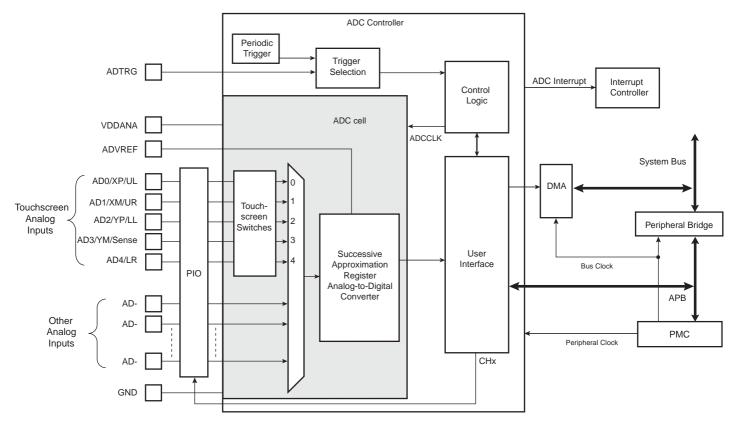

## 41.2 Embedded Characteristics

- 10-bit Resolution
- 440 kHz Conversion Rate
- Wide Range of Power Supply Operation
- Resistive 4-wire and 5-wire Touchscreen Controller
  - Position and Pressure Measurement for 4-wire Screens
  - Position Measurement for 5-wire Screens
  - Average of Up to 8 Measures for Noise Filtering
- Programmable Pen Detection Sensitivity
- Integrated Multiplexer Offering Up to 12 Independent Analog Inputs
- Individual Enable and Disable of Each Channel
- Hardware or Software Trigger
  - External Trigger Pin
  - Internal Trigger Counter
  - Trigger on Pen Contact Detection
- DMA Support
- Possibility of ADC Timings Configuration
- Two Sleep Modes and Conversion Sequencer
  - Automatic Wakeup on Trigger and Back to Sleep Mode after Conversions of all Enabled Channels
  - Possibility of Customized Channel Sequence
- Standby Mode for Fast Wakeup Time Response
  - Power Down Capability
- Automatic Window Comparison of Converted Values
- Register Write Protection

# 41.3 Block Diagram

Figure 41-1. Analog-to-Digital Converter Block Diagram with Touchscreen Mode

# 41.4 Signal Description

Table 41-1. ADC Pin Description

| Pin Name | Description           |  |  |
|----------|-----------------------|--|--|
| VDDANA   | Analog power supply   |  |  |
| ADVREF   | Reference voltage     |  |  |
| AD0-AD11 | Analog input channels |  |  |
| ADTRG    | External trigger      |  |  |

# 41.5 Product Dependencies

## 41.5.1 Power Management

The ADC Controller is not continuously clocked. The programmer must first enable the ADC Controller peripheral clock in the Power Management Controller (PMC) before using the ADC Controller. However, if the application does not require ADC operations, the ADC Controller clock can be stopped when not needed and restarted when necessary. Configuring the ADC Controller does not require the ADC Controller clock to be enabled.

## 41.5.2 Interrupt Sources

The ADC interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the ADC interrupt requires the interrupt controller to be programmed first.

Table 41-2. Peripheral IDs

| Instance | ID |
|----------|----|
| ADC      | 19 |

#### 41.5.3 I/O Lines

The digital input ADC\_ADTRG is multiplexed with digital functions on the I/O line and the selection of ADC\_ADTRG is made using the PIO controller.

The analog inputs ADC\_ADx are multiplexed with digital functions on the I/O lines. ADC\_ADx inputs are selected as inputs of the ADCC when writing a one in the corresponding CHx bit of ADC\_CHER and the digital functions are not selected.

Table 41-3. I/O Lines

| Instance | Signal | I/O Line | Peripheral |
|----------|--------|----------|------------|
| ADC      | ADTRG  | PB18     | В          |
| ADC      | AD0    | PB11     | X1         |
| ADC      | AD1    | PB12     | X1         |
| ADC      | AD2    | PB13     | X1         |
| ADC      | AD3    | PB14     | X1         |
| ADC      | AD4    | PB15     | X1         |
| ADC      | AD5    | PB16     | X1         |
| ADC      | AD6    | PB17     | X1         |
| ADC      | AD7    | PB6      | X1         |
| ADC      | AD8    | PB7      | X1         |
| ADC      | AD9    | PB8      | X1         |
| ADC      | AD10   | PB9      | X1         |
| ADC      | AD11   | PB10     | X1         |

## 41.5.4 Timer Triggers

Timer counters may or may not be used as hardware triggers depending on user requirements. Thus, some or all of the timer counters may be unconnected.

## 41.5.5 Conversion Performances

For performance and electrical characteristics of the ADC, see the section 'Electrical Characteristics'.

# 41.6 Functional Description

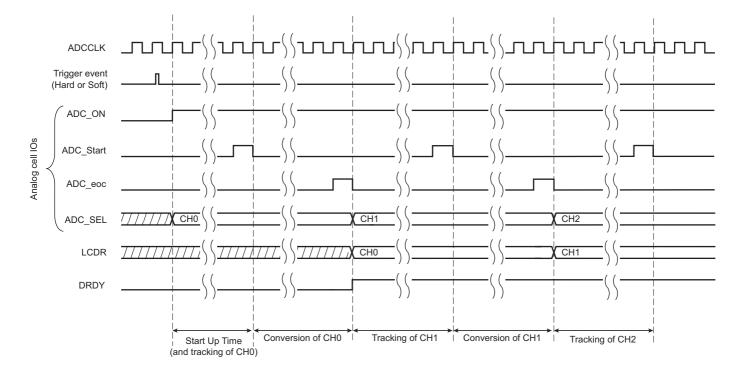

## 41.6.1 Analog-to-Digital Conversion

ADC conversions are sequenced by two operating times: the tracking time and the conversion time.

- The tracking time represents the time between the channel selection change and the time for the controller to start the ADC. The tracking time is set using the TRACKTIM field of the Mode Register (ADC\_MR).
- The conversion time represents the time for the ADC to convert the analog signal.

In order to guarantee a conversion with minimum error, after any start of conversion, the ADC controller waits a number of ADC clock cycles (called hold time) before changing the channel selection again (and so starts a new tracking operation).

Figure 41-2. Sequence of ADC Conversions

#### 41.6.2 ADC Clock

The ADC uses the ADC clock (ADCCLK) to perform conversions. The ADC clock frequency is selected in the PRESCAL field of ADC MR.

The ADC clock frequency is between  $f_{peripheral clock}/2$ , if PRESCAL is 0, and  $f_{peripheral clock}/512$ , if PRESCAL is set to 255 (0xFF).

PRESCAL must be programmed to provide the ADC clock frequency parameter given in the section 'Electrical Characteristics'.

## 41.6.3 ADC Reference Voltage

The conversion is performed on a full range between 0V and the reference voltage pin ADVREF. Analog inputs between these voltages convert to values based on a linear conversion.

#### 41.6.4 Conversion Resolution

The ADC analog cell features a 10-bit resolution.

The ADC digital controller embeds circuitry to reduce the resolution down to 8 bits.

The 8-bit selection is performed by setting the LOWRES bit in ADC\_MR. By default, after a reset, the resolution is the highest and the DATA field in the data registers is fully used. By setting the LOWRES bit, the ADC switches to the lowest resolution and the conversion results can be read in the lowest significant bits of the data registers. The two highest bits of the DATA field in the corresponding Channel Data register (ADC\_CDR) and of the LDATA field in the Last Converted Data register (ADC\_LCDR) read 0.

#### 41.6.5 Conversion Results

When a conversion is completed, the resulting digital value is stored in the Channel Data register (ADC\_CDRx) of the current channel and in the ADC Last Converted Data register (ADC\_LCDR). By setting the TAG option in the Extended Mode Register (ADC\_EMR), the ADC\_LCDR presents the channel number associated with the last converted data in the CHNB field.

The channel EOC bit and the DRDY bit in the Interrupt Status register (ADC\_ISR) are set. In the case of a connected DMA channel, DRDY rising triggers a data request. In any case, either EOC and DRDY can trigger an interrupt.

Reading one of the ADC\_CDRx clears the corresponding EOC bit. Reading ADC\_LCDR clears the DRDY bit.

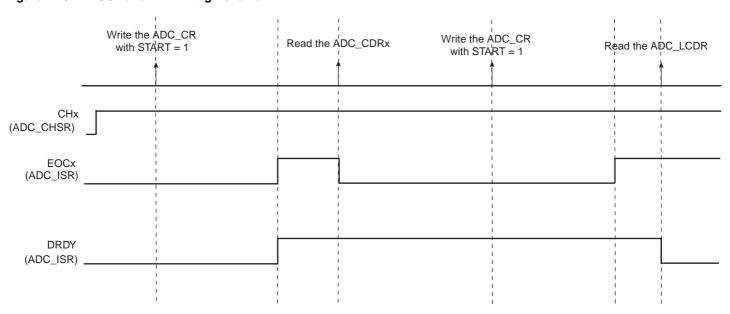

Figure 41-3. EOCx and DRDY Flag Behavior

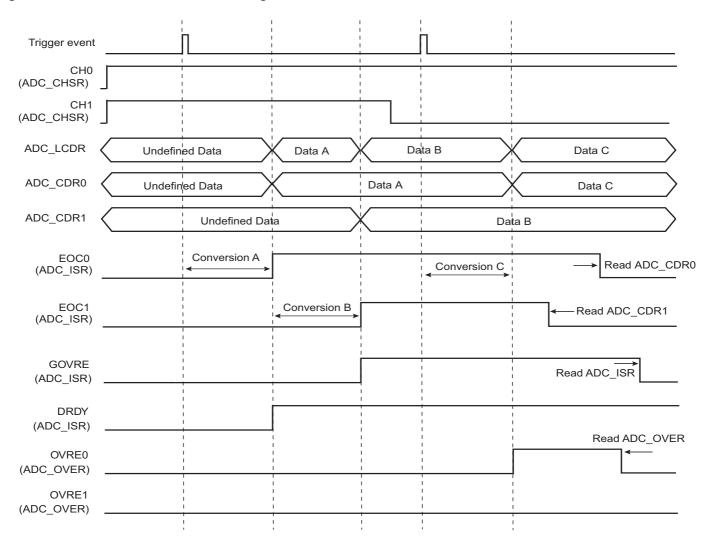

If ADC\_CDR is not read before further incoming data is converted, the corresponding OVREx flag is set in the Overrun Status register (ADC\_OVER).

New data converted when DRDY is high sets the GOVRE bit in ADC\_ISR.

The OVREx flag is automatically cleared when ADC\_OVER is read, and the GOVRE flag is automatically cleared when ADC ISR is read.

Figure 41-4. EOCx, OVREx and GOVREx Flag Behavior

**Warning:** If the corresponding channel is disabled during a conversion or if it is disabled and then reenabled during a conversion, its associated data and corresponding EOCx and GOVRE flags in ADC\_ISR and OVREx flags in ADC\_OVER are unpredictable.

## 41.6.6 Conversion Triggers

Conversions of the active analog channels are started with a software or hardware trigger. The software trigger is provided by writing the Control register (ADC\_CR) with the START bit at 1.

The hardware trigger can be one of the TIOA outputs of the Timer Counter channels or the external trigger input of the ADC (ADTRG). The hardware trigger is selected with the TRGSEL field in the ADC\_MR.

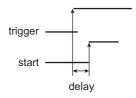

The TRGMOD field in the ADC Trigger register (ADC\_TRGR) selects the hardware trigger from the following:

- any edge, either rising or falling or both, detected on the external trigger pin TSADTRG
- the Pen Detect, depending on how the PENDET bit is set in the ADC Touchscreen Mode register (ADC\_TSMR)
- a continuous trigger, meaning the ADC Controller restarts the next sequence as soon as it finishes the current one
- a periodic trigger, which is defined by programming the TRGPER field in ADC\_TRGR

The minimum time between two consecutive trigger events must be strictly greater than the duration time of the longest conversion sequence according to configuration of registers ADC\_MR, ADC\_CHSR, ADC\_SEQRx, ADC\_TSMR.

If a hardware trigger is selected, the start of a conversion is triggered after a delay starting at each rising edge of the selected signal. Due to asynchronous handling, the delay may vary in a range of two peripheral clock periods to one ADC clock period.

Figure 41-5. Hardware Trigger Delay

Only one start command is necessary to initiate a conversion sequence on all the channels. The ADC hardware logic automatically performs the conversions on the active channels, then waits for a new request. The Channel Enable (ADC\_CHER) and Channel Disable (ADC\_CHDR) registers permit the analog channels to be enabled or disabled independently.

If the ADC is used with a DMA, only the transfers of converted data from enabled channels are performed and the resulting data buffers should be interpreted accordingly.

## 41.6.7 Sleep Mode and Conversion Sequencer

The ADC Sleep mode maximizes power saving by automatically deactivating the ADC when it is not being used for conversions. Sleep mode is selected by setting the SLEEP bit in ADC\_MR.

Sleep mode is managed by a conversion sequencer, which automatically processes the conversions of all channels at lowest power consumption.

This mode can be used when the minimum period of time between two successive trigger events is greater than the startup period of the ADC. See the section 'ADC Characteristics' in the 'Electrical Characteristics'.

When a start conversion request occurs, the ADC is automatically activated. As the analog cell requires a startup time, the logic waits during this time and starts the conversion on the enabled channels. When all conversions are complete, the ADC is deactivated until the next trigger. Triggers occurring during the sequence are ignored.

The conversion sequencer allows automatic processing with minimum processor intervention and optimized power consumption. Conversion sequences can be performed periodically using the internal timer (ADC\_TRGR). The

periodic acquisition of several samples can be processed automatically without any intervention of the processor via the DMA.

The sequence can be customized by programming the Sequence Channel Register ADC\_SEQR1 and setting the USEQ bit of the Mode Register (ADC\_MR). The user can choose a specific order of channels and can program up to 12 conversions by sequence. The user is free to create a personal sequence by writing channel numbers in ADC\_SEQR1. Not only can channel numbers be written in any sequence, channel numbers can be repeated several times. When the bit USEQ in ADC\_MR is set, the fields USCHx in ADC\_SEQR1 are used to define the sequence. Only enabled USCHx fields will be part of the sequence. Each USCHx field has a corresponding enable, CHx, in ADC\_CHER (USCHx field with the lowest x index is associated with bit CHx of the lowest index).

If all ADC channels (i.e., 12) are used on an application board, there is no restriction of usage of the user sequence. However, if some ADC channels are not enabled for conversion but rather used as pure digital inputs, the respective indexes of these channels cannot be used in the user sequence fields (see ADC\_SEQRx). For example, if channel 4 is disabled (ADC\_CSR[4] = 0), ADC\_SEQRx fields USCH1 up to USCH12 must not contain the value 4. Thus the length of the user sequence may be limited by this behavior.

As an example, if only four channels over 12 (CH0 up to CH3) are selected for ADC conversions, the user sequence length cannot exceed four channels. Each trigger event may launch up to four successive conversions of any combination of channels 0 up to 3 but no more (i.e., in this case the sequence CH0, CH0, CH1, CH1 is impossible).

A sequence that repeats the same channel several times requires more enabled channels than channels actually used for conversion. For example, the sequence CH0, CH0, CH1, CH1 requires four enabled channels (four free channels on application boards) whereas only CH0, CH1 are really converted.

Note: The reference voltage pins always remain connected in Normal mode as in Sleep mode.

## 41.6.8 Comparison Window

The ADC Controller features automatic comparison functions. It compares converted values to a low threshold, a high threshold or both, depending on the value of the CMPMODE bit in ADC\_EMR. The comparison can be done on all channels or only on the channel specified in the CMPSEL field of ADC\_EMR. To compare all channels, the CMPALL bit of ADC\_EMR must be set.

The flag can be read on the COMPE bit of the Interrupt Status register (ADC\_ISR) and can trigger an interrupt.

The high threshold and the low threshold can be read/write in the Compare Window register (ADC CWR).

If the comparison window is to be used with the LOWRES bit set in ADC\_MR, the thresholds do not need to be adjusted, as the adjustment is done internally. However, whether the LOWRES bit is set or not, thresholds must always be configured in accordance with the maximum ADC resolution.

#### 41.6.9 ADC Timings

Each ADC has its own minimal startup time that is programmed through the field STARTUP in ADC\_MR.

A minimal tracking time is necessary for the ADC to guarantee the best converted final value between two channel selections. This time must be programmed in the TRACKTIM field in ADC\_MR.

**Warning:** No input buffer amplifier to isolate the source is included in the ADC. This must be taken into consideration to program a precise value in the TRACKTIM field. See the section 'ADC Characteristics' in the 'Electrical Characteristics'.

### 41.6.10 Touchscreen

#### 41.6.10.1 Touchscreen Mode

The TSMODE parameter of the ADC Touchscreen Mode register (ADC\_TSMR) is used to enable/disable the touchscreen functionality, to select the type of screen (4-wire or 5-wire) and, in the case of a 4-wire screen and to activate (or not) the pressure measurement.

In 4-wire mode, channel 0, 1, 2 and 3 must not be used for classic ADC conversions. Likewise, in 5-wire mode, channel 0, 1, 2, 3, and 4 must not be used for classic ADC conversions.

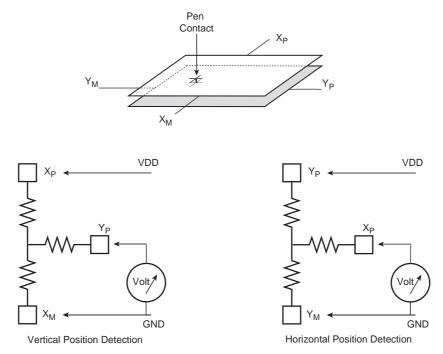

## 41.6.10.2 4-wire Resistive Touchscreen Principles

A resistive touchscreen is based on two resistive films, each one being fitted with a pair of electrodes, placed at the top and bottom on one film, and on the right and left on the other. In between, there is a layer acting as an insulator, but also enables contact when you press the screen. This is illustrated in Figure 41-6.

The TSADC controller has the ability to perform without external components:

- position measurement
- pressure measurement
- pen detection

Figure 41-6. Touchscreen Position Measurement

#### 41.6.10.3 4-wire Position Measurement Method

As shown in Figure 41-6, to detect the position of a contact, a supply is first applied from top to bottom. Due to the linear resistance of the film, there is a voltage gradient from top to bottom. When a contact is performed on the screen, the voltage propagates at the point the two surfaces come into contact with the second film. If the input impedance on the right and left electrodes sense is high enough, the film does not affect this voltage, despite its resistive nature.

For the horizontal direction, the same method is used, but by applying supply from left to right. The range depends on the supply voltage and on the loss in the switches that connect to the top and bottom electrodes.

In an ideal world (linear, with no loss through switches), the horizontal position is equal to:

$$VY_M / VDD$$
 or  $VY_P / VDD$ .

The implementation with on-chip power switches is shown in Figure 41-7. The voltage measurement at the output of the switch compensates for the switches loss.

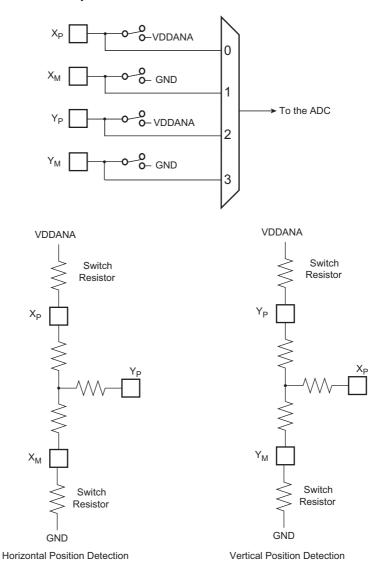

It is possible to correct for switch loss by performing the operation:

$$[VY_P - VX_M] / [VX_P - VX_M].$$

This requires additional measurements, as shown in Figure 41-7.

Figure 41-7. Touchscreen Switches Implementation

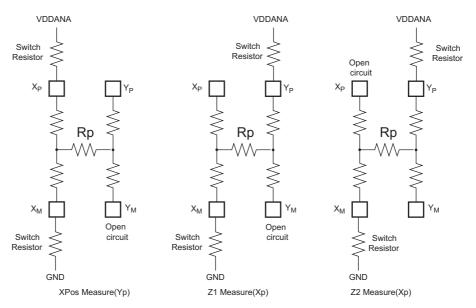

### 41.6.10.4 4-wire Pressure Measurement Method

The method to measure the pressure (Rp) applied to the touchscreen is based on the known resistance of the X-Panel resistance (Rxp).

Three conversions (Xpos,Z1,Z2) are necessary to determine the value of Rp (Zaxis resistance).

$$Rp = Rxp \times (Xpos/1024) \times [(Z2/Z1)-1]$$

Figure 41-8. Pressure Measurement

### 41.6.10.5 5-wire Resistive Touchscreen Principles

To make a 5-wire touchscreen, a resistive layer with a contact point at each corner and a conductive layer are used.

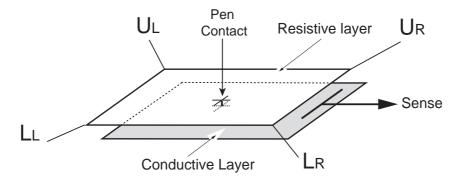

The 5-wire touchscreen differs from the 4-wire type mainly in that the voltage gradient is applied only to one layer, the resistive layer, while the other layer is the sense layer for both measurements.

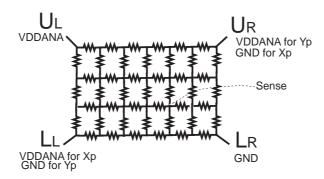

The measurement of the X position is obtained by biasing the upper left corner and lower left corner to VDDANA and the upper right corner and lower right to ground.

To measure along the Y axis, bias the upper left corner and upper right corner to VDDANA and bias the lower left corner and lower right corner to ground.

Figure 41-9. 5-Wire Principle

#### 41.6.10.6 5-wire Position Measurement Method

In an application only monitoring clicks, 100 points per second is typically needed. For handwriting or motion detection, the number of measurements to consider is approximately 200 points per second. This must take into account that multiple measurements are included (over sampling, filtering) to compute the correct point.

The 5-wire touchscreen panel works by applying a voltage at the corners of the resistive layer and measuring the vertical or horizontal resistive network with the sense input. The ADC converts the voltage measured at the point the panel is touched.

A measurement of the Y position of the pointing device is made by:

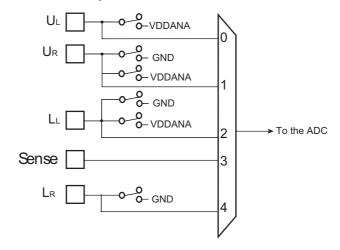

- Connecting Upper left (UL) and upper right (UR) corners to VDDANA
- Connecting Lower left (LL) and lower right (LR) corners to ground.
- The voltage measured is determined by the voltage divider developed at the point of touch (Yposition) and the SENSE input is converted by ADC.

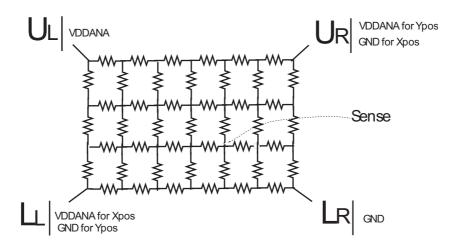

A measurement of the X position of the pointing device is made by:

- Connecting the upper left (UL) and lower left (LL) corners to ground
- Connecting the upper right and lower right corners to VDDANA.
- The voltage measured is determined by the voltage divider developed at the point of touch (Xposition) and the SENSE input is converted by ADC.

Figure 41-10. Touchscreen Switches Implementation

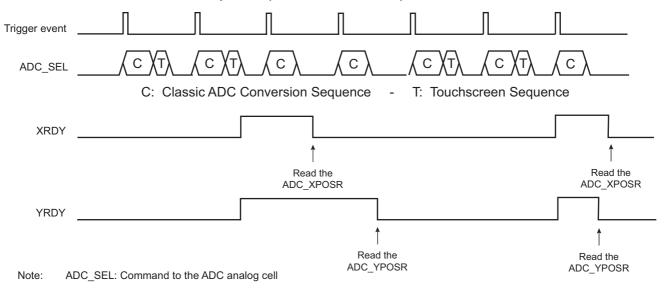

## 41.6.10.7 Sequence and Noise Filtering

The ADC Controller can manage ADC conversions and touchscreen measurement. On each trigger event the sequence of ADC conversions is performed as described in Section 41.6.7 "Sleep Mode and Conversion Sequencer". The touchscreen measure frequency can be specified in number of trigger events by writing the TSFREQ parameter in ADC\_TSMR. An internal counter counts triggers up to TSFREQ, and every time it rolls out, a touchscreen sequence is appended to the classic ADC conversion sequence (see Figure 41-11).

Additionally the user can average multiple touchscreen measures by writing the TSAV parameter in ADC\_TSMR. This can be 1, 2, 4 or 8 measures performed on consecutive triggers as illustrated in Figure 41-11 below. Consequently, the TSFREQ parameter must be greater or equal to the TSAV parameter.

Figure 41-11. Insertion of Touchscreen Sequences (TSFREQ = 2; TSAV = 1)

#### 41.6.10.8 Measured Values, Registers and Flags

As soon as the controller finishes the Touchscreen sequence, XRDY, YRDY and PRDY are set and can generate an interrupt. These flags can be read in the ADC Interrupt Status register (ADC\_ISR). They are reset independently by reading in ADC Touchscreen X Position register (ADC\_XPOSR), ADC Touchscreen Y Position register (ADC\_YPOSR) and ADC Touchscreen Pressure register (ADC\_PRESSR).

The ADC\_XPOSR presents XPOS ( $V_X - V_{Xmin}$ ) on its LSB and XSCALE ( $V_{XMAX} - V_{Xmin}$ ) aligned on the 16th bit.

The ADC\_YPOSR presents YPOS ( $V_Y - V_{Ymin}$ ) on its LSB and YSCALE ( $V_{YMAX} - V_{Ymin}$ ) aligned on the 16th bit.

To improve the quality of the measure, the user must calculate: XPOS/XSCALE and YPOS/YSCALE.

 $V_{XMAX}$ ,  $V_{Xmin}$ ,  $V_{YMAX}$ , and  $V_{Ymin}$  are measured at the first start up of the controller. These values can change during use, so it can be necessary to refresh them. Refresh can be done by writing '1' in the TSCALIB field of the control register (ADC\_CR).

The ADC\_PRESSR presents Z1 on its LSB and Z2 aligned on the 16th bit. See Section 41.6.10.4 "4-wire Pressure Measurement Method".

#### 41.6.10.9 Pen Detect Method

When there is no contact, it is not necessary to perform a conversion. However, it is important to detect a contact by keeping the power consumption as low as possible.

The implementation polarizes one panel by closing the switch on  $(X_P/U_L)$  and ties the horizontal panel by an embedded resistor connected to  $Y_M$  / Sense. This resistor is enabled by a fifth switch. Since there is no contact, no current is flowing and there is no related power consumption. As soon as a contact occurs, a current is flowing in the Touchscreen and a Schmitt trigger detects the voltage in the resistor.

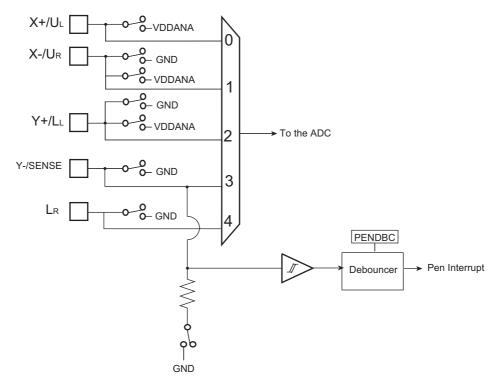

The Touchscreen Interrupt configuration is entered by programming the PENDET bit in ADC\_TSMR. If this bit is written at 1, the controller samples the pen contact state when it is not converting and waiting for a trigger.

To complete the circuit, a programmable debouncer is placed at the output of the Schmitt trigger. This debouncer is programmable up to 2<sup>15</sup> ADC clock periods. The debouncer length can be selected by programming the field PENDBC in ADC TSMR.

Due to the analog switch's structure, the debouncer circuitry is only active when no conversion (touchscreen or classic ADC channels) is in progress. Thus, if the time between the end of a conversion sequence and the arrival of the next trigger event is lower than the debouncing time configured on PENDBC, the debouncer will not detect any contact.

Figure 41-12. Touchscreen Pen Detect

The touchscreen pen detect can be used to generate an ADC interrupt to wake up the system. The pen detect generates two types of status, reported in ADC\_ISR:

- the PEN bit is set as soon as a contact exceeds the debouncing time as defined by PENDBC and remains set until ADC\_ISR is read.
- the NOPEN bit is set as soon as no current flows for a time over the debouncing time as defined by PENDBC and remains set until ADC\_ISR is read.

Both bits are automatically cleared as soon as ADC\_ISR is read, and can generate an interrupt by writing ADC\_IER.

Moreover, the rising of either one of them clears the other, they cannot be set at the same time.

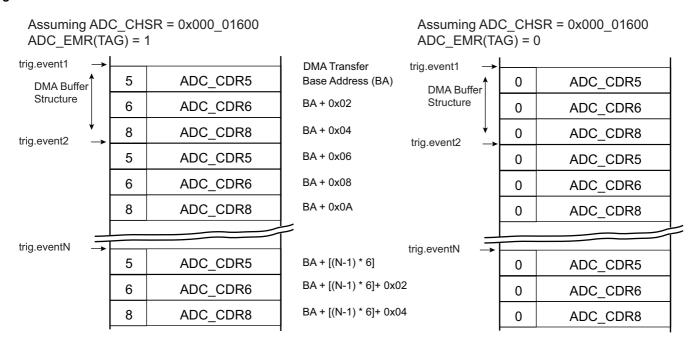

The PENS bit of the ADC\_ISR indicates the current status of the pen contact.

## 41.6.11 Buffer Structure

The DMA read channel is triggered each time a new data is stored in ADC\_LCDR. The same structure of data is repeatedly stored in ADC\_LCDR each time a trigger event occurs. Depending on user mode of operation (ADC\_MR, ADC\_CHSR, ADC\_SEQR1, ADC\_TSMR) the structure differs. Each data read to DMA buffer, carried on a half-word (16-bit), consists of last converted data right aligned and when TAG is set in ADC\_EMR, the four most significant bits are carrying the channel number thus allowing an easier post-processing in the DMA buffer or better checking the DMA buffer integrity.

Figure 41-13. Buffer Structure

As soon as touchscreen conversions are required, the pen detection function may help the post-processing of the buffer. Refer to Section 41.6.11.4 "Pen Detection Status".

## 41.6.11.1 Classical ADC Channels Only

When no touchscreen conversion is required (i.e., TSMODE = 0 in ADC\_TSMR), the structure of data within the buffer is defined by ADC\_MR, ADC\_CHSR, ADC\_SEQRx. See Figure 41-13.

If the user sequence is not used (i.e., USEQ is cleared in ADC\_MR) then only the value of ADC\_CHSR defines the data structure. For each trigger event, enabled channels will be consecutively stored in ADC\_LCDR and automatically read to the buffer.

When the user sequence is configured (i.e., USEQ is set in ADC\_MR) not only does ADC\_CHSR modify the data structure of the buffer, but ADC\_SEQRx registers may modify the data structure of the buffer as well.

#### 41.6.11.2 Touchscreen Channels Only

When only touchscreen conversions are required (i.e., TSMODE  $\neq$  0 in ADC\_TSMR and ADC\_CHSR equals 0), the structure of data within the buffer is defined by the ADC\_TSMR.

When TSMODE = 1 or 3, each trigger event adds two half-words in the buffer (assuming TSAV = 0), first half-word being XPOS of ADC\_XPOSR then YPOS of ADC\_YPOSR. If TSAV/TSFREQ  $\neq$  0, the data structure remains unchanged. Not all trigger events add data to the buffer.

When TSMODE = 2, each trigger event adds four half-words to the buffer (assuming TSAV = 0), first half-word being XPOS of ADC\_XPOSR followed by YPOS of ADC\_YPOSR and finally Z1 followed by Z2, both located in ADC\_PRESSR.

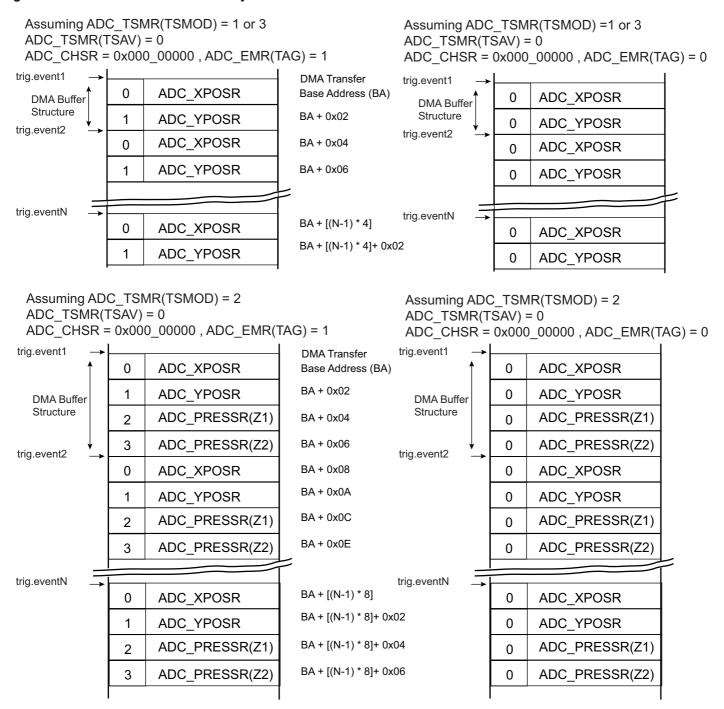

When TAG is set (ADC\_EMR), the CHNB field (four most significant bits of the ADC\_LCDR) is cleared when XPOS is transmitted and set when YPOS is transmitted, allowing an easier post-processing of the buffer or better checking buffer integrity. In case 4-wire with Pressure mode is selected, Z1 value is transmitted to the buffer along with tag set to 2 and Z2 is tagged with value 3.

XSCALE and YSCALE (calibration values) are not transmitted to the buffer because they are supposed to be constant and moreover only measured at the very first start up of the controller or upon user request.

There is no change in buffer structure whatever the value of PENDET bit configuration in ADC\_TSMR but it is recommended to use the pen detection function for buffer post-processing (refer to Section 41.6.11.4 "Pen Detection Status").

Figure 41-14. Buffer Structure When Only Touchscreen Channels are Enabled

## 41.6.11.3 Interleaved Channels

When both classic ADC channels (CH4/CH5 up to CH12 are set in ADC\_CHSR) and touchscreen conversions are required (TSMODE  $\neq$  0 in ADC\_TSMR) the structure of the buffer differs according to TSAV and TSFREQ values.

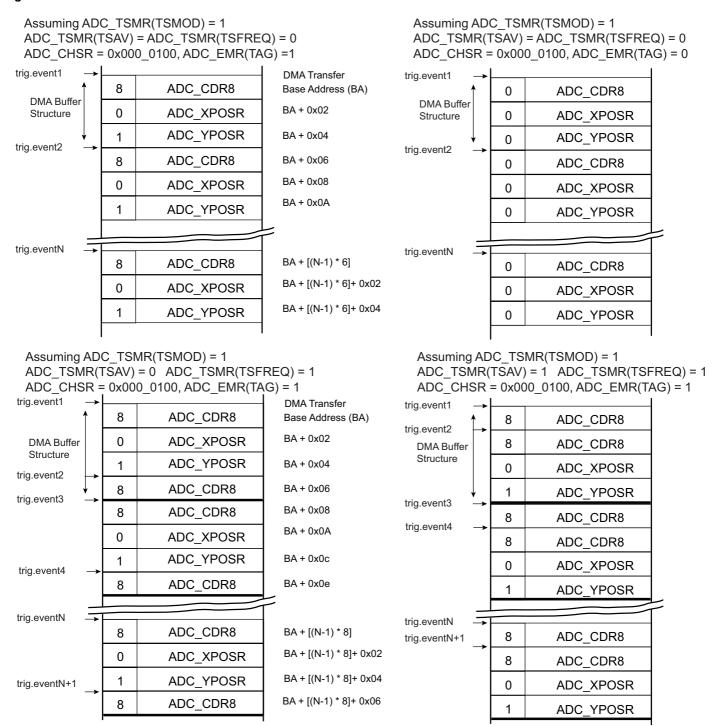

If TSFREQ  $\neq$  0, not all events generate touchscreen conversions, therefore the buffer structure is based on  $2^{\text{TSFREQ}}$  trigger events. Given a TSFREQ value, the location of touchscreen conversion results depends on TSAV value.

When TSFREQ = 0, TSAV must equal 0.

There is no change in buffer structure whatever the value of PENDET bit configuration in ADC\_TSMR but it is recommended to use the pen detection function for buffer post-processing (refer to Section 41.6.11.4 "Pen Detection Status").

Figure 41-15. Buffer Structure When Classic ADC and Touchscreen Channels are Interleaved

#### 41.6.11.4 Pen Detection Status

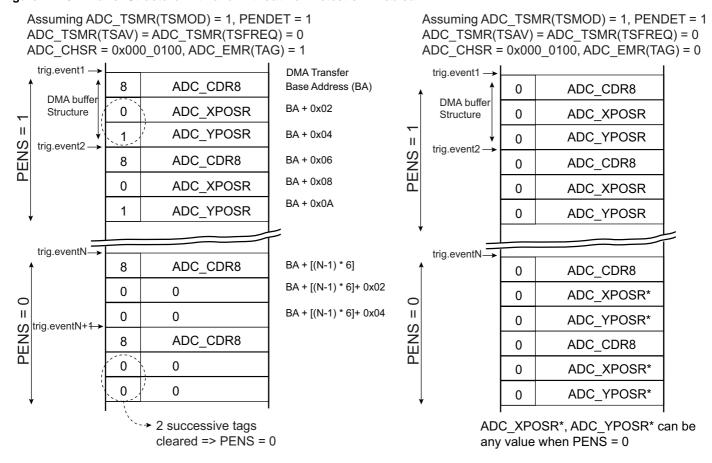

If the pen detection measure is enabled (PENDET is set in ADC\_TSMR), the XPOS, YPOS, Z1, Z2 values transmitted to the buffer through ADC\_LCDR are cleared (including the CHNB field), if the PENS flag of ADC\_ISR is 0. When the PENS flag is set, XPOS, YPOS, Z1, Z2 are normally transmitted.

Therefore, using pen detection together with tag function eases the post-processing of the buffer, especially to determine which touchscreen converted values correspond to a period of time when the pen was in contact with the screen.

When the pen detection is disabled or the tag function is disabled, XPOS, YPOS, Z1, Z2 are normally transmitted without tag and no relationship can be found with pen status, thus post-processing may not be easy.

Figure 41-16. Buffer Structure With and Without Pen Detection Enabled

# 41.6.12 Register Write Protection

To prevent any single software error from corrupting ADC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the "ADC Write Protection Mode Register" (ADC\_WPMR).

If a write access to the protected registers is detected, the WPVS flag in the "ADC Write Protection Status Register" (ADC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS flag is automatically reset by reading the ADC\_WPSR.

The following registers can be write-protected:

- ADC Mode Register
- ADC Channel Sequence 1 Register
- ADC Channel Enable Register
- ADC Channel Disable Register
- ADC Extended Mode Register
- ADC Compare Window Register
- ADC Analog Control Register
- ADC Touchscreen Mode Register
- ADC Trigger Register

# 41.7 Analog-to-Digital (ADC) User Interface

Table 41-4. Register Mapping

| Offset    | Register                         | Name       | Access     | Reset      |

| _  | _  | _  | -  | _  | -       | -     | _     |
| 7  | 6  | 5  | 4  | 3  | 2       | 1     | 0     |
| _  | _  | _  | _  | _  | TSCALIB | START | SWRST |

#### SWRST: Software Reset

0: No effect.

1: Resets the ADC, simulating a hardware reset.

### • START: Start Conversion

0: No effect.

1: Begins analog-to-digital conversion.

#### TSCALIB: Touchscreen Calibration

0: No effect.

1: Programs screen calibration (VDD/GND measurement)

If conversion is in progress, the calibration sequence starts at the beginning of a new conversion sequence. If no conversion is in progress, the calibration sequence starts at the second conversion sequence located after the TSCALIB command (Sleep mode, waiting for a trigger event).

TSCALIB measurement sequence does not affect the Last Converted Data Register (ADC\_LCDR).

# 41.7.2 ADC Mode Register

Name: ADC\_MR
Address: 0xF804C004
Access: Read/Write

| 31   | 30      | 29 | 28 | 27      | 26   | 25   | 24 |  |
|------|---------|----|----|---------|------|------|----|--|
| USEQ | _       | _  | _  |         | TRAC | KTIM |    |  |
| 23   | 22      | 21 | 20 | 19      | 18   | 17   | 16 |  |
| _    | _       | _  | _  | STARTUP |      |      |    |  |
| 15   | 14      | 13 | 12 | 11      | 10   | 9    | 8  |  |
|      | PRESCAL |    |    |         |      |      |    |  |
| 7    | •       | E  | 1  | 2       | 2    | 1    | 0  |  |
| /    | 6       | Э  | 4  | 3       | 2    | ı    | O  |  |

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

# • LOWRES: Resolution

| Value | Name    | Description        |
|-------|---------|--------------------|
| 0     | BITS_10 | 10-bit resolution. |
| 1     | BITS_8  | 8-bit resolution   |

# • SLEEP: Sleep Mode

| Value | Name   | Description  |
|-------|--------|--|
| 0     | NORMAL | Normal Mode: The ADC core and reference voltage circuitry are kept ON between conversions. |
| 1     | SLEEP  | Sleep Mode: The ADC core and reference voltage circuitry are OFF between conversions.      |

# • PRESCAL: Prescaler Rate Selection

 $\label{eq:prescale} \text{PRESCAL} = (f_{\text{peripheral clock}} / \ (2 \times f_{\text{ADCCLK}})) - 1.$ 

# • STARTUP: Startup Time

| Value | Name   | Description           |
|-------|--------|-----------------------|
| 0     | SUT0   | 0 periods of ADCCLK   |
| 1     | SUT8   | 8 periods of ADCCLK   |
| 2     | SUT16  | 16 periods of ADCCLK  |
| 3     | SUT24  | 24 periods of ADCCLK  |
| 4     | SUT64  | 64 periods of ADCCLK  |
| 5     | SUT80  | 80 periods of ADCCLK  |
| 6     | SUT96  | 96 periods of ADCCLK  |
| 7     | SUT112 | 112 periods of ADCCLK |
| 8     | SUT512 | 512 periods of ADCCLK |
| 9     | SUT576 | 576 periods of ADCCLK |
| 10    | SUT640 | 640 periods of ADCCLK |
| 11    | SUT704 | 704 periods of ADCCLK |
| 12    | SUT768 | 768 periods of ADCCLK |
| 13    | SUT832 | 832 periods of ADCCLK |
| 14    | SUT896 | 896 periods of ADCCLK |
| 15    | SUT960 | 960 periods of ADCCLK |

# • TRACKTIM: Tracking Time

Tracking Time =  $(TRACKTIM + 1) \times ADCCLK$  periods

# • USEQ: Use Sequence Enable

| Value | Name      | Description  |
|-------|-----------|--|
| 0     | NUM_ORDER | Normal Mode: The controller converts channels in a simple numeric order depending only on the channel index.                               |
| 1     | REG_ORDER | User Sequence Mode: The sequence respects what is defined in ADC_SEQR1 register and can be used to convert the same channel several times. |

# 41.7.3 ADC Channel Sequence 1 Register

Name: ADC SEQR1 Address: 0xF804C008 Access: Read/Write USCH4 USCH3 USCH2 USCH1

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

## • USCHx: User Sequence Number x

The sequence number x (USCHx) can be programmed by the channel number CHy where y is the value written in this field. The allowed range is 0 up to 11, thus only the sequencer from CH0 to CH11 can be used.

This register activates only if the USEQ field in ADC\_MR field is set to '1'.

Any USCHx field is processed only if the CHx field in ADC\_CHSR reads logical '1', else any value written in USCHx does not add the corresponding channel in the conversion sequence.

Configuring the same value in different fields leads to multiple samples of the same channel during the conversion sequence. This can be done consecutively, or not, according to user needs.

When configuring consecutive fields with the same value, the associated channel is sampled as many time as the number of consecutive values, this part of the conversion sequence being triggered by a unique event.

# 41.7.4 ADC Channel Enable Register

Name: ADC\_CHER
Address: 0xF804C010
Access: Write-only

|     | ,   |     |     |      |      |     |     |
|-----|-----|-----|-----|------|------|-----|-----|
| 31  | 30  | 29  | 28  | 27   | 26   | 25  | 24  |
| _   | _   | _   | _   | _    | _    | _   | _   |
| 23  | 22  | 21  | 20  | 19   | 18   | 17  | 16  |
| _   | _   | _   | 1   | _    | _    | -   | _   |
| 15  | 14  | 13  | 12  | 11   | 10   | 9   | 8   |
| _   | _   | _   | 1   | CH11 | CH10 | CH9 | CH8 |
| 7   | 6   | 5   | 4   | 3    | 2    | 1   | 0   |
| CH7 | CH6 | CH5 | CH4 | CH3  | CH2  | CH1 | CH0 |

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

# • CHx: Channel x Enable

0: No effect.

Note: If USEQ = 1 in the ADC\_MR, CHx corresponds to the xth channel of the sequence described in ADC\_SEQR1.

<sup>1:</sup> Enables the corresponding channel.

# 41.7.5 ADC Channel Disable Register

Name: ADC\_CHDR Address: 0xF804C014 Access: Write-only 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 CH11 CH10 CH9 CH8 7 6 5 4 3 2 1 0 CH7 CH6 CH5 CH4 CH3 CH2 CH1 CH0

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

# • CHx: Channel x Disable

0: No effect.

**Warning:** If the corresponding channel is disabled during a conversion or if it is disabled and then reenabled during a conversion, its associated data and corresponding EOCx and GOVRE flags in ADC\_ISR and OVREx flags in ADC\_OVER are unpredictable.

<sup>1:</sup> Disables the corresponding channel.

## EOCx: End of Conversion x (automatically set / cleared)

0: The corresponding analog channel is disabled, or the conversion is not finished. This flag is cleared when reading the corresponding ADC\_CDRx registers.

1: The corresponding analog channel is enabled and conversion is complete.

## XRDY: Touchscreen XPOS Measure Ready (cleared on read)

0: No measure has been performed since the last read of ADC\_XPOSR.

1: At least one measure has been performed since the last read of ADC\_ISR.

## • YRDY: Touchscreen YPOS Measure Ready (cleared on read)

0: No measure has been performed since the last read of ADC\_YPOSR.

1: At least one measure has been performed since the last read of ADC ISR.

## PRDY: Touchscreen Pressure Measure Ready (cleared on read)

0: No measure has been performed since the last read of ADC\_PRESSR.

1: At least one measure has been performed since the last read of ADC\_ISR.

# • DRDY: Data Ready (automatically set / cleared)

0: No data has been converted since the last read of ADC\_LCDR.

1: At least one data has been converted and is available in ADC\_LCDR.

# • GOVRE: General Overrun Error (cleared on read)

0: No general overrun error occurred since the last read of ADC\_ISR.

1: At least one general overrun error has occurred since the last read of ADC\_ISR.

## • COMPE: Comparison Event (cleared on read)

0: No comparison event since the last read of ADC\_ISR.

1: At least one comparison event (defined in the ADC\_EMR and ADC\_CWR) has occurred since the last read of ADC\_ISR.

# • PEN: Pen contact (cleared on read)

0: No pen contact since the last read of ADC\_ISR.

1: At least one pen contact since the last read of ADC\_ISR.

# • NOPEN: No Pen Contact (cleared on read)

0: No loss of pen contact since the last read of ADC\_ISR.

1: At least one loss of pen contact since the last read of ADC\_ISR.

# • PENS: Pen Detect Status

0: The pen does not press the screen.

1: The pen presses the screen.

Note: PENS is not a source of interruption.

# 41.7.12 ADC Overrun Status Register

Name: ADC\_OVER Address: 0xF804C03C

Access: Read-only

| 31    | 30    | 29    | 28    | 27     | 26     | 25    | 24    |

| 7       | 6<br>CMF    | •  | 4  | 3 - | 2 - | 1      | 0<br>MODE |

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

# • CMPMODE: Comparison Mode

| Value | Name | Description   |
|-------|------|---|
| 0     | LOW  | Generates an event when the converted data is lower than the low threshold of the window.   |
| 1     | HIGH | Generates an event when the converted data is higher than the high threshold of the window. |
| 2     | IN   | Generates an event when the converted data is in the comparison window.                     |
| 3     | OUT  | Generates an event when the converted data is out of the comparison window.                 |

# • CMPSEL: Comparison Selected Channel

If CMPALL = 0: CMPSEL indicates which channel has to be compared.

If CMPALL = 1: No effect.

### • CMPALL: Compare All Channels

0: Only channel indicated in CMPSEL field is compared.

1: All channels are compared.

# • TAG: Tag of the ADC\_LCDR

0: Sets CHNB field to zero in ADC\_LCDR.

1: Appends the channel number to the conversion result in ADC\_LCDR.

# 41.7.14 ADC Compare Window Register

Name: ADC\_CWR
Address: 0xF804C044
Access: Read/Write

| 31 | 30 | 29 | 28    | 27    | 26    | 25   | 24 |
|----|----|----|-------|-------|-------|------|----|
| _  | _  | _  | _     |       | HIGHT | HRES |    |
| 23 | 22 | 21 | 20    | 19    | 18    | 17   | 16 |
|    |    |    | HIGH1 | THRES |       |      |    |
| 15 | 14 | 13 | 12    | 11    | 10    | 9    | 8  |
| _  | _  | _  | _     |       | LOWT  | HRES |    |
| 7  | 6  | 5  | 4     | 3     | 2     | 1    | 0  |
|    |    |    | LOWT  | HRES  |       |      |    |

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

## • LOWTHRES: Low Threshold

Low threshold associated to compare settings of the ADC\_EMR.

If LOWRES is set in ADC\_MR, only the 10 LSB of LOWTHRES must be programmed. The two LSB will be automatically discarded to match the value carried on ADC\_CDR (8-bit).

## • HIGHTHRES: High Threshold

High threshold associated to compare settings of the ADC\_EMR.

If LOWRES is set in ADC\_MR, only the 10 LSB of HIGHTHRES must be programmed. The two LSB will be automatically discarded to match the value carried on ADC\_CDR (8-bit).

# 41.7.15 ADC Channel Data Register

**Name:** ADC\_CDRx [x=0..11]

Address: 0xF804C050

Access: Read/Write

| 31 | 30   | 29 | 28 | 27   | 26 | 25 | 24 |  |
|----|------|----|----|------|----|----|----|--|
| _  | _    | -  | _  | _    | _  | -  | _  |  |

| 15 | 14   | 13 | 12 | 11   | 10 | 9  | 8  |  |
| _  | _    | _  | _  | DATA |    |    |    |  |
| 7  | 6    | 5  | 4  | 3    | 2  | 1  | 0  |  |
|    | DATA |    |    |      |    |    |    |  |

## • DATA: Converted Data

The analog-to-digital conversion data is placed into this register at the end of a conversion and remains until a new conversion is completed. ADC\_CDRx is only loaded if the corresponding analog channel is enabled.

# 41.7.16 ADC Analog Control Register

Name: ADC\_ACR Address: 0xF804C094 Access: Read/Write

| 31 | 30 | 29 | 28 | 27 | 26 | 25    | 24    |
|----|----|----|----|----|----|-------|-------|
| _  | _  | _  | _  | _  | _  | _     | _     |
| 23 | 22 | 21 | 20 | 19 | 18 | 17    | 16    |
| _  | -  | -  | -  | _  | _  | -     | _     |
| 15 | 14 | 13 | 12 | 11 | 10 | 9     | 8     |
| _  | -  | 1  | -  | _  | _  | -     | _     |

| _  | _  | _  | _  | _  | _  | PENDE | TSENS |

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

# • PENDETSENS: Pen Detection Sensitivity

Modifies the pen detection input pull-up resistor value. See the section 'Electrical Characteristics' for further details.

# 41.7.17 ADC Touchscreen Mode Register

Name: ADC\_TSMR
Address: 0xF804C0B0
Access: Read/Write

| 31     | 30      | 29 | 28  | 27     | 26  | 25     | 24     |  |
|--------|---------|----|-----|--------|-----|--------|--------|--|
| PENDBC |         |    |     | _      | _   | _      | PENDET |  |
| 23     | 22      | 21 | 20  | 19     | 18  | 17     | 16     |  |
| _      | NOTSDMA | _  | _   |        | TSS | CTIM   |        |  |
| 15     | 14      | 13 | 12  | 11     | 10  | 9      | 8      |  |
| _      | _       | _  | _   | TSFREQ |     |        |        |  |
| 7      | 6       | 5  | 4   | 3      | 2   | 1      | 0      |  |
| _      | -       | TS | SAV | _      | _   | TSMODE |        |  |

This register can only be written if the WPEN bit is cleared in the ADC Write Protection Mode Register.

## • TSMODE: Touchscreen Mode

| Value | Name         | Description                                     |
|-------|--------------|---|
| 0     | NONE         | No Touchscreen                                  |
| 1     | 4_WIRE_NO_PM | 4-wire Touchscreen without pressure measurement |
| 2     | 4_WIRE       | 4-wire Touchscreen with pressure measurement    |
| 3     | 5_WIRE       | 5-wire Touchscreen                              |

When TSMOD equals 01 or 10 (i.e., 4-wire mode), channels 0, 1, 2 and 3 must not be used for classic ADC conversions. When TSMOD equals 11 (i.e., 5-wire mode), channels 0, 1, 2, 3, and 4 must not be used.

# • TSAV: Touchscreen Average

| Value | Name      | Description                                       |  |  |  |  |
|-------|-----------|---|--|--|--|--|
| 0     | NO_FILTER | No Filtering. Only one ADC conversion per measure |  |  |  |  |
| 1     | AVG2CONV  | verages 2 ADC conversions                         |  |  |  |  |
| 2     | AVG4CONV  | Averages 4 ADC conversions                        |  |  |  |  |
| 3     | AVG8CONV  | Averages 8 ADC conversions                        |  |  |  |  |

## • TSFREQ: Touchscreen Frequency

Defines the touchscreen frequency compared to the trigger frequency.

TSFREQ must be greater or equal to TSAV.

The touchscreen frequency is:

Touchscreen Frequency = Trigger Frequency / 2<sup>TSFREQ</sup>

## • TSSCTIM: Touchscreen Switches Closure Time

Defines closure time of analog switches necessary to establish the measurement conditions.

The closure time is:

Switch Closure Time = (TSSCTIM  $\times$  4) ADCCLK periods.

## • PENDET: Pen Contact Detection Enable

- 0: Pen contact detection disabled.
- 1: Pen contact detection enabled.

When PENDET = 1, XPOS, YPOS, Z1, Z2 values of ADC\_XPOSR, ADC\_YPOSR, ADC\_PRESSR are automatically cleared when PENS = 0 in ADC\_ISR.

## NOTSDMA: No TouchScreen DMA

- 0: XPOS, YPOS, Z1, Z2 are transmitted in ADC\_LCDR.
- 1: XPOS, YPOS, Z1, Z2 are never transmitted in ADC\_LCDR, therefore the buffer does not contains touchscreen values.

# • PENDBC: Pen Detect Debouncing Period

Debouncing period =  $2^{PENDBC}$  ADCCLK periods.

# 41.7.18 ADC Touchscreen X Position Register

Name: ADC\_XPOSR
Address: 0xF804C0B4

| Access: | Read-only |
|---------|-----------|
|---------|-----------|

| 31 | 30 | 29 | 28  | 27  | 26  | 25  | 24 |
|----|----|----|-----|-----|-----|-----|----|

|    |    | _  | XP  | OS  |     | _   |    |

#### • XPOS: X Position

The position measured is stored here. If XPOS = 0 or XPOS = XSIZE, the pen is on the border.

When pen detection is enabled (PENDET set to '1' in ADC\_TSMR), XPOS is tied to 0 while there is no detection of contact on the touchscreen (i.e., when PENS bit is cleared in ADC\_ISR).

#### XSCALE: Scale of XPOS

Indicates the max value that XPOS can reach. This value should be close to 2<sup>10</sup>.

# 41.7.19 ADC Touchscreen Y Position Register

Name: ADC\_YPOSR Address: 0xF804C0B8 Access: Read-only

|    | ,  |    |     |     |     |     |    |
|----|----|----|-----|-----|-----|-----|----|
| 31 | 30 | 29 | 28  | 27  | 26  | 25  | 24 |
| _  | _  | _  | _   |     | YSC | ALE |    |
| 23 | 22 | 21 | 20  | 19  | 18  | 17  | 16 |
|    |    |    | YSC | ALE |     |     |    |
| 15 | 14 | 13 | 12  | 11  | 10  | 9   | 8  |
| _  | _  | _  | -   |     | YP  | OS  |    |
| 7  | 6  | 5  | 4   | 3   | 2   | 1   | 0  |
|    |    |    | YP  | OS  |     |     |    |

### • YPOS: Y Position

The position measured is stored here. If YPOS = 0 or YPOS = YSIZE, the pen is on the border.

When pen detection is enabled (PENDET set to '1' in ADC\_TSMR), YPOS is tied to 0 while there is no detection of contact on the touchscreen (i.e., when PENS bit is cleared in ADC\_ISR).

## YSCALE: Scale of YPOS

Indicates the max value that YPOS can reach. This value should be close to 2<sup>10</sup>.

# 41.7.20 ADC Touchscreen Pressure Register

Name: ADC\_PRESSR Address: 0xF804C0BC

Access: Read-only

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|----|----|----|----|----|----|----|----|
| _  | _  | _  | _  |    | Z  | 2  |    |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|    |    |    | Z  | 2  |    |    |    |
| 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
| _  | _  | _  | _  |    | Z  | 1  |    |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|    |    |    | Z  | 1  |    |    |    |

### • Z1: Data of Z1 Measurement

Data Z1 necessary to calculate pen pressure.

When pen detection is enabled (PENDET set to '1' in ADC\_TSMR), Z1 is tied to 0 while there is no detection of contact on the touchscreen (i.e., when PENS bit is cleared in ADC\_ISR).

#### · Z2: Data of Z2 Measurement

Data Z2 necessary to calculate pen pressure.

When pen detection is enabled (PENDET set to '1' in ADC\_TSMR), Z2 is tied to 0 while there is no detection of contact on the touchscreen (i.e., when PENS bit is cleared in ADC\_ISR).

Note: These two values are unavailable if TSMODE is not set to 2 in ADC\_TSMR.

# 41.7.21 ADC Trigger Register

Name: ADC\_TRGR
Address: 0xF804C0C0
Access: Read/Write

| 31 | 30     | 29 | 28 | 27 | 26     | 25 | 24 |  |
|----|--------|----|----|----|--------|----|----|--|
|    | TRGPER |    |    |    |        |    |    |  |
| 23 | 22     | 21 | 20 | 19 | 18     | 17 | 16 |  |
|    | TRGPER |    |    |    |        |    |    |  |
| 15 | 14     | 13 | 12 | 11 | 10     | 9  | 8  |  |
| _  | _      | _  | -  | _  | _      | _  | _  |  |
| 7  | 6      | 5  | 4  | 3  | 2      | 1  | 0  |  |
| _  | -      | -  | -  | _  | TRGMOD |    |    |  |

### • TRGMOD: Trigger Mode

| Value | Name          | Description   |
|-------|---------------|---|
| 0     | NO_TRIGGER    | No trigger, only software trigger can start conversions   |
| 1     | EXT_TRIG_RISE | External trigger rising edge  |
| 2     | EXT_TRIG_FALL | External trigger falling edge   |
| 3     | EXT_TRIG_ANY  | External trigger any edge   |
| 4     | PEN_TRIG      | Pen Detect Trigger (shall be selected only if PENDET is set and TSAMOD = Touchscreen only mode) |
| 5     | PERIOD_TRIG   | ADC internal periodic trigger (see field TRGPER)  |
| 6     | CONTINUOUS    | Continuous Mode   |

# • TRGPER: Trigger Period

Effective only if TRGMOD defines a periodic trigger.

Defines the periodic trigger period, with the following equation:

Trigger Period = (TRGPER + 1) / ADCCLK

The minimum time between two consecutive trigger events must be strictly greater than the duration time of the longest conversion sequence depending on the configuration of registers ADC\_MR, ADC\_CHSR, ADC\_SEQRx, ADC\_TSMR.

When TRGMOD is set to pen detect trigger (i.e., 100) and averaging is used (i.e., field TSAV  $\neq$  0 in ADC\_TSMR) only one measure is performed. Thus, XRDY, YRDY, PRDY, DRDY will not rise on pen contact trigger. To achieve measurement, several triggers must be provided either by software or by setting the TRGMOD on continuous trigger (i.e., 110) until flags rise.

# 41.7.22 ADC Write Protection Mode Register

Name: ADC\_WPMR
Address: 0xF804C0E4
Access: Read/Write

| rcad, write |          |                         |                                     |  |   |   |

| •  |        |    |     |      |    | -  | •    |

#### • WPVS: Write Protection Violation Status

0: No write protection violation has occurred since the last read of the ADC\_WPSR.

#### • WPVSRC: Write Protection Violation Source

When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

<sup>1:</sup> A write protection violation has occurred since the last read of the ADC\_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

# 42. Software Modem Device (SMD)

# 42.1 Description

The Software Modem Device (SMD) is a block for communication via a modem's Digital Isolation Barrier (DIB) with a complementary Line Side Device (LSD).

SMD and LSD are two parts of the "Transformer only" solution. The transformer is the only component connecting SMD and LSD and is used for power, clock and data transfers. Power and clock are supplied by the SMD and consumed by the LSD. The data flow is bidirectional. The data transfer is based on pulse width modulation for transmission from the SMD to the LSD, and for receiving from the LSD.

There are two channels embedded into the protocol of the DIB link:

- Data channel
- Control channel

Each channel is bidirectional.

The data channel is used to transfer digitized signal samples at a constant rate of 16 bits at 16 kHz.

The control channel is used to communicate with control registers of the LSD at a maximum rate of 8 bits at 16 kHz.

The SMD performs all protocol-related data conversion for transmission and received data interpretation in both data and control channels of the link.

The SMD incorporates both RX and TX FIFOs, available through the DMAC interface. Each FIFO is able to hold eight 32-bit words (equivalent to 16 modem data samples).

## PWRCLKP PCS: PWRCLKP Pin Control Select

When DC\_PWRCLKPN is a 1, the usage of PWRCLKP\_PCS bits for direct control of PWRCLKP pin is enabled as follows:

4

PWRCLKN\_PCS2

3

1

PWRCLKP\_PV PWRCLKP\_PV2DC\_PWRCLKPN

0

MIE

X1: High impedance on PWRCLKP pin.

00: Drive low on PWRCLKP pin.

PWRCLKP\_PCS

7

10: Drive high on PWRCLKP pin.

When DC\_PWRCLKPN is a 0, the protocol logic controls PWRCLKP pin.

If PWRCLKPN\_FS bit is a 1, the above information is applied to PWRCLKN pin because of swapping with PWRCLKP.

## PWRCLKN PCS2: PWRCLKN Pin Control Select

When DC\_PWRCLKPN is a 1, the usage of PWRCLKN\_PCS2 bits for direct control of PWRCLKN pin is enabled as follows:

X1: High impedance on PWRCLKN pin.

00: Drive low on PWRCLKN pin.

10: Drive high on PWRCLKN pin.

When DC\_PWRCLKPN is a 0, the protocol logic controls PWRCLKN pin.

If PWRCLKPN FS bit is a 1, the above information is applied to PWRCLKP pin because of swapping with PWRCLKN.

## • PWRCLKP\_PV: PWRCLKP Pin Value

This bit reflects the PWRCLKP pin value if PWRCLKPN\_FS = 0, or the PWRCLKN pin value if PWRCLKPN\_FS = 1 (because of swapping with PWRCLKP).

#### • PWRCLKP PV2: PWRCLKP Pin Value

This bit reflects the PWRCLKN pin value if PWRCLKPN\_FS = 0, or the PWRCLKP pin value if PWRCLKPN\_FS = 1 (because of swapping with PWRCLKN).

# • DC\_PWRCLKPN: Direct Control of PWRCLKP, PWRCLKN Pins Enable

- 0: Enables protocol logic control of PWRCLKP, PWRCLKN pins.
- 1: Enables the use of PWRCLKP\_PCS and PWRCLKN\_PCS2 bits for direct control of PWRCLKP, PWRCLKN pins making them general purpose input/outputs (GPIOs).

# • MIE: MADCVS Interrupt Enable

- 0: Disables smd\_irq interrupt generation for MADCVS flag.
- 1: Enables smd\_irq interrupt generation for MADCVS flag.

# 43. Synchronous Serial Controller (SSC)

# 43.1 Description

The Synchronous Serial Controller (SSC) provides a synchronous communication link with external devices. It supports many serial synchronous communication protocols generally used in audio and telecom applications such as I2S, Short Frame Sync, Long Frame Sync, etc.

The SSC contains an independent receiver and transmitter and a common clock divider. The receiver and the transmitter each interface with three signals: the TD/RD signal for data, the TK/RK signal for the clock and the TF/RF signal for the Frame Sync. The transfers can be programmed to start automatically or on different events detected on the Frame Sync signal.

The SSC high-level of programmability and its use of DMA permit a continuous high bit rate data transfer without processor intervention.

Featuring connection to the DMA, the SSC permits interfacing with low processor overhead to the following:

- Codecs in master or slave mode
- DAC through dedicated serial interface, particularly I2S
- Magnetic card reader

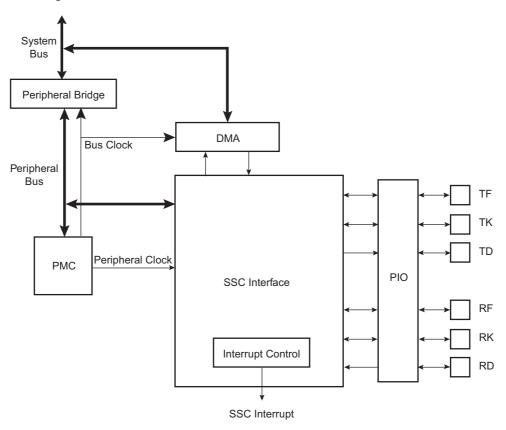

# 43.2 Embedded Characteristics

- Provides Serial Synchronous Communication Links Used in Audio and Telecom Applications
- Contains an Independent Receiver and Transmitter and a Common Clock Divider
- Interfaced with the DMA Controller (DMAC) to Reduce Processor Overhead
- Offers a Configurable Frame Sync and Data Length
- Receiver and Transmitter Can be Programmed to Start Automatically or on Detection of Different Events on the Frame Sync Signal
- Receiver and Transmitter Include a Data Signal, a Clock Signal and a Frame Synchronization Signal

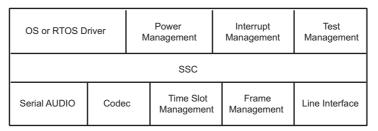

# 43.3 Block Diagram

| TD       | Transmitter Data          | Output       |

# 43.7 Product Dependencies

#### 43.7.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines.

Before using the SSC receiver, the PIO controller must be configured to dedicate the SSC receiver I/O lines to the SSC peripheral mode.

Before using the SSC transmitter, the PIO controller must be configured to dedicate the SSC transmitter I/O lines to the SSC peripheral mode.

Table 43-2. I/O Lines

| Instance | Signal | I/O Line | Peripheral |
|----------|--------|----------|------------|
| SSC      | RD     | PA27     | В          |
| SSC      | RF     | PA29     | В          |
| SSC      | RK     | PA28     | В          |
| SSC      | TD     | PA26     | В          |
| SSC      | TF     | PA25     | В          |
| SSC      | TK     | PA24     | В          |

## 43.7.2 Power Management

The SSC is not continuously clocked. The SSC interface may be clocked through the Power Management Controller (PMC), therefore the programmer must first configure the PMC to enable the SSC clock.

## 43.7.3 Interrupt

The SSC interface has an interrupt line connected to the interrupt controller. Handling interrupts requires programming the interrupt controller before configuring the SSC.

All SSC interrupts can be enabled/disabled configuring the SSC Interrupt Mask Register. Each pending and

Table 43-3. Peripheral IDs

| Instance | ID |
|----------|----|
| SSC      | 28 |

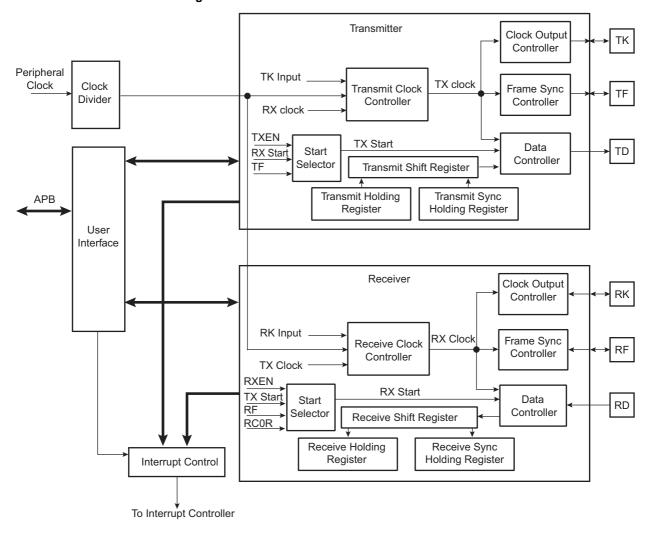

unmasked SSC interrupt will assert the SSC interrupt line. The SSC interrupt service routine can get the interrupt origin by reading the SSC Interrupt Status Register.

# 43.8 Functional Description

This chapter contains the functional description of the following: SSC Functional Block, Clock Management, Data format, Start, Transmitter, Receiver and Frame Sync.

The receiver and transmitter operate separately. However, they can work synchronously by programming the receiver to use the transmit clock and/or to start a data transfer when transmission starts. Alternatively, this can be done by programming the transmitter to use the receive clock and/or to start a data transfer when reception starts. The transmitter and the receiver can be programmed to operate with the clock signals provided on either the TK or RK pins. This allows the SSC to support many slave-mode data transfers. The maximum clock speed allowed on the TK and RK pins is the peripheral clock divided by 2.

Figure 43-6. SSC Functional Block Diagram

## 43.8.1 Clock Management

The transmitter clock can be generated by:

- an external clock received on the TK I/O pad
- the receiver clock
- the internal clock divider

The receiver clock can be generated by:

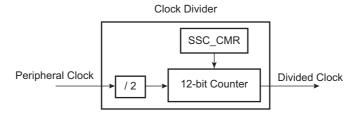

- an external clock received on the RK I/O pad
- the transmitter clock
- the internal clock divider

Furthermore, the transmitter block can generate an external clock on the TK I/O pad, and the receiver block can generate an external clock on the RK I/O pad.

This allows the SSC to support many Master and Slave Mode data transfers.

#### 43.8.1.1 Clock Divider

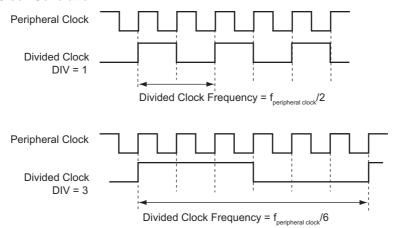

Figure 43-7. Divided Clock Block Diagram

The peripheral clock divider is determined by the 12-bit field DIV counter and comparator (so its maximal value is 4095) in the Clock Mode Register (SSC\_CMR), allowing a peripheral clock division by up to 8190. The Divided Clock is provided to both the Receiver and Transmitter. When this field is programmed to 0, the Clock Divider is not used and remains inactive.

When DIV is set to a value equal to or greater than 1, the Divided Clock has a frequency of peripheral clock divided by 2 times DIV. Each level of the Divided Clock has a duration of the peripheral clock multiplied by DIV. This ensures a 50% duty cycle for the Divided Clock regardless of whether the DIV value is even or odd.

Figure 43-8. Divided Clock Generation

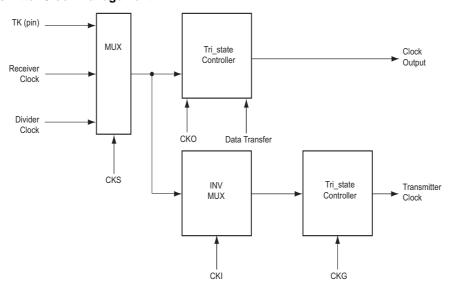

## 43.8.1.2 Transmitter Clock Management

The transmitter clock is generated from the receiver clock or the divider clock or an external clock scanned on the TK I/O pad. The transmitter clock is selected by the CKS field in the Transmit Clock Mode Register (SSC\_TCMR). Transmit Clock can be inverted independently by the CKI bits in the SSC\_TCMR.

The transmitter can also drive the TK I/O pad continuously or be limited to the actual data transfer. The clock output is configured by the SSC\_TCMR. The Transmit Clock Inversion (CKI) bits have no effect on the clock outputs. Programming the SSC\_TCMR to select TK pin (CKS field) and at the same time Continuous Transmit Clock (CKO field) can lead to unpredictable results.

Figure 43-9. Transmitter Clock Management

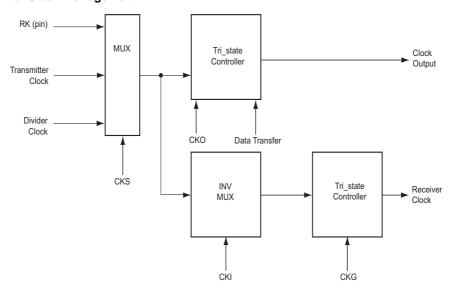

#### 43.8.1.3 Receiver Clock Management

The receiver clock is generated from the transmitter clock or the divider clock or an external clock scanned on the RK I/O pad. The Receive Clock is selected by the CKS field in SSC\_RCMR (Receive Clock Mode Register). Receive Clocks can be inverted independently by the CKI bits in SSC\_RCMR.

The receiver can also drive the RK I/O pad continuously or be limited to the actual data transfer. The clock output is configured by the SSC\_RCMR. The Receive Clock Inversion (CKI) bits have no effect on the clock outputs. Programming the SSC\_RCMR to select RK pin (CKS field) and at the same time Continuous Receive Clock (CKO field) can lead to unpredictable results.

Figure 43-10. Receiver Clock Management

#### 43.8.1.4 Serial Clock Ratio Considerations

The Transmitter and the Receiver can be programmed to operate with the clock signals provided on either the TK or RK pins. This allows the SSC to support many slave-mode data transfers. In this case, the maximum clock speed allowed on the RK pin is:

- Peripheral clock divided by 2 if Receiver Frame Synchro is input
- Peripheral clock divided by 3 if Receiver Frame Synchro is output

In addition, the maximum clock speed allowed on the TK pin is:

- Peripheral clock divided by 6 if Transmit Frame Synchro is input
- Peripheral clock divided by 2 if Transmit Frame Synchro is output

## 43.8.2 Transmitter Operations

A transmitted frame is triggered by a start event and can be followed by synchronization data before data transmission.

The start event is configured by setting the SSC\_TCMR. See Section 43.8.4 "Start" on page 1036.

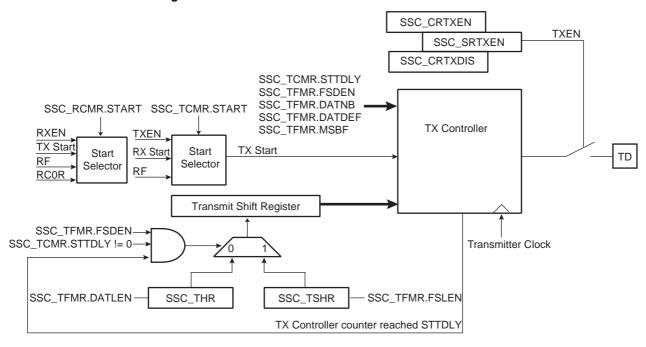

The frame synchronization is configured setting the Transmit Frame Mode Register (SSC\_TFMR). See Section 43.8.5 "Frame Sync" on page 1038.

To transmit data, the transmitter uses a shift register clocked by the transmitter clock signal and the start mode selected in the SSC\_TCMR. Data is written by the application to the SSC\_THR then transferred to the shift register according to the data format selected.

When both the SSC\_THR and the transmit shift register are empty, the status flag TXEMPTY is set in the SSC\_SR. When the Transmit Holding register is transferred in the transmit shift register, the status flag TXRDY is set in the SSC\_SR and additional data can be loaded in the holding register.

Figure 43-11. Transmitter Block Diagram

### 43.8.3 Receiver Operations

A received frame is triggered by a start event and can be followed by synchronization data before data transmission.

The start event is configured setting the Receive Clock Mode Register (SSC\_RCMR). See Section 43.8.4 "Start" on page 1036.

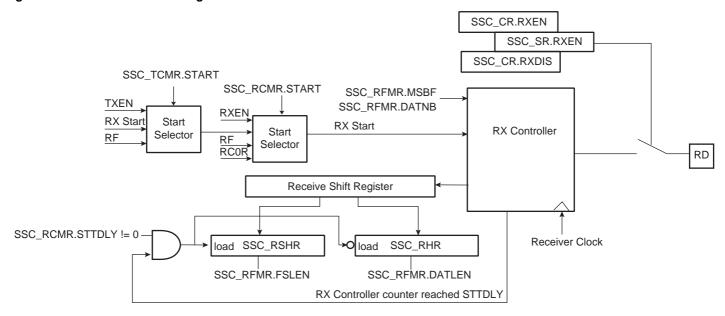

The frame synchronization is configured setting the Receive Frame Mode Register (SSC\_RFMR). See Section 43.8.5 "Frame Sync" on page 1038.

The receiver uses a shift register clocked by the receiver clock signal and the start mode selected in the SSC\_RCMR. The data is transferred from the shift register depending on the data format selected.

When the receiver shift register is full, the SSC transfers this data in the holding register, the status flag RXRDY is set in the SSC\_SR and the data can be read in the receiver holding register. If another transfer occurs before read of the Receive Holding Register (SSC\_RHR), the status flag OVERUN is set in the SSC\_SR and the receiver shift register is transferred in the SSC\_RHR.

Figure 43-12. Receiver Block Diagram

#### 43.8.4 Start

The transmitter and receiver can both be programmed to start their operations when an event occurs, respectively in the Transmit Start Selection (START) field of SSC\_TCMR and in the Receive Start Selection (START) field of SSC\_RCMR.

Under the following conditions the start event is independently programmable:

- Continuous. In this case, the transmission starts as soon as a word is written in SSC\_THR and the reception starts as soon as the Receiver is enabled.
- Synchronously with the transmitter/receiver
- On detection of a falling/rising edge on TF/RF
- On detection of a low level/high level on TF/RF
- On detection of a level change or an edge on TF/RF

A start can be programmed in the same manner on either side of the Transmit/Receive Clock Register (SSC\_RCMR/SSC\_TCMR). Thus, the start could be on TF (Transmit) or RF (Receive).

Moreover, the Receiver can start when data is detected in the bit stream with the Compare Functions.

Detection on TF/RF input/output is done by the field FSOS of the Transmit/Receive Frame Mode Register (SSC\_TFMR/SSC\_RFMR).

Figure 43-13. Transmit Start Mode

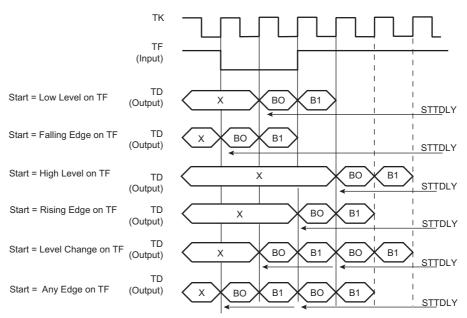

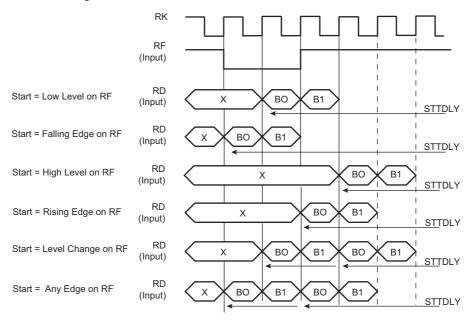

Figure 43-14. Receive Pulse/Edge Start Modes

## 43.8.5 Frame Sync

The Transmitter and Receiver Frame Sync pins, TF and RF, can be programmed to generate different kinds of frame synchronization signals. The Frame Sync Output Selection (FSOS) field in the Receive Frame Mode Register (SSC\_RFMR) and in the Transmit Frame Mode Register (SSC\_TFMR) are used to select the required waveform.

- Programmable low or high levels during data transfer are supported.
- Programmable high levels before the start of data transfers or toggling are also supported.

If a pulse waveform is selected, the Frame Sync Length (FSLEN) field in SSC\_RFMR and SSC\_TFMR programs the length of the pulse, from 1 bit time up to 256 bit times.

The periodicity of the Receive and Transmit Frame Sync pulse output can be programmed through the Period Divider Selection (PERIOD) field in SSC\_RCMR and SSC\_TCMR.

#### 43.8.5.1 Frame Sync Data

Frame Sync Data transmits or receives a specific tag during the Frame Sync signal.

During the Frame Sync signal, the Receiver can sample the RD line and store the data in the Receive Sync Holding Register and the transmitter can transfer Transmit Sync Holding Register in the shift register. The data length to be sampled/shifted out during the Frame Sync signal is programmed by the FSLEN field in SSC\_RFMR/SSC\_TFMR and has a maximum value of 256.

Concerning the Receive Frame Sync Data operation, if the Frame Sync Length is equal to or lower than the delay between the start event and the actual data reception, the data sampling operation is performed in the Receive Sync Holding Register through the receive shift register.

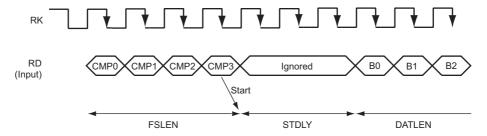

The Transmit Frame Sync Operation is performed by the transmitter only if the bit Frame Sync Data Enable (FSDEN) in SSC\_TFMR is set. If the Frame Sync length is equal to or lower than the delay between the start event and the actual data transmission, the normal transmission has priority and the data contained in the Transmit Sync Holding Register is transferred in the Transmit Register, then shifted out.

#### 43.8.5.2 Frame Sync Edge Detection

The Frame Sync Edge detection is programmed by the FSEDGE field in SSC\_RFMR/SSC\_TFMR. This sets the corresponding flags RXSYN/TXSYN in the SSC Status Register (SSC\_SR) on frame synchro edge detection (signals RF/TF).

## 43.8.6 Receive Compare Modes

Figure 43-15. Receive Compare Modes

#### 43.8.6.1 Compare Functions

The length of the comparison patterns (Compare 0, Compare 1) and thus the number of bits they are compared to is defined by FSLEN, but with a maximum value of 256 bits. Comparison is always done by comparing the last bits received with the comparison pattern. Compare 0 can be one start event of the Receiver. In this case, the receiver compares at each new sample the last bits received at the Compare 0 pattern contained in the Compare 0 Register (SSC\_RCOR). When this start event is selected, the user can program the Receiver to start a new data

transfer either by writing a new Compare 0, or by receiving continuously until Compare 1 occurs. This selection is done with the STOP bit in the SSC\_RCMR.

#### 43.8.7 Data Format

The data framing format of both the transmitter and the receiver are programmable through the Transmitter Frame Mode Register (SSC\_TFMR) and the Receiver Frame Mode Register (SSC\_RFMR). In either case, the user can independently select the following parameters:

- Event that starts the data transfer (START)
- Delay in number of bit periods between the start event and the first data bit (STTDLY)
- Length of the data (DATLEN)
- Number of data to be transferred for each start event (DATNB)
- Length of synchronization transferred for each start event (FSLEN)
- Bit sense: most or lowest significant bit first (MSBF)

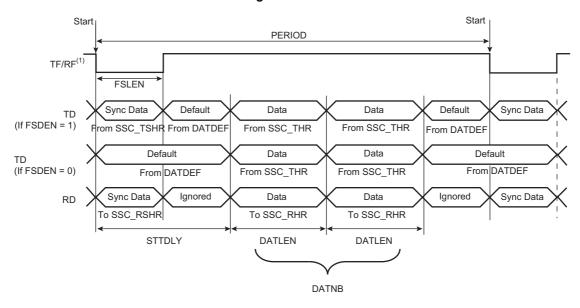

Additionally, the transmitter can be used to transfer synchronization and select the level driven on the TD pin while not in data transfer operation. This is done respectively by the Frame Sync Data Enable (FSDEN) and by the Data Default Value (DATDEF) bits in SSC\_TFMR.

Table 43-4. Data Frame Registers

| Transmitter | Receiver | Field  | Length    | Comment                              |
|-------------|----------|--------|-----------|--------------------------------------|
| SSC_TFMR    | SSC_RFMR | DATLEN | Up to 32  | Size of word                         |
| SSC_TFMR    | SSC_RFMR | DATNB  | Up to 16  | Number of words transmitted in frame |
| SSC_TFMR    | SSC_RFMR | MSBF   | _         | Most significant bit first           |
| SSC_TFMR    | SSC_RFMR | FSLEN  | Up to 256 | Size of Synchro data register        |
| SSC_TFMR    | _        | DATDEF | 0 or 1    | Data default value ended             |
| SSC_TFMR    | _        | FSDEN  | _         | Enable send SSC_TSHR                 |
| SSC_TCMR    | SSC_RCMR | PERIOD | Up to 512 | Frame size                           |
| SSC_TCMR    | SSC_RCMR | STTDLY | Up to 255 | Size of transmit start delay         |

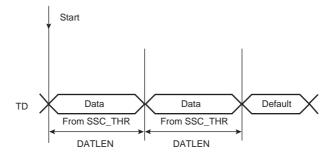

Figure 43-16. Transmit and Receive Frame Format in Edge/Pulse Start Modes

Note: 1. Example of input on falling edge of TF/RF.

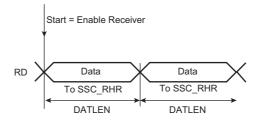

In the example illustrated in Figure 43-17 "Transmit Frame Format in Continuous Mode (STTDLY = 0)", the SSC\_THR is loaded twice. The FSDEN value has no effect on the transmission. SyncData cannot be output in continuous mode.

Figure 43-17. Transmit Frame Format in Continuous Mode (STTDLY = 0)

Start: 1. TXEMPTY set to 1
2. Write into the SSC\_THR

Figure 43-18. Receive Frame Format in Continuous Mode (STTDLY = 0)

## 43.8.8 Loop Mode

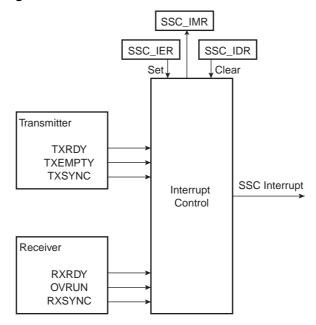

The receiver can be programmed to receive transmissions from the transmitter. This is done by setting the Loop Mode (LOOP) bit in the SSC\_RFMR. In this case, RD is connected to TD, RF is connected to TF and RK is connected to TK.

### 43.8.9 Interrupt

Most bits in the SSC\_SR have a corresponding bit in interrupt management registers.

The SSC can be programmed to generate an interrupt when it detects an event. The interrupt is controlled by writing the Interrupt Enable Register (SSC\_IER) and Interrupt Disable Register (SSC\_IDR). These registers enable and disable, respectively, the corresponding interrupt by setting and clearing the corresponding bit in the Interrupt Mask Register (SSC\_IMR), which controls the generation of interrupts by asserting the SSC interrupt line connected to the interrupt controller.

Figure 43-19. Interrupt Block Diagram

# 43.8.10 Register Write Protection

To prevent any single software error from corrupting AIC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the SSC Write Protection Mode Register (SSC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the SSC Write Protection Status Register (SSC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the SSC\_WPSR.

The following registers can be write-protected:

- SSC Clock Mode Register
- SSC Receive Clock Mode Register
- SSC Receive Frame Mode Register
- SSC Transmit Clock Mode Register
- SSC Transmit Frame Mode Register
- SSC Receive Compare 0 Register
- SSC Receive Compare 1 Register

|   | SWRST | _  | _            | _            | _  | -  | TXDIS | TXEN |
|   |       |    |              |              |    |    |       | _    |
| RXDIS RXEN  | 7     | 6  | 5            | 4            | 3  | 2  | 1     | 0    |
|   | _     | _  | -            | _            | _  | _  | RXDIS | RXEN |

#### RXEN: Receive Enable

0: No effect.

1: Enables Receive if RXDIS is not set.

## • RXDIS: Receive Disable

0: No effect.

1: Disables Receive. If a character is currently being received, disables at end of current character reception.

### • TXEN: Transmit Enable

0: No effect.

1: Enables Transmit if TXDIS is not set.

## • TXDIS: Transmit Disable

0: No effect.

1: Disables Transmit. If a character is currently being transmitted, disables at end of current character transmission.

## • SWRST: Software Reset

0: No effect.

1: Performs a software reset. Has priority on any other bit in SSC\_CR.

## 43.9.2 SSC Clock Mode Register

Name: SSC\_CMR
Address: 0xF0010004
Access: Read/Write

| , ,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,, | rtoda, milo |    |    |    |    |    |    |
|---|-------------|----|----|----|----|----|----|
| 31                                      | 30          | 29 | 28 | 27 | 26 | 25 | 24 |
| _                                       | -           | -  | -  | -  | -  | -  | _  |
| 23                                      | 22          | 21 | 20 | 19 | 18 | 17 | 16 |
| _                                       | _           | -  | -  | -  | _  | _  | _  |
| 15                                      | 14          | 13 | 12 | 11 | 10 | 9  | 8  |
| _                                       | _           | _  | _  |    | DI | V  |    |
| 7                                       | 6           | 5  | 4  | 3  | 2  | 1  | 0  |
|   |             |    | D  | IV |    |    |    |

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

### • DIV: Clock Divider

0: The Clock Divider is not active.

Any other value: The divided clock equals the peripheral clock divided by 2 times DIV.

The maximum bit rate is  $f_{peripheral\ clock}/2$ . The minimum bit rate is  $f_{peripheral\ clock}/2 \times 4095 = f_{peripheral\ clock}/8190$ .

## 43.9.3 SSC Receive Clock Mode Register

Name: SSC\_RCMR
Address: 0xF0010010
Access: Read/Write

| Access: | Read/Write |     |      |      |     |    |    |
|---------|------------|-----|------|------|-----|----|----|
| 31      | 30         | 29  | 28   | 27   | 26  | 25 | 24 |
|         |            |     | PER  | lIOD |     |    |    |
| 23      | 22         | 21  | 20   | 19   | 18  | 17 | 16 |
|         |            |     | STT  | DLY  |     |    |    |
| 15      | 14         | 13  | 12   | 11   | 10  | 9  | 8  |
| _       | -          | _   | STOP |      | STA | RT |    |
| 7       | 6          | 5   | 4    | 3    | 2   | 1  | 0  |
|         | CKG        | CKI |      | CKO  |     | Cł | KS |

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

### • CKS: Receive Clock Selection

| Value | Name | Description     |
|-------|------|-----------------|
| 0     | MCK  | Divided Clock   |
| 1     | TK   | TK Clock signal |
| 2     | RK   | RK pin          |

#### CKO: Receive Clock Output Mode Selection

| Value | Name                            | Description   |  |
|-------|---------------------------------|---|--|
| 0     | 0 NONE None, RK pin is an input |   |  |
| 1     | CONTINUOUS                      | Continuous Receive Clock, RK pin is an output                 |  |
| 2     | TRANSFER                        | Receive Clock only during data transfers, RK pin is an output |  |

### • CKI: Receive Clock Inversion

0: The data inputs (Data and Frame Sync signals) are sampled on Receive Clock falling edge. The Frame Sync signal output is shifted out on Receive Clock rising edge.

1: The data inputs (Data and Frame Sync signals) are sampled on Receive Clock rising edge. The Frame Sync signal output is shifted out on Receive Clock falling edge.

CKI affects only the Receive Clock and not the output clock signal.

### • CKG: Receive Clock Gating Selection

| Value  | Name       | Description                           |
|--|------------|---------------------------------------|
| 0  | CONTINUOUS | None                                  |
| 1 EN_RF_LOW Receive Clock enabled only if RF Low   |            | Receive Clock enabled only if RF Low  |
| 2 EN_RF_HIGH Receive Clock enabled only if RF High |            | Receive Clock enabled only if RF High |

#### START: Receive Start Selection

| Value | Name       | Description   |
|-------|------------|---|
| 0     | CONTINUOUS | Continuous, as soon as the receiver is enabled, and immediately after the end of transfer of the previous data. |
| 1     | TRANSMIT   | Transmit start  |
| 2     | RF_LOW     | Detection of a low level on RF signal   |
| 3     | RF_HIGH    | Detection of a high level on RF signal  |
| 4     | RF_FALLING | Detection of a falling edge on RF signal  |
| 5     | RF_RISING  | Detection of a rising edge on RF signal   |
| 6     | RF_LEVEL   | Detection of any level change on RF signal  |
| 7     | RF_EDGE    | Detection of any edge on RF signal  |
| 8     | CMP_0      | Compare 0   |

## • STOP: Receive Stop Selection

0: After completion of a data transfer when starting with a Compare 0, the receiver stops the data transfer and waits for a new compare 0.

1: After starting a receive with a Compare 0, the receiver operates in a continuous mode until a Compare 1 is detected.

#### STTDLY: Receive Start Delay

If STTDLY is not 0, a delay of STTDLY clock cycles is inserted between the start event and the actual start of reception. When the Receiver is programmed to start synchronously with the Transmitter, the delay is also applied.

Note: It is very important that STTDLY be set carefully. If STTDLY must be set, it should be done in relation to TAG (Receive Sync Data) reception.

#### • PERIOD: Receive Period Divider Selection

This field selects the divider to apply to the selected Receive Clock in order to generate a new Frame Sync Signal. If 0, no PERIOD signal is generated. If not 0, a PERIOD signal is generated each 2 x (PERIOD + 1) Receive Clock.

### 43.9.4 SSC Receive Frame Mode Register

Name: SSC\_RFMR
Address: 0xF0010014
Access: Read/Write

| , 100000. | rtodd, tritto |       |    |    |        |     |        |
|-----------|---------------|-------|----|----|--------|-----|--------|
| 31        | 30            | 29    | 28 | 27 | 26     | 25  | 24     |
|           | FSLE          | N_EXT |    | _  | -      | -   | FSEDGE |
| 23        | 22            | 21    | 20 | 19 | 18     | 17  | 16     |
| _         |               | FSOS  |    |    | FSL    | .EN |        |
| 15        | 14            | 13    | 12 | 11 | 10     | 9   | 8      |
| _         | _             | _     | _  |    | DAT    | NB  |        |
| 7         | 6             | 5     | 4  | 3  | 2      | 1   | 0      |
| MSBF      | _             | LOOP  |    |    | DATLEN |     |        |
|           |               |       |    |    |        |     |        |

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

### DATLEN: Data Length

0: Forbidden value (1-bit data length not supported).

Any other value: The bit stream contains DATLEN + 1 data bits.

## LOOP: Loop Mode

0: Normal operating mode.

1: RD is driven by TD, RF is driven by TF and TK drives RK.

#### MSBF: Most Significant Bit First

0: The lowest significant bit of the data register is sampled first in the bit stream.

1: The most significant bit of the data register is sampled first in the bit stream.

### • DATNB: Data Number per Frame

This field defines the number of data words to be received after each transfer start, which is equal to (DATNB + 1).

#### FSLEN: Receive Frame Sync Length

This field defines the number of bits sampled and stored in the Receive Sync Data Register. When this mode is selected by the START field in the Receive Clock Mode Register, it also determines the length of the sampled data to be compared to the Compare 0 or Compare 1 register.

This field is used with FSLEN EXT to determine the pulse length of the Receive Frame Sync signal.

Pulse length is equal to FSLEN + (FSLEN\_EXT × 16) + 1 Receive Clock periods.

## • FSOS: Receive Frame Sync Output Selection

| Value | Name  | Description   |  |
|-------|---|---|--|
| 0     | NONE  | None, RF pin is an input                              |  |
| 1     | NEGATIVE  | Negative Pulse, RF pin is an output                   |  |
| 2     | POSITIVE  | Positive Pulse, RF pin is an output                   |  |
| 3     | LOW   | Driven Low during data transfer, RF pin is an output  |  |
| 4     | HIGH  | Driven High during data transfer, RF pin is an output |  |
| 5     | TOGGLING Toggling at each start of data transfer, RF pin is an output |   |  |

## • FSEDGE: Frame Sync Edge Detection

Determines which edge on Frame Sync will generate the interrupt RXSYN in the SSC Status Register.

|   | Value | Name     | Description             |
|---|-------|----------|-------------------------|
| ſ | 0     | POSITIVE | Positive Edge Detection |
|   | 1     | NEGATIVE | Negative Edge Detection |

## • FSLEN\_EXT: FSLEN Field Extension

Extends FSLEN field. For details, refer to FSLEN bit description on page 1048.

## 43.9.5 SSC Transmit Clock Mode Register

Name: SSC\_TCMR
Address: 0xF0010018
Access: Read/Write

| Read/write |                     |                           |  |   |  |  |
|------------|---------------------|---------------------------|--|---|--|--|
| 30         | 29                  | 28                        | 27   | 26  | 25   | 24   |
|            |                     | PER                       | RIOD   |   |  |  |

| -          | -                   | -                         |  | STA   | \RT  |  |
| 6          | 5                   | 4                         | 3  | 2   | 1  | 0  |
| CKG        | CKI                 |                           | CKO  |   | Cł   | KS .   |
|            | 30<br>22<br>14<br>— | 30 29  22 21  14 13   6 5 | 30 29 28  PEF  22 21 20  STT  14 13 12   6 5 4 | 30 29 28 27  PERIOD  22 21 20 19  STTDLY  14 13 12 11 | 30 29 28 27 26  PERIOD  22 21 20 19 18  STTDLY  14 13 12 11 10  STA  6 5 4 3 2 | 30     29     28     27     26     25       PERIOD       22     21     20     19     18     17       STTDLY       14     13     12     11     10     9       -     -     -     START       6     5     4     3     2     1 |

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

## • CKS: Transmit Clock Selection

| Value | Name | Description     |
|-------|------|-----------------|
| 0     | MCK  | Divided Clock   |
| 1     | RK   | RK Clock signal |
| 2     | TK   | TK pin          |

#### CKO: Transmit Clock Output Mode Selection

| Value | Name       | Description  |  |
|-------|------------|--|--|
| 0     | NONE       | None, TK pin is an input                                       |  |
| 1     | CONTINUOUS | Continuous Transmit Clock, TK pin is an output                 |  |
| 2     | TRANSFER   | Transmit Clock only during data transfers, TK pin is an output |  |

### • CKI: Transmit Clock Inversion

0: The data outputs (Data and Frame Sync signals) are shifted out on Transmit Clock falling edge. The Frame sync signal input is sampled on Transmit clock rising edge.

1: The data outputs (Data and Frame Sync signals) are shifted out on Transmit Clock rising edge. The Frame sync signal input is sampled on Transmit clock falling edge.

CKI affects only the Transmit Clock and not the output clock signal.

### • CKG: Transmit Clock Gating Selection

| Value | Name       | Description                            |
|-------|------------|--|
| 0     | CONTINUOUS | None                                   |
| 1     | EN_TF_LOW  | Transmit Clock enabled only if TF Low  |
| 2     | EN_TF_HIGH | Transmit Clock enabled only if TF High |

## • START: Transmit Start Selection

| Value | Name       | Description  |
|-------|------------|--|
| 0     | CONTINUOUS | Continuous, as soon as a word is written in the SSC_THR (if Transmit is enabled), and immediately after the end of transfer of the previous data |
| 1     | RECEIVE    | Receive start  |
| 2     | TF_LOW     | Detection of a low level on TF signal  |
| 3     | TF_HIGH    | Detection of a high level on TF signal   |
| 4     | TF_FALLING | Detection of a falling edge on TF signal   |
| 5     | TF_RISING  | Detection of a rising edge on TF signal  |
| 6     | TF_LEVEL   | Detection of any level change on TF signal   |
| 7     | TF_EDGE    | Detection of any edge on TF signal   |

#### STTDLY: Transmit Start Delay

If STTDLY is not 0, a delay of STTDLY clock cycles is inserted between the start event and the actual start of transmission of data. When the Transmitter is programmed to start synchronously with the Receiver, the delay is also applied.

Note: Note: STTDLY must be set carefully. If STTDLY is too short in respect to TAG (Transmit Sync Data) emission, data is emitted instead of the end of TAG.

#### • PERIOD: Transmit Period Divider Selection

This field selects the divider to apply to the selected Transmit Clock to generate a new Frame Sync Signal. If 0, no period signal is generated. If not 0, a period signal is generated at each  $2 \times (PERIOD + 1)$  Transmit Clock.

### 43.9.6 SSC Transmit Frame Mode Register

Name: SSC\_TFMR
Address: 0xF001001C
Access: Read/Write

| 7100000. | rtodd, vviito |        |    |    |        |     |        |
|----------|---------------|--------|----|----|--------|-----|--------|

| 7        | 6             | 5      | 4  | 3  | 2      | 1   | 0      |
| MSBF     | _             | DATDEF |    |    | DATLEN |     |        |

This register can only be written if the WPEN bit is cleared in the SSC Write Protection Mode Register.

## · DATLEN: Data Length

0: Forbidden value (1-bit data length not supported).

Any other value: The bit stream contains DATLEN + 1 data bits.

#### DATDEF: Data Default Value

This bit defines the level driven on the TD pin while out of transmission. Note that if the pin is defined as multi-drive by the PIO Controller, the pin is enabled only if the SCC TD output is 1.

### • MSBF: Most Significant Bit First

0: The lowest significant bit of the data register is shifted out first in the bit stream.

1: The most significant bit of the data register is shifted out first in the bit stream.

## DATNB: Data Number per Frame

This field defines the number of data words to be transferred after each transfer start, which is equal to (DATNB + 1).

#### FSLEN: Transmit Frame Sync Length

This field defines the length of the Transmit Frame Sync signal and the number of bits shifted out from the Transmit Sync Data Register if FSDEN is 1.

This field is used with FSLEN\_EXT to determine the pulse length of the Transmit Frame Sync signal.

Pulse length is equal to FSLEN + (FSLEN EXT × 16) + 1 Transmit Clock period.

## • FSOS: Transmit Frame Sync Output Selection

| Value | Name     | Description                             |  |  |  |
|-------|----------|---|--|--|--|
| 0     | NONE     | None, TF pin is an input                |  |  |  |
| 1     | NEGATIVE | Negative Pulse, TF pin is an output     |  |  |  |
| 2     | POSITIVE | Positive Pulse, TF pin is an output     |  |  |  |
| 3     | LOW      | Driven Low during data transfer         |  |  |  |
| 4     | HIGH     | Driven High during data transfer        |  |  |  |
| 5     | TOGGLING | Toggling at each start of data transfer |  |  |  |

## • FSDEN: Frame Sync Data Enable

0: The TD line is driven with the default value during the Transmit Frame Sync signal.

1: SSC\_TSHR value is shifted out during the transmission of the Transmit Frame Sync signal.

# • FSEDGE: Frame Sync Edge Detection

Determines which edge on frame sync will generate the interrupt TXSYN (Status Register).

|   | Value | Name     | Description             |
|---|-------|----------|-------------------------|
| Ī | 0     | POSITIVE | Positive Edge Detection |
| Ī | 1     | NEGATIVE | Negative Edge Detection |

### • FSLEN\_EXT: FSLEN Field Extension

Extends FSLEN field. For details, refer to FSLEN bit description on page 1052.

## • TXRDY: Transmit Ready

0: Data has been loaded in SSC\_THR and is waiting to be loaded in the transmit shift register (TSR).

1: SSC\_THR is empty.

## • TXEMPTY: Transmit Empty

0: Data remains in SSC\_THR or is currently transmitted from TSR.

1: Last data written in SSC\_THR has been loaded in TSR and last data loaded in TSR has been transmitted.

### • RXRDY: Receive Ready

0: SSC\_RHR is empty.

1: Data has been received and loaded in SSC\_RHR.

### • OVRUN: Receive Overrun

0: No data has been loaded in SSC\_RHR while previous data has not been read since the last read of the Status Register.

1: Data has been loaded in SSC\_RHR while previous data has not yet been read since the last read of the Status Register.

## • CP0: Compare 0

0: A compare 0 has not occurred since the last read of the Status Register.

1: A compare 0 has occurred since the last read of the Status Register.

### • CP1: Compare 1

0: A compare 1 has not occurred since the last read of the Status Register.

1: A compare 1 has occurred since the last read of the Status Register.

## • TXSYN: Transmit Sync

0: A Tx Sync has not occurred since the last read of the Status Register.

1: A Tx Sync has occurred since the last read of the Status Register.

### RXSYN: Receive Sync

0: An Rx Sync has not occurred since the last read of the Status Register.

1: An Rx Sync has occurred since the last read of the Status Register.

#### • TXEN: Transmit Enable

0: Transmit is disabled.

1: Transmit is enabled.

### • RXEN: Receive Enable

0: Receive is disabled.

1: Receive is enabled.

#### • WPVS: Write Protection Violation Status

0: No write protection violation has occurred since the last read of the SSC\_WPSR.

#### • WPVSRC: Write Protect Violation Source

When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

<sup>1:</sup> A write protection violation has occurred since the last read of the SSC\_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

# 44. Ethernet 10/100 MAC (EMAC)

## 44.1 Description

The EMAC module implements a 10/100 Ethernet MAC compatible with the IEEE 802.3 standard using an address checker, statistics and control registers, receive and transmit blocks, and a DMA interface.

The address checker recognizes four specific 48-bit addresses and contains a 64-bit hash register for matching multicast and unicast addresses. It can recognize the broadcast address of all ones, copy all frames, and act on an external address match signal.

The statistics register block contains registers for counting various types of event associated with transmit and receive operations. These registers, along with the status words stored in the receive buffer list, enable software to generate network management statistics compatible with IEEE 802.3.

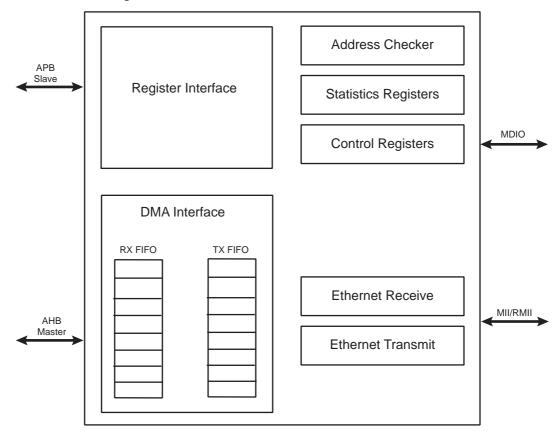

#### 44.2 Embedded Characteristics

- Supports RMII Interface to the physical layer
- Compatible with IEEE Standard 802.3
- 10 and 100 Mbit/s Operation
- Full- and Half-duplex Operation
- Statistics Counter Registers
- Interrupt Generation to Signal Receive and Transmit Completion
- DMA Master on Receive and Transmit Channels
- Transmit and Receive FIFOs
- Automatic Pad and CRC Generation on Transmitted Frames
- Automatic Discard of Frames Received with Errors
- Address Checking Logic Supports Up to Four Specific 48-bit Addresses
- Supports Promiscuous Mode Where All Valid Received Frames are Copied to Memory
- Hash Matching of Unicast and Multicast Destination Addresses
- Physical Layer Management through MDIO Interface
- Half-duplex Flow Control by Forcing Collisions on Incoming Frames
- Full-duplex Flow Control with Recognition of Incoming Pause Frames
- Support for 802.1Q VLAN Tagging with Recognition of Incoming VLAN and Priority Tagged Frames
- Multiple Buffers per Receive and Transmit Frame
- Jumbo Frames Up to 10240 bytes Supported

# 44.3 Block Diagram

Figure 44-1. EMAC Block Diagram

## 44.4 Functional Description

The EMAC has several clock domains:

- System bus clock (AHB and APB): DMA and register blocks
- Transmit clock: transmit block
- Receive clock: receive and address checker block

The system bus clock must run at least as fast as the receive clock and transmit clock (25 MHz at 100 Mbit/s, and 2.5 MHz at 10 Mbit/s).

Figure 44-1 illustrates the different blocks of the EMAC module.

The control registers drive the MDIO interface, setup up DMA activity, start frame transmission and select modes of operation such as full- or half-duplex.

The receive block checks for valid preamble, FCS, alignment and length, and presents received frames to the address checking block and DMA interface.

The transmit block takes data from the DMA interface, adds preamble and, if necessary, pad and FCS, and transmits data according to the CSMA/CD (carrier sense multiple access with collision detect) protocol. The start of transmission is deferred if CRS (carrier sense) is active.

If COL (collision) becomes active during transmission, a jam sequence is asserted and the transmission is retried after a random back off. CRS and COL have no effect in full duplex mode.

The DMA block connects to external memory through its AHB bus interface. It contains receive and transmit FIFOs for buffering frame data. It loads the transmit FIFO and empties the receive FIFO using AHB bus master operations. Receive data is not sent to memory until the address checking logic has determined that the frame should be copied. Receive or transmit frames are stored in one or more buffers. Receive buffers have a fixed length of 128 bytes. Transmit buffers range in length between 0 and 2047 bytes, and up to 128 buffers are permitted per frame. The DMA block manages the transmit and receive framebuffer queues. These queues can hold multiple frames.

#### 44.4.1 Clock

Synchronization module in the EMAC requires that the bus clock (MCK) runs at the speed of the macb\_tx/rx\_clk at least, which is 25 MHz at 100 Mbit/s, and 2.5 MHz at 10 Mbit/s.

#### 44.4.2 Memory Interface

Frame data is transferred to and from the EMAC through the DMA interface. All transfers are 32-bit words and may be single accesses or bursts of 2, 3 or 4 words. Burst accesses do not cross sixteen-byte boundaries. Bursts of four words are the default data transfer; single accesses or bursts of less than four words may be used to transfer data at the beginning or the end of a buffer.

The DMA controller performs six types of operation on the bus. In order of priority, these are:

- 1. Receive buffer manager write
- 2. Receive buffer manager read
- 3. Transmit data DMA read
- 4. Receive data DMA write
- 5. Transmit buffer manager read
- 6. Transmit buffer manager write

#### 44.4.2.1 FIFO

The FIFO depths are 128 bytes for receive and 128 bytes for transmit and are a function of the system clock speed, memory latency and network speed.

Data is typically transferred into and out of the FIFOs in bursts of four words. For receive, a bus request is asserted when the FIFO contains four words and has space for 28 more. For transmit, a bus request is generated when there is space for four words, or when there is space for 27 words if the next transfer is to be only one or two words.

Thus the bus latency must be less than the time it takes to load the FIFO and transmit or receive three words (112 bytes) of data.

At 100 Mbit/s, it takes 8960 ns to transmit or receive 112 bytes of data. In addition, six master clock cycles should be allowed for data to be loaded from the bus and to propagate through the FIFOs. For a 133 MHz master clock this takes 45 ns, making the bus latency requirement 8915 ns.

#### 44.4.2.2 Receive Buffers

Received frames, including CRC/FCS optionally, are written to receive buffers stored in memory. Each receive buffer is 128 bytes long. The start location for each receive buffer is stored in memory in a list of receive buffer descriptors at a location pointed to by the Receive Buffer Queue Pointer Register (EMAC\_RBQP). The receive buffer start location is a word address. For the first buffer of a frame, the start location can be offset by up to three bytes depending on the value written to bits 14 and 15 of the Network Configuration Register (EMAC\_NCFGR). If the start location of the buffer is offset the available length of the first buffer of a frame is reduced by the corresponding number of bytes.

Each list entry consists of two words, the first being the address of the receive buffer and the second being the receive status. If the length of a receive frame exceeds the buffer length, the status word for the used buffer is written with zeroes except for the 'Start of Frame' bit and the offset bits, if appropriate. Bit 0 of the address field is written to one to show the buffer has been used. The receive buffer manager then reads the location of the next receive buffer and fills that with receive frame data. The final buffer descriptor status word contains the complete frame status. Refer to Table 44-1 for details of the receive buffer descriptor list.

Table 44-1. Receive Buffer Descriptor Entry

| Bit  | Function   |  |  |  |  |  |  |
|------|--|--|--|--|--|--|--|
|      | Word 0   |  |  |  |  |  |  |
| 31:2 | Address of beginning of buffer   |  |  |  |  |  |  |
| 1    | Wrap - marks last descriptor in receive buffer descriptor list.  |  |  |  |  |  |  |
| 0    | Ownership - needs to be zero for the EMAC to write data to the receive buffer. The EMAC sets this to one once it has successfully written a frame to memory. |  |  |  |  |  |  |
|      | Software has to clear this bit before the buffer can be used again.  |  |  |  |  |  |  |
|      | Word 1   |  |  |  |  |  |  |
| 31   | Global all ones broadcast address detected   |  |  |  |  |  |  |
| 30   | Multicast hash match   |  |  |  |  |  |  |
| 29   | Unicast hash match   |  |  |  |  |  |  |
| 28   | External address match   |  |  |  |  |  |  |
| 27   | Reserved for future use  |  |  |  |  |  |  |
| 26   | Specific address register 1 match  |  |  |  |  |  |  |
| 25   | Specific address register 2 match  |  |  |  |  |  |  |
| 24   | Specific address register 3 match  |  |  |  |  |  |  |

Table 44-1. Receive Buffer Descriptor Entry (Continued)

| Bit   | Function  |  |  |  |
|-------|---|--|--|--|
| 23    | Specific address register 4 match   |  |  |  |
| 22    | Type ID match   |  |  |  |
| 21    | VLAN tag detected (i.e., type ID of 0x8100)   |  |  |  |
| 20    | Priority tag detected (i.e., type ID of 0x8100 and null VLAN identifier)  |  |  |  |
| 19:17 | VLAN priority (only valid if bit 21 is set)   |  |  |  |
| 16    | Concatenation format indicator (CFI) bit (only valid if bit 21 is set)  |  |  |  |
| 15    | End of frame - when set the buffer contains the end of a frame. If end of frame is not set, then the only other valid status are bits 12, 13 and 14.  |  |  |  |
| 14    | Start of frame - when set the buffer contains the start of a frame. If both bits 15 and 14 are set, then the buffer contains a whole frame.   |  |  |  |
| 13:12 | Receive buffer offset - indicates the number of bytes by which the data in the first buffer is offset from the word address. Updated with the current values of the EMAC_NCFGR. If jumbo frame mode is enabled through bit 3 of the EMAC_NCFGR, then bits 13:12 of the receive buffer descriptor entry are used to indicate bits 13:12 of the frame length. |  |  |  |
| 11:0  | Length of frame including FCS (if selected). Bits 13:12 are also used if jumbo frame mode is selected.  |  |  |  |

To receive frames, the buffer descriptors must be initialized by writing an appropriate address to bits 31 to 2 in the first word of each list entry. Bit zero must be written with zero. Bit 1 is the wrap bit and indicates the last entry in the list.

The start location of the receive buffer descriptor list must be written to the EMAC\_RBQP register before setting the 'Receive Enable' bit in the Network Control Register (EMAC\_NCR) to enable receive. As soon as the receive block starts writing received frame data to the receive FIFO, the receive buffer manager reads the first receive buffer location pointed to by the EMAC\_RBQP register.

If the filter block then indicates that the frame should be copied to memory, the receive data DMA operation starts writing data into the receive buffer. If an error occurs, the buffer is recovered. If the current buffer pointer has its wrap bit set or is the 1024th descriptor, the next receive buffer location is read from the beginning of the receive descriptor list. Otherwise, the next receive buffer location is read from the next word in memory.

There is an 11-bit counter to count out the 2048 word locations of a maximum length, receive buffer descriptor list. This is added with the value originally written to the EMAC\_RBQP register to produce a pointer into the list. A read of the EMAC\_RBQP register returns the pointer value, which is the queue entry currently being accessed. The counter is reset after receive status is written to a descriptor that has its wrap bit set or rolls over to zero after 1024 descriptors have been accessed. The value written to the EMAC\_RBQP register may be any word-aligned address, provided that there are at least 2048 word locations available between the pointer and the top of the memory.

Section 3.6 of the AMBA 2.0 specification states that bursts should not cross 1K boundaries. As receive buffer manager writes are bursts of two words, to ensure that this does not occur, it is best to write the EMAC\_RBQP register with the least three significant bits set to zero. As receive buffers are used, the receive buffer manager sets bit 0 of the first word of the descriptor to indicate *used*. If a receive error is detected the receive buffer currently being written is recovered. Previous buffers are not recovered. Software should search through the *used* bits in the buffer descriptors to find out how many frames have been received. It should be checking the 'Start of Frame' and 'End of Frame' bits, and not rely on the value returned by the EMAC\_RBQP register which changes continuously as more buffers are used.

For CRC errored frames, excessive length frames or length field mismatched frames, all of which are counted in the statistics registers, it is possible that a frame fragment might be stored in a sequence of receive buffers. Software can detect this by looking for 'Start of Frame' bit set in a buffer following a buffer with no 'End of Frame' bit set.

For a properly working Ethernet system, there should be no excessively long frames or frames greater than 128 bytes with CRC/FCS errors. Collision fragments are less than 128 bytes long. Therefore, it is a rare occurrence to find a frame fragment in a receive buffer.

If bit 0 is set when the receive buffer manager reads the location of the receive buffer, then the buffer has already been used and cannot be used again until software has processed the frame and cleared bit 0. In this case, the DMA block sets the 'Buffer Not Available' bit in the Receive Status Register (EMAC\_RSR) and triggers an interrupt.

If bit 0 is set when the receive buffer manager reads the location of the receive buffer and a frame is being received, the frame is discarded and the Receive Resource Errors Register (EMAC\_RRE) is incremented.

A receive overrun condition occurs when bus was not granted in time or because HRESP was not OK (bus error). In a receive overrun condition, the receive overrun interrupt is asserted and the buffer currently being written is recovered. The next frame received with an address that is recognized reuses the buffer.

If bit 17 of the EMAC\_NCFGR is set, the FCS of received frames shall not be copied to memory. The frame length indicated in the receive status field shall be reduced by four bytes in this case.

#### 44.4.2.3 Transmit Buffer

Frames to be transmitted are stored in one or more transmit buffers. Transmit buffers can be between 0 and 2047 bytes long, so it is possible to transmit frames longer than the maximum length specified in IEEE Standard 802.3. Zero length buffers are allowed. The maximum number of buffers permitted for each transmit frame is 128.

The start location for each transmit buffer is stored in memory in a list of transmit buffer descriptors at a location pointed to by the Transmit Buffer Queue Pointer Register (EMAC\_TBQP). Each list entry consists of two words, the first being the byte address of the transmit buffer and the second containing the transmit control and status. Frames can be transmitted with or without automatic CRC generation. If CRC is automatically generated, pad is also automatically generated to take frames to a minimum length of 64 bytes. Table 44-2 on page 1076 defines an entry in the transmit buffer descriptor list. To transmit frames, the buffer descriptors must be initialized by writing an appropriate byte address to bits 31 to 0 in the first word of each list entry. The second transmit buffer descriptor is initialized with control information that indicates the length of the buffer, whether or not it is to be transmitted with CRC and whether the buffer is the last buffer in the frame.

After transmission, the control bits are written back to the second word of the first buffer along with the 'used' bit and other status information. Bit 31 is the 'used' bit which must be zero when the control word is read if transmission is to happen. It is written to one when a frame has been transmitted. Bits 27, 28 and 29 indicate various transmit error conditions. Bit 30 is the 'wrap' bit which can be set for any buffer within a frame. If no wrap bit is encountered after 1024 descriptors, the queue pointer rolls over to the start in a similar fashion to the receive queue.

The EMAC\_TBQP register must not be written while transmit is active. If a new value is written to the EMAC\_TBQP register, the queue pointer resets itself to point to the beginning of the new queue. If transmit is disabled by writing to bit 3 of the EMAC\_NCR, the EMAC\_TBQP register resets to point to the beginning of the transmit queue. Note that disabling receive does not have the same effect on the receive queue pointer.

Once the transmit queue is initialized, transmit is activated by writing to bit 9, the 'Start Transmission' bit of the EMAC\_NCR. Transmit is halted when a buffer descriptor with its 'used' bit set is read, or if a transmit error occurs, or by writing to the 'Transmit Halt' bit of the EMAC\_NCR. (Transmission is suspended if a pause frame is received while the 'Pause Enable' bit is set in the EMAC\_NCFGR.) Rewriting the start bit while transmission is active is allowed.

Transmission control is implemented with a Tx\_go variable which is readable in the Transmit Status Register (EMAC\_TSR) at bit location 3. The Tx\_go variable is reset when:

- transmit is disabled
- a buffer descriptor with its ownership bit set is read
- a new value is written to the EMAC\_TBQP register
- bit 10, tx\_halt, of the EMAC\_NCR is written
- there is a transmit error such as too many retries or a transmit underrun.

To set tx\_go, write to bit 9, tx\_start, of the EMAC\_NCR. Transmit halt does not take effect until any ongoing transmit finishes. If a collision occurs during transmission of a multi-buffer frame, transmission automatically restarts from the first buffer of the frame. If a 'used' bit is read midway through transmission of a multi-buffer frame, this is treated as a transmit error. Transmission stops, tx\_er is asserted and the FCS is bad.

If transmission stops due to a transmit error, the transmit queue pointer resets to point to the beginning of the transmit queue. Software needs to re-initialize the transmit queue after a transmit error.

If transmission stops due to a 'used' bit being read at the start of the frame, the transmission queue pointer is not reset and transmission starts from the same transmit buffer descriptor when the 'Start Transmission' bit is written.

Table 44-2. Transmit Buffer Descriptor Entry

| Bit                         | Function  |  |  |  |
|-----------------------------|---|--|--|--|
|                             | Word 0  |  |  |  |
| 31:0 Byte Address of buffer |   |  |  |  |
|                             | Word 1  |  |  |  |
|                             | Used. Needs to be zero for the EMAC to read data from the transmit buffer. The EMAC sets this to one for the first buffer of a frame once it has been successfully transmitted. |  |  |  |
| 31                          | Software has to clear this bit before the buffer can be used again.   |  |  |  |
|                             | Note: This bit is only set for the first buffer in a frame unlike receive where all buffers have the Used bit set once used.  |  |  |  |
| 30                          | Wrap. Marks last descriptor in transmit buffer descriptor list.   |  |  |  |
| 29                          | Retry limit exceeded, transmit error detected   |  |  |  |
| 28                          | Transmit underrun, occurs either when hresp is not OK (bus error) or the transmit data could not be fetched in time or when buffers are exhausted in mid-frame.                 |  |  |  |
| 27                          | Buffers exhausted in mid-frame  |  |  |  |
| 26:17                       | Reserved  |  |  |  |
| 16                          | No CRC. When set, no CRC is appended to the current frame. This bit only needs to be set for the last buffer of a frame.  |  |  |  |
| 15                          | Last buffer. When set, this bit indicates the last buffer in the current frame has been reached.  |  |  |  |
| 14:11                       | Reserved  |  |  |  |
| 10:0                        | Length of buffer  |  |  |  |

## 44.4.3 Transmit Block

This block transmits frames in accordance with the Ethernet IEEE 802.3 CSMA/CD protocol. Frame assembly starts by adding preamble and the start frame delimiter. Data is taken from the transmit FIFO a word at a time. Data is transmitted least significant nibble first. If necessary, padding is added to increase the frame length to 60 bytes. CRC is calculated as a 32-bit polynomial. This is inverted and appended to the end of the frame, taking the frame length to a minimum of 64 bytes. If the No CRC bit is set in the second word of the last buffer descriptor of a transmit frame, neither pad nor CRC are appended.

In full-duplex mode, frames are transmitted immediately. Back-to-back frames are transmitted at least 96 bit times apart to guarantee the interframe gap.

In half-duplex mode, the transmitter checks carrier sense. If asserted, it waits for it to de-assert and then starts transmission after the interframe gap of 96 bit times. If the collision signal is asserted during transmission, the transmitter transmits a jam sequence of 32 bits taken from the data register and then retry transmission after the back off time has elapsed.

The back-off time is based on an XOR of the 10 least significant bits of the data coming from the transmit FIFO and a 10-bit pseudo random number generator. The number of bits used depends on the number of collisions seen. After the first collision, one bit is used, after the second collision, two bits are used, and so on up to 10. Above 10, all 10 bits are used. An error is indicated and no further attempts are made if 16 attempts cause collisions.

If transmit DMA underruns, bad CRC is automatically appended using the same mechanism as jam insertion and the tx\_er signal is asserted. For a properly configured system, this should never happen.

If the 'Back Pressure' bit is set in the EMAC\_NCR in half duplex mode, the transmit block transmits 64 bits of data, which can consist of 16 nibbles of 1011 or in bit-rate mode 64 ones, whenever it sees an incoming frame to force a collision. This provides a way of implementing flow control in half-duplex mode.

### 44.4.4 Pause Frame Support

The following table summarizes the start of an 802.3 pause frame.

Table 44-3. Start of an 802.3 Pause Frame

| Destination Address | Source Address | Type<br>(MAC Control Frame) | Pause Opcode | Pause Time |
|---------------------|----------------|-----------------------------|--------------|------------|
| 0x0180C2000001      | 6 bytes        | 0x8808                      | 0x0001       | 2 bytes    |

The EMAC\_NCFGR contains a receive 'Pause Enable' bit (13). If a valid pause frame is received, the Pause Time Register (EMAC\_PTR) is updated with the frame's pause time, regardless of its current contents and regardless of the state of the EMAC\_NCFGR bit 13. An interrupt (12) is triggered when a pause frame is received, assuming it is enabled in the Interrupt Mask Register (EMAC\_IMR). If bit 13 is set in the EMAC\_NCFGR and the value of the EMAC\_PTR is non-zero, no new frame is transmitted until the EMAC\_PTR has decremented to zero.

The loading of a new pause time, and hence the pausing of transmission, only occurs when the EMAC is configured for full-duplex operation. If the EMAC is configured for half-duplex, there is no transmission pause, but the pause frame received interrupt is still triggered.

A valid pause frame is defined as having a destination address that matches either the address stored in specific address register 1 or matches 0x0180C2000001 and has the MAC control frame type ID of 0x8808 and the pause opcode of 0x0001. Pause frames that have FCS or other errors are treated as invalid and are discarded. Valid pause frames received increment the Pause Frames Received Register (EMAC\_PFR).

The EMAC\_PTR decrements every 512 bit times (i.e., 128 rx\_clks in nibble mode) once transmission has stopped. For test purposes, the register decrements every rx\_clk cycle once transmission has stopped if bit 12 ('Retry Test') is set in the EMAC\_NCFGR. If the 'Pause Enable' bit (13) is not set in the EMAC\_NCFGR, then the decrementing occurs regardless of whether transmission has stopped or not.

An interrupt (13) is asserted whenever the EMAC\_PTR decrements to zero (assuming it is enabled in the EMAC\_IMR).

#### 44.4.5 Receive Block

The receive block checks for valid preamble, FCS, alignment and length, presents received frames to the DMA block and stores the frames destination address for use by the address checking block. If, during frame reception, the frame is found to be too long or rx\_er is asserted, a bad frame indication is sent to the DMA block. The DMA block then ceases sending data to memory. At the end of frame reception, the receive block indicates to the DMA

block whether the frame is good or bad. The DMA block recovers the current receive buffer if the frame was bad. The receive block signals the register block to increment the alignment error, the CRC (FCS) error, the short frame, long frame, jabber error, the receive symbol error statistics and the length field mismatch statistics.

The enable bit for jumbo frames in the EMAC\_NCFGR allows the EMAC to receive jumbo frames of up to 10240 bytes in size. This operation does not form part of the IEEE802.3 specification and is disabled by default. When jumbo frames are enabled, frames received with a frame size greater than 10240 bytes are discarded.

#### 44.4.6 Address Checking Block

The address checking (or filter) block indicates to the DMA block which receive frames should be copied to memory. Whether a frame is copied depends on what is enabled in the EMAC\_NCFGR, the state of the external match pin, the contents of the specific address and hash registers and the frame's destination address. In this implementation of the EMAC, the frame's source address is not checked. Provided that bit 18 of the EMAC\_NCFGR is not set, a frame is not copied to memory if the EMAC is transmitting in half duplex mode at the time a destination address is received. If bit 18 of the EMAC\_NCFGR is set, frames can be received while transmitting in half-duplex mode.

Ethernet frames are transmitted a byte at a time, least significant bit first. The first six bytes (48 bits) of an Ethernet frame make up the destination address. The first bit of the destination address, the LSB of the first byte of the frame, is the group/individual bit: this is *One* for multicast addresses and *Zero* for unicast. The *All Ones* address is the broadcast address, and a special case of multicast.

The EMAC supports recognition of four specific addresses. Each specific address requires two registers, specific address register bottom and specific address register top. Specific address register bottom stores the first four bytes of the destination address and specific address register top contains the last two bytes. The addresses stored can be specific, group, local or universal.

The destination address of received frames is compared against the data stored in the specific address registers once they have been activated. The addresses are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written. If a receive frame address matches an active address, the frame is copied to memory.

The following example illustrates the use of the address match registers for a MAC address of 21:43:65:87:A9:CB.

Preamble 55

SFD D5

DA (Octet0 - LSB) 21

DA (Octet 1) 43

DA (Octet 2) 65

**DA (Octet 3) 87** 

DA (Octet 4) A9

DA (Octet5 - MSB) CB

SA (LSB) 00

SA 00

**SA 00** 

**SA 00** 

**SA 00** 

SA (MSB) 43

SA (LSB) 21

The sequence above shows the beginning of an Ethernet frame. Byte order of transmission is from top to bottom as shown. For a successful match to specific address 1, the following address matching registers must be set up:

- Base address + 0x98 0x87654321 (Bottom)
- Base address + 0x9C 0x0000CBA9 (Top)

And for a successful match to the Type ID Checking Register (EMAC\_TID), the following should be set up:

Base address + 0xB8 0x00004321

#### 44.4.7 Broadcast Address

The broadcast address of 0xFFFFFFFFFFF is recognized if the 'No Broadcast' bit in the EMAC\_NCFGR is zero.

#### 44.4.8 Hash Addressing

The hash address register is 64 bits long and takes up two locations in the memory map. The least significant bits are stored in hash register bottom and the most significant bits in hash register top.

The 'Unicast Hash Enable' and the 'Multicast Hash Enable' bits in the EMAC\_NCFGR enable the reception of hash matched frames. The destination address is reduced to a 6-bit index into the 64-bit hash register using the following hash function. The hash function is an *exclusive or* of every sixth bit of the destination address.

```
hash_index[5] = da[5] ^ da[11] ^ da[17] ^ da[23] ^ da[29] ^ da[35] ^ da[41] ^
da[47]
hash_index[4] = da[4] ^ da[10] ^ da[16] ^ da[22] ^ da[28] ^ da[34] ^ da[40] ^
da[46]
hash_index[3] = da[3] ^ da[09] ^ da[15] ^ da[21] ^ da[27] ^ da[33] ^ da[39] ^
da[45]
hash_index[2] = da[2] ^ da[08] ^ da[14] ^ da[20] ^ da[26] ^ da[32] ^ da[38] ^
da[44]
hash_index[1] = da[1] ^ da[07] ^ da[13] ^ da[19] ^ da[25] ^ da[31] ^ da[37] ^
da[43]
hash_index[0] = da[0] ^ da[06] ^ da[12] ^ da[18] ^ da[24] ^ da[30] ^ da[36] ^
da[42]
```

da[0] represents the least significant bit of the first byte received, that is, the multicast/unicast indicator, and da[47] represents the most significant bit of the last byte received.

If the hash index points to a bit that is set in the hash register, then the frame is matched according to whether the frame is multicast or unicast.

A multicast match is signalled if the 'Multicast Hash Enable' bit is set. da[0] is 1 and the hash index points to a bit set in the hash register.

A unicast match is signalled if the 'Unicast Hash Enable' bit is set. da[0] is 0 and the hash index points to a bit set in the hash register.

To receive all multicast frames, the hash register should be set with all ones and the 'Multicast Hash Enable' bit should be set in the EMAC\_NCFGR.

#### 44.4.9 Copy All Frames (or Promiscuous Mode)

If the 'Copy All Frames' bit is set in the EMAC\_NCFGR, then all non-errored frames are copied to memory. For example, frames that are too long, too short, or have FCS errors or rx\_er asserted during reception are discarded and all others are received. Frames with FCS errors are copied to memory if bit 19 in the EMAC\_NCFGR is set.

### 44.4.10 Type ID Checking

The contents of the EMAC\_TID register are compared against the length/type ID of received frames (i.e., bytes 13 and 14). Bit 22 in the receive buffer descriptor status is set if there is a match. The reset state of this register is zero which is unlikely to match the length/type ID of any valid Ethernet frame.

Note: A type ID match does not affect whether a frame is copied to memory.

#### 44.4.11 VLAN Support

The following table describes an Ethernet encoded 802.1Q VLAN tag.

Table 44-4. 802.1Q VLAN Tag

| TPID (Tag Protocol Identifier) 16 bits | TCI (Tag Control Information) 16 bits                 |  |  |
|--|---|--|--|
| 0x8100                                 | First 3 bits priority, then CFI bit, last 12 bits VID |  |  |

The VLAN tag is inserted at the 13th byte of the frame, adding an extra four bytes to the frame. If the VID (VLAN identifier) is null (0x000), this indicates a priority-tagged frame. The MAC can support frame lengths up to 1536 bytes, 18 bytes more than the original Ethernet maximum frame length of 1518 bytes. This is achieved by setting bit 8 in the EMAC NCFGR.

The following bits in the receive buffer descriptor status word give information about VLAN tagged frames:

- Bit 21 set if receive frame is VLAN tagged (i.e., type ID of 0x8100)
- Bit 20 set if receive frame is priority tagged (i.e., type ID of 0x8100 and null VID). (If bit 20 is set, bit 21 is set also.)
- Bit 19, 18 and 17 set to priority if bit 21 is set
- Bit 16 set to CFI if bit 21 is set

#### 44.4.12 PHY Maintenance

The PHY Maintenance Register (EMAC\_MAN) enables the EMAC to communicate with a PHY by means of the MDIO interface. It is used during auto-negotiation to ensure that the EMAC and the PHY are configured for the same speed and duplex configuration.

The EMAC\_MAN register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit 2 is set in the Network Status Register (EMAC\_NSR) (about 2000 MCK cycles later when bit 10 is set to zero, and bit 11 is set to one in the EMAC\_NCFGR). An interrupt is generated as this bit is set. During this time, the MSB of the register is output on the MDIO pin and the LSB updated from the MDIO pin with each MDC cycle. This causes transmission of a PHY management frame on MDIO.

Reading during the shift operation returns the current contents of the shift register. At the end of management operation, the bits have shifted back to their original locations. For a read operation, the data bits are updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced.

The MDIO interface can read IEEE 802.3 clause 45 PHYs as well as clause 22 PHYs. To read clause 45 PHYs, bits 31:28 should be written as 0x0011. To write clause 45 PHYs, bits 31:28 should be written as 0x0001. See Table 44-5.

Table 44-5. Clause 22/Clause 45 PHYs Read/Write Access Configuration

|           |                | Field Configuration (EMAC_MAN Bits 31:28) |         |  |
|-----------|----------------|---|---------|--|
| PHY       | Access         | SOF[1:0]                                  | RW[1:0] |  |
| Clause 22 | Read           | 01  | 10      |  |
| Clause 22 | Write          | 01  | 01      |  |
|           | Read           | 00  | 11      |  |
| Clause 45 | Write          | 00  | 01      |  |
|           | Read + Address | 00  | 10      |  |

For a description of MDC generation, see Section 44.6.1 "Network Control Register".

# 44.4.13 Physical Interface

Depending on products, the Ethernet MAC is capable of interfacing to RMII or MII Interface. The 'RMII' bit in the User Input/Output Register (EMAC\_USRIO) controls the interface that is selected. When this bit is set, the RMII interface is selected, else the MII interface is selected.

The MII and RMII interfaces are capable of both 10 Mbit/s and 100 Mbit/s data rates as described in the IEEE 802.3u standard. The signals used by the RMII interface are described in Table 44-6.

Table 44-6. Pin Configuration

| Pin Name                             | RMII                             |
|--------------------------------------|----------------------------------|
| ETXCK_EREFCK EREFCK: Reference Clock |                                  |
| ERXDV                                | ECRSDV: Carrier Sense/Data Valid |
| ERX0-ERX1                            | ERX0-ERX1: 2-bit Receive Data    |
| ERXER                                | ERXER: Receive Error             |
| ETXEN                                | ETXEN: Transmit Enable           |
| ETX0-ETX1                            | ETX0-ETX1: 2-bit Transmit Data   |

The RMII provides a reduced pin count alternative to the IEEE 802.3u MII. It uses two bits for transmit (ETX0 and ETX1) and two bits for receive (ERX0 and ERX1). There is a Transmit Enable (ETXEN), a Receive Error (ERXER), a Carrier Sense (ECRS\_DV), and a 50 MHz Reference Clock (ETXCK\_EREFCK) for 100 Mbit/s data rate.

## 44.4.13.1 RMII Transmit and Receive Operation

The RMII maps the signals in a more pin-efficient manner. The transmit and receive bits are converted from a 4-bit parallel format to a 2-bit parallel scheme that is clocked at twice the rate. The carrier sense and data valid signals are combined into the ECRSDV signal. This signal contains information on carrier sense, FIFO status, and validity of the data. Transmit error bit (ETXER) and collision detect (ECOL) are not used in RMII mode.

# 44.5 Programming Interface

#### 44.5.1 Initialization

#### 44.5.1.1 Configuration

Initialization of the EMAC configuration (e.g., loop-back mode, frequency ratios) must be done while the transmit and receive circuits are disabled. See the description of the EMAC\_NCR and EMAC\_NCFGR earlier in this document.

To change loop-back mode, the following sequence of operations must be followed:

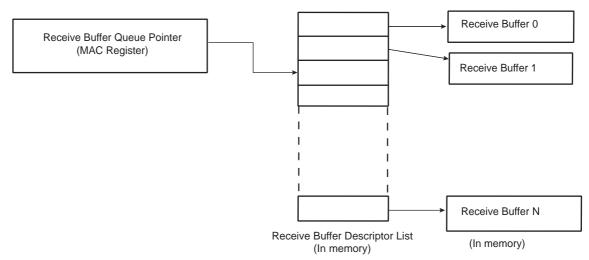

- 1. Write to EMAC NCR to disable transmit and receive circuits.
- 2. Write to EMAC\_NCR to change loop-back mode.
- 3. Write to EMAC\_NCR to re-enable transmit or receive circuits.

Note: These writes to EMAC\_NCR cannot be combined in any way.

#### 44.5.1.2 Receive Buffer List

Receive data is written to areas of data (i.e., buffers) in system memory. These buffers are listed in another data structure that also resides in main memory. This data structure (receive buffer queue) is a sequence of descriptor entries as defined in Table 44-1 "Receive Buffer Descriptor Entry". It points to this data structure.

Figure 44-2. Receive Buffer List

To create the list of buffers:

- 1. Allocate a number (*n*) of buffers of 128 bytes in system memory.
- 2. Allocate an area 2*n* words for the receive buffer descriptor entry in system memory and create *n* entries in this list. Mark all entries in this list as owned by EMAC, i.e., bit 0 of word 0 set to zero.
- 3. If less than 1024 buffers are defined, the last descriptor must be marked with the wrap bit (bit 1 in word 0 set to one).
- Write address of receive buffer descriptor entry to the EMAC\_RBQP register.
- 5. The receive circuits can then be enabled by writing to the address recognition registers and then to the EMAC NCR.

#### 44.5.1.3 Transmit Buffer List

Transmit data is read from areas of data (the buffers) in system memory These buffers are listed in another data structure that also resides in main memory. This data structure (Transmit Buffer Queue) is a sequence of descriptor entries (as defined in Table 44-2 on page 1076) that points to this data structure.

To create this list of buffers:

- 1. Allocate a number (*n*) of buffers of between 1 and 2047 bytes of data to be transmitted in system memory. Up to 128 buffers per frame are allowed.
- 2. Allocate an area 2*n* words for the transmit buffer descriptor entry in system memory and create N entries in this list. Mark all entries in this list as owned by EMAC, i.e., bit 31 of word 1 set to zero.
- 3. If fewer than 1024 buffers are defined, the last descriptor must be marked with the wrap bit bit 30 in word 1 set to one.
- 4. Write address of transmit buffer descriptor entry to EMAC\_TBQP register.
- 5. The transmit circuits can then be enabled by writing to the EMAC NCR.

### 44.5.1.4 Address Matching

The EMAC register-pair hash address and the four specific address register-pairs must be written with the required values. Each register-pair comprises a bottom register and top register, with the bottom register being written first. The address matching is disabled for a particular register-pair after the bottom-register has been written and reenabled when the top register is written. See Section 44.4.6 "Address Checking Block" for details of address matching. Each register-pair may be written at any time, regardless of whether the receive circuits are enabled or disabled.

### 44.5.1.5 Interrupts

There are 14 interrupt conditions that are detected within the EMAC. These are ORed to make a single interrupt. Depending on the overall system design, this may be passed through a further level of interrupt collection (interrupt controller). On receipt of the interrupt signal, the CPU enters the interrupt handler (Refer to the Interrupt Controller). To ascertain which interrupt has been generated, read the Interrupt Status Register (EMAC\_ISR). Note that this register clears itself when read. At reset, all interrupts are disabled.

To enable an interrupt, write to the Interrupt Enable Register (EMAC\_IER) with the pertinent interrupt bit set to one.

To disable an interrupt, write to the Interrupt Disable Register (EMAC\_IDR) with the pertinent interrupt bit set to one.

To check whether an interrupt is enabled or disabled, read the EMAC\_IMR; if the bit is set to one, the interrupt is disabled.

#### 44.5.1.6 Transmitting Frames

To set up a frame for transmission:

- 1. Enable transmit in the EMAC NCR.
- 2. Allocate an area of system memory for transmit data. This does not have to be contiguous, varying byte lengths can be used as long as they conclude on byte borders.
- 3. Set-up the transmit buffer list.
- 4. Set the EMAC NCR to enable transmission and enable interrupts.
- 5. Write data for transmission into these buffers.
- 6. Write the address to transmit buffer descriptor queue pointer.
- 7. Write control and length to word one of the transmit buffer descriptor entry.
- 8. Write to the 'Start Transmission' bit in the EMAC\_NCR.

### 44.5.1.7 Receiving Frames

When a frame is received and the receive circuits are enabled, the EMAC checks the address and, in the following cases, the frame is written to system memory:

- if it matches one of the four specific address registers.
- if it matches the hash address function.
- if it is a broadcast address (0xFFFFFFFFFFF) and broadcasts are allowed.
- if the EMAC is configured to copy all frames.

The EMAC\_RBQP register points to the next entry (see Table 44-1 on page 1073) and the EMAC uses this as the address in system memory to write the frame to. Once the frame has been completely and successfully received and written to system memory, the EMAC then updates the receive buffer descriptor entry with the reason for the address match and marks the area as being owned by software. Once this is complete an interrupt receive complete is set. Software is then responsible for handling the data in the buffer and then releasing the buffer by writing the ownership bit back to zero.

If the EMAC is unable to write the data at a rate to match the incoming frame, then an interrupt receive overrun is set. If there is no receive buffer available, i.e., the next buffer is still owned by software, the interrupt receive buffer not available is set. If the frame is not successfully received, a statistics register is incremented and the frame is discarded without informing software.

# 44.6 Ethernet MAC 10/100 (EMAC) User Interface

Table 44-7. Register Mapping

| Offset    | Register                                | Name       | Access     | Reset       |
|-----------|---|------------|------------|-------------|
| 0x00      | Network Control Register                | EMAC_NCR   | Read/Write | 0           |

| 7       | 6          | 5       | 4   | 3  | 2     | 1      | 0  |
| WESTAT  | INCSTAT    | CLRSTAT | MPE | TE | RE    | LLB    | LB |

## LB: LoopBack

Asserts the loopback signal to the PHY.

### LLB: Loopback Local

Connects txd to rxd, tx\_en to rx\_dv, forces full duplex and drives rx\_clk and tx\_clk with MCK divided by 4. rx\_clk and tx\_clk may glitch as the EMAC is switched into and out of internal loop back. It is important that receive and transmit circuits have already been disabled when making the switch into and out of internal loop back.

#### • RE: Receive Enable

When set, enables the EMAC to receive data. When reset, frame reception stops immediately and the receive FIFO is cleared. The EMAC\_RBQP register is unaffected.

## • TE: Transmit Enable

When set, enables the Ethernet transmitter to send data. When reset transmission, stops immediately, the transmit FIFO and control registers are cleared and the EMAC\_TBQP register resets to point to the start of the transmit descriptor list.

## • MPE: Management Port Enable

0: Forces MDIO to high impedance state and MDC low

1: Enables the management port

#### CLRSTAT: Clear Statistics Registers

This bit is write only. Writing a one clears the statistics registers.

#### • INCSTAT: Increment Statistics Registers

This bit is write only. Writing a one increments all the statistics registers by one for test purposes.

# WESTAT: Write Enable for Statistics Registers

Setting this bit to one makes the statistics registers writable for functional test purposes.

## • BP: Back Pressure

If set in half duplex mode, forces collisions on all received frames.

# • TSTART: Start Transmission

Writing one to this bit starts transmission.

# • THALT: Transmit Halt

Writing one to this bit halts transmission as soon as any ongoing frame transmission ends.

# 44.6.2 Network Configuration Register

Name: EMAC\_NCFGR
Address: 0xF802C004
Access: Read/Write

| Access: | Read/Write |     |     |        |       |       |      |
|---------|------------|-----|-----|--------|-------|-------|------|
| 31      | 30         | 29  | 28  | 27     | 26    | 25    | 24   |
| _       | _          | _   | _   | _      | _     | -     | -    |
| 23      | 22         | 21  | 20  | 19     | 18    | 17    | 16   |
| _       | _          | _   | _   | IRXFCS | EFRHD | DRFCS | RLCE |
| 15      | 14         | 13  | 12  | 11     | 10    | 9     | 8    |
|         | RBOF       | PAE | RTY | CI     | _K    | _     | BIG  |
| 7       | 6          | 5   | 4   | 3      | 2     | 1     | 0    |
| UNI     | MTI        | NBC | CAF | JFRAME | _     | FD    | SPD  |

## · SPD: Speed

0: 10 Mbit/s operation

1: 100 Mbit/s operation

# • FD: Full Duplex

If set to one, the transmit block ignores the state of collision and carrier sense and allows receive while transmitting.

### CAF: Copy All Frames

When set to one, all valid frames are received.

#### • JFRAME: Jumbo Frames

Set to one to enable jumbo frames of up to 10240 bytes to be accepted.

#### NBC: No Broadcast

When set to one, frames addressed to the broadcast address of all ones are not received.

#### • MTI: Multicast Hash Enable

When set to one, multicast frames are received when the 6-bit hash function of the destination address points to a bit that is set in the hash register.

### • UNI: Unicast Hash Enable

When set to one, unicast frames are received when the 6-bit hash function of the destination address points to a bit that is set in the hash register.

## • BIG: Receive 1536 Bytes Frames

Setting this bit means the EMAC receives frames up to 1536 bytes in length. Normally, the EMAC would reject any frame above 1518 bytes.

## • CLK: MDC Clock Divider

Set according to system clock speed. This determines by what number system clock is divided to generate MDC. For conformance with 802.3, MDC must not exceed 2.5 MHz (MDC is only active during MDIO read and write operations).

| Value | Name   | Description                           |  |  |  |  |
|-------|--------|---------------------------------------|--|--|--|--|
| 0     | MCK_8  | MCK divided by 8 (MCK up to 20 MHz)   |  |  |  |  |
| 1     | MCK_16 | ICK divided by 16 (MCK up to 40 MHz)  |  |  |  |  |
| 2     | MCK_32 | MCK divided by 32 (MCK up to 80 MHz)  |  |  |  |  |
| 3     | MCK_64 | MCK divided by 64 (MCK up to 160 MHz) |  |  |  |  |

## · RTY: Retry Test

0: Normal operation

1: The back off between collisions is always one slot time. Setting this bit helps in testing the 'too many retries' condition. Also used in the pause frame tests to reduce the pause counters decrement time from 512 bit times, to every rx\_clk cycle.

#### PAE: Pause Enable

When set, transmission pauses when a valid pause frame is received.

## • RBOF: Receive Buffer Offset

Indicates the number of bytes by which the received data is offset from the start of the first receive buffer.

| Value | Name     | Description                                    |
|-------|----------|--|
| 0     | OFFSET_0 | No offset from start of receive buffer         |
| 1     | OFFSET_1 | One-byte offset from start of receive buffer   |
| 2     | OFFSET_2 | Two-byte offset from start of receive buffer   |
| 3     | OFFSET_3 | Three-byte offset from start of receive buffer |

# • RLCE: Receive Length Field Checking Enable

When set, frames with measured lengths shorter than their length fields are discarded. Frames containing a type ID in bytes 13 and 14 — length/type ID = 0600 — are not counted as length errors.

### • DRFCS: Discard Receive FCS

When set, the FCS field of received frames is not copied to memory.

#### EFRHD: Enable Frames Received in Half Duplex

Enable Frames to be received in half-duplex mode while transmitting.

## IRXFCS: Ignore RX FCS

0: Normal operation

1: Frames with FCS/CRC errors are not rejected and no FCS error statistics are counted.

# 44.6.3 Network Status Register

Name: EMAC\_NSR
Address: 0xF802C008

Access: Read-only

|    | •  |    |    |    |      |      |    |
|----|----|----|----|----|------|------|----|
| 31 | 30 | 29 | 28 | 27 | 26   | 25   | 24 |

| _  | _  | _  | _  | _  | IDLE | MDIO | _  |

# • MDIO: MDIO Input Status

Returns status of the mdio\_in pin. Use the PHY Maintenance Register for reading managed frames rather than this bit.

# • IDLE: PHY Management Logic Status

0: The PHY logic is running.

1: The PHY management logic is idle (i.e., has completed).

## 44.6.4 Transmit Status Register

Name: EMAC\_TSR
Address: 0xF802C014
Access: Read/Write

| Access: | Read/Write |      |     |     |      |     |     |
|---------|------------|------|-----|-----|------|-----|-----|
| 31      | 30         | 29   | 28  | 27  | 26   | 25  | 24  |
| _       | _          | _    | _   | _   | _    | _   | _   |
| 23      | 22         | 21   | 20  | 19  | 18   | 17  | 16  |
| _       | _          | -    | -   | _   | -    | -   | _   |
| 15      | 14         | 13   | 12  | 11  | 10   | 9   | 8   |
| _       | _          | _    | _   | _   | _    | _   | _   |
| 7       | 6          | 5    | 4   | 3   | 2    | 1   | 0   |
| _       | UND        | COMP | BEX | TGO | RLES | COL | UBR |

This register, when read, provides details of the status of a transmit. Once read, individual bits may be cleared by writing a one to them. It is not possible to set a bit to one by writing to the register.

### UBR: Used Bit Read (cleared by writing a one to this bit)

Set when a transmit buffer descriptor is read with its used bit set.

## COL: Collision Occurred (cleared by writing a one to this bit)

Set by the assertion of collision.

#### RLES: Retry Limit Exceeded (cleared by writing a one to this bit)

#### TGO: Transmit Go

If high transmit is active.

#### BEX: Buffers Exhausted Mid-frame (cleared by writing a one to this bit)

If the buffers run out during transmission of a frame, then transmission stops, FCS shall be bad and tx\_er asserted.

## COMP: Transmit Complete (cleared by writing a one to this bit)

Set when a frame has been transmitted.

### UND: Transmit Underrun (cleared by writing a one to this bit)

Set when transmit DMA was not able to read data from memory, either because the bus was not granted in time, because a not OK hresp(bus error) was returned or because a used bit was read midway through frame transmission. If this occurs, the transmitter forces bad CRC.

## 44.6.5 Receive Buffer Queue Pointer Register

Name: EMAC\_RBQP
Address: 0xF802C018
Access: Read/Write

| Access. | rcad, write |    |    |    |    |    |    |
|---------|-------------|----|----|----|----|----|----|
| 31      | 30          | 29 | 28 | 27 | 26 | 25 | 24 |
|         |             |    | AD | DR |    |    |    |
| 23      | 22          | 21 | 20 | 19 | 18 | 17 | 16 |
|         |             |    | AD | DR |    |    |    |
| 15      | 14          | 13 | 12 | 11 | 10 | 9  | 8  |
|         |             |    | AD | DR |    |    |    |
| 7       | 6           | 5  | 4  | 3  | 2  | 1  | 0  |
|         |             | AD | DR |    |    | -  | _  |

This register points to the entry in the receive buffer queue (descriptor list) currently being used. It is written with the start location of the receive buffer descriptor list. The lower order bits increment as buffers are used up and wrap to their original values after either 1024 buffers or when the wrap bit of the entry is set.

Reading this register returns the location of the descriptor currently being accessed. This value increments as buffers are used. Software should not use this register for determining where to remove received frames from the queue as it constantly changes as new frames are received. Software should instead work its way through the buffer descriptor queue checking the used bits.

Receive buffer writes also comprise bursts of two words and, as with transmit buffer reads, it is recommended that bit 2 is always written with zero to prevent a burst crossing a 1K boundary, in violation of section 3.6 of the AMBA specification.

## • ADDR: Receive Buffer Queue Pointer Address

Written with the address of the start of the receive queue, reads as a pointer to the current buffer being used.

# 44.6.6 Transmit Buffer Queue Pointer Register

Name: EMAC\_TBQP
Address: 0xF802C01C
Access: Read/Write

| Access. | rtead/vviite |    |    |    |    |    |    |
|---------|--------------|----|----|----|----|----|----|
| 31      | 30           | 29 | 28 | 27 | 26 | 25 | 24 |
|         |              |    | AD | DR |    |    |    |
| 23      | 22           | 21 | 20 | 19 | 18 | 17 | 16 |
|         |              |    | AD | DR |    |    |    |
| 15      | 14           | 13 | 12 | 11 | 10 | 9  | 8  |
|         |              |    | AD | DR |    |    |    |
| 7       | 6            | 5  | 4  | 3  | 2  | 1  | 0  |
|         |              | AD | DR |    |    | _  | _  |

This register points to the entry in the transmit buffer queue (descriptor list) currently being used. It is written with the start location of the transmit buffer descriptor list. The lower order bits increment as buffers are used up and wrap to their original values after either 1024 buffers or when the wrap bit of the entry is set. This register can only be written when bit 3 in the EMAC\_TSR is low.

As transmit buffer reads consist of bursts of two words, it is recommended that bit 2 is always written with zero to prevent a burst crossing a 1K boundary, in violation of section 3.6 of the AMBA specification.

#### • ADDR: Transmit Buffer Queue Pointer Address

Written with the address of the start of the transmit queue, reads as a pointer to the first buffer of the frame being transmitted or about to be transmitted.

## 44.6.7 Receive Status Register

Name: EMAC\_RSR
Address: 0xF802C020

| Access: | Read/Write |    |    |    |     |     |     |
|---------|------------|----|----|----|-----|-----|-----|
| 31      | 30         | 29 | 28 | 27 | 26  | 25  | 24  |
| _       | -          | -  | -  | _  | -   | -   | -   |
| 23      | 22         | 21 | 20 | 19 | 18  | 17  | 16  |
| _       | -          | _  | -  | _  | -   | -   | -   |
| 15      | 14         | 13 | 12 | 11 | 10  | 9   | 8   |
| _       | -          | _  | -  | _  | _   | -   | -   |
| 7       | 6          | 5  | 4  | 3  | 2   | 1   | 0   |
| _       | -          | _  | -  | _  | OVR | REC | BNA |

This register, when read, provides details of the status of a receive. Once read, individual bits may be cleared by writing a one to them. It is not possible to set a bit to one by writing to the register.

### • BNA: Buffer Not Available (cleared by writing a one to this bit)

An attempt was made to get a new buffer and the pointer indicated that it was owned by the processor. The DMA rereads the pointer each time a new frame starts until a valid pointer is found. This bit is set at each attempt that fails even if it has not had a successful pointer read since it has been cleared.

## REC: Frame Received (cleared by writing a one to this bit)

One or more frames have been received and placed in memory.

## OVR: Receive Overrun (cleared by writing a one to this bit)

The DMA block was unable to store the receive frame to memory, either because the bus was not granted in time or because a not OK hresp(bus error) was returned. The buffer is recovered if this happens.

## 44.6.8 Interrupt Status Register

Name: EMAC\_ISR
Address: 0xF802C024
Access: Read/Write

| Access: | Read/Write |      |      |       |       |       |     |

| 7       | 6          | 5    | 4    | 3     | 2     | 1     | 0   |
| TCOMP   | TXERR      | RLEX | TUND | TXUBR | RXUBR | RCOMP | MFD |

## MFD: Management Frame Done (cleared on read)

The PHY Maintenance Register has completed its operation.

## • RCOMP: Receive Complete (cleared on read)

A frame has been stored in memory.

# • RXUBR: Receive Used Bit Read (cleared on read)

Set when a receive buffer descriptor is read with its used bit set.

## • TXUBR: Transmit Used Bit Read (cleared on read)

Set when a transmit buffer descriptor is read with its used bit set.

# • TUND: Ethernet Transmit Buffer Underrun (cleared on read)

The transmit DMA did not fetch frame data in time for it to be transmitted or hresp returned not OK. Also set if a used bit is read mid-frame or when a new transmit queue pointer is written.

# • RLEX: Retry Limit Exceeded (cleared on read)

### TXERR: Transmit Error (cleared on read)

Transmit buffers exhausted in mid-frame - transmit error.

#### TCOMP: Transmit Complete (cleared on read)

Set when a frame has been transmitted.

# ROVR: Receive Overrun (cleared on read)

Set when the 'Receive Overrun' bit in EMAC\_ISR gets set.

# HRESP: Hresp Not OK (cleared on read)

Set when the DMA block sees a bus error.

## • PFRE: Pause Frame Received (cleared on read)

Indicates a valid pause has been received.

• PTZ: Pause Time Zero (cleared on read)

Set when the EMAC\_PTR, 0x38 decrements to zero.

# 44.6.9 Interrupt Enable Register

Name: EMAC\_IER
Address: 0xF802C028
Access: Write-only

| Access: | Write-only |     |      |       |       |       |     |

| TCOMP   | TXERR     | RLE | TUND | TXUBR | RXUBR | RCOMP | MFD |

# • MFD: Management Frame Done

Management done interrupt masked.

## • RCOMP: Receive Complete

Receive complete interrupt masked.

## • RXUBR: Receive Used Bit Read

Receive used bit read interrupt masked.

#### • TXUBR: Transmit Used Bit Read

Transmit used bit read interrupt masked.

#### • TUND: Ethernet Transmit Buffer Underrun

Transmit underrun interrupt masked.

# • RLE: Retry Limit Exceeded

Retry limit exceeded interrupt masked.

### • TXERR: Transmit Error

Transmit buffers exhausted in mid-frame interrupt masked.

# • TCOMP: Transmit Complete

Transmit complete interrupt masked.

## • ROVR: Receive Overrun

Receive overrun interrupt masked.

# • HRESP: Hresp Not OK

Hresp not OK interrupt masked.

## • PFR: Pause Frame Received

Pause frame received interrupt masked.

# • PTZ: Pause Time Zero

Pause time zero interrupt masked.

# 44.6.12 PHY Maintenance Register

Name: EMAC\_MAN
Address: 0xF802C034
Access: Read/Write

|           |               |    | DA   | TA |    |    |    |

Note: To read clause 45 PHYs, bits 31:28 should be written as 0x0011. This overlaps the SOF and RW fields.

#### . DATA: PHY Transmit or Receive Data

For a write operation this is written with the data to be written to the PHY.

After a read operation this contains the data read from the PHY.

#### • CODE: Must Be Two

Must be written to 2. Reads as written.

## • REGA: PHY Register Address

Specifies the register in the PHY to access.

#### • PHYA: PHY Address

#### • RW: PHY Read/Write Command

1: Write command

2: Read command

Any other value is an invalid PHY management frame.

#### · SOF: Start of Frame

Must be written to one for a valid frame.

| 7       | 6 –        | 5 – | 4 – | 3 - | 2 – | 1<br>CLKEN |      |

# • RMII: Reduced MII

When set, this bit enables the RMII operation mode.

# • CLKEN: Clock Enable

0: Reduces power consumption when the treasurer is not used

1: Enables the transceiver input clock

# 44.6.26 EMAC Statistics Registers

These registers reset to zero on a read and stick at all ones when they count to their maximum value. They should be read frequently enough to prevent loss of data. The receive statistics registers are only incremented when the 'Receive Enable' bit is set in the Network Control Register (EMAC\_NCR). To write to these registers, bit 7 must be set in the EMAC\_NCR. The statistics register block contains the following registers.

# 44.6.26.1 Pause Frames Received Register

Name: EMAC\_PFR Address: 0xF802C03C Access: Read-write FROK 

# • FROK: Pause Frames Received OK

A 16-bit register counting the number of good pause frames received. A good frame has a length of 64 to 1518 (1536 if bit 8 set in EMAC\_NCFGR) and has no FCS, alignment or receive symbol errors.

FROK

# 44.6.26.2 Frames Transmitted OK Register

Name: EMAC\_FTO Address: 0xF802C040 Read-write Access:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

# • MCF: Multicollision Frames

A 16-bit register counting the number of frames experiencing between two and fifteen collisions prior to being successfully transmitted, i.e., no underrun and not too many retries.

# 44.6.26.5 Frames Received OK Register

Name: EMAC\_FRO
Address: 0xF802C04C
Access: Read-write

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|----|----|----|----|----|----|----|----|
| _  | _  | -  | -  | _  | _  | _  | _  |

|    |    | ·  | FR | OK | ·  | ·  |    |

# • FROK: Frames Received OK

A 24-bit register counting the number of good frames received, i.e., address recognized and successfully copied to memory. A good frame is of length 64 to 1518 bytes (1536 if bit 8 set in EMAC\_NCFGR) and has no FCS, alignment or receive symbol errors.

# 44.6.26.6 Frames Check Sequence Errors Register

Name: EMAC\_FCSE
Address: 0xF802C050
Access: Read-write

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

|    |    |    | FC | SE |    |    |    |

### • FCSE: Frame Check Sequence Errors

An 8-bit register counting frames that are an integral number of bytes, have bad CRC and are between 64 and 1518 bytes in length (1536 if bit 8 set in EMAC\_NCFGR). This register is also incremented if a symbol error is detected and the frame is of valid length and has an integral number of bytes.

# 44.6.26.7 Alignment Errors Register

Name: EMAC\_ALE
Address: 0xF802C054
Access: Read-write

| 31 | 30  | 29 | 28 | 27 | 26 | 25 | 24 |  |  |  |
|----|-----|----|----|----|----|----|----|--|--|--|
| _  | _   | _  | _  | _  | _  | -  | _  |  |  |  |
| 23 | 22  | 21 | 20 | 19 | 18 | 17 | 16 |  |  |  |

|    | ALE |    |    |    |    |    |    |  |  |  |

### • ALE: Alignment Errors

An 8-bit register counting frames that are not an integral number of bytes long and have bad CRC when their length is truncated to an integral number of bytes and are between 64 and 1518 bytes in length (1536 if bit 8 set in EMAC\_NCFGR). This register is also incremented if a symbol error is detected and the frame is of valid length and does not have an integral number of bytes.

# 44.6.26.8 Deferred Transmission Frames Register

Name: EMAC\_DTF Address: 0xF802C058 Access: Read-write

| 31 | 30 | 29 | 28             | 27 | 26 | 25 | 24 |
|----|----|----|----------------|----|----|----|----|
| _  | _  | _  | _              | _  | _  | _  | _  |
| 23 | 22 | 21 | 20             | 19 | 18 | 17 | 16 |
| _  | _  |    |                | _  | _  |    | _  |
| 15 | 14 | 13 | 12             | 11 | 10 | 9  | 8  |
|    |    |    | D <sup>-</sup> | ΓF |    |    |    |
| 7  | 6  | 5  | 4              | 3  | 2  | 1  | 0  |
|    |    |    | D.             | ΤF |    |    |    |

# • DTF: Deferred Transmission Frames

A 16-bit register counting the number of frames experiencing deferral due to carrier sense being active on their first attempt at transmission. Frames involved in any collision are not counted nor are frames that experienced a transmit underrun.

# 44.6.26.9 Late Collisions Register

Name: EMAC\_LCOL Address: 0xF802C05C

Access: Read-write

| 31 | 30   | 29 | 28 | 27 | 26 | 25 | 24 |  |  |  |
|----|------|----|----|----|----|----|----|--|--|--|
| _  | _    | _  | _  | _  | _  | _  | _  |  |  |  |
| 23 | 22   | 21 | 20 | 19 | 18 | 17 | 16 |  |  |  |
| _  | _    | -  |    | -  |    | ı  | _  |  |  |  |
| 15 | 14   | 13 | 12 | 11 | 10 | 9  | 8  |  |  |  |
| _  | _    | 1  | _  | -  | _  | 1  | _  |  |  |  |
| 7  | 6    | 5  | 4  | 3  | 2  | 1  | 0  |  |  |  |
|    | LCOL |    |    |    |    |    |    |  |  |  |

# • LCOL: Late Collisions

An 8-bit register counting the number of frames that experience a collision after the slot time (512 bits) has expired. A late collision is counted twice; i.e., both as a collision and a late collision.

# 44.6.26.10 Excessive Collisions Register

Name: EMAC\_ECOL Address: 0xF802C060 Read-write Access:

| 31 | 30 | 29 | 28 | 27  | 26 | 25 | 24 |
|----|----|----|----|-----|----|----|----|
| _  | _  | 1  | _  | _   | _  | -  | _  |

| _  | _  | _  | _  | _  | -  | ı  | _  |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|    |    |    | TU | ND |    |    |    |

# • TUND: Transmit Underruns

An 8-bit register counting the number of frames not transmitted due to a transmit DMA underrun. If this register is incremented, then no other statistics register is incremented.

# 44.6.26.12 Carrier Sense Errors Register

Name: EMAC\_CSE
Address: 0xF802C068
Access: Read-write

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|----|----|----|----|----|----|----|----|
| _  | _  | _  | _  | _  | _  | -  | _  |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| _  | _  | -  | _  | _  | _  | 1  | _  |
| 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
| _  | _  | -  | _  | _  | _  | _  | _  |
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|    |    |    | C  | SE | •  |    |    |

# • CSE: Carrier Sense Errors

An 8-bit register counting the number of frames transmitted where carrier sense was not seen during transmission or where carrier sense was deasserted after being asserted in a transmit frame without collision (no underrun). Only incremented in half-duplex mode. The only effect of a carrier sense error is to increment this register. The behavior of the other statistics registers is unaffected by the detection of a carrier sense error.

# 44.6.26.13 Receive Resource Errors Register

Name: EMAC\_RRE Address: 0xF802C06C Access: Read-write 

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|----|----|----|----|----|----|---|---|
|    |    |    | RF | RE |    |   |   |

|    | ROVR |    |    |    |    |    |    |

# • ROVR: Receive Overrun

An 8-bit register counting the number of frames that are address recognized but were not copied to memory due to a receive DMA overrun.

# 44.6.26.15 Receive Symbol Errors Register

Name: EMAC\_RSE Address: 0xF802C074 Access: Read-write 

# • RSE: Receive Symbol Errors

An 8-bit register counting the number of frames that had rx\_er asserted during reception. Receive symbol errors are also counted as an FCS or alignment error if the frame is between 64 and 1518 bytes in length (1536 if bit 8 is set in the EMAC\_NCFGR). If the frame is larger, it is recorded as a jabber error.

RSE

# 44.6.26.16 Excessive Length Errors Register

Name: EMAC\_ELE
Address: 0xF802C078
Access: Read-write

| 31 | 30  | 29 | 28 | 27 | 26 | 25 | 24 |
|----|-----|----|----|----|----|----|----|
| _  | _   | _  | _  | _  | _  | _  | _  |

|    | RLFM |    |    |    |    |    |    |

# • RLFM: Receive Length Field Mismatch

An 8-bit register counting the number of frames received that have a measured length shorter than that extracted from its length field. Checking is enabled through bit 16 of the EMAC\_NCFGR. Frames containing a type ID in bytes 13 and 14 (i.e., length/type ID = 0x0600) are not counted as length field errors, neither are excessive length frames.

# 45. LCD Controller (LCDC)

# 45.1 Description

The LCD Controller (LCDC) consists of logic for transferring LCD image data from an external display buffer to an LCD module. The LCDC has one display input buffer per overlay that fetches pixels through the AHB master interface and a lookup table to allow palletized display configurations. The LCDC is programmable on a per overlay basis, and supports different LCD resolution, window size, image format and pixel depth.

The LCDC is connected to the ARM Advanced High Performance Bus (AHB) as a master for reading pixel data. It also integrates an APB interface to configure its registers.

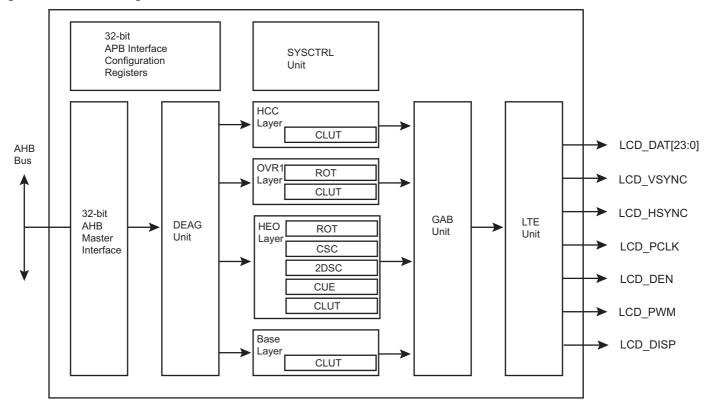

#### 45.2 Embedded Characteristics

- One AHB Master Interface
- Supports Single Scan Active TFT Display
- Supports 12-, 16-, 18- and 24-bit Output Mode through the Spatial Dithering Unit
- Asynchronous Output Mode Supported
- 1, 2, 4, 8 bits per pixel (palletized)
- 12, 16, 18, 19, 24, 25 and 32 bits per pixel (non-palletized)
- Supports One Base Layer (background)
- Supports OVR1 Layer Window
- Supports One High End Overlay (HEO) Window
- Supports One Hardware Cursor, Free Ranging up to a size limit of 128x128 pixels
- Little Endian Memory Organization
- Programmable Timing Engine, with Integer Clock Divider
- Programmable Polarity for Data, Line Synchro and Frame Synchro
- Hardware Cursor Fixed Size on the following patterns: 32x32, 64x64 and 128x128
- Display Size up to 800 × 600
- Color Lookup Table with up to 256 entries and Predefined 8-bit Alpha
- Programmable Negative and Positive Row Striding for all layers
- Programmable Negative and Positive Pixel Striding for all Overlay1 and HEO layers
- High End Overlay supports 4:2:0 Planar Mode and Semiplanar Mode
- High End Overlay supports 4:2:2 Planar Mode and Packed Memory Mode
- High End Overlay includes Chroma Upsampling unit and Programmable Scaler
- Integrates Fully Programmable Color Space Conversion
- Overlay1 and High End Overlay integrate Rotation Engine: 90, 180, 270
- Blender Function Supports Arbitrary 8-bit Alpha value and Chroma Keying
- DMA User interface uses Linked List Structure and Add-to-queue Structure

# 45.5 Product Dependencies

#### 45.5.1 I/O Lines

The pins used for interfacing the LCDC may be multiplexed with PIO lines. The programmer must first program the PIO Controller to assign the pins to their peripheral function. If I/O lines of the LCDC are not used by the application, they can be used for other purposes by the PIO Controller.

Table 45-2. I/O Lines

| Instance | Signal   | I/O Line | Peripheral |
|----------|----------|----------|------------|
| LCDC     | LCDDAT0  | PC0      | Α          |

# 45.5.2 Power Management

The LCDC is not continuously clocked. The user must first enable the LCDC clock in the Power Management Controller before using it (PMC\_PCER).

# 45.5.3 Interrupt Sources

The LCDC interrupt line is connected to one of the internal sources of the Advanced Interrupt Controller. Using the LCDC interrupt requires prior programming of the AIC.

Table 45-3. Peripheral IDs

| Instance | ID |
|----------|----|
| LCDC     | 25 |

# 45.6 Functional Description

The LCD module integrates the following digital blocks:

- DMA Engine Address Generation (DEAG)—This block performs data prefetch and requests access to the AHB interface.
- Input FIFO stores the stream of pixels.
- Color Lookup Table (CLUT)—These 256 RAM-based lookup table entries are selected when the color depth is set to 1, 2, 4 or 8 bpp.
- Chroma Upsampling Engine (CUE)—This block is selected when the input image sampling format is YUV (Y'CbCr) 4:2:0 and converts it to higher quality 4:4:4 image.
- Color Space Conversion (CSC)—changes the color space from YUV to RGB.
- Two Dimension Scaler (2DSC)—resizes the image.
- Global Alpha Blender (GAB)—performs programmable 256 level alpha blending.
- Output FIFO—stores the pixel prior to display.
- LCD Timing Engine—provides a fully programmable HSYNC-VSYNC interface.

The DMA controller reads the image through the AHB master interface. The LCDC engine formats the display data, then the GAB performs alpha blending if required, and writes the final pixel into the output FIFO. The programmable timing engine drives a valid pixel onto the LCD\_DAT[23:0] display bus.

#### 45.6.1 Timing Engine Configuration

### 45.6.1.1 Pixel Clock Period Configuration

The pixel clock (PCLK) generated by the timing engine is the source clock (SCLK) divided by the field CLKDIV in the LCDC\_LCDCFG0 register. The source clock can be selected between the system clock and the 2x system clock with the field CLKSEL located in the LCDC\_LCDCFG0 register.

Pixel Clock period formula:

$$PCLK = \frac{SCLK}{CLKDIV + 2}$$

The Pixel Clock polarity is also programmable.

#### 45.6.1.2 Horizontal and Vertical Synchronization Configuration

The following fields are used to configure the timing engine:

- LCDC LCDCFG1.HSPW
- LCDC LCDCFG1.VSPW
- LCDC\_LCDCFG2.VFPW
- LCDC\_LCDCFG2.VBPW
- LCDC\_LCDCFG3.HFPW
- LCDC\_LCDCFG3.HBPW
- LCDC\_LCDCFG4.PPL
- LCDC\_LCDCFG4.RPF

The polarity of output signals is also programmable.

#### 45.6.1.3 Timing Engine Power Up Software Operation

The following sequence is used to enable the display:

- 1. Configure LCD timing parameters, signal polarity and clock period.
- 2. Enable the Pixel Clock by writing one to to bit LCDC\_LCDEN.CLKEN.
- 3. Poll bit LCDC\_LCDSR.CLKSTS to check that the clock is running.
- 4. Enable Horizontal and Vertical Synchronization by writing one to bit LCDC\_LCDEN.SYNCEN.
- 5. Poll bit LCDC\_LCDSR.LCDSTS to check that the synchronization is up.
- 6. Enable the display power signal writing one to bit LCDC LCDEN.DISPEN.
- 7. Poll bit LCDC\_LCDSR.DISPSTS to check that the power signal is activated.

The field LCDC\_LCDCFG5.GUARDTIME is used to configure the number of frames before the assertion of the DISP signal.

#### 45.6.1.4 Timing Engine Power Down Software Operation

The following sequence is used to disable the display:

- 1. Disable the DISP signal writing bit LCDC\_LCDDIS.DISPDIS.
- 2. Poll bit LCDC\_LCDSR.DISPSTS to verify that the DISP is no longer activated.
- 3. Disable the HSYNC and VSYNC signals by writing one to to bit LCDC\_LCDDIS.SYNCDIS.
- 4. Poll bit LCDC\_LCDSR.LCDSTS to check that the synchronization is off.
- 5. Disable the Pixel clock by writing one to bit LCDC\_LCDDIS.CLKDIS.

### 45.6.2 DMA Software Operations

#### 45.6.2.1 DMA Channel Descriptor (DSCR) Alignment and Structure

The DMA Channel Descriptor (DSCR) must be word aligned.

The DMA Channel Descriptor structure contains three fields:

- DSCR.CHXADDR: Frame Buffer base address register
- DSCR.CHXCTRL: Transfer Control register
- DSCR.CHXNEXT: Next Descriptor Address register

Table 45-4. DMA Channel Descriptor Structure

| System Memory | Structure Field for channel CHX |
|---------------|---------------------------------|
| DSCR + 0x0    | ADDR                            |
| DSCR + 0x4    | CTRL                            |
| DSCR + 0x8    | NEXT                            |

#### 45.6.2.2 Programming a DMA Channel

- 1. Check the status of the channel reading the CHXCHSR register.
- 2. Write the channel descriptor (DSCR) structure in the system memory by writing DSCR.CHXADDR Frame base address, DSCR.CHXCTRL channel control and DSCR.CHXNEXT next descriptor location.
- 3. If more than one descriptor is expected, the DFETCH bit of DSCR.CHXCTRL is set to one to enable the descriptor fetch operation.
- 4. Write the DSCR.CHXNEXT register with the address location of the descriptor structure and set DFETCH bit of the DSCR.CHXCTRL register to one.
- 5. Enable the relevant channel by writing one to the CHEN bit of the CHXCHER register.
- 6. An interrupt may be raised if unmasked when the descriptor has been loaded.

#### 45.6.2.3 Disabling a DMA channel

- 1. Clear the DFETCH bit in the DSCR.CHXCTRL field of the DSCR structure will disable the channel at the end of the frame.
- 2. Set the DSCR.CHXNEXT register of the DSCR structure will disable the channel at the end of the frame.
- 3. Writing one to the CHDIS bit of the CHXCHDR register will disable the channel at the end of the frame.
- 4. Writing one to the CHRST bit of the CHXCHDR register will disable the channel immediately. This may occur in the middle of the image.
- 5. Poll CHSR bit in the CHXCHSR register until the channel is successfully disabled.

# 45.6.2.4 DMA Dynamic Linking of a New Transfer Descriptor

- 1. Write the new descriptor structure in the system memory.
- 2. Write the address of the new structure in the CHXHEAD register.
- 3. Add the new structure to the queue of descriptors by writing one to the A2QEN bit of the CHXCHER register.
- 4. The new descriptor will be added to the queue on the next frame.
- 5. An interrupt will be raised if unmasked, when the head descriptor structure has been loaded by the DMA channel.

#### 45.6.2.5 DMA Interrupt Generation

The DMA controller operation sets the following interrupt flags in the interrupt status register CHXISR:

- DMA field indicates that the DMA transfer is completed.
- DSCR field indicates that the descriptor structure is loaded in the DMA controller.
- ADD field indicates that a descriptor has been added to the descriptor queue.
- DONE field indicates that the channel transfer has terminated and the channel is automatically disabled.

#### 45.6.2.6 DMA Address Alignment Requirements

When programming the DSCR.CHXADDR register of the DSCR structure the following requirement must be met.

Table 45-5. DMA address alignment when CLUT Mode is selected

| CLUT Mode | DMA Address Alignment |
|-----------|-----------------------|
| 1 bpp     | 8-bit                 |
| 2 bpp     | 8-bit                 |
| 4 bpp     | 8-bit                 |
| 8 bpp     | 8-bit                 |

Table 45-6. DMA address alignment when RGB Mode is selected

| RGB Mode              | DMA Address Alignment |
|-----------------------|-----------------------|
| 12 bpp RGB 444        | 16-bit                |
| 16 bpp ARGB 4444      | 16-bit                |
| 16 bpp RGBA 4444      | 16-bit                |
| 16 bpp RGB 565        | 16-bit                |
| 16 bpp TRGB 1555      | 16-bit                |
| 18 bpp RGB 666        | 32-bit                |
| 18 bpp RGB 666 PACKED | 8-bit                 |
| 19 bpp TRGB 1666      | 32-bit                |
| 19 bpp TRGB 1666      | 8-bit                 |

Table 45-6. DMA address alignment when RGB Mode is selected (Continued)

| RGB Mode              | DMA Address Alignment |
|-----------------------|-----------------------|
| 24 bpp RGB 888        | 32-bit                |
| 24 bpp RGB 888 PACKED | 8-bit                 |
| 25 bpp TRGB 1888      | 32-bit                |
| 32 bpp ARGB 8888      | 32-bit                |
| 32 bpp RGBA 8888      | 32-bit                |

Table 45-7. DMA address alignment when YUV Mode is selected

| YUV Mode                       | DMA Address Alignment |
|--------------------------------|-----------------------|
| 32 bpp AYCrCb                  | 32-bit                |
| 16 bpp YCrCb 4:2:2             | 32-bit                |
| 16 has comissioner VCrCh 4:2:2 | Y 8-bit               |
| 16 bpp semiplanar YCrCb 4:2:2  | CrCb 16-bit           |
|                                | Y 8-bit               |
| 16 bpp planar YCrCb 4:2:2      | Cr 8-bit              |
|                                | Cb 8-bit              |
| 42 has VCrCh 4:2:0             | Y 8-bit               |
| 12 bpp YCrCb 4:2:0             | CrCb 16-bit           |
|                                | Y 8-bit               |
| 12 bpp YCrCb 4:2:0             | Cr 8-bit              |
|                                | Cb 8-bit              |

#### 45.6.3 Display Software Configuration

#### 45.6.3.1 System Bus Access Attributes

These attributes are defined to improve bandwidth of the pixel stream.

- LOCKDIS bit: when set to one the AHB lock signal is not asserted when the PSTRIDE value is different from zero (rotation in progress).
- ROTDIS bit: when set to one the Pixel Striding optimization is disabled.
- DLBO bit: when set to one only defined burst lengths are performed when the DMA channel retrieves the data from the memory.
- BLEN field: defines the maximum burst length of the DMA channel.
- SIF bit: defines the targeted DMA interface.

#### 45.6.3.2 Color Attributes

- CLUTMODE field: selects the Color Lookup Table mode
- RGBMODE field: selects the RGB mode
- YUVMODE field: selects the Luminance Chrominance mode

#### 45.6.3.3 Window Position, Size, Scaling and Striding Attributes

- XPOS, YPOS fields: define the position of the overlay window
- XSIZE, YSIZE fields: define the size of the displayed window
- XMEM\_SIZE, YMEM\_SIZE fields: fields define the size of the image frame buffer
- XSTRIDE, PSTRIDE fields: define the line and pixel striding
- XFACTOR, YFACTOR fields: define the scaling ratio

The position and size attributes are to be programmed to keep the window within the display area.

When the Color Lookup Table Mode is enabled the restrictions detailed in the following table apply on the horizontal and vertical window size.

Table 45-8. Color Lookup Table Mode and Window Size

| CLUT Mode | x-y Size Requirement |
|-----------|----------------------|
| 1 bpp     | multiple of 8 pixels |
| 2 bpp     | multiple of 4 pixels |
| 4 bpp     | multiple of 2 pixels |
| 8 bpp     | free size            |

Pixel striding is disabled when CLUT mode is enabled.

When YUV mode is enabled the restrictions detailed in the following table apply on the window size.

Table 45-9. YUV Mode and Window Size

| YUV Mode             | x-y Requirement, Scaling Turned Off | x-y Requirement, Scaling Turned On |
|----------------------|-------------------------------------|------------------------------------|
| AYUV                 | free size                           | x-y size is greater than 5         |
| YUV 4:2:2 packed     | xsize is greater than 2 pixels      | x-y size is greater than 5         |
| YUV 4:2:2 semiplanar | xsize is greater than 2 pixels      | x-y size is greater than 5         |
| YUV 4:2:2 planar     | xsize is greater than 2 pixels      | x-y size is greater than 5         |
| YUV 4:2:0 semiplanar | xsize is greater that 2 pixels      | x-y size is greater than 5         |
| YUV 4:2:0 planar     | xsize is greater than 2 pixels      | x-y size is greater than 5         |

In RGB mode, there is no restriction on the line length.

#### 45.6.3.4 Overlay Blender Attributes

When two or more video layers are used, alpha blending is performed to defined the final image displayed. Each window has its own blending attributes.

- CRKEY bit: enables the chroma keying and match logic
- INV bit: performs bit inversion at pixel level
- ITER2BL bit: when set the iterated data path is selected
- ITER bit: when set the iterated value is used in the iterated datapath, otherwise the iterated value is set to 0
- REVALPHA bit: uses the reverse alpha value
- GAEN bit: enables the global alpha value in the data path
- LAEN bit: enables the local alpha value from the pixel
- OVR bit: when set the overlay is selected as an input of the blender
- DMA bit: the DMA data path is activated
- REP bit: enables the bit replication to fill the 24-bit internal data path
- DSTKEY bit: when set, Destination keying is enabled
- GA field: defines the global alpha value

#### 45.6.3.5 Window Attributes Software Operation

- 1. When required, write the overlay attributes configuration registers.
- 2. Set UPDATEEN field of the CHXCHER register.
- 3. Poll UPDATESR field in the CHXCHSR, the update applies when that field is reset.

#### 45.6.5.5 4:2:0 Planar Mode Frame Buffer Memory Mapping

In Planar Mode, the three video components Y, Cr and Cb are split into three memory areas and stored in a raster-scan order. These three memory planes are contiguous and always aligned on a 32-bit boundary.

#### Table 45-42. 4:2:0 planar mode Luminance memory mapping with little endian organization for byte 0x0, 0x1, 0x2, 0x3

### 45.6.6 Chrominance Upsampling Unit

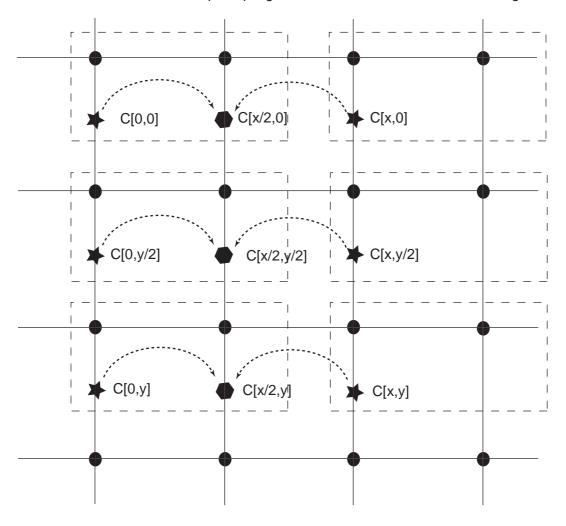

Both 4:2:2 and 4:2:0 input formats are supported by the LCDC. In 4:2:2, the two chrominance components are sampled at half the sample rate of the luminance. The horizontal chrominance resolution is halved. When this input format is selected, the chrominance upsampling unit uses two chrominances to interpolate the missing component.

In 4:2:0, Cr and Cb components are subsampled at a factor of two vertically and horizontally. When this input mode is selected, the chrominance upsampling unit uses two and four chroma components to generate the missing horizontal and vertical components.

Figure 45-2. 4:2:2 Upsampling Algorithm

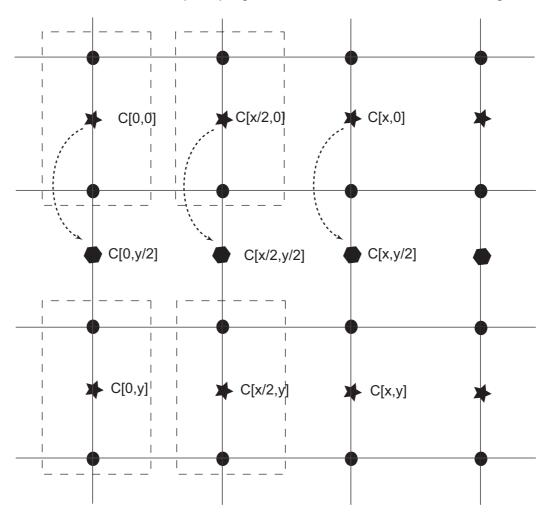

Vertical and Horizontal upsampling 4:2:2 to 4:4:4 conversion 0 or 180 degree

- Y sample
- Cr Cb calculated at encoding time
- Cr Cb interpolated from 2 Chroma Component

Figure 45-3. 4:2:2 Packed Memory Upsampling Algorithm

- ★ Cr Cb calculated at encoding time
- Cr Cb from the previous line (interpolated)

Figure 45-4. 4:2:2 semiplanar and planar Upsampling Algorithm - 90 or 270 degree rotation activated

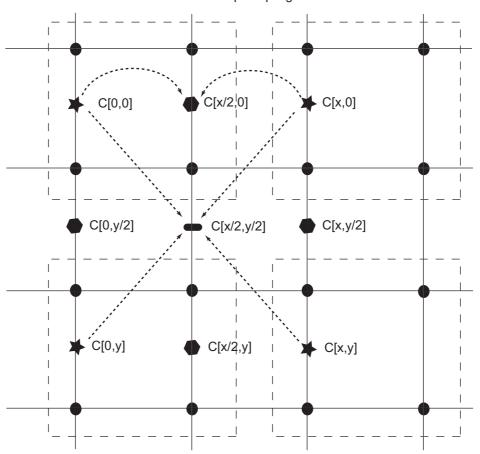

Vertical and Horizontal upsampling 4:2:2 to 4:4:4 conversion 90 or 270 degree

- Y sample
- Cr Cb calculated at encoding time
- Cr Cb interpolated

Figure 45-5. 4:2:0 Upsampling Algorithm

Vertical and Horizontal upsampling 4:2:0 to 4:4:4 conversion

- Y sample
- Cr Cb interpolated from 2 Chroma Component
- Cr Cb interpolated from 4 Chroma Component

$$Chroma\left[\frac{x}{2},\ 0\right] = \frac{Cr[0,\ 0] + Cr[0,\ x]}{2}$$

$$Chroma\left[0, \frac{y}{2}\right] = \frac{Cr[0, 0] + C[0, y]}{2}$$

$$Chroma\begin{bmatrix} \frac{x}{2}, & \frac{y}{2} \end{bmatrix} = \frac{Cr[0, & 0] + Cr[x, & 0] + Cr[y, & 0] + Cr[x, & y]}{4}$$

$$Chroma\left[x, \frac{y}{2}\right] = \frac{Cr[x, 0] + Cr[x, y]}{2}$$

$$Chroma\left[\frac{x}{2}, y\right] = \frac{Cr[0, y] + Cr[x, y]}{2}$$

#### 45.6.6.1 Chrominance Upsampling Algorithm

- 1. Read line n from chrominance cache and interpolate [x/2,0] chrominance component filling the 1 x 2 kernel with line n. If the chrominance cache is empty, then fetch the first line from external memory and interpolate from the external memory. Duplicate the last chrominance at the end of line.
- 2. Fetch line n+1 from external memory, write line n + 1 to chrominance cache, read line n from the chrominance cache. interpolate [0,y/2], [x/2,y/2] and [x, y/2] filling the 2x2 kernel with line n and n+1. Duplicate the last chrominance line to generate the last interpolated line.
- 3. Repeat step 1 and step 2.

#### 45.6.7 Line and Pixel Striding

The LCDC includes a mechanism to increment the memory address from a programmable amount when the end of line has been reached, this offset is referred as XSTRIDE and is defined on a per overlay basis. It also contains a PSTRIDE field that allows a programmable jump at the pixel level. Pixel stride is the value from one pixel to the next.

#### 45.6.7.1 Line Striding

When the end of line has been reached, the DMA address counter points to the next pixel address. The channel DMA address register is added to the XSTRIDE field, and then updated. If XSTRIDE is set to zero, the DMA address register remains unchanged. The XSTRIDE field of the channel configuration register is aligned to the pixel size boundary. The XSTRIDE field is a two's complement number. The following formula applies at the line boundary and indicates how the DMA controller computes the next pixel address. The function Sizeof() returns the number of bytes required to store a pixel.

NextPixelAddress = CurrentPixelAddress + Sizeof(pixel) + XSTRIDE

#### 45.6.7.2 Pixel Striding

The DMA channel engine may optionally fetch non contiguous pixels. The channel DMA address register is added to the PSTRIDE field and then updated. If PSTRIDE is set to zero, the DMA address register remains unchanged and pixels are contiguous. The PSTRIDE field of the channel configuration register is aligned to the pixel size boundary. The PSTRIDE is a two's complement number. The following formula applies at the pixel boundary and indicates how the DMA controller computes the next pixel address. The function Sizeof() returns the number of bytes required to store a pixel.

NextPixelAddress = CurrentPixelAddress + Sizeof(pixel) + PSTRIDE

# 45.6.8 Color Space Conversion Unit

The color space conversion unit converts Luminance Chrominance color space into the Red Green Blue color space. The conversion matrix is defined below and is fully programmable through the LCDC user interface

$$\begin{bmatrix} R \\ G \\ B \end{bmatrix} = \begin{bmatrix} CSCRY \ CSCRU \ CSCRV \\ CSCGY \ CSCGU \ CSCGV \\ CSCBY \ CSCBU \ CSCBV \end{bmatrix} \begin{bmatrix} Y - Yoff \\ Cb - Cboff \\ Cr - Croff \end{bmatrix}$$

Color space conversion coefficients are defined with the following equation:

$$CSC^{(Note)} = \frac{1}{2^7} \cdot \left[ -2^9 \cdot c_9 + \sum_{n=0}^{8} c_n \cdot 2^n \right]$$

Color space conversion coefficients are defined with one sign bit, 2 integer bits and 7 fractional bits. The range of the CSC coefficients is defined below with a step of 1/128.

-4 ≤CSC<sup>(Note)</sup> ≤3.9921875

(Note) CSC values for all matrix coefficients.

Additionally a set scaling factor {Yoff, Cboff, Croff} can be applied.

#### 45.6.9 Two Dimension Scaler

The High End Overlay (HEO) data path includes a hardware scaler that allows image resize in both horizontal and vertical direction.

#### 45.6.9.1 Horizontal Scaler

The XMEM\_SIZE field of the LCDC\_HEOCFG4 register indicates the horizontal size minus one of the image in the system memory. The XSIZE field of the LCDC\_HEOCFG3 register contains the horizontal size minus one of the window. The SCALEN field of the LCDC\_HEOCFG13 register is set to one. The scaling factor is programmed in the XFACTOR field of the LCDC\_HEOCFG13 register.

$$XFACTOR = floor\left(\frac{1024 \times (XMEMSIZE + 1)}{(XSIZE + 1)}\right)$$

#### 45.6.9.2 Vertical Scaler

The YMEM\_SIZE field of the LCDC\_HEOCFG4 register indicates the vertical size minus one of the image in the system memory. The YSIZE field of the LCDC\_HEOCFG3 register contains the vertical size minus one of the window. The SCALEN field of the LCDC\_HEOCFG13 register is set to one. The scaling factor is programmed in the YFACTOR field of the LCDC\_HEOCFG13 register.

$$YFACTOR = floor\left(\frac{1024 \times (YMEMSIZE + 1)}{(YSIZE + 1)}\right)$$

### 45.6.10 Hardware Cursor

The LCDC integrates a hardware cursor database. This layer features only a minimal set of color among 1, 2, 4 and 8 bpp palletized and 16 bpp to 32 bpp true color. The cursor size is limited to  $128 \times 128$  pixels.

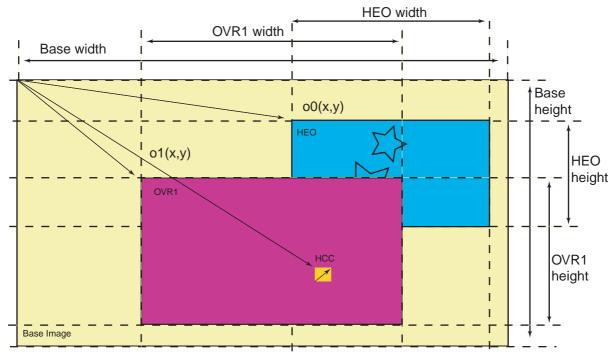

#### 45.6.11 Color Combine Unit

### 45.6.11.1 Window Overlay

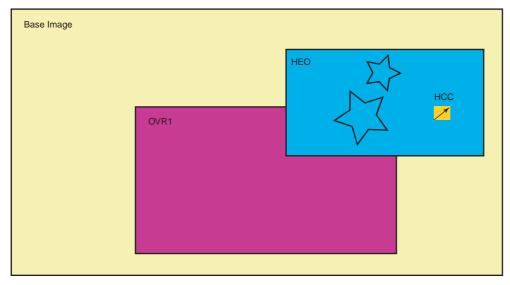

The LCDC provides hardware support for multiple "overlay plane" that can be used to display windows on top of the image without destroying the image located below. The overlay image can use any color depth. Using the overlay alleviates the need to re-render the occluded portion of the image. When pixels are combined together through the alpha blending unit, a new color is created. This new pixel is called an iterated pixel and is passed to the next blending stage. Then, this pixel may be combined again with another pixel. The VIDPRI field located in the LCDC\_HEOCFG12 register configures the video priority algorithm used to display the layers. When VIDPRI field is set to zero the OVR1 layer is located above the HEO layer. When VIDPRI field is set to one, OVR1 is located below the HEO layer.

Figure 45-6. Overlay Example with two different video prioritization algorithms

Video Prioritization Algorithm 1: HCC > OVR1 > HEO > BASE

Video Prioritization Algorithm 2: HCC > HEO > OVR1 > BASE

# 45.6.11.2 Overlay Blending

The blending function requires two pixels (one iterated from the previous blending stage and one from the current overlay color) and a set of blending configuration parameters. These parameters define the color operation.

Figure 45-7. Alpha Blender Function

Figure 45-9. Global Alpha Blender

# 45.6.11.4 Window Blending

Figure 45-10. 256-level Alpha Blending

Video Prioritization Algorithm 1: OVR1 > HEO > BASE

#### 45.6.11.5 Color Keying

Color keying involves a method of bit-block image transfer (Blit). This entails blitting one image onto another where not all the pixels are copied. Blitting usually involves two bitmaps, a source bitmap and a destination bitmap. A raster operation (ROP) is performed to define whether the iterated color or the overlay color is to be visible or not.

### Source Color Keying

If the masked overlay color matches the color key then the iterated color is selected. Source Color Keying is activated using the following configuration.

- Select the Overlay to Blit
- Clear DSTKEY bit
- Activate Color Keying—set CRKEY bit
- Program Color Key writing RKEY, GKEY and BKEY fields
- Program Color Mask writing RKEY, GKEY and BKEY fields

When the Mask register is set to zero, the comparison is disabled and the raster operation is activated.

### Destination Color Keying

If the iterated masked color matches the color key then the overlay color is selected. Destination Color Keying is activated using the following configuration:

- Select the Overlay to Blit
- Set DSTKEY bit
- Activate Color Keying—set CRKEY bit
- Program Color Key writing RKEY, GKEY and BKEY fields
- Program Color Mask writing RKEY, GKEY and BKEY fields

When the Mask register is set to zero, the comparison is disabled and the raster operation is activated.

#### 45.6.12 LCDC Overall Performance

# 45.6.12.1 Color Lookup Table (CLUT)

| _  | _      | _  | _        | _         | _      | -         | _         |  |  |  |
| 23 | 22     | 21 | 20       | 19        | 18     | 17        | 16        |  |  |  |
|    | CLKDIV |    |          |           |        |           |           |  |  |  |
| 15 | 14     | 13 | 12       | 11        | 10     | 9         | 8         |  |  |  |
| _  | _      | _  | CGDISHCR | CGDISHEO  | _      | CGDISOVR1 | CGDISBASE |  |  |  |
| 7  | 6      | 5  | 4        | 3         | 2      | 1         | 0         |  |  |  |
| _  | _      | _  | _        | CLKPWMSEL | CLKSEL | _         | CLKPOL    |  |  |  |

# CLKPOL: LCD Controller Clock Polarity

0: Data/Control signals are launched on the rising edge of the Pixel Clock.

1: Data/Control signals are launched on the falling edge of the Pixel Clock.

#### • CLKSEL: LCD Controller Clock Source Selection

0: The Asynchronous output stage of the LCD controller is fed by MCK.

1: The Asynchronous output state of the LCD controller is fed by 2x MCK.

#### CLKPWMSEL: LCD Controller PWM Clock Source Selection

0: The slow clock is selected and feeds the PWM module.

1: The system clock is selected and feeds the PWM module.

### . CGDISBASE: Clock Gating Disable Control for the Base Layer

0: Automatic Clock Gating is enabled for the Base Layer.

1: Clock is running continuously.

### CGDISOVR1: Clock Gating Disable Control for the Overlay 1 Layer

0: Automatic Clock Gating is enabled for the Overlay 1 Layer.

1: Clock is running continuously.

### CGDISHEO: Clock Gating Disable Control for the High End Overlay

0: Automatic Clock Gating is enabled for the High End Overlay Layer.

1: Clock is running continuously.

# • CGDISHCR: Clock Gating Disable Control for the Hardware Cursor Layer

0: Automatic Clock Gating is enabled for the Hardware Cursor Layer.

1: Clock is running continuously.

# • CLKDIV: LCD Controller Clock Divider

8-bit width clock divider for pixel clock LCD\_PCLK.

pixel\_clock = selected\_clock / (CLKDIV + 2)

where selected\_clock is equal to system\_clock when CLKSEL field is set to 0 and system\_clock2x when CLKSEL is set to one.

# 45.7.2 LCD Controller Configuration Register 1

Name: LCDC\_LCDCFG1

**Address:** 0xF8038004

Access: Read/Write

| 31 | 30 | 29   | 28   | 27 | 26 | 25 | 24 |  |
|----|----|------|------|----|----|----|----|--|
| _  | -  | _    | _    | _  | _  | _  | _  |  |
| 23 | 22 | 21   | 20   | 19 | 18 | 17 | 16 |  |
| _  | _  |      | VSPW |    |    |    |    |  |
| 15 | 14 | 13   | 12   | 11 | 10 | 9  | 8  |  |
| _  | -  | _    | -    | _  | _  | _  | _  |  |
| 7  | 6  | 5    | 4    | 3  | 2  | 1  | 0  |  |
| _  | _  | HSPW |      |    |    |    |    |  |

# • HSPW: Horizontal Synchronization Pulse Width

Width of the LCD\_HSYNC pulse, given in pixel clock cycles. Width is (HSPW + 1) LCD\_PCLK cycles.

# VSPW: Vertical Synchronization Pulse Width

Width of the LCD\_VSYNC pulse, given in number of lines. Width is (VSPW + 1) lines.

#### 45.7.3 **LCD Controller Configuration Register 2**

Name: LCDC\_LCDCFG2

Address: 0xF8038008 Access: Read/Write

| 31 | 30 | 29   | 28   | 27 | 26 | 25 | 24 |  |
|----|----|------|------|----|----|----|----|--|
| _  | _  | _    | _    | _  | _  | _  | _  |  |
| 23 | 22 | 21   | 20   | 19 | 18 | 17 | 16 |  |
| _  | _  |      | VBPW |    |    |    |    |  |
| 15 | 14 | 13   | 12   | 11 | 10 | 9  | 8  |  |
| _  | -  | -    | _    | _  | -  | _  | _  |  |
| 7  | 6  | 5    | 4    | 3  | 2  | 1  | 0  |  |
| _  | _  | VFPW |      |    |    |    |    |  |

# • VFPW: Vertical Front Porch Width

This field indicates the number of lines at the end of the Frame. The blanking interval is equal to (VFPW+1) lines.

### • VBPW: Vertical Back Porch Width

This field indicates the number of lines at the beginning of the Frame. The blanking interval is equal to VBPW lines.

# 45.7.4 LCD Controller Configuration Register 3

Name: LCDC\_LCDCFG3

Address: 0xF803800C Access: Read/Write

| 31 | 30   | 29 | 28  | 27 | 26 | 25 | 24 |  |  |  |
|----|------|----|-----|----|----|----|----|--|--|--|
| _  | _    | -  | -   | -  | _  | _  | _  |  |  |  |
| 23 | 22   | 21 | 20  | 19 | 18 | 17 | 16 |  |  |  |
|    | HBPW |    |     |    |    |    |    |  |  |  |
| 15 | 14   | 13 | 12  | 11 | 10 | 9  | 8  |  |  |  |
| _  | _    | _  | _   | _  | _  | _  | _  |  |  |  |
| 7  | 6    | 5  | 4   | 3  | 2  | 1  | 0  |  |  |  |
|    |      |    | HFI | PW |    |    |    |  |  |  |

# • HFPW: Horizontal Front Porch Width

Number of pixel clock cycles inserted at the end of the active line. The interval is equal to (HFPW + 1) LCD\_PCLK cycles.

### • HBPW: Horizontal Back Porch Width

Number of pixel clock cycles inserted at the beginning of the line. The interval is equal to (HBPW + 1) LCD\_PCLK cycles.

#### 45.7.5 **LCD Controller Configuration Register 4**

Name: LCDC\_LCDCFG4

Address: 0xF8038010 Access: Read/Write

| 31 | 30  | 29 | 28 | 27 | 26 | 25  | 24 |  |  |  |
|----|-----|----|----|----|----|-----|----|--|--|--|
| _  | _   | _  | _  | _  |    | RPF |    |  |  |  |
| 23 | 22  | 21 | 20 | 19 | 18 | 17  | 16 |  |  |  |
|    | RPF |    |    |    |    |     |    |  |  |  |
| 15 | 14  | 13 | 12 | 11 | 10 | 9   | 8  |  |  |  |
| _  | _   | _  | _  | _  |    | PPL |    |  |  |  |
| 7  | 6   | 5  | 4  | 3  | 2  | 1   | 0  |  |  |  |
|    | PPL |    |    |    |    |     |    |  |  |  |

# • RPF: Number of Active Rows Per Frame

Number of active lines in the frame. The frame height is equal to (RPF + 1) lines.

# • PPL: Number of Pixels Per Line

Number of pixels in the frame. The number of active pixels in the frame is equal to (PPL + 1) pixels.

# 45.7.6 LCD Controller Configuration Register 5

Name: LCDC LCDCFG5

**Address:** 0xF8038014

Access: Read/Write

| 31      | 30     | 29    | 28        | 27      | 26      | 25    | 24    |  |
|---------|--------|-------|-----------|---------|---------|-------|-------|--|
| _       | -      | _     | -         | -       | _       | _     | -     |  |
| 23      | 22     | 21    | 20        | 19      | 18      | 17    | 16    |  |
| _       | _      | _     | GUARDTIME |         |         |       |       |  |
| 15      | 14     | 13    | 12        | 11      | 10      | 9     | 8     |  |
| _       | _      | VSPHO | VSPSU     | _       | _       | MODE  |       |  |
| 7       | 6      | 5     | 4         | 3       | 2       | 1     | 0     |  |
| DISPDLY | DITHER | _     | DISPPOL   | VSPDLYE | VSPDLYS | VSPOL | HSPOL |  |

### . HSPOL: Horizontal Synchronization Pulse Polarity

0: Active High

1: Active Low

# • VSPOL: Vertical Synchronization Pulse Polarity

0: Active High

1: Active Low

### • VSPDLYS: Vertical Synchronization Pulse Start

0: The first active edge of the Vertical synchronization pulse is synchronous with the second edge of the horizontal pulse.

1: The first active edge of the Vertical synchronization pulse is synchronous with the first edge of the horizontal pulse.

### VSPDLYE: Vertical Synchronization Pulse End

0: The second active edge of the Vertical synchronization pulse is synchronous with the second edge of the horizontal pulse.

1: The second active edge of the Vertical synchronization pulse is synchronous with the first edge of the horizontal pulse.

# • DISPPOL: Display Signal Polarity

0: Active High

1: Active Low

#### DITHER: LCD Controller Dithering

0: Dithering logical unit is disabled.

1: Dithering logical unit is activated.

### • DISPDLY: LCD Controller Display Power Signal Synchronization

0: the LCD\_DISP signal is asserted synchronously with the second active edge of the horizontal pulse.

1: the LCD DISP signal is asserted asynchronously with both edges of the horizontal pulse.

# • MODE: LCD Controller Output Mode

| Value | Name         | Description                                 |
|-------|--------------|---|
| 0     | OUTPUT_12BPP | LCD output mode is set to 12 bits per pixel |
| 1     | OUTPUT_16BPP | LCD output mode is set to 16 bits per pixel |
| 2     | OUTPUT_18BPP | LCD output mode is set to 18 bits per pixel |
| 3     | OUTPUT_24BPP | LCD output mode is set to 24 bits per pixel |

# • VSPSU: LCD Controller Vertical Synchronization Pulse Setup Configuration

- 0: The vertical synchronization pulse is asserted synchronously with horizontal pulse edge.
- 1: The vertical synchronization pulse is asserted one pixel clock cycle before the horizontal pulse.

### • VSPHO: LCD Controller Vertical Synchronization Pulse Hold Configuration

- 0: The vertical synchronization pulse is asserted synchronously with horizontal pulse edge.
- 1: The vertical synchronization pulse is held active one pixel clock cycle after the horizontal pulse.

#### • GUARDTIME: LCD DISPLAY Guard Time

Number of frames inserted during start up before LCD\_DISP assertion.

Number of frames inserted after LCD\_DISP reset.

# 45.7.7 LCD Controller Configuration Register 6

Name: LCDC\_LCDCFG6

Address: 0xF8038018
Access: Read/Write

| 31 | 30 | 29 | 28     | 27   | 26 | 25    | 24 |
|----|----|----|--------|------|----|-------|----|
| _  | _  | _  | _      | _    | _  | _     | _  |
| 23 | 22 | 21 | 20     | 19   | 18 | 17    | 16 |
| _  | _  | _  | _      | _    | _  | _     | _  |
| 15 | 14 | 13 | 12     | 11   | 10 | 9     | 8  |
|    |    |    | PWM    | CVAL |    |       |    |
| 7  | 6  | 5  | 4      | 3    | 2  | 1     | 0  |
| _  | -  | -  | PWMPOL | _    |    | PWMPS |    |

### • PWMPS: PWM Clock Prescaler

This field selects the configuration of the counter prescaler module.

| Value | Name   | Description   |
|-------|--------|---|
| 0     | DIV_1  | The counter advances at a rate of f <sub>COUNTER</sub> = f <sub>PWM_SELECTED_CLOCK</sub>      |
| 1     | DIV_2  | The counter advances at a rate of f <sub>COUNTER</sub> = f <sub>PWM_SELECTED_CLOCK</sub> / 2  |
| 2     | DIV_4  | The counter advances at a rate of f <sub>COUNTER</sub> = f <sub>PWM_SELECTED_CLOCK</sub> / 4  |
| 3     | DIV_8  | The counter advances at a rate of f <sub>COUNTER</sub> = f <sub>PWM_SELECTED_CLOCK</sub> / 8  |
| 4     | DIV_16 | The counter advances at a rate of f <sub>COUNTER</sub> = f <sub>PWM_SELECTED_CLOCK</sub> / 16 |
| 5     | DIV_32 | The counter advances at a of rate f <sub>COUNTER</sub> = f <sub>PWM_SELECTED_CLOCK</sub> / 32 |
| 6     | DIV_64 | The counter advances at a of rate f <sub>COUNTER</sub> = f <sub>PWM_SELECTED_CLOCK</sub> / 64 |

### • PWMPOL: LCD Controller PWM Signal Polarity

This bit defines the polarity of the PWM output signal.

0: Output pulses are low level

1: Output pulses are high level (The output will be high whenever the value in the counter is less than the value CVAL).

### • PWMCVAL: LCD Controller PWM Compare Value

PWM compare value. Used to adjust the analog value obtained after an external filter to control the contrast of the display.

#### 45.7.8 **LCD Controller Enable Register**

Name: LCDC\_LCDEN Address: 0xF8038020 Write-only Access:

| 31 | 30 | 29 | 28 | 27    | 26     | 25     | 24    |
|----|----|----|----|-------|--------|--------|-------|
| _  | -  | _  | _  | -     | _      | _      | _     |

| _  | _  | _  | -  | PWMEN | DISPEN | SYNCEN | CLKEN |

### • CLKEN: LCD Controller Pixel Clock Enable

0: No effect

1: Pixel clock logical unit is activated

### SYNCEN: LCD Controller Horizontal and Vertical Synchronization Enable

0: No effect

1: Both horizontal and vertical synchronization (LCD\_VSYNC and LCD\_HSYNC) signals are generated.

# • DISPEN: LCD Controller DISP Signal Enable

0: No effect

1: LCD\_DISP signal is generated

# • PWMEN: LCD Controller Pulse Width Modulation Enable

0: No effect

1: PWM is enabled

# 45.7.9 LCD Controller Disable Register

Name: LCDC\_LCDDIS
Address: 0xF8038024

| _  | _  | _  | _  | PWMDIS | DISPDIS | SYNCDIS | CLKDIS |

#### • CLKDIS: LCD Controller Pixel Clock Disable

0: No effect.

1: Disable the pixel clock.

### SYNCDIS: LCD Controller Horizontal and Vertical Synchronization Disable

0: No effect.

1: Disable the synchronization signals after the end of the frame.

# DISPDIS: LCD Controller DISP Signal Disable

0: No effect.

1: Disable the DISP signal.

### • PWMDIS: LCD Controller Pulse Width Modulation Disable

0: No effect.

1: Disable the pulse width modulation signal.

# • CLKRST: LCD Controller Clock Reset

0: No effect.

1: Reset the pixel clock generator module. The pixel clock duty cycle may be violated.

### • SYNCRST: LCD Controller Horizontal and Vertical Synchronization Reset

0: No effect.

1: Reset the timing engine. Both Horizontal and vertical pulse width are violated.

# DISPRST: LCD Controller DISP Signal Reset

0: No effect.

1: Reset the DISP signal.

#### PWMRST: LCD Controller PWM Reset

0: No effect.

1: Reset the PWM module, the duty cycle may be violated.

1: Interrupt source is enabled.

#### 45.7.14 LCD Controller Interrupt Status Register

Name: LCDC\_LCDISR
Address: 0xF8038038
Access: Read-only

|    | -  |    |         |     |      |      |      |
|----|----|----|---------|-----|------|------|------|
| 31 | 30 | 29 | 28      | 27  | 26   | 25   | 24   |
| _  | _  | -  | _       | _   | _    | -    | _    |
| 23 | 22 | 21 | 20      | 19  | 18   | 17   | 16   |
| _  | -  | -  | _       | _   | _    | -    | _    |
| 15 | 14 | 13 | 12      | 11  | 10   | 9    | 8    |
| _  | _  | _  | _       | HCR | HEO  | OVR1 | BASE |
| 7  | 6  | 5  | 4       | 3   | 2    | 1    | 0    |
| _  | _  | _  | FIFOERR | _   | DISP | DIS  | SOF  |

#### SOF: Start of Frame Interrupt Status Register

When set to one this flag indicates that a start of frame event has been detected. This flag is reset after a read operation.

#### DIS: LCD Disable Interrupt Status Register

When set to one this flag indicates that the horizontal and vertical timing generator has been successfully disabled. This flag is reset after a read operation.

#### DISP: Power-up/Power-down Sequence Terminated Interrupt Status Register

When set to one this flag indicates whether the power-up sequence or power-down sequence has terminated. This flag is reset after a read operation.

#### FIFOERR: Output FIFO Error

When set to one this flag indicates that an underflow occurs in the output FIFO. This flag is reset after a read operation.

#### BASE: Base Layer Raw Interrupt Status Register

When set to one this flag indicates that a Base layer interrupt is pending. This flag is reset as soon as the BASEISR register is read.

#### • OVR1: Overlay 1 Raw Interrupt Status Register

When set to one this flag indicates that an Overlay 1 layer interrupt is pending. This flag is reset as soon as the OVR1ISR register is read.

#### . HEO: High End Overlay Raw Interrupt Status Register

When set to one this flag indicates that a Hi End layer interrupt is pending. This flag is reset as soon as the HEOISR register is read.

#### HCR: Hardware Cursor Raw Interrupt Status Register

When set to one this flag indicates that a Hardware Cursor layer interrupt is pending. This flag is reset as soon as the HCRISR register is read.

# 45.7.15 Base Layer Channel Enable Register

Name: LCDC\_BASECHER

Address: 0xF8038040 Access: Write-only

## • BLEN: AHB Burst Length

| Value | Name       | Description   |
|-------|------------|---|
| 0     | AHB_SINGLE | AHB Access is started as soon as there is enough space in the FIFO to store one 32-bit data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts can be used. INCR is used for a burst of 2 and 3 beats.   |
| 1     | AHB_INCR4  | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of four 32-bit data. An AHB INCR4 Burst is preferred. SINGLE, INCR and INCR4 bursts can be used. INCR is used for a burst of 2 and 3 beats.                    |
| 2     | AHB_INCR8  | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of eight 32-bit data. An AHB INCR8 Burst is preferred. SINGLE, INCR, INCR4 and INCR8 bursts can be used. INCR is used for a burst of 2 and 3 beats.            |
| 3     | AHB_INCR16 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of sixteen 32-bit data. An AHB INCR16 Burst is preferred. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts can be used. INCR is used for a burst of 2 and 3 beats. |

# • DLBO: Defined Length Burst Only For Channel Bus Transaction.

0: Undefined length INCR burst is used for a burst of 2 and 3 beats.

1: Only Defined Length burst is used (SINGLE, INCR4, INCR8 and INCR16).

## • BLEN: AHB Burst Length

| Value | Name       | Description   |
|-------|------------|---|
| 0     | AHB_SINGLE | AHB Access is started as soon as there is enough space in the FIFO to store one 32-bit data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are preferred. INCR is used for a burst of 2 and 3 beats.   |
| 1     | AHB_INCR4  | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of four 32-bit data. An AHB INCR4 Burst is preferred. SINGLE, INCR and INCR4 bursts can be used. INCR is used for a burst of 2 and 3 beats.                    |
| 2     | AHB_INCR8  | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of eight 32-bit data. An AHB INCR8 Burst is preferred. SINGLE, INCR, INCR4 and INCR8 bursts can be used. INCR is used for a burst of 2 and 3 beats.            |
| 3     | AHB_INCR16 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of sixteen 32-bit data. An AHB INCR16 Burst is preferred. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts can be used. INCR is used for a burst of 2 and 3 beats. |

## • DLBO: Defined Length Burst Only for Channel Bus Transaction.

0: Undefined length INCR burst is used for a burst of 2 and 3 beats.

1: Only Defined Length burst is used (SINGLE, INCR4, INCR8 and INCR16).

#### • ROTDIS: Hardware Rotation Optimization Disable

0: Rotation optimization is enabled.

1: Rotation optimization is disabled.

#### • LOCKDIS: Hardware Rotation Lock Disable

0: AHB lock signal is asserted when a rotation is performed.

1: AHB lock signal is cleared when a rotation is performed.

0: Pixel difference is set to 0.

1: Pixel difference is set to the iterated pixel value.

#### • REVALPHA: Blender Reverse Alpha

0: Pixel difference is multiplied by alpha.

1: Pixel difference is multiplied by 1 - alpha.

### • GAEN: Blender Global Alpha Enable

0: Global alpha blending coefficient is disabled.

1: Global alpha blending coefficient is enabled.

# • LAEN: Blender Local Alpha Enable

0: Local alpha blending coefficient is disabled.

1: Local alpha blending coefficient is enabled.

#### • OVR: Blender Overlay Layer Enable

0: Overlay pixel color is set to the default overlay pixel color.

1: Overlay pixel color is set to the DMA channel pixel color.

# • DMA: Blender DMA Layer Enable

- 0: The default color is used on the Overlay 1 Layer.
- 1: The DMA channel retrieves the pixels stream from the memory.

## • REP: Use Replication logic to expand RGB color to 24 bits

- 0: When the selected pixel depth is less than 24 bpp, the pixel is shifted and least significant bits are set to 0.
- 1: When the selected pixel depth is less than 24 bpp, the pixel is shifted and the least significant bit replicates the MSB.

### • DSTKEY: Destination Chroma Keying

- 0: Source Chroma keying is enabled.
- 1: Destination Chroma keying is used.

#### • GA: Blender Global Alpha

Global alpha blender for the current layer.

# 45.7.52 High End Overlay Layer Channel Enable Register

Name: LCDC\_HEOCHER

**Address:** 0xF8038280

Access: Write-only

| 31 | 30 | 29 | 28 | 27 | 26    | 25       | 24   |
|----|----|----|----|----|-------|----------|------|
| _  | _  | -  | _  | _  | _     | _        | _    |

| _  | _  | -  | -  | _  | A2QEN | UPDATEEN | CHEN |

## • CHEN: Channel Enable Register

0: No effect.

1: Enable the DMA channel.

## • UPDATEEN: Update Overlay Attributes Enable Register

0: No effect.

1: update windows attributes on the next start of frame.

# • A2QEN: Add Head Pointer Enable Register

Write this field to one to add the head pointer to the descriptor list. This field is reset by hardware as soon as the head register is added to the list.

# 45.7.53 High End Overlay Layer Channel Disable Register

Name: LCDC\_HEOCHDR

Address: 0xF8038284

Access: Write-only

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24    |
|----|----|----|----|----|----|----|-------|
| _  | _  | -  | _  | -  | _  | -  | _     |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16    |

#### • DMA: End of DMA Transfer

When set to one this flag indicates that an End of Transfer has been detected. This flag is reset after a read operation.

#### DSCR: DMA Descriptor Loaded

When set to one this flag indicates that a descriptor has been loaded successfully. This flag is reset after a read operation.

#### ADD: Head Descriptor Loaded

When set to one this flag indicates that the descriptor pointed to by the head register has been loaded successfully. This flag is reset after a read operation.

#### DONE: End of List Detected

When set to one this flag indicates that an End of List condition has occurred. This flag is reset after a read operation.

#### OVR: Overflow Detected

When set to one this flag indicates that an overflow occurred. This flag is reset after a read operation.

#### UDMA: End of DMA Transfer for U component

When set to one this flag indicates that an End of Transfer has been detected. This flag is reset after a read operation.

#### UDSCR: DMA Descriptor Loaded for U component

When set to one this flag indicates that a descriptor has been loaded successfully. This flag is reset after a read operation.

#### UADD: Head Descriptor Loaded for U component

When set to one this flag indicates that the descriptor pointed to by the head register has been loaded successfully. This flag is reset after a read operation.

#### UDONE: End of List Detected for U component

When set to one this flag indicates that an End of List condition has occurred. This flag is reset after a read operation.

#### UOVR: Overflow Detected for U component

When set to one this flag indicates that an overflow occurred. This flag is reset after a read operation.

#### • VDMA: End of DMA Transfer for V component

When set to one this flag indicates that an End of Transfer has been detected. This flag is reset after a read operation.

## • VDSCR: DMA Descriptor Loaded for V component

When set to one this flag indicates that a descriptor has been loaded successfully. This flag is reset after a read operation.

#### VADD: Head Descriptor Loaded for V component

When set to one this flag indicates that the descriptor pointed to by the head register has been loaded successfully. This flag is reset after a read operation.

### • VDONE: End of List Detected for V component

When set to one this flag indicates that an End of List condition has occurred. This flag is reset after a read operation.

## • VOVR: Overflow Detected for V component

When set to one this flag indicates that an overflow occurred. This flag is reset after a read operation.

|-------|--------------------------|---|--|--|--|--|--|--|
| Value | Name                     | Description   |  |  |  |  |  |  |
| 0     | AHB_SINGLE               | AHB Access is started as soon as there is enough space in the FIFO to store one 32-bit data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts can be used. INCR is used for a burst of 2 and 3 beats.   |  |  |  |  |  |  |
| 1     | AHB_INCR4                | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of four 32-bit data. An AHB INCR4 Burst is preferred. SINGLE, INCR and INCR4 bursts can be used. INCR is used for a burst of 2 and 3 beats.                    |  |  |  |  |  |  |
| 2     | AHB_INCR8                | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of eight 32-bit data. An AHB INCR8 Burst is preferred. SINGLE, INCR, INCR4 and INCR8 bursts can be used. INCR is used for a burst of 2 and 3 beats.            |  |  |  |  |  |  |
| 3     | AHB_INCR16               | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of sixteen 32-bit data. An AHB INCR16 Burst is preferred. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts can be used. INCR is used for a burst of 2 and 3 beats. |  |  |  |  |  |  |

### • BLENUV: AHB Burst Length for U-V Channel

| Value | Name       | Description   |
|-------|------------|---|
| 0     | AHB_SINGLE | AHB Access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts can be used. INCR is used for a burst of 2 and 3 beats.  |
| 1     | AHB_INCR4  | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of four 32-bit data. An AHB INCR4 Burst is preferred. SINGLE, INCR and INCR4 bursts can be used. INCR is used for a burst of 2 and 3 beats.                    |
| 2     | AHB_INCR8  | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. An AHB INCR8 Burst is preferred. SINGLE, INCR, INCR4 and INCR8 bursts can be used. INCR is used for a burst of 2 and 3 beats.                       |
| 3     | AHB_INCR16 | AHB Access is started as soon as there is enough space in the FIFO to store a total amount of sixteen 32-bit data. An AHB INCR16 Burst is preferred. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts can be used. INCR is used for a burst of 2 and 3 beats. |

# • DLBO: Defined Length Burst Only For Channel Bus Transaction

0: Undefined length INCR burst is used for a burst of 2 and 3 beats.

1: Only defined length burst is used (SINGLE, INCR4, INCR8 and INCR16).

## • ROTDIS: Hardware Rotation Optimization Disable

0: Rotation optimization is enabled.

1: Rotation optimization is disabled.

## • LOCKDIS: Hardware Rotation Lock Disable

0: AHB lock signal is asserted when a rotation is performed.

1: AHB lock signal is cleared when a rotation is performed.

#### YUV422ROT: YUV 4:2:2 Rotation

When set to one this bit indicates that the Chroma Upsampling kernel is configured to use the 4:2:2 Rotation Algorithm. This field is relevant only when a rotation angle of 90 degrees or 270 degrees is used.

#### YUV422SWP: YUV 4:2:2 SWAP

When set to one the Y component of the YUV 4:2:2 packed memory data stream is swapped.

0: Iterated pixel is the blended pixel.

1: Iterated pixel is the inverted pixel.

#### ITER2BL: Blender Iterated Color Enable

0: Final adder stage operand is set to 0.

1: Final adder stage operand is set to the iterated pixel value.

#### • ITER: Blender Use Iterated Color

0: Pixel difference is set to 0.

1: Pixel difference is set to the iterated pixel value.

#### • REVALPHA: Blender Reverse Alpha

0: Pixel difference is multiplied by alpha.

1: Pixel difference is multiplied by 1 - alpha.

#### • GAEN: Blender Global Alpha Enable

0: Global alpha blending coefficient is disabled.

1: Global alpha blending coefficient is enabled.

# • LAEN: Blender Local Alpha Enable

0: Local alpha blending coefficient is disabled.

1: Local alpha blending coefficient is enabled.

#### • OVR: Blender Overlay Layer Enable

0: Overlay pixel color is set to the default overlay pixel color.

1: Overlay pixel color is set to the DMA channel pixel color.

### • DMA: Blender DMA Layer Enable

- 0: The default color is used on the Overlay 1 Layer.
- 1: The DMA channel retrieves the pixels stream from the memory.

#### • REP: Use Replication logic to expand RGB color to 24 bits

- 0: When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0.
- 1: When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the MSB.

#### • DSTKEY: Destination Chroma Keying

- 0: Source Chroma keying is enabled.
- 1: Destination Chroma keying is used.

#### • VIDPRI: Video Priority

- 0: HEO layer is located below Overlay 1.
- 1: HEO layer is located above Overlay 1.

#### • GA: Blender Global Alpha

Global alpha blender for the current layer.

### • CRKEY: Blender Chroma Key Enable

0: Chroma key matching is disabled.

1: Chroma key matching is enabled.

#### INV: Blender Inverted Blender Output Enable

0: Iterated pixel is the blended pixel.

1: Iterated pixel is the inverted pixel.

#### • ITER2BL: Blender Iterated Color Enable

0: final adder stage operand is set to 0.

1: Final adder stage operand is set to the iterated pixel value.

#### • ITER: Blender Use Iterated Color

0: Pixel difference is set to 0.

1: Pixel difference is set to the iterated pixel value.

#### • REVALPHA: Blender Reverse Alpha

0: Pixel difference is multiplied by alpha.

1: Pixel difference is multiplied by 1 - alpha.

#### • GAEN: Blender Global Alpha Enable

0: Global alpha blending coefficient is disabled.

1: Global alpha blending coefficient is enabled.

# • LAEN: Blender Local Alpha Enable

0: Local alpha blending coefficient is disabled.

1: Local alpha blending coefficient is enabled.

#### • OVR: Blender Overlay Layer Enable

0: Overlay pixel color is set to the default overlay pixel color.

1: Overlay pixel color is set to the DMA channel pixel color.

Atmel-11055F-ATARM-SAM9X35-Datasheet\_31-Aug-15

# • DMA: Blender DMA Layer Enable

- 0: The default color is used on the Overlay 1 Layer.
- 1: The DMA channel retrieves the pixels stream from the memory.

### • REP: Use Replication logic to expand RGB color to 24 bits

- 0: When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0.
- 1: When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the MSB.

#### • DSTKEY: Destination Chroma Keying

- 0: Source Chroma keying is enabled.
- 1: Destination Chroma keying is used.

#### • GA: Blender Global Alpha

Global alpha blender for the current layer.

| Operating Temperature (Industrial)40° C to + 85° C                       |
|--|
| Junction Temperature125°C  |
| Storage Temperature60°C to + 150°C                                       |
| Voltage on Input Pins with Respect to Ground0.3V to VDDIO+0.3V(+ 4V max) |
| Maximum Operating Voltage (VDDCORE, VDDPLLA, VDDUTMIC)1.2V               |
| (VDDIOM)2.0V   |
| (VDDIOPx, VDDUTMII, VDDOSC, VDDANA and VDDBU)4.0V                        |
| Total DC Output Current on all I/O lines350 mA                           |

\*NOTICE:

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### 46.2 DC Characteristics

The following characteristics are applicable to the operating temperature range:  $T_A = -40$ °C to +85°C, unless otherwise specified.

Table 46-2. DC Characteristics

| Symbol                 | Parameter                                 | Conditions | Min      | Тур     | Max      | Unit  |
|------------------------|---|------------|----------|---------|----------|-------|

# 46.3 Power Consumption

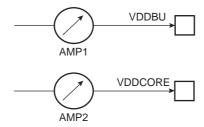

- Typical power consumption of PLLs, Slow Clock and Main Oscillator.
- Power consumption of power supply in four different modes: Active, Idle, Ultra Low-power and Backup.
- Power consumption by peripheral: calculated as the difference in current measurement after having enabled then disabled the corresponding clock.

#### 46.3.1 Power Consumption versus Modes

The values in Table 46-3 and Table 46-4 are estimated values of the power consumption with operating conditions as follows:

- $V_{DDIOM} = 1.8V$
- V<sub>DDIOP0</sub> and V<sub>DDIOP1</sub> = 3.3V
- $V_{DDPLLA} = 1.0V$
- $V_{DDCORF} = 1.0V$
- $V_{DDBU} = 3.3V$
- T<sub>Δ</sub> = 25° C
- There is no consumption on the I/Os of the device

Figure 46-1. Measures Schematics

These figures represent the power consumption estimated on the power supplies.

Table 46-3. Power Consumption for Different Modes

| Mode   | Conditions  | Consumption | Unit |
|--|---|-------------|------|
| Active   | ARM Core clock is 400 MHz. MCK is 133 MHz. All peripheral clocks activated. onto AMP2 | 109         | mA   |
| Idle   | Idle state, waiting an interrupt. All peripheral clocks de-activated. onto AMP2       | 38          | mA   |
| Ultra low power  | ARM Core clock is 500 Hz. All peripheral clocks de-activated. onto AMP2               | 8           | mA   |
| Backup Device only V <sub>DDBU</sub> powered onto AMP1 |   | 8           | μA   |

Table 46-4. Power Consumption by Peripheral in Active Mode

| Peripheral | Consumption | Unit                  |
|------------|-------------|-----------------------|
| ADC        | 5           | μΑ/MHz <sup>(1)</sup> |
| CAN        | 17          | μΑ/MHz <sup>(1)</sup> |

Table 46-4. Power Consumption by Peripheral in Active Mode (Continued)

| Peripheral             | Consumption | Unit                  |
|------------------------|-------------|-----------------------|
| DMA                    | 1           | μΑ/MHz <sup>(1)</sup> |
| EMAC                   | 39          | μΑ/MHz <sup>(1)</sup> |
| HSMCI                  | 28          | μΑ/MHz <sup>(1)</sup> |
| LCDC                   | 30          | μΑ/MHz <sup>(1)</sup> |
| PIO Controller         | 1           | μΑ/MHz <sup>(1)</sup> |
| PWM                    | 6           | μΑ/MHz <sup>(1)</sup> |
| SMD                    | 14          | μΑ/MHz <sup>(1)</sup> |
| SPI                    | 3           | μΑ/MHz <sup>(1)</sup> |
| SSC                    | 5           | μΑ/MHz <sup>(1)</sup> |
| Timer Counter Channels | 12          | μΑ/MHz <sup>(1)</sup> |
| TWI                    | 2           | μΑ/MHz <sup>(1)</sup> |
| UDPHS                  | 22          | μΑ/MHz <sup>(1)</sup> |
| UHPHS                  | 60          | μΑ/MHz <sup>(1)</sup> |
| USART                  | 6           | μΑ/MHz <sup>(1)</sup> |

Note: 1. Reference frequency is peripheral frequency. It can be a division (1, 2, 4, 8) of MCK. Refer to PMC section for more details.

### 46.4 Clock Characteristics

#### 46.4.1 Processor Clock Characteristics

Table 46-5. Processor Clock Waveform Parameters

| Symbol                  | Parameter                 | Conditions                             | Min                | Max | Unit |
|-------------------------|---------------------------|--|--------------------|-----|------|
| 1/(t <sub>CPPCK</sub> ) | Processor Clock Frequency | $V_{DDCORE} = 0.9V, T_A = 85^{\circ}C$ | 125 <sup>(1)</sup> | 400 | MHz  |

Note: 1. For DDR2 usage only, there are no limitations to LP-DDR, SDRAM and mobile SDRAM.

#### 46.4.2 Master Clock Characteristics

The master clock is the maximum clock at which the system is able to run. It is given by the smallest value of the internal bus clock and EBI clock.

Table 46-6. Master Clock Waveform Parameters

| Symbol                  | Parameter              | Conditions                             | Min                | Max | Unit |
|-------------------------|------------------------|--|--------------------|-----|------|
| 1/(t <sub>CPMCK</sub> ) | Master Clock Frequency | $V_{DDCORE} = 0.9V, T_A = 85^{\circ}C$ | 125 <sup>(1)</sup> | 133 | MHz  |

Note: 1. For DDR2 usage only, there are no limitations to LP-DDR, SDRAM and mobile SDRAM.

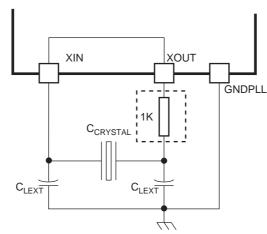

### 46.5 Main Oscillator Characteristics

Table 46-7. Main Oscillator Characteristics

| Symbol                              | Parameter                    | Conditions                                  | Min | Тур  | Max  | Unit |
|-------------------------------------|------------------------------|---|-----|------|------|------|
| 1/(t <sub>CPMAIN</sub> )            | Crystal Oscillator Frequency |   | 12  |      | 16   | MHz  |
| C <sub>CRYSTAL</sub> <sup>(1)</sup> | Crystal Load Capacitance     |   | 15  |      | 20   | pF   |
| 0                                   | External Load Consistence    | C <sub>CRYSTAL</sub> = 15 pF <sup>(1)</sup> |     | 27   |      | pF   |
| C <sub>LEXT</sub>                   | External Load Capacitance    | C <sub>CRYSTAL</sub> = 20 pF <sup>(1)</sup> |     | 32   |      | pF   |
|                                     | Duty Cycle                   |   | 40  |      | 60   | %    |
| t <sub>START</sub>                  | Startup Time                 |   |     |      | 2    | ms   |
| I <sub>DDST</sub>                   | Standby Current Consumption  | Standby mode                                |     |      | 1    | μA   |
| P <sub>ON</sub>                     | Drive Level                  |   |     |      | 150  | μW   |
| I <sub>DD ON</sub>                  | Current Dissipation          | @ 12 MHz                                    |     | 0.52 | 0.55 | mA   |
|                                     |                              | @ 16 MHz                                    |     | 0.7  | 1.1  | mA   |

Note: 1. The C<sub>CRYSTAL</sub> value is specified by the crystal manufacturer. In our case, C<sub>CRYSTAL</sub> must be between 15 pF and 20 pF. All parasitic capacitance, package and board, **must be calculated** in order to reach 15 pF (minimum targeted load for the oscillator) by taking into account the internal load C<sub>INT</sub>. So, to target the minimum oscillator load of 15 pF, external capacitance must be 15 pF - 4 pF = 11 pF which means that 22 pF is the target value (22 pF from XIN to GND and 22 pF from XOUT to GND). If 20 pF load is targeted, the sum of pad, package, board and external capacitances must be 20 pF - 4 pF = 16 pF which means 32 pF (32 pF from XIN to GND and 32 pF from XOUT to GND).

Figure 46-2. Main Oscillator Schematics

Note: A 1K resistor must be added on XOUT pin for crystals with frequencies lower than 8 MHz.

# 46.5.1 Crystal Oscillator Characteristics

The following characteristics are applicable to the operating temperature range:  $T_A = -40$ °C to 85°C and worst case of power supply, unless otherwise specified.

Table 46-8. Crystal Characteristics

| Symbol             | Parameter                     | Conditions                        | Min | Тур | Max | Unit |
|--------------------|-------------------------------|-----------------------------------|-----|-----|-----|------|
|                    |                               | @ 16 MHz                          |     |     | 80  |      |

### 46.9 PLL Characteristics

Table 46-15. PLLA Characteristics

| Symbol             | Parameter           | Conditions           | Min | Тур | Max | Unit |
|--------------------|---------------------|----------------------|-----|-----|-----|------|
| f <sub>OUT</sub>   | Output Frequency    | Refer to Table 46-16 | 400 |     | 800 | MHz  |
| f <sub>IN</sub>    | Input Frequency     |                      | 2   |     | 32  | MHz  |
|                    | 0                   | Active mode          |     | 7   | 9   | mA   |
| I <sub>PLL</sub>   | Current Consumption | Standby mode         |     |     | 1   | μΑ   |
| t <sub>START</sub> | Startup Time        |                      |     |     | 50  | μs   |

The following configuration of bit PMC\_PLLICPR.ICPLLA and field CKGR\_PLLAR.OUTA must be done for each PLLA frequency range.

Table 46-16. PLLA Frequency Regarding ICPLLA and OUTA

| PLL Frequency Range (MHz) | PMC_PLLICPR.ICPLLA Value | CKGR_PLLAR.OUTA Value |
|---------------------------|--------------------------|-----------------------|
| 745–800                   | 0                        | 00                    |
| 695–750                   | 0                        | 01                    |
| 645–700                   | 0                        | 10                    |
| 595–650                   | 0                        | 11                    |
| 545–600                   | 1                        | 00                    |
| 495–550                   | 1                        | 01                    |
| 445–500                   | 1                        | 10                    |
| 400–450                   | 1                        | 11                    |

#### 46.9.1 UTMI PLL Characteristics

Table 46-17. Phase Lock Loop Characteristics

| Symbol             | Parameter           | Conditions   | Min | Тур | Max | Unit |
|--------------------|---------------------|--------------|-----|-----|-----|------|
| f <sub>IN</sub>    | Input Frequency     |              | 4   | 12  | 32  | MHz  |
| f <sub>OUT</sub>   | Output Frequency    |              | 450 | 480 | 600 | MHz  |
|                    | 0                   | Active mode  |     | 5   | 8   | mA   |
| I <sub>PLL</sub>   | Current Consumption | Standby mode |     |     | 1.5 | μA   |
| t <sub>START</sub> | Startup Time        |              |     |     | 50  | μs   |

#### 46.10 I/Os

The following criteria is used to define the maximum frequency of the I/Os:

- Output duty cycle (40%–60%)
- Minimum output swing: 100 mV to V<sub>DDIO</sub> 100 mV
- Addition of rising and falling time inferior to 75% of the period

Table 46-18. I/O Characteristics

| Symbol           | Parameter                                 | Conditions      | Min             | Max              | Unit    |
|------------------|---|-----------------|-----------------|------------------|---------|
|                  | , , , ,                                   | 3.3V domain (1) | 100 (Low Drive) | 200 (High Drive) | N 41 1- |
| I <sub>max</sub> | V <sub>DDIOP</sub> powered pins frequency | 1.8V domain (2) | 50 (Low Drive)  | 166 (High Drive) | MHz     |

Notes: 1. 3.3V domain:  $V_{DDIOP}$  from 3.0V to 3.6V, maximum external capacitor = 20 pF

2. 1.8V domain:  $V_{DDIOP}$  from 1.65V to 1.95V, maximum external capacitor = 20 pF

# 46.11 USB HS Characteristics

Table 46-19. USB HS Electrical Characteristics

| Symbol                | Parameter   | Conditions               | Min | Тур | Max | Unit |
|-----------------------|---|--------------------------|-----|-----|-----|------|
| R <sub>PUI</sub>      | Bus Pull-up Resistor on Upstream Port (idle bus)                | In LS or FS Mode         |     | 1.5 |     | kΩ   |
| R <sub>PUA</sub>      | Bus Pull-up Resistor on Upstream Port (upstream port receiving) | In LS or FS Mode         |     | 15  |     | kΩ   |
| Settling tim          | e   |                          |     |     |     |      |
| t <sub>BIAS</sub>     | Bias settling time  |                          |     |     | 20  | μs   |
| t <sub>OSC</sub>      | Oscillator settling time  | With Crystal 12 MHz      |     |     | 2   | ms   |
| t <sub>SETTLING</sub> | Settling time   | f <sub>IN</sub> = 12 MHz |     | 0.3 | 0.5 | ms   |

Table 46-20. USB HS Static Power Consumption

| Symbol                | Parameter                                       | Conditions        | Min | Тур | Max | Unit |
|-----------------------|---|-------------------|-----|-----|-----|------|
| I <sub>BIAS</sub>     | Bias current consumption on VBG                 |                   |     |     | 1   | μA   |
|                       | HS Transceiver and I/O current consumption      |                   |     |     | 8   | μΑ   |
| IVDDUTMII             | LS / FS Transceiver and I/O current consumption | No connection (1) |     |     | 3   | μA   |
| I <sub>VDDUTMIC</sub> | Core, PLL, and Oscillator current consumption   |                   |     |     | 2   | μA   |

Note: 1. If cable is connected add 200 µA (Typical) due to Pull-up/Pull-down current consumption.

Table 46-21. USB HS Dynamic Power Consumption

| Symbol                | Parameter                                    | Conditions                   | Min | Тур | Max | Unit |
|-----------------------|--|------------------------------|-----|-----|-----|------|
| I <sub>BIAS</sub>     | Bias current consumption on VBG              |                              |     | 0.7 | 0.8 | mA   |
|                       | HS Transceiver current consumption           | HS transmission              |     | 47  | 60  | mA   |
|                       | HS Transceiver current consumption           | HS reception                 |     | 18  | 27  | mA   |
| I <sub>VDDUTMII</sub> | LS / FS Transceiver current consumption      | FS transmission 0m cable (1) |     | 4   | 6   | mA   |
|                       | LS / FS Transceiver current consumption      | FS transmission 5m cable (1) |     | 26  | 30  | mA   |
|                       | LS / FS Transceiver current consumption      | FS reception (1)             |     | 3   | 4.5 | mA   |
| I <sub>VDDUTMIC</sub> | PLL, Core and Oscillator current consumption |                              |     | 5.5 | 9   | mA   |

Note: 1. Including 1 mA due to Pull-up/Pull-down current consumption.

# 46.12 USB Transceiver Characteristics

Table 46-22. USB Transceiver Electrical Characteristics

| Symbol           | Parameter   | Conditions   | Min   | Тур | Max   | Unit |

| t <sub>FE</sub>   | Transition Fall Time    | C <sub>LOAD</sub> = 50 pF | 4   |     | 20     | ns   |
| t <sub>FRFM</sub> | Rise/Fall time Matching |                           | 90  |     | 111.11 | %    |

# 46.13 Analog-to-Digital Converter (ADC)

Table 46-24. Channel Conversion Time and ADC Clock

| Parameter                             | Conditions               | Min | Тур | Max  | Unit |
|---------------------------------------|--------------------------|-----|-----|------|------|
| ADC Clock Frequency                   | 10-bit resolution mode   |     |     | 13.2 | MHz  |
| Startup Time                          | Return from Idle Mode    |     |     | 40   | μs   |
| Track and Hold Acquisition Time (TTH) | ADC Clock = 13.2 MHz (1) | 0.5 |     |      | μs   |
| Conversion Time (TCT)                 | ADC Clock = 13.2 MHz (1) |     |     | 1.74 |      |
| Conversion Time (TCT)                 | ADC Clock = 5 MHz (1)    |     |     | 4.6  | μs   |
| Throughout Poto                       | ADC Clock = 13.2 MHz (1) |     |     | 440  | kono |
| Throughput Rate                       | ADC Clock = 5 MHz (1)    |     |     | 192  | ksps |

Note: 1. The Track-and-Hold Acquisition Time is given by: TTH (ns) = 500 +  $(0.12 \times Z_{IN})(\Omega)$ 

The ADC internal clock is divided by 2 in order to generate a clock with a duty cycle of 75%. So the maximum conversion time is given by:

$$TCT(\mu s) = \frac{23}{f_{clk}}(MHz)$$

The full speed is obtained for an input source impedance of  $< 50 \ \Omega$  maximum, or TTH = 500 ns.

In order to make the TSADC work properly, the SHTIM field in TSADCC Mode Register is to be calculated according to this Track and Hold Acquisition Time, also called Sampled and Hold Time.

Table 46-25. External Voltage Reference Input

| Parameter                     | Conditions | Min | Тур | Max    | Unit |
|-------------------------------|------------|-----|-----|--------|------|

| Current Consumption on VDDANA |            |     |     | 600    | μΑ   |

Table 46-26. Analog Inputs

| Parameter           | Conditions | Min | Тур | Max    | Unit |
|---------------------|------------|-----|-----|--------|------|
| Input Voltage Range |            | 0   |     | ADVREF | V    |
| Input Peak Current  |            |     |     | 2.5    | mA   |
| Input Capacitance   |            |     | 7   | 10     | pF   |
| Input Impedance     |            |     | 50  |        | Ω    |

Table 46-27. Transfer Characteristics

| Symbol                        | Parameter                  | Conditions           | Min | Тур | Max  | Unit |
|-------------------------------|----------------------------|----------------------|-----|-----|------|------|
|                               | Resolution                 |                      |     | 10  |      | bit  |
| INL                           | Integral Non-linearity     |                      |     |     | ±2   | LSB  |
| DNL Differential Non-linearit | Differential New Linearity | ADC Clock = 13.2 MHz |     |     | ±2   | LSB  |
|                               | Differential Non-linearity | ADC Clock = 5 MHz    |     |     | ±0.9 |      |
| E <sub>G</sub>                | Offset Error               |                      |     |     | ±10  | mV   |
| E <sub>o</sub>                | Gain Error                 | ADC Clock = 13.2 MHz |     |     | ±3   | I CD |
|                               |                            | ADC Clock = 5 MHz    |     |     | ±2   | LSB  |

Table 46-28. Pen Detection Sensitivity

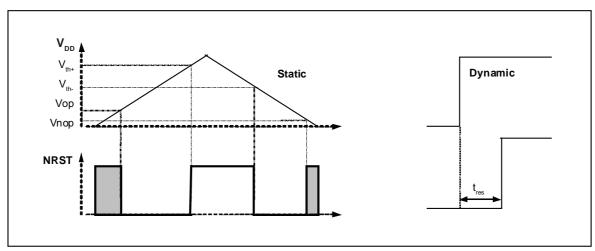

| ADC_ACR [1:0] | Resistor ( $k\Omega$ ) |
|---------------|------------------------|
| 0             | 200                    |
| 1             | 150                    |
| 2             | 100 (default)          |
| 3             | 50                     |

The Pen Detection Sensitivity is programmable by an ADC internal resistor. This resistor is set depending on the value of the PENDETSENS field in ADC\_ACR, offset 0x94 in the ADC User Interface.

#### 46.14 POR Characteristics

A general presentation of Power-On-Reset (POR) characteristics is provided in Figure 46-5.

Figure 46-5. General Presentation of POR Behavior

When a very slow (versus  $t_{RES}$ ) supply rising slope is applied on POR VDD pin, the reset time becomes negligible and the reset signal is released when  $V_{DD}$  rises higher than  $V_{th+}$ .

When a very fast (versus  $t_{RES}$ ) supply rising slope is applied on POR VDD pin, the voltage threshold becomes negligible and the reset signal is released after  $t_{RES}$  time. It is the smallest possible reset time.

### 46.14.1 Core Power Supply POR Characteristics

Table 46-29. Core Power Supply POR Characteristics

| Symbol           | Parameter                 | Conditions                  | Min | Тур | Max  | Unit |
|------------------|---------------------------|-----------------------------|-----|-----|------|------|
| V <sub>th+</sub> | Threshold Voltage Rising  | Minimum Slope of +2.0V/30ms | 0.5 | 0.7 | 0.89 | V    |
| $V_{th}$         | Threshold Voltage Falling | Minimum Slope of +2.0V/30ms | 0.4 | 0.6 | 0.85 | V    |
| t <sub>RES</sub> | Reset Time                | _                           | 30  | 70  | 130  | μs   |
| I <sub>DD</sub>  | Current consumption       | After t <sub>RES</sub>      | _   | 3   | 7    | μΑ   |

# 46.14.2 Backup Power Supply POR Characteristics

Table 46-30. Backup Power Supply POR Characteristics

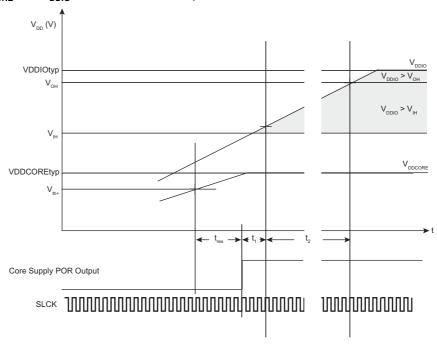

| Symbol           | Parameter                 | Conditions                  | Min  | Тур  | Max  | Unit |
|------------------|---------------------------|-----------------------------|------|------|------|------|
| V <sub>th+</sub> | Threshold Voltage Rising  | Minimum Slope of +2.0V/30ms | 1.42 | 4.52 | 1.62 | V    |
| V <sub>th-</sub> | Threshold Voltage Falling | Minimum Slope of +2.0V/30ms | 1.35 | 1.45 | 1.55 | V    |
| t <sub>RES</sub> | Reset Time                | V <sub>DDBU</sub> is 3.3V   | 30   | 80   | 220  | μs   |
|                  |                           | V <sub>DDBU</sub> is 1.8V   | 40   | 100  | 330  |      |
| I <sub>DD</sub>  | Current consumption       | After t <sub>RES</sub>      | _    | 6    | 8.5  | μΑ   |

# **46.15 Power Sequence Requirements**

The AT91 board design must comply with the power-up guidelines below to guarantee reliable operation of the device. Any deviation from these sequences may prevent the device from booting.

#### 46.15.1 Power-Up Sequence

Figure 46-6. V<sub>DDCORE</sub> and V<sub>DDIO</sub> Constraints at Startup

 $V_{\text{DDCORE}}$  and  $V_{\text{DDBU}}$  are controlled by internal POR (Power-On-Reset) to guarantee that these power sources reach their target values prior to the release of POR.

- V<sub>DDIOP</sub> must be ≥ V<sub>IH</sub> (refer to DC characteristics, Table 46-2, for more details), (t<sub>RES</sub> + t<sub>1</sub>) at the latest, after V<sub>DDCORE</sub> has reached V<sub>th+</sub>
- V<sub>DDIOM</sub> must reach V<sub>OH</sub> (refer to DC characteristics, Table 46-2, for more details), (t<sub>RES</sub> + t<sub>1</sub> + t<sub>2</sub>) at the latest, after V<sub>DDCORE</sub> has reached V<sub>th+</sub>
  - t<sub>RES</sub> is a POR characteristic
  - $t_1 = 3 \times t_{SLCK}$
  - $t_2 = 16 \times t_{SLCK}$

The  $t_{SLCK}$  min (22  $\mu$ s) is obtained for the maximum frequency of the internal RC oscillator (44 kHz).

- $t_{RES} = 30 \ \mu s$
- $t_1 = 66 \, \mu s$
- $t_2 = 352 \,\mu s$
- V<sub>DDPLL</sub> is to be established prior to V<sub>DDCORE</sub> to ensure the PLL is powered once enabled into the ROM code.

As a conclusion, establish  $V_{DDIOP}$  and  $V_{DDIOM}$  first, then  $V_{DDPLL}$ , and  $V_{DDCORE}$  last, to ensure a reliable operation of the device.

### 46.15.2 Power-Down Sequence

To ensure that the device does not operate outside the operating conditions defined in Table 4-1 "Power Supplies", it is good practice to first place the device in reset state before removing its power supplies. No specific sequencing is required with respect to its supply channels as long as the NRST line is held active during the the power-down phase.

Figure 46-7. Recommended Power-Down Sequence

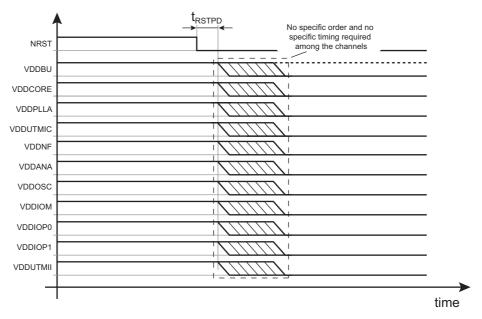

Table 46-31. Power-down Timing Specification

| Symbol             | Parameter                 | Conditions                                 | Min | Max | Unit |
|--------------------|---------------------------|--|-----|-----|------|
| t <sub>RSTPD</sub> | Reset Delay at Power-Down | From NRST low to the first supply turn-off | 0   | 1   | ms   |

# 46.16 SMC Timings

### **46.16.1 Timing Conditions**

SMC Timings are given for MAX corners.

Timings are given assuming a capacitance load on data, control and address pads.

Table 46-32. Capacitance Load

|        | Coi   | ner  |
|--------|-------|------|
| Supply | Max   | Min  |
| 3.3V   | 50 pF | 5 pF |
| 1.8V   | 30 pF | 5 pF |

In the following tables, t<sub>CPMCK</sub> is MCK period.

### 46.16.2 Timing Extraction

#### 46.16.2.1 Zero Hold Mode Restrictions

Table 46-33. Zero Hold Mode Use Maximum System Clock Frequency (MCK)

|                  |               | M                  |                    |      |
|------------------|---------------|--------------------|--------------------|------|
| Symbol           | Parameter     | VDDIOM supply 1.8V | VDDIOM supply 3.3V | Unit |
| f <sub>max</sub> | MCK frequency | 66                 | 66                 | MHz  |

#### 46.16.2.2 Read Timings

Table 46-34. SMC Read Signals - NRD Controlled (READ\_MODE = 1)

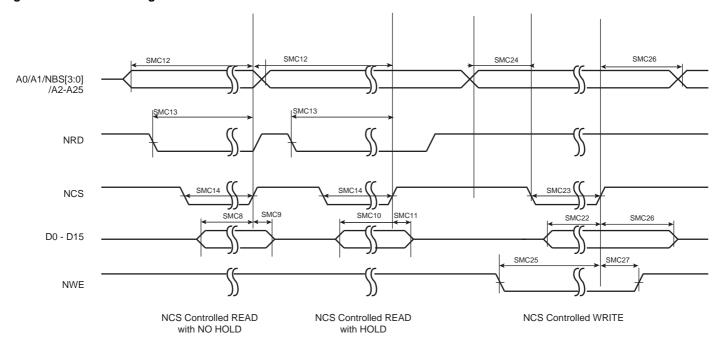

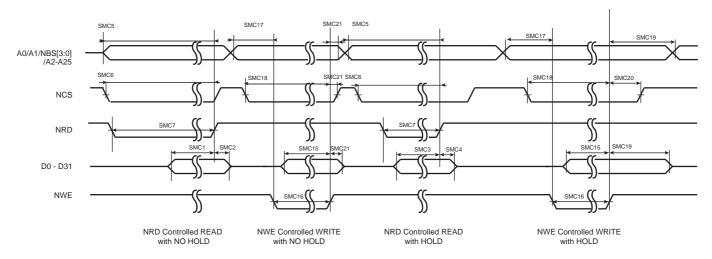

Figure 46-9. SMC Timings - NRD Controlled Read and NWE Controlled Write

# **46.17 DDRSDRC Timings**

The DDRSDRC controller satisfies the timings of standard DDR2, LP-DDR, SDR and LP-SDR modules. DDR2, LP-DDR and SDR timings are specified by the JEDEC standard.

Supported speed grade limitations:

- DDR2-400 limited at 133 MHz clock frequency (1.8V, 30 pF on data/control, 10 pF on CK/CK#)
- LP-DDR limited at 133 MHz clock frequency (1.8V, 30 pF on data/control, 10 pF on CK)
- SDR-100 (3.3V, 50 pF on data/control, 10 pF on CK)
- SDR-133 (3.3V, 50 pF on data/control, 10 pF on CK)
- LP-SDR-133 (1.8V, 30 pF on data/control, 10 pF on CK)

### 46.18 Peripheral Timings

#### 46.18.1 SPI

#### 46.18.1.1 Maximum SPI Frequency

The following formulas give maximum SPI frequency in Master read and write modes and in Slave read and write modes.

#### **Master Write Mode**

The SPI is only sending data to a slave device such as an LCD, for example. The limit is given by SPI<sub>2</sub> (or SPI<sub>5</sub>) timing. Since it gives a maximum frequency above the maximum pad speed (see Section 46.10 "I/Os"), the maximum SPI frequency is the one from the pad.

#### **Master Read Mode**

$$f_{SPCK}Max = \frac{1}{SPI_0(\text{or } SPI_3) + t_{valid}}$$

 $t_{\text{valid}}$  is the slave time response to output data after deleting an SPCK edge. For a non-volatile memory with  $t_{\text{valid}}$  (or  $t_{\text{v}}$ ) is 12 ns Max,  $f_{\text{SPCK}}$ Max = 39 MHz @  $V_{\text{DDIO}}$  = 3.3V.

#### **Slave Read Mode**

In slave mode, SPCK is the input clock for the SPI. The max SPCK frequency is given by setup and hold timings SPI<sub>7</sub>/SPI<sub>8</sub> (or SPI<sub>10</sub>/SPI<sub>11</sub>). Since this gives a frequency well above the pad limit, the limit in slave read mode is given by SPCK pad.

#### **Slave Write Mode**

$$f_{SPCK}Max = \frac{1}{SPI_6(\text{or } SPI_9) + t_{setup}}$$

 $\ensuremath{t_{\text{setup}}}\xspace$  is the setup time from the master before sampling data (12 ns).

This gives  $f_{SPCK}Max = 39 \text{ MHz} @ V_{DDIO} = 3.3V.$ 

#### 46.18.1.2 Timing Conditions

Timings are given assuming a capacitance load on MISO, SPCK and MOSI.

Table 46-38. Capacitance Load for MISO, SPCK and MOSI (product dependent)

|        | Corner |      |  |
|--------|--------|------|--|
| Supply | Max    | Min  |  |
| 3.3V   | 40 pF  | 5 pF |  |
| 1.8V   | 20 pF  | 5 pF |  |

# 46.18.2 SSC

### 46.18.2.1 Timing Conditions

Timings are given assuming a capacitance load as defined in Table 46-41.

Table 46-41. Capacitance Load

|                     | Corner |      |  |
|---------------------|--------|------|--|
| Supply              | Max    | Min  |  |
| 3.3V <sup>(1)</sup> | 30 pF  | 5 pF |  |
| 1.8V <sup>(2)</sup> | 20 pF  | 5 pF |  |

Notes: 1. 3.3V domain: V<sub>DDIO</sub> from 3.0V to 3.6V, maximum external capacitor = 30 pF.

2. 1.8V domain:  $V_{DDIO}$  from 1.65V to 1.95V, maximum external capacitor = 20 pF.

| SSC <sub>9</sub>  | RF/RD hold time after RK edge (RK input)    |                                 | t <sub>CPMCK</sub>                             |  | ns   |
| SSC <sub>10</sub> | RK edge to RF (RK input)                    |                                 | 2.6 <sup>(1)</sup>                             | 15.2 <sup>(1)</sup>                            | ns   |
| SSC <sub>11</sub> | RF/RD setup time before RK edge (RK output) |                                 | 14.1 - t <sub>CPMCK</sub>                      |  | ns   |
| SSC <sub>12</sub> | RF/RD hold time after RK edge (RK output)   |                                 | t <sub>CPMCK</sub> - 2.5                       |  | ns   |
| SSC <sub>13</sub> | RK edge to RF (RK output)                   |                                 | -5.9 <sup>(1)</sup>                            | 5.2 <sup>(1)</sup>                             | ns   |

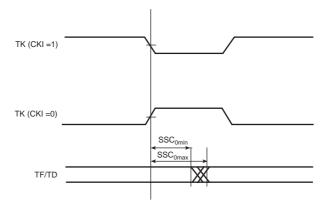

Notes: 1. For output signals (TF, TD, RF), minimum and maximum access times are defined. The minimum access time is the time between the TK (or RK) edge and the signal change. The maximum access time is the time between the TK edge and the signal stabilization. Figure 46-24 illustrates minimum and maximum accesses for SSC0. The same applies to SSC1, SSC4, and SSC7, SSC10 and SSC13.

| lotoo: 1          | For output signals (TE TD DE) minimum and m | ·                               |  |  |      |

Notes: 1. For output signals (TF, TD, RF), minimum and maximum access times are defined. The minimum access time is the time between the TK (or RK) edge and the signal change. The maximum access time is the time between the TK edge and the signal stabilization. Figure 46-24 illustrates minimum and maximum accesses for SSC0. The same applies to SSC1, SSC4, and SSC7, SSC10 and SSC13.

Figure 46-24. Minimum and Maximum Access Time of Output Signals

#### 46.18.3 HSMCI

The High Speed MultiMedia Card Interface (HSMCI) supports the MultiMedia Card (MMC) Specification V4.3, the SD Memory Card Specification V2.0, the SDIO V2.0 specification and CE-ATA V1.1.

### 46.18.4 EMAC

#### 46.18.4.1 Timing Conditions

Table 46-44. Capacitance Load on Data, Clock Pads

|        | Corner |       |      |  |
|--------|--------|-------|------|--|
| Supply | Max    | Min   |      |  |
| 3.3V   | 20 pF  | 20 pF | 0 pF |  |
| 1.8V   | 20 pF  | 20 pF | 0 pF |  |

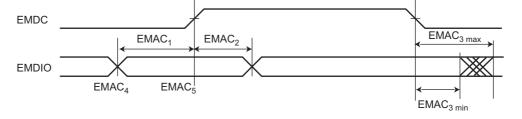

# 46.18.4.2 Timing Constraints

Table 46-45. EMAC Signals Relative to EMDC

| Symbol            | Parameter                        | Min (ns) | Max (ns) |
|-------------------|----------------------------------|----------|----------|
| EMAC <sub>1</sub> | Setup for EMDIO from EMDC rising | 10       | _        |
| EMAC <sub>2</sub> | Hold for EMDIO from EMDC rising  | 10       | _        |
| EMAC <sub>3</sub> | EMDIO toggling from EMDC rising  | 0 (1)    | 300 (1)  |

Note: 1. For EMAC output signals, minimum and maximum access times are defined. The minimum access time is the time between the EMDC rising edge and the signal change. The maximum access timing is the time between the EMDC rising edge and the signal stabilizes. Figure 46-25 illustrates minimum and maximum accesses for EMAC3.

Figure 46-25. Min and Max Access Time of EMAC Output Signals

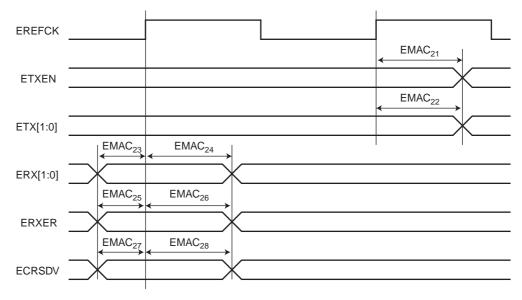

### 46.18.4.3 RMII Mode

Table 46-46. EMAC RMII Timings

| Symbol             | Parameter                           | Min (ns) | Max (ns) |
|--------------------|-------------------------------------|----------|----------|
| EMAC <sub>21</sub> | ETXEN toggling from EREFCK rising   | 2        | 16       |
| EMAC <sub>22</sub> | ETX toggling from EREFCK rising     | 2        | 16       |
| EMAC <sub>23</sub> | Setup for ERX from EREFCK rising    | 4        | _        |

- Notes: 1. Required only for  $f_{TWCK} > 100 \text{ kHz}$ .
  - 2.  $C_b$  = capacitance of one bus line in pF. Per I2C Standard,  $C_b$  Max = 400 pF
  - 3. The TWCK low period is defined as follows:  $t_{low} = ((CLDIV \times 2^{CKDIV}) + 4) \times t_{MCK}$
  - 4. The TWCK high period is defined as follows:  $t_{high} = ((CHDIV \times 2^{CKDIV}) + 4 \times t_{MCK})$
  - 5.  $t_{CP\_MCK} = MCK$  bus period.

## 48. Marking

All devices are marked with the Atmel logo and the ordering code.

Additional marking may be in one of the following formats:

YYWW V XXXXXXXXX <u>ARM</u>

#### where

"YY": manufactory year"WW": manufactory week

"V": revision

"XXXXXXXXXX": lot number

# 49. Ordering Information

Table 49-1. SAM9X35 Ordering Information

| Ordering Code             | Package | Carrier Type  | Operating Temperature Range |
|---------------------------|---------|---------------|-----------------------------|
| AT91SAM9X35-CU            | BGA217  | Tray          | Industrial                  |
| AT915AM9X35-CU BGA217 Ira | ITay    | -40°C to 85°C |                             |

### 50. Errata

## 50.1 External Bus Interface (EBI)

#### 50.1.1 EBI: Data lines are Hi-Z after reset

Data lines are Hi-Z after reset. This does not affect boot capabilities neither on NOR nor on NAND memories.

Problem Fix/Workaround

None.

## 50.2 Reset Controller (RSTC)

#### 50.2.1 RSTC: Reset during SDRAM Accesses

When a Reset occurs (user reset, software reset) the SDRAM clock is turned off. Inopportunely, if this occurs at the same time as a SDRAM read access, the SDRAM maintains the data until the restart of the SDRAM clock.

This leads to a data bus conflict and affects adversely the boot memories connected on the EBI:

- NAND Flash boot functionality, if the system boots out of the internal ROM.
- NOR Flash boot, if the system boots on an external memory connected on the EBI CSO.

Problem Fix/Workaround

Two workarounds are available:

- 1. Boot from Serial Flash or Data Flash on SPI.
- 2. Connect the NAND Flash on D16–D23 and set NFD0 ON D16 to 1 in the CCFG EBICSA register.

**Warning!** Due to databus sharing, workaround 2 prohibits connecting another device on the EBI, even if VDDNF equals VDDIOM.

## 50.3 Static Memory Controller (SMC)

#### 50.3.1 SMC: SMC DELAY I/O registers are write-only

Contrary to what is stated in the datasheet, the SMC DELAY I/O registers are write-only.

Problem Fix/Workaround

None.

## 50.4 USB High Speed Host Port (UHPHS) and Device Port (UDPHS)

#### 50.4.1 UHPHS/UDPHS: Bad Lock of the USB High speed transceiver DLL

The DLL used to oversample the incoming bitstream may not lock in the correct phase, leading to a bad reception of the incoming packets.

This issue may occur after the USB device resumes from the Suspend mode.

The DLL is used only in the High Speed mode, meaning the Full Speed mode is not impacted by this issue.

This issue may occur on the USB device after a reset leading to a SAM-BA connection issue.

Problem Fix/Workaround:

To prevent a SAM-BA execution issue, the USB device must be connected via a USB Full Speed hub to the PC.

At application level, the DLL can be re-initialized in the correct state by toggling the BIASEN bit (high -> low -> high) when resuming from the Suspend mode.

The BIASEN bit is located in the CKGR UCKR register in PMC user interface.

The function below can be used to generate the pulse on the bias signal.

```
void generate_pulse_bias(void)
{
unsigned int * pckgr_uckr = (unsigned int *) 0xFFFFC1C;
* pckgr_uckr &= ~AT91_PMC_BIASEN;
* pckgr_uckr |= AT91_PMC_BIASEN;
}
```

In the USB device driver, the generate\_pulse\_bias function must be implemented in the "USB end of reset" and "USB end of resume" interrupts.

## 50.5 Timer Counter (TC)

#### 50.5.1 TC: The TIOA5 signal is not well connected

The TIOA5 enable signal is not well connected internally, it is shared with the TIOB5 enable signal.

TIOB5 is working normally.

TIOA5 is working normally in Capture Mode.

Waveform Mode is not available for TIOA5 if the TC\_CMR.ETRGEDG bit is set to 1, 2 or 3.

Problem Fix/Workaround

None.

## 50.6 LCD Controller (LCDC)

#### 50.6.1 LCDC: LCDC PWM is not usable

When slow clock is selected as the source clock to feed PWM with (CLKPWMSEL in LCDC\_LCDCFG0), the output waveform generated is corrupted. When the MCK is selected, the prescaler (PWMPS in LCDC\_LCDCFG6) is not sized to generate the PWM output in a range of 200 Hz–1 kHz.

Problem fix/Workaround

Use standalone PWM output instead of LCDC embedded PWM.

## 50.7 Boot Strategy

#### 50.7.1 NAND Flash Boot Detection using ONFI parameters does not work

During NAND Flash initialization, the ONFI parameters detection may not work correctly.

This can lead to an incorrect configuration of ECC settings, reading wrong data from the NAND Flash memory, and the inability to boot from this memory.

Problem Fix/Workaround

When programming the bootable program in the NAND Flash, always use the header method, with any NAND Flash memory, ONFI compliant or not.

## 50.8 Real Time Clock (RTC)

#### 50.8.1 RTC: Interrupt Mask Register cannot be used

Interrupt Mask Register read always returns 0.

Problem Fix/Workaround

None.

# **Revision History**

In the tables that follow, the most recent version of the document appears first.

| Doc. Rev.<br>11055F | Comments   |
|---------------------|--|
|                     | Editorial and formatting changes throughout  |
|                     | Section 3. "Package and Pinout"  |
|                     | Table 3-1 "I/O Type Description": changed VBG voltage range to 1.15–1.25V  |
|                     | Table 3-2 "I/O Type Assignment and Frequency": removed signal name "ISI_MCK" from I/O type GPIO_CLK  |
|                     | Section 11. "Boot Sequence Controller (BSC)"   |
|                     | Section 11.1 "Description": reworded first paragraph   |
|                     | Section 11.4.1 "Boot Sequence Controller Configuration Register":  |
|                     | - updated BOOT field description   |
|                     | - changed name of BOOTKEY field to WPKEY and updated field description   |
|                     | Section 12. "Advanced Interrupt Controller (AIC)"  |
|                     | Harmonized description of AIC_FVR (is "FIQ Vector Register")   |
|                     | Section 12.2 "Embedded Characteristics": renamed bullet "Write Protected Registers" to "Register Write Protection"   |
|                     | Section 12.8.8 "Register Write Protection": updated title (was "Write Protection Registers") and reworded content  |
|                     | Section 12.9.13 "AIC End of Interrupt Command Register": added ENDIT bit (register bit 0)  |
|                     | Section 12.9.15 "AIC Debug Control Register": renamed bit "GMSK: General Mask" to "GMSK: General Interrupt Mask"   |

|           | Section 16.1 "Description": updated slow clock frequency   |
|           | Section 16.2 "Embedded Characteristics": added bullet "Watchdog Clock is independent from Processor Clock"   |
|           | Section 16.4 "Functional Description": below third paragraph, added sentence "When the WDDIS bit is set, the fields WDV and WDD must not be modified."   |
|           | Figure 16-2 "Watchdog Behavior": "WDT_CR = WDRSTT" corrected to "WDT_CR.WDRSTT=1"  |
|           | Section 16.5.1 "Watchdog Timer Control Register": added note below bitmap; updated descriptions of WDRSTT bit and KEY field  |
|           | Section 16.5.2 "Watchdog Timer Mode Register": added two notes below bitmap; added note to WDDIS bit description   |
|           | Section 16.5.3 "Watchdog Timer Status Register": updated WDUNF and WDERR bit descriptions  |
|           | Section 17. "Shutdown Controller (SHDWC)"  |
| 31-Aug-15 | Section 17.6 "Functional Description": inserted heading Section 17.6.1 "Wake-up Inputs"  |
|           | Section 17.7.1 "Shutdown Control Register": updated KEY field description  |
|           | Section 17.7.2 "Shutdown Mode Register": updated description of fields WKMODE0 and CPTWK0  |
|           | Section 18. "General Purpose Backup Registers (GPBR)"  |
|           | Updated Section 18.1 "Description"   |
|           | Updated Section 18.2 "Embedded Characteristics"  |
|           | Table 18-1 "Register Mapping": added reset value 0x00000000 for all registers SYS_GPBRx  |
|           | Section 18.3.1 "General Purpose Backup Register x": inserted sentence "These registers are reset at first power-up and on each loss of VDDBU"  |
|           | Section 19. "Slow Clock Controller (SCKC)"   |
|           | Updated Section 19.1 "Description"   |
|           | Updated Figure 19-1 "Block Diagram"  |
|           | Inserted heading Section 19.4 "Functional Description" and updated content   |
|           | Section 19.5.1 "Slow Clock Controller Configuration Register": updated bit descriptions; removed reset value (redundant with reset value in Table 19-1 "Register Mapping")   |
|           | Section 20. "Clock Generator"  |
|           | Section 20.2 "Embedded Characteristics": updated description of low-power RC oscillator  |
|           | Replaced section "Slow Clock Selection" with new Section 20.4 "Slow Clock"   |
|           | Revised Section 20.5 "Main Clock"  |
|           | Removed section "Main Clock Selection" (refer to Section 20.5.3 "Main Clock Source Selection")   |
|           | Updated Section 20.7 "UTMI Phase Lock Loop Programming"  |

| Doc. Rev.<br>11055F | Comments  |
|---------------------|---|
|                     | Section 21. "Power Management Controller (PMC)"   |
|                     | Moved Section 21.3 "Block Diagram" to follow Section 21.2 "Embedded Characteristics"  |
|                     | Section 21.4 "Master Clock Controller":   |
|                     | - in first paragraph, changed "MCK is the clock provided to all the peripherals and the memory controller" to "MCK is the source clock of the peripheral clocks";                 |
|                     | - below fourth paragraph, inserted note concerning fields MDIV and CSS  |
|                     | Updated Section 21.5 "Processor Clock Controller"   |
|                     | Added Section 21.10 "Fast Wake-up from Backup Mode"   |
|                     | Revised Section 21.11 "Peripheral Clock Controller"   |
|                     | Added Section 21.13 "Main Clock Failure Detector"   |
|                     | Revised Section 21.14 "Programming Sequence" (was 6 steps; now 10 steps)  |
|                     | Added Section 21.16 "Register Write Protection"   |
|                     | Table 21-3 "Register Mapping":  |
|                     | - replaced offset range '0x000C-0x0018' with offset '0x000C' as reserved  |
|                     | - replaced offset range '0x0070-0x0078' with '0x0070-0x007C' as reserved  |
|                     | - defined offset range '0x0110-0x0150' as reserved  |
|                     | Section 21.17.1 "PMC System Clock Enable Register": added sentence about write protection   |
|                     | Section 21.17.2 "PMC System Clock Disable Register": added sentence about write protection  |
|                     | Section 21.17.3 "PMC System Clock Status Register": added sentence about write protection   |
|                     | Section 21.17.4 "PMC Peripheral Clock Enable Register": added sentence about write protection   |
| 31-Aug-15           | Section 21.17.5 "PMC Peripheral Clock Disable Register": added sentence about write protection  |
|                     | Section 21.17.8 "PMC Clock Generator Main Oscillator Register": added warning "Bits 6:4 must always be configured to 0 when programming the CKGR_MOR"; updated field descriptions |
|                     | Section 21.17.9 "PMC Clock Generator Main Clock Frequency Register":  |
|                     | - added sentence about write protection   |
|                     | - updated descriptions of fields MAINF and MAINFRDY   |
|                     | Section 21.17.10 "PMC Clock Generator PLLA Register":   |
|                     | - added sentence about write protection   |
|                     | - changed size of MULA field from 11 to 8 bits  |
|                     | - added description for register bit 29: "ONE: Must Be Set to 1"  |
|                     | Section 21.17.11 "PMC Master Clock Register": added sentence about write protection; updated CSS field configuration value 2  |
|                     | Section 21.17.12 "PMC USB Clock Register": added sentence about write protection  |
|                     | Section 21.17.14 "PMC Programmable Clock Register": added sentence about write protection   |
|                     | Section 21.17.15 "PMC Interrupt Enable Register": added bit configuration values  |
|                     | Section 21.17.16 "PMC Interrupt Disable Register": added bit configuration values   |
|                     | Section 21.17.18 "PMC Interrupt Mask Register": added bit configuration values  |
|                     | Section 21.17.19 "PLL Charge Pump Current Register": added sentence about write protection  |
|                     | Updated Section 21.17.20 "PMC Write Protection Mode Register"   |
|                     | Updated Section 21.17.21 "PMC Write Protection Status Register"   |
|                     | Section 21.17.22 "PMC Peripheral Control Register": updated descriptions of fields PID and DIV  |

| Doc. Rev.<br>11055F | Comments   |
|---------------------|--|
|                     | Section 22. "Parallel Input/Output Controller (PIO)"   |
|                     | Replaced all instances of "PIO clock" and "PIO controller clock" with "peripheral clock"; in graphics, renamed "MCK" waveforms to "Peripheral clock" waveforms where applicable; replaced instances of "div_slclk" with "div_slck"; replaced instances of "slow_clock" with "slck" |
|                     | Section 22.2 "Embedded Characteristics": deleted bullet "Lock of the Configuration by the Connected Peripheral"; renamed bullet "Write Protect Registers" to "Register Write Protection"   |
|                     | Section 22.3 "Block Diagram": updated Figure 22-1 "Block Diagram"; removed Figure 23-2. "Application Block Diagram"  |
|                     | Section 22.4.2 "External Interrupt Lines": added text on use of WKUPx input pins as external interrupt lines   |
|                     | Added Table 22-1 "Peripheral IDs"  |
|                     | Section 22.5.1 "Pull-up and Pull-down Resistor Control": changed information to specify that pull-up or pull-down can be set   |
|                     | Section 22.5.3 "Peripheral A or B or C or D Selection":  |
|                     | - added two sentences on products that do not have A, B, C or D peripherals, beginning with "If the software selects a peripheral A,B,C or D which does not exist for a pin"   |
|                     | - at end of sentence beginning with "Note that multiplexing of", added a cross reference to Figure 22-2 "I/O Line Control Logic" for clarity   |
|                     | - replaced "the corresponding bit at level zero in PIO_ABCDSR2 means peripheral D is selected" with "the corresponding bit at level one in PIO_ABCDSR2 means peripheral D is selected"   |
|                     | Figure 22-2 "I/O Line Control Logic": updated connectivity between clocks and glitch/debouncing filter block; renamed "Resynchronization Stage" to "Peripheral Clock Resynchronization Stage"; added pull-up and pull-down resistors with associated registers                     |
| 31-Aug-15           | Section 22.5.9 "Input Glitch and Debouncing Filters": replaced instance of "less than 1/2 master clock (MCK)" with "less than 1/2 peripheral clock"; replaced instances of "MCK" with "peripheral clock"   |
| 31-Aug-13           | Figure 22-5 "Input Debouncing Filter Timing": inserted "(div_slck)" under "Divided Slow Clock" waveform label  |
|                     | Section 22.5.10 "Input Edge/Level Interrupt": edited, reorganized and reformatted example of interrupt generation (migrated configuration subsections into Table 22-2 "Configuration for Example Interrupt Generation")  |
|                     | Moved Section 22.5.14 "I/O Lines Programming Example" to precede Section 22.5.15 "Register Write Protection"   |
|                     | Section 22.5.15 "Register Write Protection": changed section title and updated content   |
|                     | Section 22.6 "Parallel Input/Output Controller (PIO) User Interface": removed reset values from register description sections (redundant with reset values in Table 22-4 "Register Mapping")   |
|                     | Table 22-4 "Register Mapping": removed Lock Status register (PIO_LOCKSR); offset 0x00E0 now reserved; corrected reserved offset range (was 0x00EC-0x00F8; is 0x00EC-0x00FC)  |
|                     | Section 22.6.25 "PIO Peripheral ABCD Select Register 2": added addresses   |
|                     | Section 22.6.26 "PIO Input Filter Slow Clock Disable Register": updated P0–P31 bit description   |
|                     | Section 22.6.27 "PIO Input Filter Slow Clock Enable Register": updated P0–P31 bit description  |
|                     | Section 22.6.28 "PIO Input Filter Slow Clock Status Register": updated P0–P31 bit description  |
|                     | Section 22.6.29 "PIO Slow Clock Divider Debouncing Register": updated 'DIV' field description  |
|                     | Section 22.6.32 "PIO Pad Pull-Down Status Register": deleted sentence about register write protection  |
|                     | Section 22.6.38 "PIO Additional Interrupt Modes Mask Register": modified P0–P31 bit description  |
|                     | Removed section 23.7.45 "PIO Lock Status Register"   |
|                     | Updated Section 22.6.45 "PIO Write Protection Mode Register"   |
|                     | Updated Section 22.6.46 "PIO Write Protection Status Register"   |
|                     | Section 22.6.47 "PIO Schmitt Trigger Register": updated 'SCHMITTx' bit description   |
|                     | Section 22.6.48 "PIO I/O Delay Register": updated 'Delayx' field description   |

| Doc. Rev.<br>11055F | Comments  |
|---------------------|---|
|                     | Section 23. "Debug Unit (DBGU)"   |
|                     | Instances of "Master clock" or "MCK" replaced by "peripheral clock"   |
|                     | Updated Section 23.2 "Embedded Characteristics"   |
|                     | Updated Figure 23-1 "Debug Unit Functional Block Diagram"   |
|                     | Section 23.6.10 "Debug Unit Chip ID Register" changed name and description of value 0xA5 for ARCH field (was reserved; is now ATSAMA5xx / ATSAMA5xx Series)   |
|                     | Section 28. "Static Memory Controller (SMC)"  |
|                     | Added Table 28-3 "I/O Lines"  |
|                     | Section 28.9 "Standard Read and Write Protocols": deleted subsection "Write Protected Registers"  |
|                     | Updated Section 28.9.1.3 "Read Cycle"   |
|                     | Updated Section 28.9.3.3 "Write Cycle"  |
|                     | Section 28.14.2 "Byte Access Type in Page Mode": "SMC_REGISTER" corrected to "SMC Mode Register (SMC_MODE)"   |
|                     | Removed section 29.15 "Programmable IO Delays"  |
|                     | Added Section 28.15 "Register Write Protection"   |
|                     | Table 28-9 "Register Mapping": removed registers SMC_DELAY1-SMC_DELAY8 (offset range 0xC0-0xDC now reserved)  |
|                     | Section 28.16.1 "SMC Setup Register": added sentence about write protection   |
|                     | Section 28.16.2 "SMC Pulse Register": added sentence about write protection   |
|                     | Section 28.16.3 "SMC Cycle Register": added sentence about write protection   |
|                     | Section 28.16.4 "SMC Mode Register":  |
| 31-Aug-15           | - added sentence about write protection   |
|                     | - added sentence about confirming the SMC configuration   |
|                     | - updated descriptions of bits/fields READ_MODE, WRITE_MODE, EXNW_MODE, BAT, DBW, and PS  |
|                     | Removed section 29.16.5 "SMC DELAY I/O Register"  |
|                     | Section 28.16.5 "SMC Write Protection Mode Register": removed "Reset" line; updated WPEN and WPKEY field descriptions   |
|                     | Section 28.16.6 "SMC Write Protection Status Register": removed "Reset" line; updated WPVS and WPVSRC field descriptions                                      |
|                     | Section 29. "DDR SDR SDRAM Controller (DDRSDRC)"  |
|                     | Removed instances of or references to "temperature compensated self refresh", "TCR" field, and acronym "TCSR"   |
|                     | Section 29.4.2 "Low-power DDR1-SDRAM Initialization": added "Low-power" to title and modified step 6  |
|                     | Section 29.5.1 "SDRAM Controller Write Cycle": added note defining TWRD   |
|                     | Figure 29-12 "Single Read Access, Row Closed, Latency = 3, DDR2-SDRAM Device": modified diagram to add one cycle and corrected "Latency = 2" to "Latency = 3" |
|                     | Figure 29-16 "Burst Read Access, Latency = 2, SDR-SDRAM Devices": removed DQS[1:0] waveform   |
|                     | Section 29.5.4 "Power Management": added note specifying that possible SDRAM constraint of 4K cycles of burst autorefresh is not supported                    |
|                     | Updated Section 29.5.6 "Register Write Protection"  |
|                     | Section 29.6.3 "SDR-SDRAM Address Mapping for 32-bit Memory Data Bus Width": updated footnote 2   |
|                     | Table 29-16 "Register Mapping": added row for reserved offset 0x28; added row for reserved offset range 0xEC-0xFC   |
|                     | Removed "Reset" line from individual register descriptions (reset values are provided in Table 29-16 "Register Mapping")                                      |

| Doc. Rev.<br>11055F | Comments   |
|---------------------|--|
|                     | Section 29. "DDR SDR SDRAM Controller (DDRSDRC)" (cont'd)  |
|                     | Section 29.7.1 "DDRSDRC Mode Register": updated MODE field description   |
|                     | Section 29.7.3 "DDRSDRC Configuration Register": updated descriptions of fields NC, NR, CAS, DIC, OCD, NB, and DECOD   |
|                     | Section 29.7.4 "DDRSDRC Timing Parameter 0 Register": updated TWTR field description   |
|                     | Section 29.7.7 "DDRSDRC Low-power Register": updated descriptions of fields LPCB, DS, TIMEOUT, APDE, and UPD_MR  |
|                     | Section 29.7.8 "DDRSDRC Memory Device Register": updated descriptions of fields MD and DBW   |
|                     | Section 29.7.10 "DDRSDRC High Speed Register": updated DIS_ANTICIP_READ bit description  |
|                     | Section 29.7.11 "DDRSDRC Write Protection Mode Register": updated descriptions of fields WPEN and WPKEY  |
|                     | Section 30. "DMA Controller (DMAC)"  |
|                     | Section 30.1 "Description": deleted sentence "The DMAC embeds 8 channels" from end of section  |
|                     | Section 30.2 "Embedded Characteristics": added DMAC0 and DMAC1 references; added bullet "Register Write Protection"  |
|                     | Section 30.3: inserted heading "DMA Controller Peripheral Connections" and updated content   |
|                     | Added Section 30.5 "Product Dependencies"  |
|                     | Section 30.6.1 "Basic Definitions": removed definition of "Flow controller"  |
|                     | Section 30.6.3.1 "Software Handshaking": replaced instance of "last transaction register" with "Software Last Transfer Flag Register"  |
|                     | Section 30.6.4.1 "Multi-buffer Transfers": in second paragraph, corrected "automatic mode is disabled by writing a '1' in DMAC_CTRLBx.AUTO bit" to "automatic mode is disabled by clearing the DMAC_CTRLBx.AUTO bit" |
| 31-Aug-15           | Section 30.6.6 "Disabling a Channel Prior to Transfer Completion": in last paragraph, corrected "by writing a '1' to the DMAC_CHER.RESx field register" to read "by setting the DMAC_CHDR.RESx bit"                  |
|                     | Section 30.6.6.1 "Abnormal Transfer Termination":  |
|                     | - in first sentence, corrected "the channel enable bit, DMAC_CHDR.ENAx" to read "the channel enable bit, DMAC_CHER.ENAx"   |
|                     | - in second paragraph, corrected "the global enable bit in the DMAC Configuration Register (DMAC_EN.ENABLE bit)" to read "the general enable bit in the DMAC Enable Register (DMAC_EN.ENABLE)"                       |
|                     | Section 30.7 "DMAC Software Requirements": removed four bullets referencing "flow controller"; removed bullet referencing hardware handshake interface protocol  |
|                     | Section 30.6.7 "Register Write Protection": updated title (was "Write Protection Registers"), moved to Section 30.6 "Functional Description" and updated content   |
|                     | Removed reset values above the bitmaps from individual register description sections (register reset values are provided in Table 30-5 "Register Mapping")   |
|                     | Table 30-5 "Register Mapping": in last row, corrected reserved offset range "0x01EC-0x1FC" to "0x1EC-0x1FC"  |
|                     | Section 30.8.1 "DMAC Global Configuration Register": updated ARB_CFG bit description   |
|                     | Section 30.8.15 "DMAC Channel x [x = 07] Descriptor Address Register": updated DSCR_IF field description   |
|                     | Section 30.8.17 "DMAC Channel x [x = 07] Control B Register": changed size of FC field from 3 bits to 2 bits; updated descriptions of fields DIF and SIF   |
|                     | Section 30.8.19 "DMAC Channel $x$ [ $x = 07$ ] Source Picture-in-Picture Configuration Register": deleted sentence referencing write protection  |
|                     | Section 30.8.20 "DMAC Channel x [ $x = 07$ ] Destination Picture-in-Picture Configuration Register": deleted sentence referencing write protection   |
|                     | Updated Section 30.8.21 "DMAC Write Protection Mode Register"  |
|                     | Section 30.8.22 "DMAC Write Protection Status Register": updated description of field WPVSRC   |

| Doc. Rev.<br>11055F | Comments  |
|---------------------|---|
|                     | Section 31. "USB High Speed Device Port (UDPHS)"  |
|                     | Figure 31-1 "Block Diagram": updated signal line configuration between UTMI and DP and between UTMI and DM  |
|                     | Updated Figure 31-2 "Board Schematic"   |
|                     | Section 31.5.1 "Power Management": corrected names of referenced registers  |
|                     | Table 31-3 "USB Transfer Events": added column headers  |
|                     | Table 31-4 "UDPHS Endpoint Description": corrected link to footnote in "Endpoint Type" column   |
|                     | Figure 31-6 "Example of DPRAM Allocation and Reorganization": updated diagram to indicate sequence of four steps; inserted caption "DPRAM allocation sequence:" below figure              |
|                     | Reorganized hierarchy of subsections in Section 31.6.10 "Handling Transactions with USB V2.0 Device Peripheral"   |
|                     | Table 31-6 "Register Mapping": defined offset range 0xE4–0xFC as reserved   |
|                     | Section 31.7.1 "UDPHS Control Register": added "(cleared upon USB reset)" to relevant field descriptions  |
|                     | Section 31.7.2 "UDPHS Frame Number Register": added "(cleared upon USB reset)" to field descriptions  |
|                     | Section 31.7.3 "UDPHS Interrupt Enable Register": added "(cleared upon USB reset)" to bit descriptions  |
|                     | Section 31.7.4 "UDPHS Interrupt Status Register": added "(cleared upon USB reset)" to EPT_x bit description   |
|                     | Section 31.7.8 "UDPHS Endpoint Configuration Register": added "(cleared upon USB reset)" to field descriptions  |
|                     | Section 31.7.13 "UDPHS Endpoint Control Register (Control, Bulk, Interrupt Endpoints)": added "(cleared upon USB reset)" to bit descriptions  |
|                     | Section 31.7.14 "UDPHS Endpoint Control Register (Isochronous Endpoint)": added "(cleared upon USB reset)" to bit descriptions  |
|                     | Section 31.7.19 "UDPHS Endpoint Status Register (Control, Bulk, Interrupt Endpoints)": updated description of BUSY_BANK_STA field; added "(cleared upon USB reset)" to field descriptions |
| 31-Aug-15           | Section 31.7.20 "UDPHS Endpoint Status Register (Isochronous Endpoint)": updated description of BUSY_BANK_STA field; added "(cleared upon USB reset)" to field descriptions               |
|                     | Section 32. "USB Host High Speed Port (UHPHS)"  |
|                     | Figure 32-2 "Board Schematic to Interface UHP High-speed Host Controller": below figure, added note "10 pF capacitor on VBG is a provision and may not be populated."                     |
|                     | Section 32.5.2 "Power Management": corrected names of referenced registers and bits   |
|                     | Section 32.5.3 "Interrupt Sources": renamed "Advanced Interrupt Controller (AIC)" and "AIC" to "interrupt controller"   |
|                     | Updated link to "www.usb.org" in Section 32.6.2 "EHCI" and Section 32.6.3 "OHCI"  |
|                     | Section 33. "High Speed Multimedia Card Interface (HSMCI)"  |
|                     | Section 33.1 "Description": in fourth paragraph, removed sentence "Only one slot can be selected at a time (slots are multiplexed)"   |
|                     | Figure 33-1 "Block Diagram (4-bit configuration)": updated title (was "Block Diagram"); added note below figure   |
|                     | Table 33-4 "Bus Topology": removed four pins 10(DAT[4])–13(DAT[7])  |
|                     | Section 33.8.1 "Command - Response Operation": reorganized table content in ALL_SEND_CID command example  |
|                     | Figure 33-8 "Read Functional Flow Diagram": corrected instance of HSMCI_MR to HSMCI_BLKR; deleted footnote 2 "This field is also accessible in the HSMCI Block Register (HSMCI_BLKR)."    |
|                     | Figure 33-9 "Write Functional Flow Diagram": corrected instance of HSMCI_MR to HSMCI_BLKR; deleted footnote 2 "This field is also accessible in the HSMCI Block Register (HSMCI_BLKR)."   |
|                     | Figure 33-10 "Read Multiple Block and Write Multiple Block": corrected instance of HSMCI_MR to HSMCI_BLKR   |
|                     | Section 33.13 "Register Write Protection": updated title (was "Write Protection Registers"); revised content  |
|                     | Section 33.14.7 "HSMCI Block Register": updated BLKLEN field description  |
|                     | Section 33.14.12 "HSMCI Status Register": updated bit descriptions  |
|                     | Section 33.14.16 "HSMCI DMA Configuration Register": changed size of CHKSIZE field from 3 to 2 bits   |

| Doc. Rev.<br>11055F | Comments  |
|---------------------|---|
|                     | Section 33. "High Speed Multimedia Card Interface (HSMCI)" (cont'd)   |
|                     | Updated Section 33.14.18 "HSMCI Write Protection Mode Register" and Section 33.14.19 "HSMCI Write Protection Status Register"   |
|                     | Section 34. "Serial Peripheral Interface (SPI)"   |
|                     | Instances of "MCK" replaced by "peripheral clock"   |
|                     | Updated Section 34.2 "Embedded Characteristics"   |
|                     | Updated Figure 34-1 "Block Diagram"   |
|                     | Updated Section 34.7.1 "Modes of Operation"   |
|                     | Figure 34-3 "SPI Transfer Format (NCPHA = 1, 8 bits per transfer)": updated note below diagram  |
|                     | Figure 34-4 "SPI Transfer Format (NCPHA = 0, 8 bits per transfer)": updated note below diagram  |
|                     | Updated Section 34.7.3 "Master Mode Operations" including subsections and diagrams  |
|                     | Updated Section 34.7.4 "SPI Slave Mode"   |
|                     | Table 34-5 "Register Mapping": changed SPI_SR reset value to 0x0; defined offset ranges 0x40–0xE0 and 0xEC–0xFC as reserved   |
|                     | Section 34.8.1 "SPI Control Register": updated description of SPIDIS bit; added bits REQCLR, TXFCLR, RXFCLR, FIFOEN, and FIFODIS  |
|                     | Section 34.8.2 "SPI Mode Register": updated DLYBCS field description  |
|                     | Section 34.8.5 "SPI Status Register": updated bit descriptions; added UNDES bit   |
|                     | Section 34.8.6 "SPI Interrupt Enable Register": removed TXBUFE bit; added UNDES bit   |
|                     | Section 34.8.7 "SPI Interrupt Disable Register": added UNDES bit  |
|                     | Section 34.8.8 "SPI Interrupt Mask Register": added UNDES bit   |
| 31-Aug-15           | Section 34.8.9 "SPI Chip Select Register": updated SCBR, DLYBS, and DLYBCT field descriptions; added CSNAAT bit   |
|                     | Section 34.8.10 "SPI Write Protection Mode Register": updated field descriptions  |
|                     | Section 34.8.11 "SPI Write Protection Status Register": updated WPVSRC field description  |
|                     | Section 35. "Timer Counter (TC)"  |
|                     | Instances of "Master clock" or "MCK" replaced by "peripheral clock"   |
|                     | Updated Section 35.1 "Description"  |
|                     | Moved Table 35-1 "Timer Counter Clock Assignment" from Section 35.1 "Description" to Section 35.3 "Block Diagram"   |
|                     | Updated Section 35.2 "Embedded Characteristics"   |
|                     | Added Table 35-5 "Peripheral IDs"   |
|                     | Updated Section 35.6.2 "32-bit Counter"   |
|                     | Updated Section 35.6.3 "Clock Selection"  |
|                     | Updated Section 35.6.11.1 "WAVSEL = 00"   |
|                     | Updated Figure 35-9 "WAVSEL = 10 without Trigger" and Figure 35-10 "WAVSEL = 10 with Trigger"   |
|                     | Updated Section 35.6.11.3 "WAVSEL = 01"   |
|                     | Updated Figure 35-13 "WAVSEL = 11 without Trigger" and Figure 35-14 "WAVSEL = 11 with Trigger"  |
|                     | Added Section 35.6.14 "2-bit Gray Up/Down Counter for Stepper Motor"  |
|                     | Added Section 35.6.15 "Register Write Protection"   |
|                     | Table 35-6 "Register Mapping": added Stepper Motor Mode Register (TC_SMMR) and Write Protection Mode Register (TC_WPMR)   |
|                     | Section 35.7.2 "TC Channel Mode Register: Capture Mode": in 'Name' line, replaced "(WAVE = 0)" with "(CAPTURE_MODE)"; added sentence about write protection; updated TCCLKS field description |

| Doc. Rev.<br>11055F | Comments  |
|---------------------|---|
|                     | Section 35. "Timer Counter (TC)" (cont'd)   |
|                     | Section 35.7.3 "TC Channel Mode Register: Waveform Mode": in 'Name' line, replaced "(WAVE = 1)" with "(WAVEFORM_MODE)"; added sentence about write protection; updated TCCLKS and ENETRG field descriptions   |
|                     | Added Section 35.7.4 "TC Stepper Motor Mode Register"   |
|                     | Added sentence about write protection in Section 35.7.6 "TC Register A", Section 35.7.7 "TC Register B" and Section 35.7.8 "TC Register C"  |
|                     | Section 35.7.9 "TC Status Register": updated bit descriptions   |
|                     | Section 35.7.14 "TC Block Mode Register": added sentence about write protection; corrected TC2XC2S field configuration values: value 2 is TIOA0 (was TIOA1); value 3 is TIOA1 (was TIOA2)   |
|                     | Added Section 35.7.15 "TC Write Protection Mode Register"   |
|                     | Section 37. "Two-wire Interface (TWI)"  |
|                     | Instances of "shift register" replaced by "internal shifter"  |
|                     | Updated Section 37.1 "Description"  |
|                     | Table 37-1 "Atmel TWI Compatibility with I2C Standard": added clock synchronization as a supported feature  |
|                     | Updated Section 37.2 "Embedded Characteristics"   |
|                     | Updated Figure 37-1 "Block Diagram"   |
|                     | Removed section "Application Block Diagram"   |
|                     | Updated Table 37-3 "I/O Lines Description"  |
|                     | Section 37.6.2 "Power Management": deleted bullet "Enable the peripheral clock"   |
| 31-Aug-15           | Section 37.7.3 "Master Mode": moved to Section 37.7 "Functional Description" and removed section "Application Block Diagram"  |
|                     | Updated Section 37.7.3.2 "Programming Master Mode" and Section 37.7.3.3 "Master Transmitter Mode"   |
|                     | Section 37.7.3.4 "Master Receiver Mode": removed "after the STOP condition" from end of second sentence in second paragraph; removed reference to clock stretching in the "Warning" (clock stretching is a slave-only mechanism)  |
|                     | Figure 38-11. "Master Read Clock Stretching with Multiple Data Bytes" replaced by Figure 37-9 "Master Read Wait State with Multiple Data Bytes"   |
|                     | Section 37.7.3.5 "Internal Address":  |
|                     | - changed 'N' to 'NA' as abbreviation for "Not Acknowledge" under "7-bit Slave Addressing"  |
|                     | - at end of text under "10-bit Slave Addressing", "byte write to an Atmel AT24LC512 EEPROM" replaced by "byte write to a memory device"   |
|                     | Updated Section 37.7.3.6 "Using the DMA Controller"   |
|                     | Added missing "Yes" and "No" in Figure 37-15 "TWI Write Operation with Multiple Data Bytes with or without Internal Address", in Figure 37-17 "TWI Read Operation with Single Data Byte and Internal Address", and in Figure 37-18 "TWI Read Operation with Multiple Data Bytes with or without Internal Address" |
|                     | Section 37.7.4 "Multi-master Mode" moved to Section 37.7 "Functional Description"   |
|                     | Section 37.7.5 "Slave Mode" moved to Section 37.7 "Functional Description"; removed section "Application Block Diagram"   |
|                     | Section 37.7.5.3 "Receiving Data":  |
|                     | - under "Read Sequence", added sentence describing how to clear TXRDY flag  |
|                     | - under "Clock Synchronization Sequence", removed reference to TWI_THR  |
|                     | - added "Clock Stretching Sequence"   |

| Doc. Rev.<br>11055F | Comments   |  |
|---------------------|--|--|
|                     | Section 37. "Two-wire Interface (TWI)" (cont'd)  |  |
|                     | Section 37.7.5.4 "Data Transfer":  |  |
|                     | - changed heading "Clock Synchronization" to "Clock Synchronization/Stretching" and updated content  |  |
|                     | - at end of last sentence under "Clock Synchronization in Write Mode", changed "in Read mode" to "in Write mode"   |  |
|                     | - EOSVACC corrected to EOSACC in Figure 37-22 "Read Access Ordered by a Master" and in Figure 37-23 "Write Access Ordered by a Master"   |  |
|                     | - GCACC corrected to GACC in Figure 37-24 "Master Performs a General Call"   |  |
|                     | - "SCL is stretched" changed to "TWCK is stretched" in Figure 37-26 "Clock Synchronization in Write Mode"  |  |
|                     | Figure 37-29 "Read Write Flowchart in Slave Mode": "SVREAD = 0" corrected to "SVREAD = 1"; "RXRDY= 0 ?" corrected to "RXRDY = 1 ?"   |  |
|                     | Added Section 37.7.5.5 "Using the DMA Controller"  |  |
|                     | Section 37.7.6 "Register Write Protection": updated title (was "Write Protection System"), revised content and moved to Section 37.7 "Functional Description"  |  |
|                     | Table 37-7 "Register Mapping": removed TWI_THR reset value; defined offset range 0x38–0xE0 as reserved   |  |
|                     | Removed reset value from individual register description sections (reset values are provided in Table 37-7 "Register Mapping")   |  |
|                     | Section 37.8.1 "TWI Control Register": in START bit description, replaced "defined in the mode register" with "defined in the TWI Master Mode Register (TWI_MMR)"; updated descriptions of bits MSEN and SVEN; removed QUICK bit |  |
|                     | Section 37.8.5 "TWI Clock Waveform Generator Register": updated field descriptions   |  |
|                     | Section 37.8.6 "TWI Status Register": updated bit descriptions   |  |
|                     | Section 37.8.11 "TWI Transmit Holding Register": corrected access from "Read-write" to "Write-only"  |  |
| 31-Aug-15           | Revised Section 37.8.12 "TWI Write Protection Mode Register" and Section 37.8.13 "TWI Write Protection Status Register"  |  |
|                     | Section 38. "Universal Synchronous Asynchronous Receiver Transmitter (USART)"  |  |
|                     | Replaced all references to 'MCK' with 'peripheral clock' in text, figures and equations  |  |
|                     | Section 38.2 "Embedded Characteristics": added bullets "Digital Filter on Receive Line" and "Register Write Protection"  |  |
|                     | Section 38.3 "Block Diagram": removed table "SPI Operating Mode" (information is already present in Table 38-1 "I/O Line Description")   |  |
|                     | Updated Figure 38-1 "USART Block Diagram"  |  |
|                     | Removed section 39.4 "Application Block Diagram"   |  |
|                     | Section 38.5.1 "I/O Lines": deleted paragraph "To prevent the TXD line"  |  |
|                     | Table 38-2 "I/O Lines": removed 'USART3' rows  |  |
|                     | Section 38.5.2 "Power Management": removed sentence 'Configuring the USART does not require the USART clock to be enabled.'  |  |
|                     | Section 38.5.3 "Interrupt Sources": deleted sentence "Note that it is not recommended to use the USART interrupt line in edge sensitive mode."   |  |
|                     | Table 38-3 "Peripheral IDs": removed 'USART3' row  |  |
|                     | Section 38.6 "Functional Description": removed list of peripheral characteristics that was redundant with list in Section 38.2 "Embedded Characteristics"  |  |
|                     | Updated Section 38.6.1 "Baud Rate Generator"   |  |
|                     | Updated Figure 38-2 "Baud Rate Generator" and Figure 38-3 "Fractional Baud Rate Generator"   |  |
|                     | Section 38.6.3.3 "Asynchronous Receiver": updated third paragraph  |  |
|                     | Table 38-7 "Possible Values for the Fi/Di Ratio": in top row, replaced "774" with "744"  |  |
|                     | Corrected Figure 38-21 "Parity Error" for stop bit value   |  |

| Doc. Rev.<br>11055F | Comments   |
|---------------------|--|
|                     | Section 38. "Universal Synchronous Asynchronous Receiver Transmitter (USART)" (cont'd)   |
|                     | Section 38.6.3.4 "Manchester Decoder": deleted paragraph referencing RXIDLV bit in US_MAN register   |
|                     | Section 38.6.3.8 "Parity": updated third paragraph   |
|                     | Replaced 33400 baudrate with 38400 in Table 38-9 "Maximum Timeguard Length Depending on Baud Rate" and Table 38-10 "Maximum Time-out Period"   |
|                     | Section 38.6.3.15 "Hardware Handshaking": updated text and added Figure 38-27 "Receiver Behavior when Operating with Hardware Handshaking"   |
|                     | Section 38.6.4.2 "Protocol T = 0":   |
|                     | - under heading "Transmit Character Repetition", corrected "ITERATION bit" to "ITER bit"; corrected "RSIT bit" to "RSTIT bit"  |
|                     | - under heading "Disable Successive Receive NACK", changed last sentence to read "As soon as MAX_ITERATION is reached, no error signal is driven on the I/O line and the ITER bit in the US_CSR is set." |
|                     | Table 38-12 "IrDA Baud Rate Error": added missing units of measure to column headers ("Bit/s" for Baud Rate and "µs" for Pulse Time)   |
|                     | Section 38.6.5.3 "IrDA Demodulator": added a paragraph on IRDA_FILTER programming criteria   |
|                     | Updated Figure 38-36 "Example of RTS Drive with Timeguard"   |
|                     | Revised Section 38.6.7.5 "Character Transmission"  |
|                     | Section 38.6.10 "Register Write Protection": modified title and updated text   |
|                     | Table 38-16 "Register Mapping":  |
|                     | - added reset value '0x0' for US_MR, US_CSR, and US_NER  |
| 31-Aug-15           | - changed register name "Manchester Encoder Decoder Register" to "Manchester Configuration Register" and corrected reset value to 0x30011004   |
|                     | - defined offset range 0x0060-0x00E0 as reserved   |
|                     | - in last row, corrected 0x5C-0xFC to 0x00EC-0x00FC as reserved offset range   |
|                     | Section 38.7.1 "USART Control Register": updated descriptions of bits RSTIT, STTTO, RETTO, RTSEN, and RTSDIS   |
|                     | Section 38.7.3 "USART Mode Register": updated descriptions of fields USART_MODE, USCLKS, DSNACK, and FILTER; added INVDATA bit   |
|                     | Section 38.7.4 "USART Mode Register (SPI_MODE)": added CLKO bit; deleted CHMODE field description (CHMODE field is not present in bitmap)  |
|                     | Section 38.7.6 "USART Interrupt Enable Register (SPI_MODE)": added NSSE bit  |
|                     | Section 38.7.9 "USART Interrupt Disable Register (SPI_MODE)": added NSSE bit   |
|                     | Section 38.7.12 "USART Interrupt Mask Register (SPI_MODE)": added NSSE bit   |
|                     | Section 38.7.14 "USART Channel Status Register": updated bit descriptions  |
|                     | Section 38.7.15 "USART Channel Status Register (SPI_MODE)": updated bit descriptions; added bits NSSE and NSS  |
|                     | Section 38.7.16 "USART Channel Status Register (LIN_MODE)": updated descriptions of all bits except LINBLS   |
|                     | Section 38.7.19 "USART Baud Rate Generator Register": restructured equations in CD field description   |
|                     | Section 38.7.20 "USART Receiver Time-out Register": restructured equation in TO field description  |
|                     | Section 38.7.21 "USART Transmitter Timeguard Register": restructured equation in TG bit description  |
|                     | Section 38.7.22 "USART FI DI RATIO Register": updated FI_DI_RATIO field description  |
|                     | Section 38.7.24 "USART IrDA Filter Register": updated IRDA_FILTER field description  |
|                     | Section 38.7.29 "USART Write Protection Mode Register": removed "Reset" line; updated field descriptions   |
|                     | Section 38.7.30 "USART Write Protection Status Register": removed "Reset" line; updated WPVSRC field description   |

| Doc. Rev.<br>11055F | Comments  |
|---------------------|---|
|                     | Section 39. "Universal Asynchronous Receiver Transmitter (UART)"  |
|                     | Updated Figure 39-1 "UART Block Diagram"  |
|                     | Added Table 39-3 "Peripheral IDs"   |
|                     | Section 39.5 "Functional Description": changed title (was "UART Operations")  |
|                     | Section 39.5.1 "Baud Rate Generator": updated to change "master clock" or "MCK" to "peripheral clock"                                   |
|                     | Section 39.5.2.4 "Receiver Overrun": updated text   |
|                     | Table 39-4 "Register Mapping": added offsets 0x0040–0x0048 to reserved area   |
|                     | Section 39.6.9 "UART Baud Rate Generator Register": updated CD field description  |
|                     | Section 40. "Controller Area Network (CAN)"   |
|                     | Instances of "MCK" replaced by "Peripheral clock"   |
|                     | Section 40.2 "Embedded Characteristics": renamed feature "Write Protected Registers" to "Register Write Protection"                     |
|                     | Section 40.9.12 "CAN Write Protection Mode Register": updated field descriptions  |
|                     | Section 40.9.13 "CAN Write Protection Status Register": updated WPVSRC field description  |
|                     | Section 40.9.21 "CAN Message Control Register": updated MACR bit description  |
|                     | Section 41. "Analog-to-Digital Converter (ADC)"   |
|                     | Replaced all references to 'MCK' with 'peripheral clock'  |
|                     | Replaced instances of "ADCClock" with "ADC clock" or acronym "ADCCLK"   |
|                     | Updated Section 41.1 "Description"  |
|                     | Updated Figure 41-1 "Analog-to-Digital Converter Block Diagram with Touchscreen Mode"   |
|                     | Section 41.5 "Product Dependencies":  |
| 31-Aug-15           | - removed section "Analog Inputs"   |
|                     | - updated Section 41.5.3 "I/O Lines"  |
|                     | Updated Section 41.6.1 "Analog-to-Digital Conversion"   |
|                     | Added Section 41.6.2 "ADC Clock"  |
|                     | Section 41.6.3 "ADC Reference Voltage": changed title (was "Conversion Reference")  |
|                     | Updated Section 41.6.4 "Conversion Resolution"  |
|                     | Updated Section 41.6.5 "Conversion Results"   |
|                     | Updated Section 41.6.6 "Conversion Triggers"  |
|                     | Updated Section 41.6.7 "Sleep Mode and Conversion Sequencer"  |
|                     | Section 41.6.8 "Comparison Window": removed paragraph referencing "a filtering option"  |
|                     | Section 41.6.11 "Buffer Structure": updated text and added Figure 41-13 "Buffer Structure"  |
|                     | Section 41.6.12 "Register Write Protection": updated title and text; removed ADC Channel Sequence 2 Register from listed registers      |
|                     | Table 41-4 "Register Mapping": removed Channel Sequence Register 2 / ADC_SEQR2 (offset 0x0C now reserved); added line "0x94" (reserved) |
|                     | Section 41.7.2 "ADC Mode Register":   |
|                     | - removed FWUP bit  |
|                     | - updated descriptions of fields PRESCAL and USEQ   |
|                     | Section 41.7.3 "ADC Channel Sequence 1 Register": removed four fields USCH8:USCH5 from bitmap; updated USCHx field description          |
|                     | Removed section "ADC Channel Sequence 2 Register"   |
|                     | Section 41.7.4 "ADC Channel Enable Register": removed reference to ADC_SEQR2 in CHx bit description                                     |

| Doc. Rev.<br>11055F | ev. Comments   |  |  |  |
|---------------------|--|--|--|--|
|                     | Section 41. "Analog-to-Digital Converter (ADC)" (cont'd)   |  |  |  |
|                     | Section 41.7.5 "ADC Channel Disable Register": updated CHx warning text  |  |  |  |
|                     | Section 41.7.11 "ADC Interrupt Status Register": updated bit descriptions  |  |  |  |
|                     | Section 41.7.13 "ADC Extended Mode Register": removed CMPFILTER field; in TAG bit description, corrected "ADC_LDCR" to "ADC_LCDR"  |  |  |  |
|                     | Section 41.7.15 "ADC Channel Data Register": in 'DATA' field description, corrected "The Convert Data Register (CDR)" to "ADC_CDRx"  |  |  |  |
|                     | Section 41.7.21 "ADC Trigger Register": updated TRGMOD field description; removed instance of ADC_SEQR2 from TRGPER field description  |  |  |  |
|                     | Section 41.7.22 "ADC Write Protection Mode Register": updated descriptions of WPEN bit and WPKEY field   |  |  |  |
|                     | Section 41.7.23 "ADC Write Protection Status Register": updated description of WPVSRC field  |  |  |  |
|                     | Section 42. "Software Modern Device (SMD)"   |  |  |  |
|                     | Section 42.1 "Description": corrected acronym "HLSD" to "LSD" (Line Side Device)   |  |  |  |
|                     | Added Section 42.4 "Software Modern Device (SMD) User Interface"   |  |  |  |
|                     | Section 43. "Synchronous Serial Controller (SSC)"  |  |  |  |
|                     | Updated Figure 43-1 "Block Diagram"  |  |  |  |
|                     | Moved Section 43.5 "SSC Application Examples" to follow Section 43.4 "Application Block Diagram"   |  |  |  |
|                     | Figure 43-5 "Time Slot Application Block Diagram": removed arrowhead going into "CODEC Second Time Slot" from "Data In" line   |  |  |  |
|                     | Section 43.8 "Functional Description": replaced instances of "Master Clock" or "MCK" with "peripheral clock"   |  |  |  |
|                     | Section 43. "Synchronous Serial Controller (SSC)" (cont'd)   |  |  |  |
| 31-Aug-15           | Section 43.8.5.1 "Frame Sync Data": at end of second paragraph, replaced "has a maximum value of 16" with "has a maximum value of 256"   |  |  |  |
|                     | Updated Figure 43-8 "Divided Clock Generation"   |  |  |  |
|                     | Figure 43-15 "Receive Compare Modes": deleted instance of "Up to 16 bits (4 in this example)" under FSLEN label  |  |  |  |
|                     | Section 43.8.6.1 "Compare Functions": at end of first sentence, replaced "maximum value of 16 bits" with "maximum value of 256 bits"   |  |  |  |
|                     | Table 43-4 "Data Frame Registers": replaced "Up to 16" with "Up to 256" as length for field FSLEN  |  |  |  |
|                     | Section 43.8.10 "Register Write Protection": updated title (was "Write Protection Registers") and transferred to Section 43.8 "Functional Description"; updated third paragraph describing how WPVS bit is cleared |  |  |  |
|                     | Table 43-5 "Register Mapping": corrected reserved space (replaced single offset range 0x50–0xFC with two ranges 0x50–0xE0 and 0xEC–0xFC)   |  |  |  |
|                     | Section 43.9.2 "SSC Clock Mode Register": updated DIV field description  |  |  |  |
|                     | Section 43.9.6 "SSC Transmit Frame Mode Register": updated FSOS field description  |  |  |  |
|                     | Section 43.9.17 "SSC Write Protection Mode Register": removed reset value line (register reset values are provided in Table 43-5 "Register Mapping"); updated descriptions of WPEN bit and WPKEY field             |  |  |  |
|                     | Section 43.9.18 "SSC Write Protection Status Register": removed reset value line (register reset values are provided in Table 43-5 "Register Mapping"); updated WPVSRC field description                           |  |  |  |
|                     | Section 44. "Ethernet 10/100 MAC (EMAC)"   |  |  |  |
|                     | Section 44.4 "Functional Description": in first sentence, changed "MACB" to "EMAC"   |  |  |  |
|                     | Section 44.4.12 "PHY Maintenance":   |  |  |  |
|                     | - in last paragraph, inserted sentence "To write clause 45 PHYs, bits 31:28 should be written as 0x0001."  |  |  |  |
|                     | - added Table 44-5 "Clause 22/Clause 45 PHYs Read/Write Access Configuration"  |  |  |  |

| Doc. Rev.<br>11055F | Comments   |
|---------------------|--|
|                     | Section 44. "Ethernet 10/100 MAC (EMAC)" (cont'd)  |
|                     | Table 44-7 "Register Mapping":   |
|                     | - added reset value for Network Status Register  |
|                     | - inserted reserved space at offsets 0x8C, 0xBC, and 0xC4  |
|                     | Section 44.6.2 "Network Configuration Register": updated descriptions of bits SPD, FD, and EFRHD   |
|                     | Section 44.6.3 "Network Status Register": updated bit descriptions   |
|                     | Section 44.6.9 "Interrupt Enable Register": updated MFD and TXERR bit descriptions   |
|                     | Section 44.6.10 "Interrupt Disable Register": updated MFD and TXERR bit descriptions   |
|                     | Section 44.6.11 "Interrupt Mask Register": updated MFD and TXERR bit descriptions  |
|                     | Section 44.6.12 "PHY Maintenance Register":  |
|                     | - below bitmap, added note "To read clause 45 PHYs, bits[31:28] should be written as 0x0011. This overlaps the SOF and RW fields."   |
|                     | - updated descriptions of DATA, CODE, REGA, RW, and SOF  |
|                     | Section 44.6.14 "Hash Register Bottom": updated ADDR field description   |
|                     | Section 44.6.15 "Hash Register Top": updated ADDR field description  |
|                     | Section 44.6.16 "Specific Address 1 Bottom Register": updated ADDR field description   |
|                     | Section 44.6.17 "Specific Address 1 Top Register": updated ADDR field description  |
|                     | Section 44.6.18 "Specific Address 2 Bottom Register": updated ADDR field description   |
|                     | Section 44.6.19 "Specific Address 2 Top Register": updated ADDR field description  |
|                     | Section 44.6.20 "Specific Address 3 Bottom Register": updated ADDR field description   |
| 24                  | Section 44.6.21 "Specific Address 3 Top Register": updated ADDR field description  |
| 31-Aug-15           | Section 44.6.22 "Specific Address 4 Bottom Register": updated ADDR field description   |
|                     | Section 44.6.23 "Specific Address 4 Top Register": updated ADDR field description  |
|                     | Section 45. "LCD Controller (LCDC)"  |
|                     | Section 45.6.3.4 "Overlay Blender Attributes": renamed "ITER Field" to "ITER bit" and added description  |
|                     | Revised Figure 45-2 "4:2:2 Upsampling Algorithm" (replaced "upsampling 4:2:0 to 4:4:4 conversion" graphics with "upsampling 4:2:2 to 4:4:4 conversion 0 or 180 degree" graphics) |
|                     | Updated Section 45.6.7.1 "Line Striding"   |
|                     | Updated Section 45.6.7.2 "Pixel Striding"  |
|                     | Removed reset values from register description sections (reset values are found in Table 45-55 "Register Mapping")   |
|                     | Table 45-55 "Register Mapping":  |
|                     | - removed reset values from write-only registers   |
|                     | - removed five registers LCDC_ADDRSIZE, LCDC_IPNAME1, LCDC_IPNAME2, LCDC_FEATURES, and LCDC_VERSION (offset range 0x1FEC–0x1FFC now reserved)                                    |
|                     | Section 45.7.72 "High End Overlay Layer Configuration 1 Register": updated YUV422ROT bit description   |
|                     | Section 46. "Electrical Characteristics"   |
|                     | Table 46-1 "Absolute Maximum Ratings*": renamed "VDDIOM0" to "VDDIOM"; removed "VDDIOM1"   |
|                     | Table 46-2 "DC Characteristics":   |
|                     | - V <sub>DDBU</sub> min value 1.8V changed to 1.65V  |
|                     | - updated parameters Low-level Output Voltage (V <sub>OL</sub> ) and High-level Output Voltage (V <sub>OH</sub> )  |
|                     | - renamed "V <sub>DDIOM1</sub> " to "V <sub>DDIOM</sub> " in R <sub>PULLUP</sub> conditions  |
|                     | - renamed "V <sub>DDIOM1</sub> " to "V <sub>DDIOP1</sub> " in I <sub>O</sub> conditions  |

| Doc. Rev.<br>11055F | Comments   |
|---------------------|--|
|                     | Section 46. "Electrical Characteristics" (cont'd)  |
|                     | Table 46-9 "XIN Clock Electrical Characteristics": corrected bit names in conditions for C <sub>IN</sub> , R <sub>IN</sub> , and V <sub>IN</sub>                     |
|                     | Added Section 46.15.2 "Power-Down Sequence"  |
|                     | Section 46.18.1.1 "Maximum SPI Frequency": updated description under "Master Read Mode"  |
|                     | Table 46-41 "Capacitance Load": added footnotes to provide details on 1.8V and 3.3V domains  |
| 31-Aug-15           | Replaced single SSC timings table with two updated tables: Table 46-42 "SSC Timings - 1.8V Peripheral Supply" and Table 46-43 "SSC Timings - 3.3V Peripheral Supply" |
|                     | Table 46-45 "EMAC Signals Relative to EMDC": deleted two footnotes "VDDIO from" and "See Note"   |
|                     | Table 46-46 "EMAC RMII Timings": deleted footnote "See Note"   |
|                     | Table 46-49 "Two-wire Serial Bus Requirements": in last row of table, corrected symbol to "t <sub>BUF</sub> " and conditions to "t <sub>LOW</sub> "                  |
|                     | Updated Figure 46-30 "Two-wire Serial Bus Timing"  |
|                     | Section 49. "Ordering Information"   |
|                     | Table 49-1 "SAM9X35 Ordering Information": replaced "Package Type" with "Carrier Type"   |

| Doc. Rev.<br>11055E | Comments  |
|---------------------|---|
|                     | General editorial and formatting changes throughout document  |
|                     | Updated first line of document title on page 1 (was "AT91SAM ARM-based Embedded MPU"; is "ARM-based Embedded MPU")  |
|                     | Section 2. "Block Diagram"  |
|                     | Figure 2-1 "SAM9X35 Block Diagram": flipped diagram right for ease of viewing   |
|                     | Section 4. "Package and Pinout"   |
|                     | Table 4-2 "SAM9X35 I/O Type Assignment and Frequency":  |
|                     | - GPIO: replaced "All PIO lines except the following" with "All PIO lines except GPIO_CLK, GPIO_CLK2, and GPIO_ANA"   |
|                     | - EBI: replaced "All Data lines (Input/output) except the following" with "All data lines (Input/output)"   |
|                     | - EBI_O: replaced "All Address and control lines (output only) except the following" with "All address and control lines (output only) except EBI_CLK"                                      |
|                     | Table 4-3 "Pin Description BGA217": removed "PU" reset state for SHDN signal  |
|                     | Section 5. "Power Considerations"   |
|                     | Table 5-1 "SAM9X35 Power Supplies": in VDDNF "Powers" description, replaced instance of "D16-D32" with "D16–D31"  |
|                     | Section 6. "Memories"   |
|                     | Figure 6-1 "SAM9X35 Memory Mapping": replaced "SCKCR" with "SCKC_CR"; replaced "BSCR" with "BSC_CR"   |
|                     | Section 7. "System Controller"  |
|                     | Figure 7-1 "SAM9X35 System Controller Block Diagram": replaced "SCKCR" with "SCKC_CR"; replaced "BSCR" with "BSC_CR"  |
|                     | Section 7.2 "Backup Section": replaced bullet "Slow Clock Control Register (SCKCR)" with "Slow Clock Controller Configuration Register (SCKC_CR)"; corrected instance of "BSCR" to "BSC_CR" |

| Doc. Rev.<br>11055E | Comments  |
|---------------------|---|
|                     | Section 25. "Bus Matrix (MATRIX)"   |
|                     | Updated Table 25-1 "List of Bus Matrix Masters":  |
|                     | - Master 9 (was ISI DMA; is LCD DMA)  |
|                     | - added Master 11 (Reserved)  |
|                     | Section 25.2.2 "Matrix Slaves": in first sentence, replaced "manages 9 slaves" with "manages 10 slaves"   |
|                     | Updated Table 25-3 "Master to Slave Access": changed description of Master 9 (was ISI DMA; is LCD DMA)  |
|                     | Section 25.6 "Register Write Protection": changed title (was "Write Protect Registers") and revised contents  |
|                     | Deleted section "Chip Configuration User Interface" (register CCFG_EBICSA is now found in Section 25.7 "Bus Matrix (MATRIX) User Interface"                 |
|                     | Table 25-4 "Register Mapping":  |
|                     | - defined offset 0x002C as reserved   |
|                     | - defined offsets 0x0104–0x011C as reserved   |
|                     | - at offset 0x0120, inserted register CCFG_EBICSA   |
|                     | - defined offsets 0x0124–0x01FC as reserved   |
|                     | Section 25.7.1 "Bus Matrix Master Configuration Registers": inserted sentence about write protection  |
|                     | Section 25.7.2 "Bus Matrix Slave Configuration Registers": inserted sentence about write protection   |
|                     | Section 25.7.3 "Bus Matrix Priority Registers A For Slaves":  |
|                     | - updated register range in Name (was MATRIX_PRAS0MATRIX_PRAS8; is MATRIX_PRAS0MATRIX_PRAS9)  |
|                     | - inserted sentence about write protection  |
|                     | Section 25.7.4 "Bus Matrix Priority Registers B For Slaves":  |
|                     | - updated register range in Name (was MATRIX_PRBS0MATRIX_PRBS8; is MATRIX_PRBS0MATRIX_PRBS9)  |
|                     | - inserted sentence about write protection  |
|                     | Section 25.7.5 "Bus Matrix Master Remap Control Register": inserted sentence about write protection   |
|                     | Section 25.7.6 "EBI Chip Select Assignment Register": changed reset value from 0x00000000 to 0x00000200; updated NFD0_ON_D16 and DDR_MP_EN bit descriptions |
|                     | Updated Section 25.7.7 "Write Protection Mode Register"   |
|                     | Updated Section 25.7.8 "Write Protection Status Register"   |
|                     | Section 26. "External Bus Interface (EBI)"  |
|                     | Minor formatting and editorial changes throughout   |
|                     | Section 26.2 "Embedded Characteristics": replaced bullet "MLC Nand Flash ECC Controller" with "8-bit NAND Flash ECC Controller"                             |
|                     | Table 26-4 "EBI Pins and External Device Connections": in footnote, replaced instance of "D16-D24" with "D16-D23"   |
|                     | Section 26.5.3.4 "Power supplies": in second paragraph, replaced instance of "D16-D32" with "D16-D31"   |
|                     | Section 45. "Ethernet MAC 10/100 (EMAC)"  |
|                     | Section 45.2 "Embedded Characteristics": in first bullet, replaced "Supports MII" with "Supports RMII"  |
|                     | Table 45-5 "Pin Configuration": replaced MII configuration with RMII configuration  |
|                     | Section 45.6.25 "User Input/Output Register": deleted "When reset, it selects the MII mode" from RMII bit description                                       |

| Doc. Rev.<br>11055E | Comments  |
|---------------------|---|
|                     | Section 47. "Electrical Characteristics"  |
|                     | Table 47-2 "DC Characteristics": added input impedance characteristics  |
|                     | Table 47-5 "Processor Clock Waveform Parameters": added footnote "For DDR2 usage only, there are no limitations to LP-DDR, SDRAM and mobile SDRAM"                  |
|                     | Figure 47-2 "Main Oscillator Schematics": added note "A 1K resistor must be added on XOUT pin for crystals with frequencies lower than 8 MHz" below figure          |
|                     | Table 47-10 "12 MHz RC Oscillator Characteristics": added conditions to parameter "Power Consumption Oscillation"   |
|                     | Table 47-18 "I/O Characteristics": added values; replaced "40 pF" with "20 pF" in footnote defining 3.3V domain   |
|                     | Revised Section 47.14 "POR Characteristics" to add Figure 47-5 "General Presentation of POR Behavior" and Section 47.14.2 "Backup Power Supply POR Characteristics" |
|                     | Table 47-29 "Core Power Supply POR Characteristics": added conditions to parameter "Threshold Voltage Falling"  |
|                     | Promoted Section 47.15 "Power Sequence Requirements" to heading level 2 (was level 3)   |
|                     | Table 47-32 "Zero Hold Mode Use Maximum System Clock Frequency (MCK)": in values columns, changed header "Min" to "Max"   |
|                     | Added Section 47.19 "Two-wire Interface Characteristics"  |
|                     | Section 50. "SAM9X35 Errata"  |
|                     | Updated Section 50.2.1 "RSTC: Reset during SDRAM Accesses"  |
|                     | Added Section 50.7 "Boot Strategy"  |
|                     | Added Section 50.8 "Real Time Clock (RTC)"  |
|                     | "Revision History": corrected document No. in table column header for Rev. D (was 11054D; is 11055D)  |

| Doc. Rev.<br>11055D | Comments   | Change<br>Request<br>Ref. <sup>(1)</sup> |

|                     | Introduction:  |  |
|                     | Section 1. "Features", added DBGU in the Peripherals list.   | rfo                                      |
|                     | Section 8.2 "Peripheral Identifiers", added data on System Controller Interrupt in Table 8-1 "Peripheral Identifiers".                   | 8516                                     |
|                     | MATRIX:  |  |
|                     | Section 25.7.6.1 "EBI Chip Select Assignment Register", updated the description of a warning note in "DDR_MP_EN: DDR Multi-port Enable". | 8532                                     |
|                     | DMAC:  |  |
|                     | Added Section 31.2.1 "DMA Controller 0" and Section 31.2.2 "DMA Controller 1".   | 8526                                     |
|                     | SPI:   | 05.44                                    |
|                     | Added references on SPKC in Section 35.2 "Embedded Characteristics".   | 8541                                     |
|                     | Errata:  |  |
|                     | Added Section 50.5 "Timer Counter (TC)".   | 8517                                     |

| Doc. Rev.<br>11055C | Comments  | Change<br>Request<br>Ref. (1) |
|---------------------|---|-------------------------------|
|                     | Introduction:   |                               |
|                     | Section 6.3.3 "DDR2SDR Controller", replaced LPDDR2 with LPDDR.   | 8146                          |
|                     | Added "Write Protected Registers" in the peripherals list in Section 1. "Features".   | 8213                          |
|                     | Added "4-bank" references to the DDR2 characteristics in Section 1. "Features", Section 1. "Features" and Section 6.3.3 "DDR2SDR Controller".   | 8282                          |
|                     | Section 5.1 "Power Supplies", added PLLUTMI cell as a power to the VDDPLLA line in Table 5-1 "SAM9X35 Power Supplies".  | 8368                          |
|                     | Section 1. "Features", replaced "MLC/SLC NAND Controller" with "MLC/SLC 8-bit NAND Controller" in Memories list.  | 8403                          |
|                     | Section 6.3.2 "Static Memory Controller", replaced "8- or 16-bit Data Bus" with "8-, 16-, or 32-bit Data Bus".  | 8420                          |
|                     | Replaced TSADVREF with ADVREF in Figure 2-1 "SAM9X35 Block Diagram".  | 8454                          |
|                     | Boot Strategies:  |                               |
|                     | Section 11.3 "Chip Setup", added Table 11-1 "External Clock and Crystal Frequencies allowed for Boot Sequence (in MHz)" and the corresponding text below the table.   | 8269                          |
|                     | Section 11.4.1 "NVM Boot Sequence", replaced "Boot Sequence Register (BSCR)" with "Boot Sequence Configuration Register (BSC_CR)" and updated the acronym of this register in the entire section.  Added a reference to the "Boot Sequence Controller (BSC)" section.  Replaced "BSCR value" with "BOOT Value" in the heading line in Table 11-2 "Boot Sequence Configuration Register Values". | rfo                           |
|                     | BSC:  |                               |
|                     | Section 12.4.1 "Boot Sequence Configuration Register":  | 7996                          |
|                     | - updated the BSC_CR register table   | 8184                          |
|                     | - added a reference to the "NVM Boot Sequence" section in "BOOT: Boot Media Sequence".  | rfo                           |
|                     | Section 12.2 "Embedded Characteristics", removed "Product-dependent order" line.  |                               |
|                     | Added Section 12.3 "Product Dependencies".  |                               |
|                     | Updated the acronym of Boot Sequence Configuration Register from "BSCR" to "BSC_CR".  |                               |
|                     | AIC:  |                               |
|                     | Section 13.10.2 "AIC Source Mode Register", removed the PRIOR bitfield table as values 0 to 7 can be used and updated the description of this bitfield in "PRIOR: Priority Level".  | 8017                          |
|                     | RSTC:   |                               |
|                     | Section 14.5.1 "Reset Controller Control Register", updated description of the EXTRST bitfield for the RSTC_CR register in "EXTRST: External Reset".  | 8271                          |
|                     | RTC:  |                               |
|                     | Section 15.6 "Real-time Clock (RTC) User Interface", updated the peripheral name from "Real Time Clock" to "Real-time Clock" and replaced the Reserved Register line "0x30-0xF8" with two lines "0x30-0xC4" and "0xC8-0xF8" (Reserved Register) in Table 15-1 "Register Mapping".   | 8280                          |
|                     | WDT:  |                               |
|                     | Added the 4th paragraph "If the watchdog is restarted" in Section 17.4 "Functional Description".  | 8128:                         |
|                     | Section 17.5.3 "Watchdog Timer Status Register", added a note in "WDERR: Watchdog Error".   |                               |
|                     | Updated Section 17.2 "Embedded Characteristics".  | 8218                          |
|                     | SHDWC:  |                               |
|                     | Removed AMBA references from Section 18.2 "Embedded Characteristics".   | rfo                           |
|                     | Section 18.3 "Block Diagram", removed redundant Figure 18-2. Sutdown Controller Block Diagram.  | 8454                          |

| Doc. Rev.<br>11055C | Comments  | Change<br>Request<br>Ref. (1) |
|---------------------|---|-------------------------------|
|                     | GPBR:   |                               |
|                     | Section 19.3.1 "General Purpose Backup Register x", removed 'x' from the bitfield names in the SYS_GPBRx register table and in the description below.   | 7990                          |
|                     | SCKC:   |                               |
|                     | are located not in Slow Clock Control Register (SCKCR) but in Slow Clock Configuration Register (SCKC_CR).  | 8322                          |
|                     | Fixed Figure 20-1 "Block Diagram" for better representation.  | rfo                           |
|                     | CKGR:   |                               |
|                     | Section 21.6.2 "Switch from Internal 12 MHz RC Oscillator to the 12 MHz Crystal", fixed a typo in the sequence order: MAINRDY> MOSCXTS.   | 8327                          |
|                     | Section 21.7 "Divider and PLLA Block", added the PLLADIV2 block between the PLLA block and the PLLACK reference in Figure 21-6 "Divider and PLLA Block Diagram".  | 8401                          |
|                     | Updated Crystal Oscillator range from "3 to 20 MHz" to "12 to 16 MHz" in Section 21.2 "Embedded Characteristics", Section 21.5 "Main Clock", Figure 21-3 "Main Clock Block Diagram", Section 21.6.6 "12 to 16 MHz Crystal Oscillator", Section 21.6.7 "Main Clock Oscillator Selection", and Section 21.6.8 "Main Clock Frequency Counter". | 8413                          |
|                     | Section 21.3 "CKGR Block Diagram", updated the UPLL block connections in Figure 21-1 "Clock Generator Block Diagram".   |                               |
|                     | PMC:  |                               |
|                     | Section 22.4 "Block Diagram", removed the "/1, /2" divider block in Figure 22-2 "General Clock Block Diagram".  | 8401                          |
|                     | Section 22.13 "Power Management Controller (PMC) User Interface", updated the CKGR_MOR reset value (0x0100_0008> 0x0000_0008) in Table 22-3 "Register Mapping".   | 8447                          |
|                     | PIO:  |                               |
|                     | Section 23.4.4 "Interrupt Generation", updated the 1st paragraph.   | 8324                          |
|                     | Section 23.5.10 "Input Edge/Level Interrupt", replaced "to the Advanced Interrupt Controller (AIC)" with "to the interrupt controller" in the paragraph "When an input Edge or Level is detected".  |                               |
|                     | EBI:  |                               |
|                     | Section 26.5.1 "Hardware Interface", fixed typos in Table 26-4 "EBI Pins and External Device Connections": the power supply of A20, A23, A24, A25, NCS2, NCS4 and NCS5 is VDDNF and not VDDIOM.   | 8179                          |
|                     | Updated EBIx pin data in Table 26-2 "EBI Pins and Memory Controllers I/O Lines Connections" and added A13 as SDRAMC pin in the A15 line in Table 26-4 "EBI Pins and External Device Connections".   | rfo                           |
|                     | PMECC:  |                               |
|                     | Figure 27-2 "Software/Hardware Multibit Error Correction Dataflow", "READ PAGE" and "PROGRAM PAGE" positions swapped in the flow chart.   | 7495                          |
|                     | Figure 27-5 "Read Operation with Spare Decoding", configuration revised as "SPAREEN set to One and AUTO set to Zero."   |                               |
|                     | Section 27.2 "Embedded Characteristics", added a line about supporting 8-bit Nand Flash data bus.   | 8403                          |
|                     | Section 27.6.11 "PMECC Interrupt Status Register", replaced duplicate bits 31 - 24 with missing 7 - 0 in the PMECC_ISR register table.  | rfo                           |
|                     | PMERRLOC:   |                               |
|                     | Section 28.5.10 "Error Location SIGMAx Register", "SIGMAN" bitfield name replaced with "SIGMAx" in the PMERRLOC_SIGMAx [x=024] register table.  | 8339                          |

|                     | Replaced "turned out" with "switched to output mode" in the first paragraphe in Section 29.9.4.1 "Write is Controlled by NWE (WRITE_MODE = 1)" and Section 29.9.4.2 "Write is Controlled by NCS (WRITE_MODE = 0)".  | 7925                          |
|                     | DDRSDRC:  |                               |
|                     | Section 30.2 "Embedded Characteristics", removed duplicate reference to DDR2-SDRAM.   | 8146                          |
|                     | DMAC:   |                               |
|                     | Section 31.4.5.1 "Programming Examples", value '1'> '0' for a masked BTC (DMAC_EBCIMR.BTCx = '0') in "Multi-buffer Transfer with Source Address Auto-reloaded and Destination Address Auto-reloaded (Row 10)".  | 7393                          |
|                     | Updated names:  |                               |
|                     | - 'Buffer Complete Interrupt'> 'Buffer Transfer Completed Interrupt'  |                               |
|                     | - 'Chained Buffer Interrupt'> 'Chained Buffer Transfer Completed Interrupt'   |                               |
|                     | - 'Transfer Complete Interrupt'> 'Chained Buffer Transfer Completed Interrupt'  |                               |
|                     | - $KEEPON[n]$ > $KEEPX$ , $STALLED[n]$ > $STALX$ , $ENABLE[n]$ > $ENAX$ , $SUSPEND[n]$ > $SUSPX$ , $RESUME[n]$ > $RESX$ , $EMPTY[n]$ > $EMPTX$ .  |                               |
|                     | - Read the Channel Enable register> Read the Channel Handler Status register.   |                               |
|                     | Detailed bitfield acronyms when missing.  |                               |
|                     | Updated Section 31.2 "Embedded Characteristics":  | rfo                           |
|                     | - updated the list of embedded characteristics  |                               |
|                     | - removed Section 31.2.1 DMA Controller 0 and Section 31.2.1 DMA Controller 1.  |                               |
|                     | Section 31.7.16 "DMAC Channel x [x = 07] Control A Register", updated SCSIZE and DCSIZE bitfield tables.  | 8143                          |
|                     | Section 31.7.21 "DMAC Write Protect Mode Register", updated the descriptions of WPEN and WPKEY bitfields: replaced the wrong values 0x444D4143 and 0x50494F with 0x444D41, and replaced '("DMAC" in ASCII)' with '("DMA" in ASCII)'.  | 8404                          |
|                     | Section 31.7.2 "DMAC Enable Register", Section 31.7.15 "DMAC Channel $x$ [ $x = 07$ ] Descriptor Address Register", Section 31.7.16 "DMAC Channel $x$ [ $x = 07$ ] Control A Register", and Section 31.7.17 "DMAC Channel $x$ [ $x = 07$ ] Control B Register", added respectively descriptions of the following bitfields: | rfo                           |
|                     | - "ENABLE: General Enable of DMA"   |                               |
|                     | - "DSCR_IF: Descriptor Interface Selection"   |                               |
|                     | - "DONE: Current Descriptor Stop Command and Transfer Completed Memory Indicator"   |                               |
|                     | - "IEN: Interrupt Enable Not"   |                               |
|                     | Updated the last paragraph in Section 31.4.4.3 "Ending Multi-buffer Transfers".   | 8441                          |

|                     | - Section 32.7.12 "UDPHS Endpoint Control Disable Register (Isochronous Endpoint)"  |                               |
|                     | - Section 32.7.13 "UDPHS Endpoint Control Register (Control, Bulk, Interrupt Endpoints)"  |                               |
|                     | - Section 32.7.14 "UDPHS Endpoint Control Register (Isochronous Endpoint)"  |                               |
|                     | - Section 32.7.15 "UDPHS Endpoint Set Status Register (Control, Bulk, Interrupt Endpoints)"   |                               |
|                     | - Section 32.7.16 "UDPHS Endpoint Set Status Register (Isochronous Endpoint)"   |                               |
|                     | - Section 32.7.17 "UDPHS Endpoint Clear Status Register (Control, Bulk, Interrupt Endpoints)"   |                               |
|                     | - Section 32.7.18 "UDPHS Endpoint Clear Status Register (Isochronous Endpoint)"   |                               |
|                     | - Section 32.7.19 "UDPHS Endpoint Status Register (Control, Bulk, Interrupt Endpoints)"   |                               |
|                     | - Section 32.7.20 "UDPHS Endpoint Status Register (Isochronous Endpoint)"   |                               |
|                     | Renamed ER_CRC_NTR bitfield to ERR_CRC_NTR.   | 8405                          |
|                     | Added ISOENDPT right-hand side qualifier to alternate register definitions in Section 32.7.10, Section 32.7.12, Section 32.7.14, Section 32.7.16, Section 32.7.18, and Section 32.7.20. Fixed typos.                        |                               |
|                     | Section 32.2 "Embedded Characteristics": removed Figure 32-1. USB Selection and Table 32-1. UDPHS Endpoint Description (see Section 32.6.1 and Section 32.6.4 instead).   | rfo                           |
|                     | Added Section 32.6.1 "UTMI Transceivers Sharing" (extracted from Section 32.2 "Embedded Characteristics").  |                               |
|                     | Updated Section 32.6.4 "USB Transfer Event Definitions": added Table 32-4 "UDPHS Endpoint Description" with notes and the text below (extracted from Section 32.2 "Embedded Characteristics").                              |                               |
|                     | UHPHS:  |                               |
|                     | Section 33.2 "Embedded Characteristics": removed Figure 33-1 USB Selection, Section 33.2.1 EHCl and Section 33.2.2 OHCl including Figure 33-2 Board Schematics to Interface UHP Device Controller.                          | 8104,<br>8236                 |
|                     | Added Section 33.4 "Typical Connection" and Section 33.6 "Functional Description" (extracted from Section 33.2 "Embedded Characteristics").   |                               |
|                     | Section 33.4 "Typical Connection", replaced the typical connection figure with a new Figure 33-2 "Board Schematic to Interface UHP High-speed Host Controller".   |                               |
|                     | HSMCI:  |                               |
|                     | Section 34.14.12 "HSMCI Status Register", removed the first phrase in the "NOTBUSY: HSMCI Not Busy" bitfield description (not only for Write operations now).   | 8394                          |
|                     | Section 34.6.3 "Interrupt", replaced references to NVIC/AIC with "interrupt controller".  | 0.424                         |
|                     | Section 34.14.7 "HSMCI Block Register", replaced BCNT bitfield table with the corresponding description and updated Warning note in "BCNT: MMC/SDIO Block Count - SDIO Byte Count".   | 8431                          |
|                     | Section 34.14.16 "HSMCI DMA Configuration Register", updated CHKSIZE bitfield in the register table (bits 6, 5 and 4 now), and updated the description of this bitfield in "CHKSIZE: DMA Channel Read and Write Chunk Size" |                               |

| Doc. Rev.<br>11055C | Comments   | Change<br>Request<br>Ref. (1) |
|---------------------|--|-------------------------------|
|                     | SPI:   |                               |
|                     | Replaced references to "Advanced Interrupt Controller" with "Interrupt Controller".  | 7513                          |
|                     | Section 35.8.9 "SPI Chip Select Register", added a phrase specifying when this register can be written and updated the table in "BITS: Bits Per Transfer": reserved bits are from 9 to 15.     | 7931                          |
|                     | Section 35.7.3.5 "Peripheral Selection", corrected a cross-reference for the footnote.   | 8025                          |
|                     | Section 35.8.10 "SPI Write Protection Mode Register", replaced "SPIWPKEY" with "WPKEY" and "SPIWPEN" with "WPEN" and added a list of write-protected registers.                                | 8136                          |
|                     | Section 35.8.11 "SPI Write Protection Status Register", replaced "SPIWPVSRC" with "WPVSRC" and "SPIWPVS" with "WPVS" and updated the description of "WPVS: Write Protection Violation Status". |                               |
|                     | Section 35.2 "Embedded Characteristics", removed redundant text line and updated the line "Programmable Transfer Delay Between Consecutive".   | 8210                          |
|                     | Section 35.8.1 "SPI Control Register", removed the last phrase in "SWRST: SPI Software Reset".   | 8362                          |
|                     | TC:  |                               |
|                     | The number of identical 32-bit Timer Counter channels is not three anymore but six.  | 8648                          |
|                     | Section 36.2 "Embedded Characteristics", updated the line on input/output signals.   |                               |
|                     | Section 36.7 "Timer Counter (TC) User Interface", added a row for reserved registers (offsets '0xC8 - 0xD4') in Table 36-5 "Register Mapping".   |                               |
|                     | Updated the order of register description sections to match the order in Table 36-5 "Register Mapping".  | rfo                           |
|                     | PWM:   |                               |
|                     | Section 37.5.2 "Power Management", updated the second paragraph.   | 8105                          |
|                     | Section 37.2 "Embedded characteristics", updated the last line of the list.  | rfo                           |
|                     | TWI:   |                               |
|                     | Section 38.1 "Description", fixed a typo: removed "20" at the end of the 1st paragraph.  | 7921                          |
|                     | Added three paragraphs in Section 38.8.5 "Master Receiver Mode".   | 8426                          |
|                     | Added Table 38-11 "Master Read Clock Stretching with Multiple Data Bytes".   |                               |
|                     | Added Section 38.11 "Write Protection System".   |                               |
|                     | Added Section 38.8.7.1 "Data Transmit with the DMA" and Section 38.8.7.2 "Data Receive with the DMA".  |                               |
|                     | Updated Section 38.12 "Two-wire Interface (TWI) User Interface":   |                               |
|                     | - Table 38-6 "Register Mapping", added rows for Protection Mode Register (0xE4) and Protection Status Register   |                               |
|                     | - added Section 38.12.12 "TWI Write Protection Mode Register" and Section 38.12.13 "TWI Write Protection Status Register"  |                               |
|                     | - added a phrase specifying when the TWI_SMR and TWI_CWGR registers can be written in Section 38.12.3 "TWI Slave Mode Register" and Section 38.12.5 "TWI Clock Waveform Generator Register".   |                               |

| Doc. Rev.<br>11055C | Comments  | Change<br>Request<br>Ref. (1) |
|---------------------|---|-------------------------------|
|                     | USART:  |                               |
|                     | Section 39.7.3.4 "Manchester Decoder", added a paragraph "In order to increase the compatibility".  | 8012                          |
|                     | Section 39.8 "Universal Synchronous Asynchronous Receiver Transmitter (USART) User Interface":  |                               |
|                     | - updated the reset value of the US_MAN register from '0x30011004' to '0xB0011004' in Table 39-16 "Register Mapping"  |                               |
|                     | - updated descriptions of US_CR, US_MR, US_IER, US_IDR, US_IMR, and US_CSR registers in:  |                               |
|                     | Section 39.8.1 "USART Control Register"   |                               |
|                     | Section 39.8.3 "USART Mode Register"  |                               |
|                     | Section 39.8.5 "USART Interrupt Enable Register"  |                               |
|                     | Section 39.8.8 "USART Interrupt Disable Register"   |                               |
|                     | Section 39.8.11 "USART Interrupt Mask Register"   |                               |
|                     | Section 39.8.14 "USART Channel Status Register"   |                               |
|                     | - added sections:   |                               |
|                     | Section 39.8.2 "USART Control Register (SPI_MODE)"  |                               |
|                     | Section 39.8.4 "USART Mode Register (SPI_MODE)"   |                               |
|                     | Section 39.8.6 "USART Interrupt Enable Register (SPI_MODE)"   |                               |
|                     | Section 39.8.7 "USART Interrupt Enable Register (LIN_MODE)"   |                               |
|                     | Section 39.8.9 "USART Interrupt Disable Register (SPI_MODE)"  |                               |
|                     | Section 39.8.10 "USART Interrupt Disable Register (LIN_MODE)"   |                               |
|                     | Section 39.8.12 "USART Interrupt Mask Register (SPI_MODE)"  |                               |
|                     | Section 39.8.13 "USART Interrupt Mask Register (LIN_MODE)"  |                               |
|                     | Section 39.8.15 "USART Channel Status Register (SPI_MODE)"  |                               |
|                     | Section 39.8.16 "USART Channel Status Register (LIN_MODE)"  |                               |
|                     | Section 39.7.4.1 "ISO7816 Mode Overview", removed the last phrase about missing ISO7816 inverted mode support.  | 8097                          |
|                     | Section 39.7.10 "Write Protection Registers", updated the WPVS flag reset description in the 3d paragraph.  | 8212                          |
|                     | Section 39.8.3 "USART Mode Register", updated the MAX_ITERATION field description.  |                               |
|                     | Section 39.8.25 "USART Manchester Configuration Register", changed the definition of the bitfield 29 from "1" to "ONE" and added the corresponding description. |                               |
|                     | Added Section 39.8.28 "USART LIN Baud Rate Register".   |                               |
|                     | Figure 39-39 "Header Transmission" and Figure 39-42 "Slave Node Synchronization" reformatted for readability.   | 8398                          |
|                     | Section 39.7.1 "Baud Rate Generator", replaced "or 6" with "or 6 times lower" in the last phrase of the introduction text.                                      |                               |
|                     | Section 39.6 "Product Dependencies", added rows for USART3 in Table 39-3 "I/O Lines" and in Table "Peripheral IDs".   | rfo                           |
|                     | UART:   |                               |
|                     | Section 40.4.3 "Interrupt Source", replaced the term "Nested Vectored Interrupt Controller" and/or its acronym "NVIC" with "Interrupt Controller".              | 8326                          |
|                     | Section 39.2 "Embedded Characteristics", removed the 2nd line with redundant information.   |                               |
|                     | Section 39.1 "Description", updated the 2nd paragraph.  | rfo                           |

| Doc. Rev.<br>11055C | Comments  | Change<br>Request<br>Ref. <sup>(1)</sup> |
|---------------------|---|--|
|                     | CAN:  |  |
|                     | Added information on Write Protected Registers:   | 8215                                     |
|                     | - added a line in Section 41.2 "Embedded Characteristics"   |  |
|                     | - added rows for Write Protect Mode Register (CAN_WPMR) and Write Protect Status Register (CAN_WPSR) in Table 41-6 "Register Mapping"   |  |
|                     | - added Section 41.8.5 "Write Protected Registers", Section 41.9.12 "CAN Write Protection Mode Register" and Section 41.9.13 "CAN Write Protection Status Register"   |  |
|                     | - added a phrase specifying when a register can be written (restricted by CAN Write Protection Mode Register) in:   |  |
|                     | Section 41.9.1 "CAN Mode Register"  |  |
|                     | Section 41.9.6 "CAN Baudrate Register"  |  |
|                     | Section 41.9.14 "CAN Message Mode Register"   |  |
|                     | Section 41.9.15 "CAN Message Acceptance Mask Register"  |  |
|                     | Section 41.9.16 "CAN Message ID Register"   |  |
|                     | Updated offsets for reserved registers in Table 41-6 "Register Mapping":  |  |
|                     | - 0x002C - 0x01FC> 0x002C - 0x00E0  |  |
|                     | - added a row: - 0x00EC - 0x01FC  |  |
|                     | Updated the register table and the corresponding bitfield name in:  |  |
|                     | Section 41.9.7 "CAN Timer Register"   |  |
|                     | Section 41.9.8 "CAN Timestamp Register"   |  |
|                     | Section 41.9.14 "CAN Message Mode Register"   |  |
|                     | Section 41.9.18 "CAN Message Status Register"   |  |
|                     | Section 41.9.1 "CAN Mode Register", fixed a typo in "LPM: Disable/Enable Low Power Mode" ('w'> '0').  |  |
|                     | Section 41.9.14 "CAN Message Mode Register", updated the bitfield table in "MOT: Mailbox Object Type".  |  |
|                     | Section 41.6.1 "I/O Lines", added Table 41-2 "I/O Lines".   |  |
|                     | ADC:  |  |
|                     | Section 42.8.15 "ADC Compare Window Register", added two paragraphs about programming LOWTHRES and HIGHTHRES bitfields depending on the LOWRES bitfield settings (ADC Mode Register).   | 8045                                     |
|                     | Increased the size of XPOS/XSCALE/YPOS/YSCALE fields from 10 to 12-bit in Section 42.8.19 "ADC Touchscreen X Position Register", Section 42.8.20 "ADC Touchscreen Y Position Register" and Section 42.8.21 "ADC Touchscreen Pressure Register". | 8229                                     |
|                     | Section 42.6.4 "Conversion Results", removed "and EOC bit corresponding to the last converted channel" from the last phrase of the third paragraph.   | 8357                                     |
|                     | Section 42.2 "Embedded Characteristics", added the value of Conversion Rate in the 2nd line.  | 8385                                     |

| Doc. Rev.<br>11055C | Comments  | Change<br>Request<br>Ref. (1) |

|                     | SSC:  |                               |
|                     | Section 44.7.1.1 "Clock Divider", removed Table 43-4 related to Figure 44-5 "Divided Clock Generation" (duplicated data in Section 44.7.1.4 "Serial Clock Ratio Considerations").   | 7303                          |
|                     | Section 44.6.3 "Interrupt", replaced AIC references with "interrupt controller".  | 8466                          |
|                     | Section 44.9 "Synchronous Serial Controller (SSC) User Interface":  |                               |
|                     | - updated descriptions of CKS, CKO, and CKG bitfields in:   |                               |
|                     | Section 44.9.3 "SSC Receive Clock Mode Register"  |                               |
|                     | Section 44.9.5 "SSC Transmit Clock Mode Register"   |                               |
|                     | - updated register tables and a description of FSOS bitfield in:  |                               |
|                     | Section 44.9.4 "SSC Receive Frame Mode Register"  |                               |
|                     | Section 44.9.6 "SSC Transmit Frame Mode Register"   |                               |
|                     | Section 44.9.14 "SSC Interrupt Enable Register", fixed a typo (0=0=> 0=).   |                               |
|                     | Electrical Characteristics:   |                               |
|                     | Section 47.5 "Main Oscillator Characteristics", replaced minimum CCRYSTAL value of 17.5 with 15 in Table 47-7 "Main Oscillator Characteristics" and in the corresponding note. Updated the related values in the same note. | 8098                          |
|                     | Section 47.5.1 "Crystal Oscillator Characteristics", added maximum and minimum CCRYSTAL values for ESR in Table 47-8 "Crystal Characteristics".   |                               |
|                     | Section 47.2 "DC Characteristics", updated RPULLUP parameter characteristics in Table 47-2 "DC Characteristics".  | 8147                          |
|                     | Replaced "Input Leakage Current" with "Input Peak Current" in Table 47-26 "Analog Inputs".  | rfo                           |
|                     | Mechanical Overview:  |                               |
|                     | Updated the table title in Table 48-4 "Package Information".  | 8186                          |
|                     | Errata:   |                               |
|                     | Section 50.1 "External Bus Interface (EBI)", updated the problem description and fix/ workaround.   | 8250                          |
|                     | Removed sections concerning PIO and RTC.  |                               |
|                     | Added Section 50.2 "Reset Controller (RSTC)", Section 43.3 "Static Memory Controller (SMC)", and Section 43.4 "USB High Speed Host Port (UHPHS) and Device Port (UDPHS)".   |                               |
|                     | Added Section 43.6 "LCD Controller (LCDC)".   | 8321                          |
|                     | Removed "Boot Sequence Controller (BSC)" section (see "Boot Strategies" and "BSC" above for the related modifications).   | rfo                           |

DISCLAIMER: The information in this document is provided in connection with Atmel products. No license, express or implied, by estoppel or otherwise, to any intellectual property right IS GRANDED TO THE MINIMITATION IN THE MATERIAL PRODUCTS. THE MINIMITATION OF THE USE OR INDICATED ON THE ATMEL WEBSITE, ATMEL ASSUMES NO LIABILITY WHATSOEVER AND DISCLAIMS ANY EXPRESS, IMPLIED OR STATUTORY WARRANTY RELATING TO ITS PRODUCTS INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. IN NO EVENT SHALL ATMEL BE LIABLE FOR ANY DIRECT, INDIRECT, CONSEQUENTIAL, PUNITIVE, SPECIAL OR INCIDENTAL DAMAGES (INCLUDING, WITHOUT LIMITATION), DAMAGES FOR LOSS AND PROFITS, BUSINESS INTERRUPTION, OR LOSS OF INFORMATION) ARISING OUT OF THE USE OR INABILITY TO USE THIS DOCUMENT, EVEN IF ATMEL HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. Atmel makes no representations or warranties with respect to the accuracy or completeness of the contents of this document and reserves the right to make changes to specifications and products descriptions at any time without notice. Atmel does not make any commitment to update the information contained herein. Unless specifically provided otherwise, Atmel products are not suitable for, and shall not be used in, automotive applications. Atmel products are not intended, authorized, or warranted for use as components in applications intended to support or sustain life.

SAFETY-CRITICAL, MILITARY, AND AUTOMOTIVE APPLICATIONS DISCLAIMER: Atmel products are not designed for and will not be used in connection with any applications where the failure of such products would reasonably be expected to result in significant personal injury or death ("Safety-Critical Applications") without an Atmel officer's specific written consent. Safety-Critical Applications include, without limitation, life support devices and systems, equipment or systems for the operation of nuclear facilities and weapons systems. Atmel products are not designed nor intended for use in military or aerospace applications or environments unless specifically designated by Atmel as military-grade. Atmel products are not designed nor intended for use in automotive applications unless specifically designated by Atmel as automotive-grade.
