

16-BIT CONSTANT CURRENT LED DRIVER

DESCRIPTION

SD16739 is a constant current LED driver with advanced Bi-CMOS technology, the constant current is determined by external resistor. It includes a 16-bit shift register, latches, the constant current driver and etc. In the output stage, there are 16 current sources which provide a 1-45mA constant current drive for LED through bipolar device.

FEATURES

- * Output current adjustable through external resistor
- * Data serial-in/serial-out
- * 16-channel constant current output
- * Output current: 1~45mA
- * 30MHz clock frequency
- * Fast output current response, ENABLE min. width:30ns
- * Current Precision (all output are ON)

Precision	
Between bits	Between ICs
<±2%	<±3%

APPLICATIONS

- * LED screen

PIN CONFIGURATION

PIN DESCRIPTION

Pin No.	Pin Name	I/O	Pin Function
1	GND	--	Ground
2	SERIAL-IN	I	Shift register input pin
3	CLOCK	I	Clock input pin for shift register
4	LATCH	I	Data strobe pin for the latch
5 ~ 20	OUT0 ~ OUT15	I/O	Output pins
21	ENABLE	I	Output enable pin (active low)
22	SERIAL-OUT	O	Shift register output pin
23	R-EXT	I/O	External resistor connecting pin
24	VDD	--	Power supply

FUNCTION DESCRIPTION

In the LED display applications, SD16739 can maintain almost no change in different channels or between the different chips. In the different channels, the current changes less than $\pm 2\%$, while between the different chips, the current changes less than $\pm 3\%$.

There is only one pin connected to ground which is shared as analog ground, digital ground and power ground. It is recommended to route with min. inductance against switching noise and output current noise-induced IC faults. In order to obtain a good current output, the chip needs an appropriate output voltage. According to the electrical characteristics table, users can get minimum output voltage and other related information. Even in the same output current conditions, the minimum output voltage of every part is different.

In order to avoid noise interference, the resistance should be placed close to the pin R-EXT.

TIME SEQUENCE

NOTE: When $\overline{\text{LATCH}}$ is low, latch the data;

When $\overline{\text{LATCH}}$ high, data is is transmitted from input to output of register;

When $\overline{\text{ENABLE}}$ is low, normal response output;

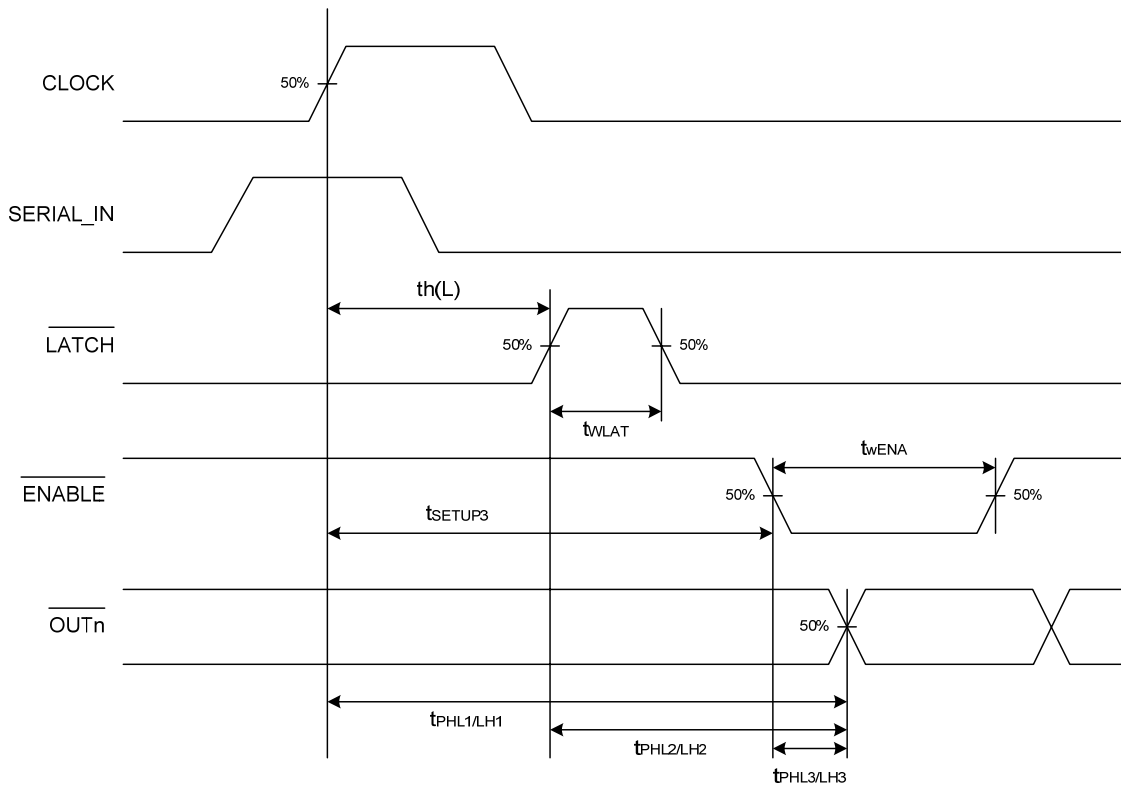

When $\overline{\text{ENABLE}}$ is high, output is not available.

SEQUENCE WAVEFORM

1. Clock, serial-in, serial-out

2. Clock, serial-in, LATCH, ENABLE, OUTn

3. $\overline{\text{OUTn}}$

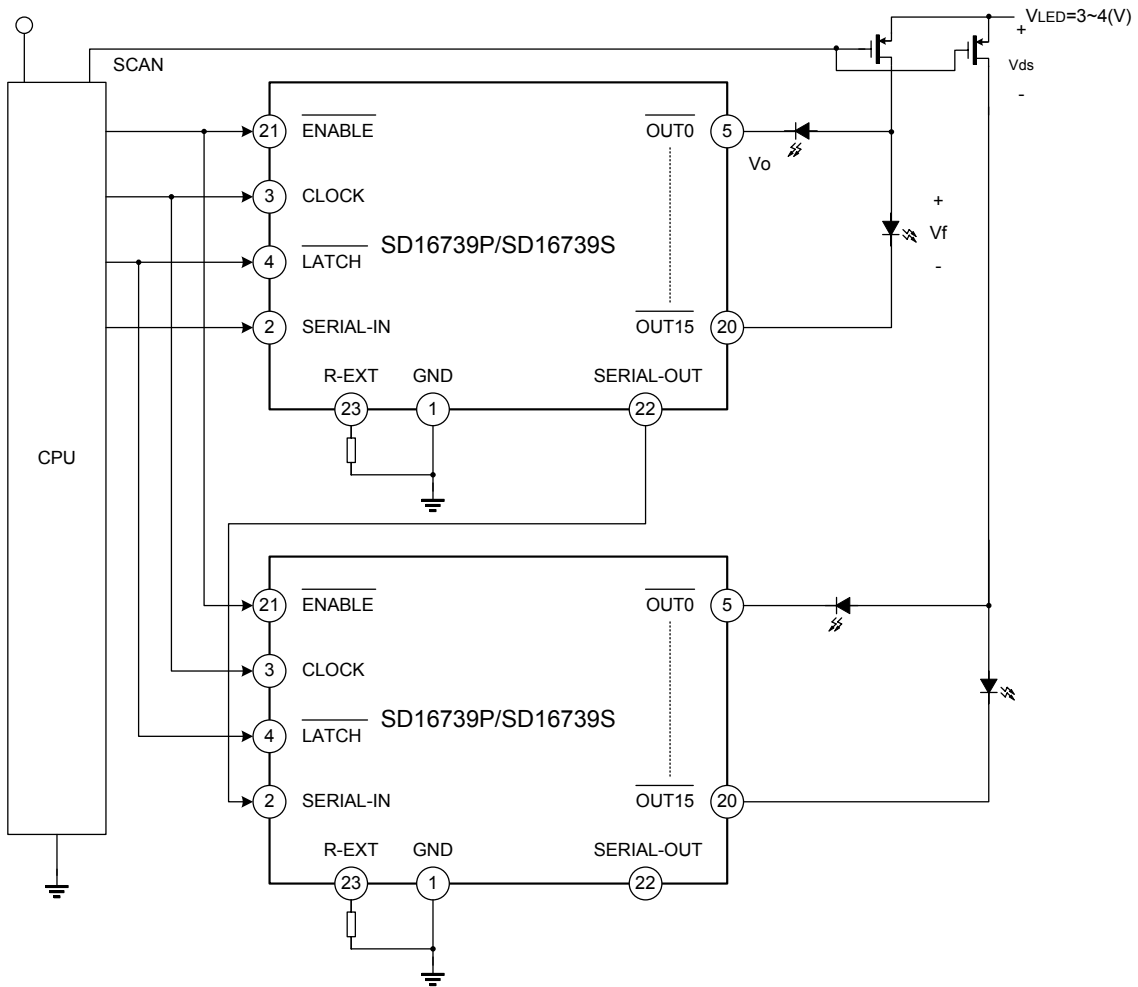

TEST CIRCUIT

For this test circuit, $T_{opr}=25^{\circ}\text{C}$, $V_{DD}=V_{IH}=3.3\text{V}/5\text{V}$, $V_{IL}=0\text{V}$, $R_{EXT}=910\Omega$, $V_L=5.0\text{V}$, $R_L=200\Omega$, $C_L=10\text{pF}$.

TYPICAL APPLICATION CIRCUIT

Note: this circuit and corresponding parameters are just for reference, please set the parameter according to practical circuit.

ELECTRICAL CHARACTERISTIC CURVE

IOUT is given by:

$$I_{OUT} = (V_{R-EXT} / R_{EXT}) \times 15.2; V_{R-EXT} = 1.185V$$

Where, VR-EXT is voltage of R-EXT, and REXT is the resistance of resistor connected to R-EXT.

Power dissipation (PD)

Max. power dissipation is given by: $PD_{(max)} = (T_j - T_a) / R_{th(j-a)}$ and actual power dissipation when 16 channel are all ON is expressed as: $PD_{(act)} = (I_{DD} \times V_{DD}) + (I_{OUT} \times Duty \times V_{CE} \times 16)$.

Hence, to make $PD_{(act)} \leq PD_{(max)}$, output current and duty cycle should be:

$$I_{OUT} = \{ [(T_j - T_a) / R_{th(j-a)}] - (I_{DD} \times V_{DD}) \} / V_{CE} / Duty / 16, \text{ where } T_j = 150^\circ\text{C}.$$

All the parameters are just for reference, please test for your design.

MOS DEVICES OPERATE NOTES:

Electrostatic charges may exist in many things. Please take following preventive measures to prevent effectively the MOS electric circuit as a result of the damage which is caused by discharge:

- The operator must put on wrist strap which should be earthed to against electrostatic.
- Equipment cases should be earthed.
- All tools used during assembly, including soldering tools and solder baths, must be earthed.
- MOS devices should be packed in antistatic/conductive containers for transportation.

Disclaimer :

- Silan reserves the right to make changes to the information herein for the improvement of the design and performance without further notice! Customers should obtain the latest relevant information before placing orders and should verify that such information is complete and current.
- All semiconductor products malfunction or fail with some probability under special conditions. When using Silan products in system design or complete machine manufacturing, it is the responsibility of the buyer to comply with the safety standards strictly and take essential measures to avoid situations in which a malfunction or failure of such Silan products could cause loss of body injury or damage to property.
- Silan will supply the best possible product for customers!
