

MicroPower Hall-Effect Switch

SDC8312/SDC8312A

General Description

SDC8312 is a micropower integrated Hall switch designed to sense the applied magnetic flux density and give a digital output, which indicates the present condition of the magnitude sensed. The typical power consumption is below 10 μ W at 2.7V, so the micropower design is especially suitable for battery-operated systems such as cellular phones or laptop computers, in which power consumption is one major concern. The magnetic switching points are precise and insensitive to process and temperature variations. For SDC8312, the output will be at the "high" level when no magnetic field is applied.

Applications

- Folding, sliding, rotary screen mobile phone
- Notebook computer, digital camera
- Position sensor switch

Features

- Micropower consumption
- 2.4~4.5V power supply
- Chopper amplifier based design: insensitive to noise and offset caused by process variations, operating temperature and mechanical stress
- Switching for both poles of a magnet(Omnipolar)
- Digital output
- CMOS process
- Package: SOT-23-3、TO-92S

Function Description

Power On Reset

Used to detect the power-up ramp and reset the digital circuits to attain correct operation as soon as the power is ready.

Oscillator + Sequencer

The built-in oscillator provides the clock signal, which is taken by the sequencer to determine the periods of the operating mode and the stand-by mode. Typically the operating time is about 60 us and the stand-by time is 75 ms. Using such a clocking scheme, the average power consumption is almost equal to the stand-by mode, which is under 10 uW at 2.7V.

Bias Generator

Bias generator provides precise, temperature and process insensitive current sources for both the Hall plate and chopper amplifier. These current sources in turn guarantee proper operation of the chip and a accurate switching point.

Chopper Amplifier

In order to get a higher resolution, IC uses the chopper amplifier in the design. It can dynamically remove the offset and interference.

Hysteresis Control

This block determines the switching threshold of the Hall switch in different situations.
