

# SG6742ML/MR Highly Integrated Green-Mode PWM Controller

### Features

- High-Voltage Startup
- Low Operating Current: 2.7mA
- Linearly Decreasing PWM Frequency to 22KHz
- Frequency Hopping to Reduce EMI Emission
- Fixed PWM Frequency: 65KHz
- Peak-Current-Mode Control
- Cycle-by-Cycle Current Limiting
- Leading-Edge Blanking
- Synchronized Slope Compensation
- Internal Open-Loop Protection
- GATE Output Maximum Voltage Clamp: 18V
- V<sub>DD</sub> Under-Voltage Lockout (UVLO)
- V<sub>DD</sub> Over-Voltage Protection (OVP)
- Programmable Over-Temperature Protection (OTP)
- Internal Latch Circuit (OVP, OTP)
- Internal Sense Short-Circuit Protection
- Build-in 5ms Soft-Start Function
- Constant Power Limit (Full AC Input Range)
- Internal OTP Sensor with Hysteresis

# Applications

General-purpose switch-mode power supplies and flyback power converters, including:

- Power Adapters
- Open-Frame SMPS

### Description

The highly integrated SG6742ML/MR PWM controller provides several features to enhance the performance of flyback converters.

To minimize standby power consumption, a proprietary green-mode function provides off-time modulation to linearly decrease the switching frequency at light-load conditions. To avoid acoustic-noise problems, the minimum PWM frequency is set above 22KHz. The green-mode function enables the power supply to meet international power conservation requirements. With the internal high-voltage startup circuitry, the power loss due to bleeding resistors is also eliminated. To further reduce power consumption, SG6742ML/MR is manufactured using the BiCMOS process, which allows an operating current of only 2.7mA.

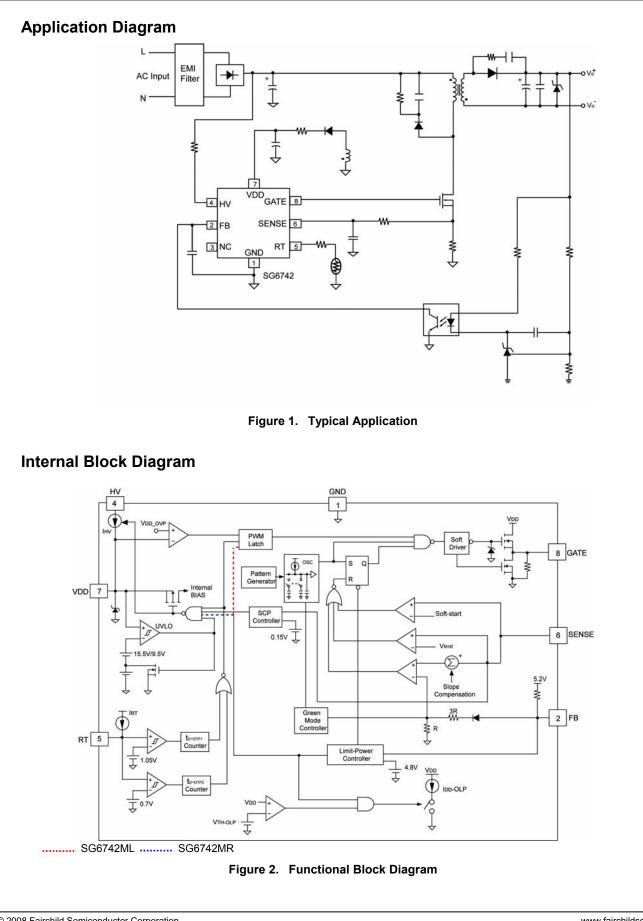

SG6742ML/MR integrates a frequency-hopping function that helps reduce EMI emission of a power supply with minimum line filters. Its built-in synchronized slope compensation achieves stable peak-current-mode control. The proprietary, internal line compensation ensures constant output power limit over a wide AC input voltage range, from  $90V_{AC}$  to  $264V_{AC}$ .

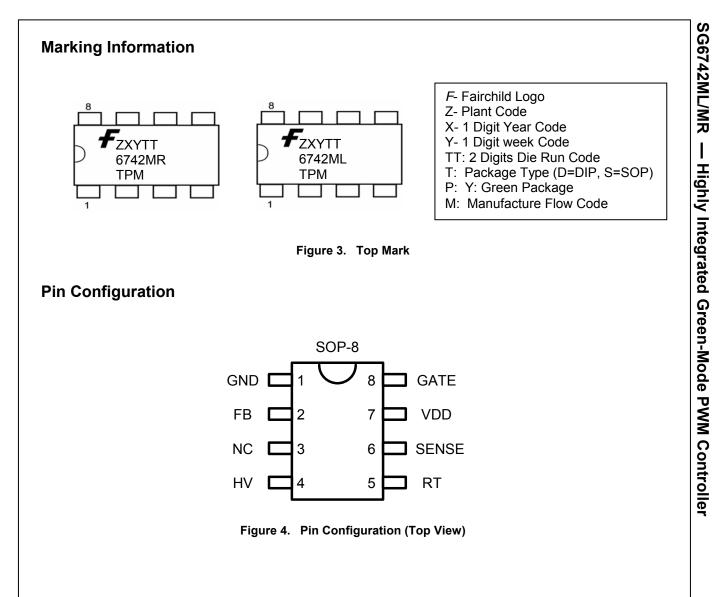

SG6742ML/MR provides many protection functions. In addition to cycle-by-cycle current limiting, the internal open-loop protection circuit ensures safety should an open-loop or output short-circuit failure occur. PWM output is disabled until V<sub>DD</sub> drops below the UVLO lower limit, when the controller starts up again. As long as V<sub>DD</sub> exceeds ~26V, the internal OVP circuit is triggered.

SG6742ML/MR is available in an 8-pin SOP package.

Part Number	Operating Temperature Range	OLP Function	Package	Eco Status	Packing Method
SG6742MLSY	-40 to +105°C	Latch	8-Lead Small Outline Package (SOP)	Green	Tape & Reel
SG6742MRSY	-40 to +105°C	Restart	8-Lead Small Outline Package (SOP)	Green	Tape & Reel

### **Ordering Information**

# **Pin Definitions**

Pin #	Name	Description
1	GND	Ground.
2	FB	The signal from the external compensation circuit is fed into this pin. The PWM duty cycle is determined in response to the signal on this pin and the current-sense signal on the SENSE pin.
3	NC	No connection.
4	HV	For startup, this pin is pulled high to the line input or bulk capacitor via resistors.
5	RT	For over-temperature protection, an external NTC thermistor is connected from this pin to the GND pin. The impedance of the NTC decreases at high temperatures. Once the voltage of the RT pin drops below a fixed limit, PWM output is latched.
6	SENSE	Current sense. The sensed voltage is used for peak-current-mode control and cycle-by-cycle current limiting.
7	VDD	Power supply. The internal protection circuit disables PWM output as long as $V_{\text{DD}}$ exceeds the OVP trigger point.
8	GATE	The totem-pole output driver. Soft driving waveform is implemented for improved EMI.

SG6742ML/MR — Highly Integrated Green-Mode PWM Controller

## **Absolute Maximum Ratings**

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter		Min.	Max.	Unit
V <sub>VDD</sub>	DC Supply Voltage <sup>(1, 2)</sup>			30	V
V <sub>FB</sub>	FB Pin Input Voltage		-0.3	7.0	V
V <sub>SENSE</sub>	SENSE Pin Input Voltage		-0.3	7.0	V
V <sub>RT</sub>	RT Pin Input Voltage		-0.3	7.0	V
V <sub>HV</sub>	HV Pin Input Voltage			500	V
PD	Power Dissipation ( $T_A < 50^{\circ}C$ )			400	mW
$\Theta_{JA}$	Thermal Resistance (Junction-to-Air)			141	°C/W
TJ	Operating Junction Temperature		-40	+125	°C
T <sub>STG</sub>	Storage Temperature Range		-55	+150	°C
TL	Lead Temperature (Wave Soldering	or IR, 10 Seconds)		+260	°C
ESD	Electrostatic Discharge Capability, Human Body Model, JESD22-A114	All Pins Except HV Pin		4	kV
ESD	Electrostatic Discharge Capability, Machine Model, JESD22-A115	All Pins Except HV Pin		200	V

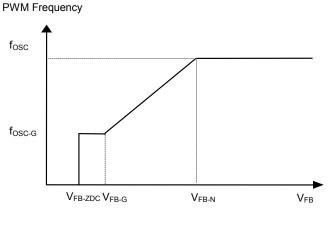

Notes:

1. All voltage values, except differential voltages, are given with respect to the network ground terminal.

2. Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device.

SG6742ML/MR — Highly Integrated Green-Mode PWM Controller

### **Functional Description**

### **Startup Current**

For startup, the HV pin is connected to the line input or bulk capacitor through an external diode and resistor,  $R_{\rm HV}$ , (1N4007 / 100K $\Omega$  recommended). Typical startup current drawn from the HV pin is 2.3mA and charges the hold-up capacitor through the diode and resistor. When the  $V_{\rm DD}$  capacitor level reaches  $V_{\rm DD-ON}$ , the startup current switches off. At this moment, the  $V_{\rm DD}$  capacitor only supplies the SG6742ML/MR to keep the  $V_{\rm DD}$  before the auxiliary winding of the main transformer provides the operating current.

### **Operating Current**

Operating current is around 2.7mA. The low operating current enables better efficiency and reduces the requirement of  $V_{DD}$  hold-up capacitance.

### **Green-Mode Operation**

The proprietary green-mode function provides off-time modulation to reduce the switching frequency in light-load and no-load conditions. The on time is limited for better abnormal or brownout protection.  $V_{FB}$ , which is derived from the voltage feedback loop, is taken as the reference. Once  $V_{FB}$  is lower than the threshold voltage, switching frequency is continuously decreased to the minimum green-mode frequency of around 22KHz.

### **Current Sensing / PWM Current Limiting**

Peak-current-mode control is utilized to regulate output voltage and provide pulse-by-pulse current limiting. The switch current is detected by a sense resistor into the SENSE pin. The PWM duty cycle is determined by this current-sense signal and V<sub>FB</sub>, the feedback voltage. When the voltage on SENSE pin reaches around  $V_{COMP}$ =(V<sub>FB</sub>-0.6)/4, the switch cycle is terminated immediately.  $V_{COMP}$  is internally clamped to a variable voltage around 0.85V for output power limit.

### Leading-Edge Blanking (LEB)

Each time the power MOSFET is switched on, a turn-on spike occurs on the sense-resistor. To avoid premature termination of the switching pulse, a leading-edge blanking time is built in. During this blanking period, the current-limit comparator is disabled and cannot switch off the gate driver.

### **Under-Voltage Lockout (UVLO)**

The turn-on and turn-off thresholds are fixed internally at 15.5V and 9.5V. During startup, the hold-up capacitor must be charged to 15.5V through the startup resistor to enable the IC. The hold-up capacitor continues to supply  $V_{DD}$  before the energy can be delivered from auxiliary winding of the main transformer.  $V_{DD}$  must not drop below 9.5V during startup. This UVLO hysteresis window ensures that hold-up capacitor is adequate to supply  $V_{DD}$  during startup.

### Gate Output / Soft Driving

The BiCMOS output stage is a fast totem-pole gate driver. Cross conduction has been avoided to minimize heat dissipation, increase efficiency, and enhance reliability. The output driver is clamped by an internal 18V Zener diode to protect power MOSFET transistors against undesirable gate over voltage. A soft driving waveform is implemented to minimize EMI.

### Soft-Start

For many applications, it is necessary to minimize the inrush current at startup. The built-in 5ms soft-start circuit significantly reduces the startup current spike and output voltage overshoot.

### **Built-in Slope Compensation**

The sensed voltage across the current-sense resistor is used for peak-current-mode control and pulse-by-pulse current limiting. Built-in slope compensation improves stability and prevents sub-harmonic oscillation. SG6742ML/MR inserts a synchronized, positive-going, ramp at every switching cycle.

### **Constant Output Power Limit**

When the SENSE voltage across sense resistor  $R_s$  reaches the threshold voltage, around 0.9V, the output GATE drive is turned off after a small delay,  $t_{PD}$ . This delay introduces an additional current proportional to  $t_{PD}$ .  $V_{IN} / L_P$ . Since the delay is nearly constant regardless of the input voltage  $V_{IN}$ , higher input voltage results in a larger additional current and the output power limit is higher than under low input line voltage. To compensate this variation for a wide AC input range, a sawtooth power-limiter is designed to solve the unequal power-limit problem. The power limiter is designed as a positive ramp signal fed to the inverting input of the OCP comparator. This results in a lower current limit at high-line inputs than at low-line inputs.

### **V**<sub>DD</sub> Over-Voltage Protection (OVP)

 $V_{\text{DD}}$  over-voltage protection is built in to prevent damage due to abnormal conditions. If the  $V_{\text{DD}}$  voltage is over the over-voltage protection voltage ( $V_{\text{DD-OVP}}$ ) and lasts for  $t_{\text{D-VDDOVP}}$ , the PWM pulses are disabled until the  $V_{\text{DD}}$  voltage drops below the UVLO, then starts again. Over-voltage conditions are usually caused by open feedback loops.

### **Thermal Protection**

An NTC thermistor,  $R_{NTC}$ , in series with resistor  $R_A$ , can be connected from the RT pin to ground. A constant current  $I_{RT}$  is output from the RT pin. The voltage on the RT pin can be expressed as  $V_{RT=}I_{RT} \cdot (R_{NTC} + R_A)$ , where  $I_{RT}$  is 100µA. At high ambient temperatures,  $R_{NTC}$ is smaller, such that  $V_{RT}$  decreases. When  $V_{RT}$  is less than 1.05V ( $V_{RTTH1}$ ), the PWM turns off after 12ms ( $t_{D-OTP1}$ ). If  $V_{RT}$  is less than 0.7V ( $V_{RTTH2}$ ), PWM turns off after 100µs ( $t_{D-OTP2}$ ).

### Functional Description (Continued)

### **Limited Power Control**

The FB voltage increases every time the output of the power supply is shorted or overloaded. If the FB voltage remains higher than a built-in threshold for longer than  $t_{D-OLP}$ , PWM output is turned off. As PWM output is turned off,  $V_{DD}$  begins decreasing.

When  $V_{DD}$  goes below the turn-off threshold (~9.5V) the controller is totally shut down.  $V_{DD}$  is charged up to the turn-on threshold voltage of 15.5V through the startup resistor until PWM output is restarted. This protection feature continues as long as the overloading condition persists. This prevents the power supply from overheating due to overloading conditions. When V<sub>RT</sub> is less than 1.05V (V<sub>RTTH1</sub>), the PWM is turned off after 12ms (t<sub>D-OTP1</sub>). If V<sub>RT</sub> is less than 0.7V (V<sub>RTTH2</sub>), PWM is turned off after 100µs (t<sub>D-OTP2</sub>).

### **Noise Immunity**

Noise on the current sense or control signal may cause significant pulse-width jitter, particularly in continuous-conduction mode. Slope compensation helps alleviate this problem. Good placement and layout practices should be followed. Avoiding long PCB traces and component leads, locating compensation and filter components near the SG6742ML/MR, and increasing the power MOS gate resistance improve performance.
