

## FEATURES

- Linearly decreasing PWM frequency
- Green-mode under light-load and zero-load conditions
- Constant voltage (CV) and constant current (CC)
- No secondary feedback
- Low start-up current (8μA)
- Low operating current (3.6mA)
- Leading-edge blanking
- Constant power limit
- Universal AC input range
- Synchronized slope compensation
- 140°C OTP sensor with hysteresis
- $V_{DD}$  over-voltage clamping
- Cycle-by-cycle current limiting
- Under-voltage lockout (UVLO)
- Fixed PWM frequency with hopping
- Gate output maximum voltage clamped at 17V
- Small SOT-26 package

## APPLICATIONS

Low-power flyback power converters, such as:

- Battery chargers for cellular phones, cordless phones, PDAs, digital cameras, and power tools
- Power adapters for ink jet printers, video game consoles, and portable audio players
- Open-frame SMPS for TV/DVD standby and other auxiliary supplies, home appliances, consumer electronics, and PC 5V standby-power
- Replacements for linear transformers and RCC SMPS

## DESCRIPTION

This highly integrated PWM controller provides several features to enhance the performance of low-power flyback converters. To minimize standby power consumption, the proprietary green-mode function provides off-time modulation to linearly decrease the switching frequency under light-load and zero-load conditions. This green-mode function enables the power supply to meet international power conservation requirements. The supply voltage,  $V_{DD}$ , is also used for feedback compensation, to regulate the output voltage without requiring a conventional TL431 and a photo-coupler. The typical start-up current is only 8μA, while the typical operating current can be as low as 3.6mA. A large start-up resistance could be used to achieve even higher power conversion efficiency. SGP400 integrates a frequency hopping function, which helps reduce EMI emission of a power supply with minimum line filters. Built-in synchronized slope compensation maintains the stability of peak current-mode control. Proprietary internal compensation ensures constant output power limiting over a universal range of AC input voltages, from 90V<sub>AC</sub> to 264V<sub>AC</sub>. Pulse-by-pulse current limiting ensures a constant output current, even if a short-circuit occurs. Also, the internal protection circuit disables PWM output if  $V_{DD}$  exceeds 22.7V. The gate output is clamped at 16.7V to protect the power MOS from over-voltage damage. The built-in over temperature protection (OTP) function shuts down the controller at 140°C with a 30°C hysteresis. The SGP400, designed to provide a low-cost total solution for flyback converters, is available in a small footprint, 6-pin, SOT-26 package.

## PIN CONFIGURATION

## ORDERING INFORMATION

Part Number	PWM Frequency	Pb-Free	Package
SGP400TZ	65KHz		6-Pin SOT-26
SGP400DZ	65KHz		8-Pin DIP-8

## PIN DESCRIPTIONS

Name	Pin No.		Type	Function
	DIP-8	SOT-26		
GATE	1	6	Driver Output	The totem-pole output driver to drive the power MOSFET.
VDD	2	5	Supply	Power supply.
NC	3	NA		NC pin.
SENSE	4	4	Analog Input	Current sense. It senses the voltage across a sensed resistor. To provide over-current protection, PWM output is disabled if the voltage exceeds an internal threshold. This pin also provides current information for current-mode control.
NC	5	3		NC pin.
NC	6	NA		NC pin.
FB	7	2	Analog Input	Feedback. The FB pin provides feedback information to the internal PWM comparator. This feedback is used to control the duty cycle. When no feedback is provided, this pin is left open.
GND	8	1	Supply	Ground.

## TYPICAL CHARACTERISTICS

Low-Power Green-Mode PWM Flyback Power Controller without Secondary Feedback

**SGP400**

## OPERATION DESCRIPTION

SGP400 devices integrate many useful functions for low-power switch-mode power supplies. The following descriptions highlight key features of the SGP400.

### Start-up Current

The required start-up current is only 8 $\mu$ A, which allows a high-resistance, low-wattage start-up resistor to be used to supply the controller's start-up power. A 1.5M $\Omega$ /0.25W start-up resistor can be used over a wide input range (100V-240V AC) with very little power loss.

### Operating Current

The operating current is normally 3.6mA. The low operating current results in higher efficiency and reduces the required  $V_{DD}$  hold-up capacitance. A 10 $\mu$ F/25V  $V_{DD}$  hold-up capacitor can be used over a wide input range (100V-240V AC) with very little power loss.

### Green-Mode Operation

The proprietary green-mode function provides off-time modulation to linearly decrease the switching frequency under light-load and zero-load conditions. The on-time is limited to provide better protection against brownouts and other abnormal conditions.

This green-mode function dramatically reduces power consumption under light-load and zero-load conditions. Power supplies using the SGP400 can easily meet international restrictions regarding standby power consumption.

### Constant Voltage (CV), Constant

### Current (CC) without Feedback

The SGP400 can tightly regulate the output voltage and provide over-current protection without requiring secondary-side feedback signals. For improved CV and CC accuracy, the transformer leakage inductance should be reduced as much as possible.

### Over-Temperature Protection (OTP)

The SGP400 has a built-in temperature sensing circuit to shut down PWM output if the junction temperature exceeds 140°C. While PWM output is shut down, the  $V_{DD}$  voltage gradually drops to the UVLO voltage. Some of the internal circuits are shut down and  $V_{DD}$  gradually starts increasing again. When  $V_{DD}$  reaches 17V, all the internal circuits, including the temperature sensing circuit, start operating normally. If the junction temperature is still higher than 140°C, the PWM controller shuts down immediately. This situation continues until the temperature drops below 110°C. The PWM output is then turned back on. The temperature hysteresis window for the OTP circuit is 30°C.

### $V_{DD}$ Over-Voltage Clamping

$V_{DD}$  over-voltage clamping is built-in to prevent damage from over-voltage conditions. When  $V_{DD}$  exceeds 22.7V, PWM output is shut down. Over-voltage conditions may be caused by an open photo-coupler loop or a short-circuit in the output.

### Oscillator Operation

The oscillation frequency is fixed at 65KHz.

### Leading-Edge Blanking

Each time the power MOSFET switches on, a spike occurs at the sense resistor. To avoid premature termination of the switching pulse, a 310ns leading-edge blanking time is built in. Conventional RC filtering is not necessary. During the blanking period, the current-limit comparator is disabled and cannot switch off the gate drive.

### Constant Output Power Limit

When the SENSE voltage across the sense resistor,  $R_s$ , reaches the threshold voltage (around 1.0V), the output GATE drive is turned off after a small propagation delay  $t_{PD}$ . This propagation delay introduces additional current, proportional to  $t_{PD} \cdot V_{IN} / L_p$ . The propagation delay is nearly constant, regardless of the input line voltage  $V_{IN}$ . Higher input line voltages result in larger additional currents. Under high input-line voltages, the output power limit is higher than under low input-line voltages.

Over a wide range of AC input voltages, the variation can be significant. To compensate for this, the threshold voltage is adjusted by adding a positive ramp ( $V_{LIMIT\_RAMP}$ ). This ramp signal can vary from 0.77V to 1.05V and it flattens out at 1.05V. A smaller threshold voltage forces the output GATE drive to terminate earlier, reducing total PWM turn-on time and making the output power equal to that of the low line input. This proprietary internal compensation feature ensures a constant output power limit over a wide range of AC input voltages ( $90V_{AC}$  to  $264V_{AC}$ ).

### Under-voltage Lockout (UVLO)

The turn-on/turn-off thresholds are fixed internally at 17V/8V. To enable the SGP400 during start-up, the hold-up capacitor must first be charged to 17V through the start-up resistor.

The hold-up capacitor continues to supply  $V_{DD}$  before energy can be delivered from the auxiliary winding of the main transformer.  $V_{DD}$  must not drop below 8V during this start-up process. This UVLO hysteresis window ensures that the hold-up capacitor can adequately supply  $V_{DD}$  during start-up.

### Gate Output

The BiCMOS output stage is a fast totem pole gate driver. Cross-conduction has been avoided to minimize heat dissipation, increase efficiency, and enhance reliability. The output driver is clamped by an internal 17V Zener diode to protect the power MOSFET transistors against any harmful over-voltage gate signals.

### Slope Compensation

The sensed voltage across the current sense resistor is used for current-mode control and pulse-by-pulse current limiting. The built-in slope compensation function improves power supply stability and prevents sub-harmonic oscillations that normally would occur because of peak current mode control. A positively sloped, synchronized ramp is activated with every switching cycle. The slope of the ramp is:

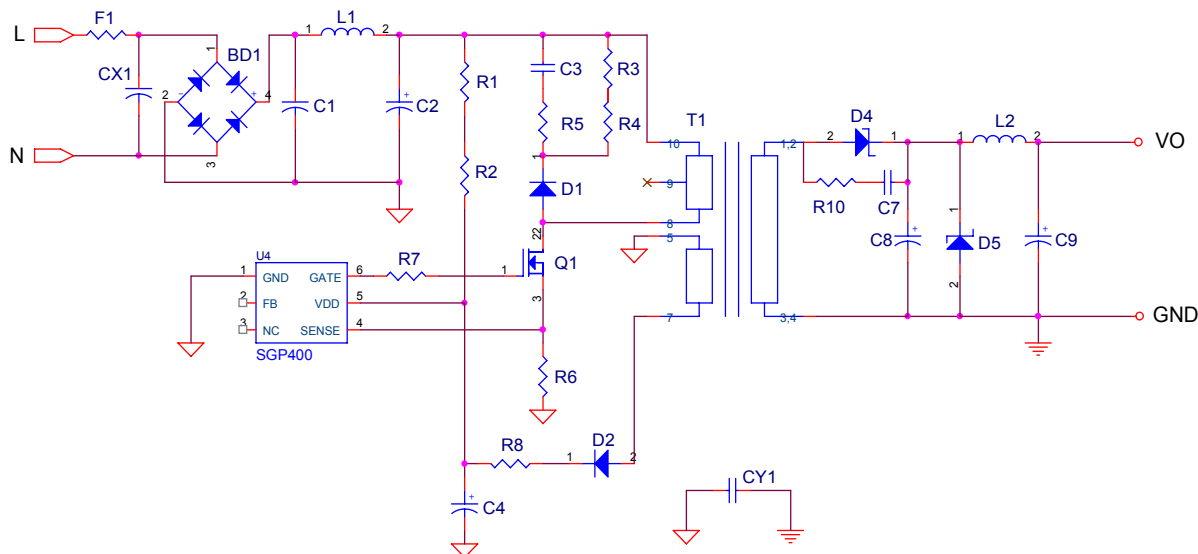

$$\frac{0.33 \times \text{Duty}}{\text{Duty(max)}} \quad (1)$$

### Noise Immunity

Noise from the current sense or the control signal may cause significant pulse-width jitter, particularly in continuous-conduction mode. Slope compensation helps alleviate this problem. Good placement and layout practices should be followed. Avoid long PCB traces and component leads. Compensation and filter components should be located near the SGP400. Finally, increasing the power-MOS gate resistance is advised.
