Revision History

Date	Description
May 25, 2015	Datasheet released.

4GB (512Mx64) DDR3 SDRAM Module - 256Mx8 Based 204-Pin Unbuffered SO-DIMM, Non-ECC

Features

- Standard = JEDEC
- Configuration = Non-ECC
- Number of Module Ranks = 2
- Number of Devices = 16
- $V_{DD} = V_{DDQ} = 1.35V/1.5V$
- $V_{DDSPD} = 3.0V$ to 3.6V
- Cycle Time = 1.25ns
- CAS Latency = 5, 6, 7, 8, 9, 10, 11
- Additive Latency = 0, CL-1, and CL-2
- CAS Write Latency (CWL) = 5, 6, 7, 8
- Burst Length = BC4, BL8, BC4 or BL8 (on the fly)
- Burst Type = Nibble Sequential & Interleave Mode
- Internal Banks per SDRAM = 8
- Refresh = 8K/64ms
- Device Package = Monolithic FBGA
- Lead Finish = $\geq 0.76\mu m$ Gold
- Length x Height = 67.60mm x 30.00mm
- No. of sides = Double-sided
- Mating Connector (Examples)
 - Horizontal = Foxconn - AS0A626-UASN-7F
- ZQ calibration supported
- On chip DLL align DQ, DQS and \overline{DQS} transition with CK transition
- DM write data-in at both the rising and falling edges of the data strobe
- All addresses and control inputs latched on the rising edges of the clock
- Dynamic On Die Termination supported
- Driver strength selected by EMRS
- Asynchronous RESET pin supported
- Write Levelization supported
- 8-bit pre-fetch

Addressing

Device Configuration	256Mx8
Number of Internal Banks	8
Bank Address	BA0 - BA2
Auto precharge	A10/AP
BC switch on the fly	A12/ \overline{BC}
Row Address	A0 - A14
Column Address	A0 - A9
Page size	1KB

Pin Description Table

Symbol	Type	Polarity	Function
$\overline{CK0-CK1}$, CK0-CK1	Input	Differential Crossing	CK and \overline{CK} are differential clock inputs. All the DDR3 SDRAM address/control inputs are sampled on the crossing of the positive edge of CK and the negative edge of \overline{CK} . Output (read) data is referenced to the crossing of CK and \overline{CK} (Both directions of crossing).
CKE0-CKE1	Input	Active High	Activates the SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode, or the Self Refresh mode.
$\overline{CS0-CS1}$	Input	Active Low	Enables the associated SDRAM command decoder when low and disables the command decoder when high. When decoder is disabled, new commands are ignored but previous operations continue. This signal provides for external rank selection on systems with multiple ranks.
ODT0-ODT1	Input	Active High	When high, termination resistance is enabled for all DQ, DQS, \overline{DQS} and DM pins, assuming this function is enabled on the DRAM.
BA0-BA2	Input	-	Selects which SDRAM bank of the eight is activated.

Pin Description Table (Continued)

Symbol	Type	Polarity	Function
A0-A14	Input	-	During a Bank Activate command cycle, address inputs define the row address (RA0-RA14). During a Read or Write command cycle, address inputs define the column address (CA0-CA9). In addition to the column address, AP is used to invoke auto-precharge operation at the end of the burst read or write cycle. If AP is high, auto-precharge is selected and BA0, BA1, BA2 defines the bank to be precharged. If AP is low, auto-precharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0, BA1, BA2 to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0, BA1 or BA2. If AP is low, BA0, BA1 and BA2 are used to define which bank to precharge. A12(\overline{BC}) is sampled during READ and WRITE commands to determine if burst chop (on-the-fly) will be performed (HIGH, no burst chop; LOW, burst chopped).
RAS, CAS, WE	Input	Active Low	RAS, CAS, and WE (along with CS) define the command being entered.
DQ0-DQ63	Input/ Output	-	Data Input/Output pins.
$\overline{DQS0-DQS7}$ DQS0-DQS7	Input/ Output	Differential Crossing	Data strobe for input and output data.
DM0-DM7	Input	Active High	DM is an input mask signal for write data. Input data is masked when DM is sampled high coincident with that input data during a write access. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ and DQS loading.
SA0-SA1	Input	-	These signals are tied at the system to either V_{SS} or V_{DDSPD} to configure the serial SPD EEPROM address range.
SDA	Input/ Output	-	This bidirectional pin is used to transfer data into or out of the SPD EEPROM. An external resistor may be connected from the SDA bus line to V_{DDSPD} to act as a pull-up on the system board.
SCL	Input	-	This signal is used to clock data into and out of the SPD EEPROM. An external resistor may be connected from the SCL bus tied to V_{DDSPD} to act as a pull-up on the system board.
\overline{EVENT}	Output	Active Low	This signal indicates that a thermal event has been detected in the thermal sensing device. The system should guarantee the electrical level requirement is met for the EVENT pin on TS/SPD part. No pull-up resistor is provided on DIMM.
\overline{RESET}	Input	Active Low	Asynchronous Reset is active when \overline{RESET} is LOW, and inactive when \overline{RESET} is HIGH. \overline{RESET} must be HIGH during normal operation. \overline{RESET} is CMOS rail to rail signal with DC high and low at 80% and 20% of V_{DD} .
V_{DD}, V_{SS}	Supply	-	Power and ground for the DDR3 SDRAM input buffers, and core logic. V_{DD} and V_{DDQ} pins are tied to V_{DD}/V_{DDQ} planes on these modules. V_{SS} pins are tied to V_{SS} planes on these modules.
V_{DDQ}	Supply	-	Power supply for the DDR3 SDRAM output buffers to provide improved noise immunity. V_{DDQ} shares the same power plane as V_{DD} pins.
V_{REFDQ}	Supply	-	Reference voltage for I/O inputs.
V_{REFCA}	Supply	-	Reference voltage for address/command inputs.
V_{DDSPD}	Supply	-	Power supply for SPD EEPROM. This supply is separate from the V_{DD}/V_{DDQ} power plane.
V_{TT}	Supply	-	Termination voltage for address/command/control/clock nets.
NC	-	-	No Connect.

Block Diagram (Continued)

Clock Wiring

CK Signals	Clock Wiring
CK0/ $\overline{\text{CK0}}$	8 SDRAMs (U1-U2, U7, U9, U11-U12, U17, U19)
CK1/ $\overline{\text{CK1}}$	8 SDRAMs (U5-U6, U8, U10, U15-U16, U18, U20)

Notes:

1. All address, command and control signal lines are terminated through a 39Ω series resistor to V_{TT} .
2. Data bits may be swapped within a device. However, DQ/DQS/DM relationship must be maintained as shown on page 7.

Physical Dimensions

204-Pin Unbuffered SO-DIMM Module

(All dimensions are in millimeters with ± 0.15 mm tolerance unless specified otherwise.)

Mode Register (MR0) Table Definition

The mode register stores the data for controlling the various operating modes of DDR3 SDRAM. It controls CAS latency, burst length, burst chop, burst sequence, test mode, DLL reset, t_{WR} and various vendor specific options to make DDR3 SDRAM useful for various applications. The mode register is written by asserting low on \overline{CS} , \overline{RAS} , \overline{CAS} , \overline{WE} , BA0, BA1 and BA2 while controlling the state of address pins A0~A15.

Notes:

- BA2 and A13~A15 are reserved for future use and must be programmed to 0 during MRS.
- WR_{min} (write recovery for auto-precharge) in clock cycles is calculated by dividing t_{WR} (in ns) by t_{CK} (in ns) and rounding up to the next integer: $WR_{min} [\text{cycles}] = \text{Round-up} (t_{WR}[\text{ns}] / t_{CK}[\text{ns}])$. The WR value in the mode register must be programmed to be equal or larger than WR_{min} . The programmed WR value is used with t_{RP} to determine t_{DAL} .

Mode Register (MR1) Table Definition

The Mode Registers MR1 stores the data for enabling or disabling the DLL, output driver strength, Rtt_Nom impedance, additive latency, Write Leveling enable, TDQS enable and Qoff. The Mode Register 1 is written by asserting low on CS, RAS, CAS, WE, high on BA0 and low on BA1 and BA2, while controlling the state of address pins A0~A15.

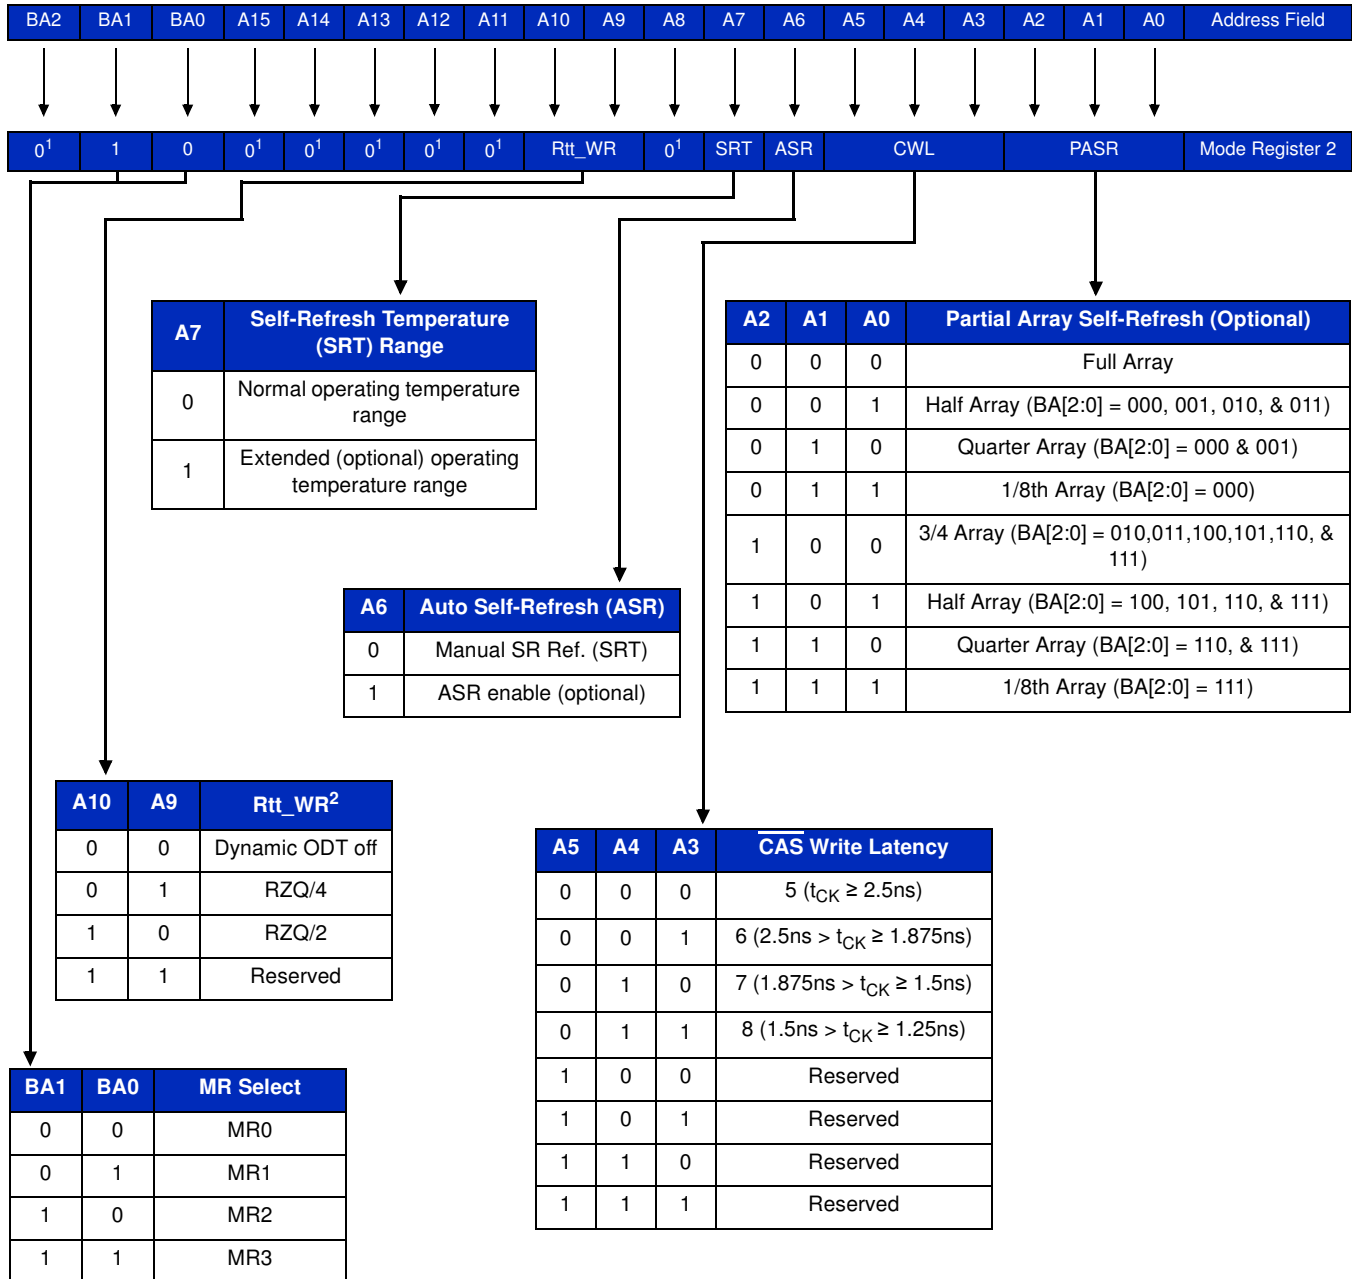

Notes:

1. BA2 and A8, A10, A13~A15 are reserved for future use and must be programmed to 0 during MRS.
2. Outputs disabled - DQs, DQSs, DQSs.
3. In Write Leveling Mode (MR1[bit7] = 1) with MR1[bit12] = 1, all Rtt_Nom settings are allowed; in Write Leveling Mode (MR1[bit7] = 1) with MR1[bit12] = 0, only Rtt_Nom settings of RZQ/2, RZQ/4 and RZQ/6 are allowed.
4. If Rtt_Nom is used during Writes, only the values RZQ/2, RZQ/4 and RZQ/6 are allowed.

Mode Register (MR2) Table Definition

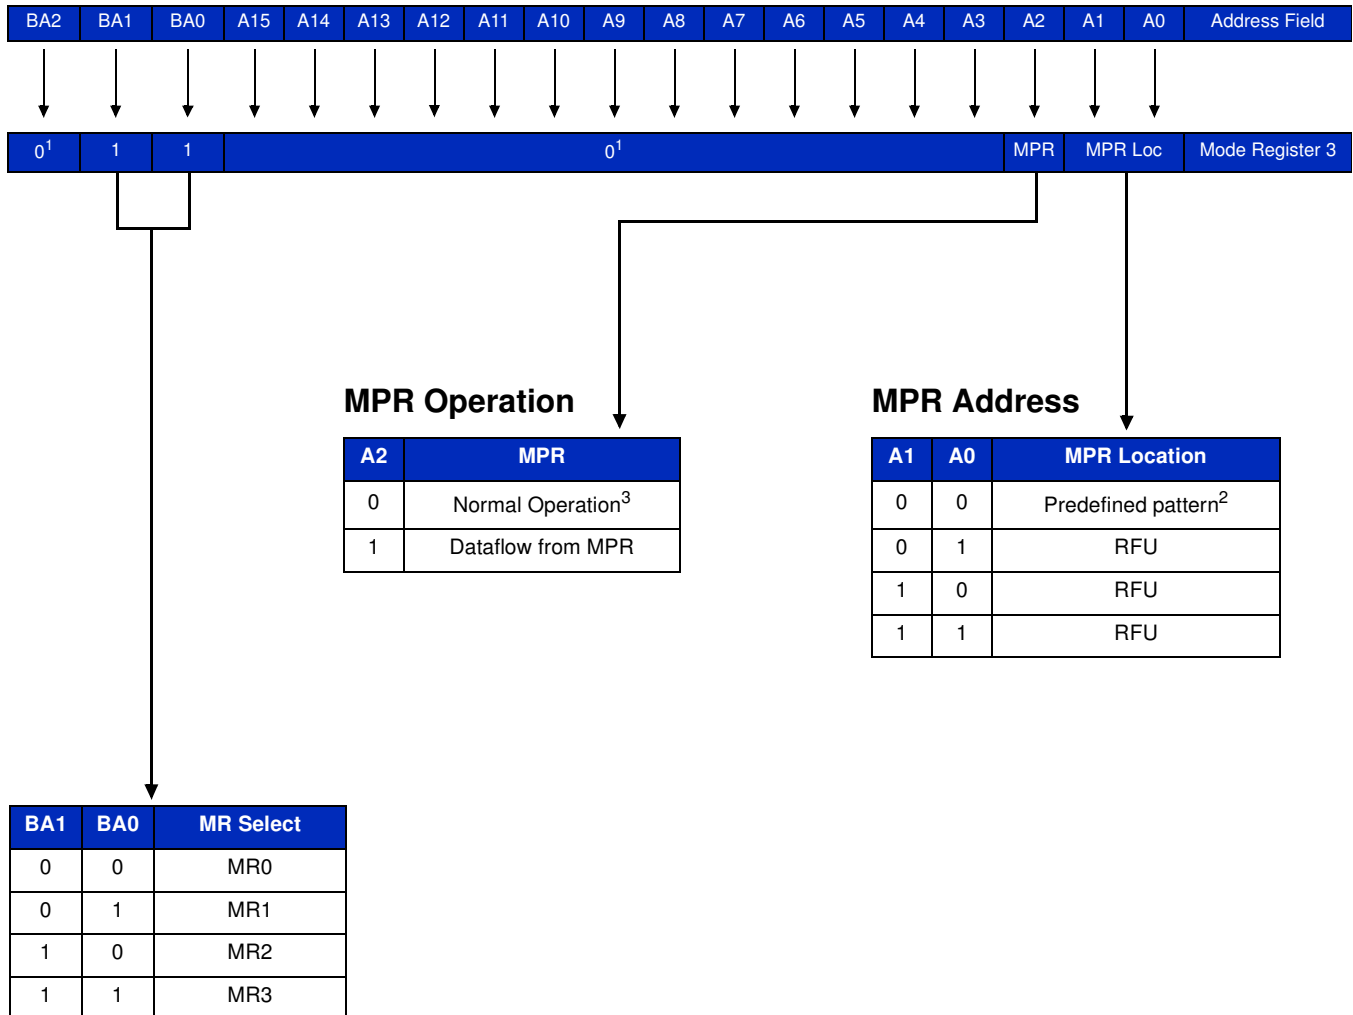

The Mode Registers MR2 stores the data for controlling refresh related features, Rtt_WR impedance, and CAS Write Latency. The Mode Register 2 is written by asserting low on CS, RAS, CAS, WE, high on BA1 and low on BA0 and BA2 while controlling the state of address pins A0~A15.

Notes:

- BA2, A8 and A11~A15 are reserved for future use and must be programmed to 0 during MRS.
- If Rtt_WR value can be applied during writes even when Rtt_Nom is disabled. During Write Leveling, Dynamic ODT is not available.

Mode Register (MR3) Table Definition

The Mode Register MR3 controls Multi-purpose registers. The Mode Register 3 is written by asserting low on \overline{CS} , \overline{RAS} , \overline{CAS} , \overline{WE} , high on BA1 and BA0, low on BA2 while controlling the state of address pins A0~A15.

Notes:

1. BA2, A3~A15 are reserved for future use and must be programmed to 0 during MRS.
2. The predefined pattern will be used for read synchronization.
3. When MPR control is set for normal operation (MR3 A[2] = 0), then MR3 A[1:0] will be ignored.

Command Truth Table

The following Truth Tables provide a general reference of available commands. For a more detailed description please refer to the device data sheets.

- Notes 1- 4 apply to the entire Command Truth Table.
- Note 5 applies to all Read/Write command.

[BA= Bank address, RA= row Address, CA = Column Address, \overline{BC} = Burst chop, X = Don't care, V = Valid]

Command Truth Table

Notes:

1. All DDR3 SDRAM commands are defined by states of \overline{CS} , \overline{RAS} , \overline{CAS} , \overline{WE} , and CKE at the rising edge of the clock. The MSB of BA, RA and CA are device density and configuration dependant.
2. \overline{RESET} command is enabled when Low, which will be used only for asynchronous reset, so \overline{RESET} must be maintained HIGH during any function.
3. Bank addresses (BA) determine which bank is to be operated upon. For (E)MRS, BA selects an (Extended) Mode Register.
4. "V" means "H or L (but a defined logic level)" and "X" means either "defined or undefined (like floating) logic level".
5. Burst reads or writes cannot be terminated or interrupted and Fixed/on-the-Fly BL will be defined by the MRS.
6. The Power-Down Mode does not perform any refresh operation.
7. The state of ODT does not affect the states described in this table. The ODT function is not available during Self-Refresh.
8. Self-Refresh Exit is asynchronous.
9. V_{REF} (Both V_{REFDQ} and V_{REFCA}) must be maintained during Self-Refresh operation.
10. The No Operation command should be used in cases when the DDR3 SDRAM is in an idle or wait state. The purpose of the No Operation command (NOP) is to prevent the DDR3 SDRAM from registering any unwanted commands between operations. A No Operation command will not terminate a previous operation that is still executing, such as a burst read and write cycle.
11. The Deselect command performs the same function as No Operation command.
12. Refer to the CKE Truth Table for more detail with CKE transition.

CKE Truth Table

- Notes 1-7 apply to the entire CKE Truth Table.
- CKE low is allowed only if t_{MRD} and t_{MOD} are satisfied.

CKE Truth Table

Current State	CKE		Command (N) ³ RAS, CAS, WE, CS	Action (N) ³	Notes
	Previous Cycle (N-1)	Current Cycle (N)			
Power-Down	L	L	X	Maintain Power-Down	14, 15

Reading	H	L	Deselect or NOP	Power-Down Entry	11, 13, 14, 17
Writing	H	L	Deselect or NOP	Power-Down Entry	11, 13, 14, 17
Precharging	H	L	Deselect or NOP	Power-Down Entry	11, 13, 14, 17
Refreshing	H	L	Deselect or NOP	Precharge Power-Down Entry	11
All Banks Idle	H	L	Deselect or NOP	Precharge Power-Down Entry	11, 13, 14, 18
		L	Refresh	Self-Refresh	9, 13, 18
For more details with all signals, see Command Truth Table on page 14.					10

Notes:

- CKE (N) is the logic state of CKE at clock edge N; CKE (N-1) was the state of CKE at the previous clock edge.
- Current state is defined as the state of the DDR3 SDRAM immediately prior to clock edge N.
- COMMAND (N) is the command registered at clock edge N, and ACTION (N) is a result of COMMAND (N), ODT is not included here.
- All states and sequences not shown are illegal or reserved unless explicitly described elsewhere in this document.
- The state of ODT does not affect the states described in this table. The ODT function is not available during Self-Refresh.
- CKE must be registered with the same value on t_{CKEmin} consecutive positive clock edges. CKE must remain at the valid input level the entire time it takes to achieve the t_{CKEmin} clocks of registration. Thus, after any CKE transition, CKE may not transition from its valid level during the time period of $t_{IS} + t_{CKEmin} + t_{IH}$.
- Deselect and NOP are defined in the Command Truth Table.
- On Self-Refresh Exit, Deselect or NOP commands must be issued on every clock edge occurring during the t_{XS} period. Read or ODT commands may be issued only after t_{XSDLL} is satisfied.
- Self-Refresh mode can only be entered from the All Banks Idle state.
- Must be a legal command as defined in the Command Truth Table.
- Valid commands for Power-Down Entry and Exit are NOP and Deselect only.
- Valid commands for Self-Refresh Exit are NOP and Deselect only.
- Self-Refresh can not be entered during Read or Write operations.
- The Power-Down does not perform any refresh operations.
- "X" means "don't care" (including floating around V_{REF}) in Self-Refresh and Power-Down. It also applies to Address pins.
- V_{REF} (Both V_{REFDQ} and V_{REFCA}) must be maintained during Self-Refresh operation.
- If all banks are closed at the conclusion of the read, write or precharge command, then Precharge Power-Down is entered, otherwise Active Power-Down is entered.
- "Idle state" is defined as all banks are closed (t_{RP} , t_{DAL} , etc. satisfied), no data bursts are in progress, CKE is high, and all timings from previous operations are satisfied (t_{MRD} , t_{MOD} , t_{RFC} , t_{ZQinit} , t_{ZQoper} , t_{ZQCS} , etc.) as well as all Self-Refresh exit and Power-Down Exit parameters are satisfied (t_{XS} , t_{XP} , t_{XPDLL} , etc.).

Absolute Maximum Ratings

Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Units	Notes
V _{DD}	Voltage on V _{DD} relative to V _{SS}	-0.4 ~ 1.975	V	1, 3
V _{DDQ}	Voltage on V _{DDQ} relative to V _{SS}	-0.4 ~ 1.975	V	1, 3
V _{IN} , V _{OUT}	Voltage on any pin relative to V _{SS}	-0.4 ~ 1.975	V	1
V _{DDSPD}	Voltage on V _{DDSPD} relative to V _{SS}	3.0 ~ 3.6	V	1
T _{STG}	Storage Temperature	-50 to +100	°C	1, 2

Notes:

- Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- Storage Temperature is the case surface temperature on the center/top side of the DRAM.
- V_{DD} and V_{DDQ} must be within 300 mV of each other at all times and V_{REF} must be not greater than 0.6*V_{DDQ}. When V_{DD} and V_{DDQ} are less than 500 mV; V_{REF} may be equal to or less than 300 mV.

Recommended DC Operating Conditions

Symbol	Parameter	Voltage	Rating			Units	Notes
			Min	Typical	Max		
V _{DD}	Supply Voltage	1.35V	1.283	1.35	1.45	V	1, 5
		1.5V	1.425	1.5	1.575	V	1, 4, 5
V _{DDQ}	Supply Voltage for Output	1.35V	1.283	1.35	1.45	V	1, 2, 5
		1.5V	1.425	1.5	1.575	V	1, 2, 4, 5
V _{DDSPD}	SPD Supply Voltage		3.0	3.3	3.6	V	
V _{TT}	Termination Voltage	1.35V	0.6415	0.675	0.725	V	3
		1.5V	0.7125	0.75	0.7875	V	3
V _{SS}	Ground		0	0	0	V	

Notes:

- Under all conditions, V_{DDQ} must be less than or equal to V_{DD}.
- V_{DDQ} tracks with V_{DD}. AC parameters are measured with V_{DD} and V_{DDQ} tied together.
- V_{TT} = V_{DDQ}/2
- 1.35V modules are also operable at 1.5V. If set for 1.5V operation, the module will follow the timing parameters for 1.5V operation.
- Once initialized for operation, the voltage can only be changed by putting the module into RESET.

Operating Temperature Range

Symbol	Parameter	Range	Units	Notes
T _{OPER}	Normal Operating Temperature Range (Case)	0 to 95	°C	1, 2, 3

Notes:

- Operating Temperature T_{OPER} is the case surface temperature on the center/top side of the DRAM.
- The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0 °C and 85 °C under all operating conditions.
- Some applications require operation of the DRAM between 85 °C and 95 °C case temperature. Full specifications are supported in this range, but the following additional conditions apply:
 - Refresh commands must be doubled in frequency, therefore reducing the Refresh interval t_{REFI} to 3.9µs. It is also possible to specify a component with 1X refresh (t_{REFI} to 7.8µs) in the Extended Temperature Range. Please refer to the SPD for option availability.
 - If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b) or enable the optional Auto Self-Refresh mode (MR2 A6 = 1b and MR2 A7 = 0b). Please refer to the SPD for option availability.

Temperature Sensor Characteristics³

Symbol	Description	Test Condition ¹	Typical ²	Max	Units
JEDEC B-Grade	Accuracy for corresponding range 3.0 V ≤ V _{DDSPD} ≤ 3.6 V	+75 °C ≤ T _{AMB} ≤ +95 °C	±0.5	±1	°C
		+40 °C ≤ T _{AMB} ≤ +125 °C	±1	±2	°C
		-40 °C ≤ T _{AMB} ≤ +125 °C	±2	±3	°C

Notes:

- Guaranteed ambient operating temperature: T_{AMB} = -40 °C to 125 °C (except where noted).
- Typical numbers taken at V_{DDSPD} = 3.3 V, T_{AMB} = 25 °C.
- The temperature sensor may not be installed on all modules. Check the block diagram to determine if it is installed.

Refresh Parameters

Parameter	Symbol	2Gb	Units
REF command to ACT or REF command time	t _{RFC}	160	ns
Average periodic refresh interval	t _{REFI}	0 °C ≤ T _{CASE} ≤ 85 °C	7.8
		85 °C ≤ T _{CASE} ≤ 95 °C	3.9

AC and DC Logic Input Levels for Single-Ended Signals

Symbol	Parameter	DDR3L-1600		Units	Notes
		Min	Max		
1.35V					
V_{IH} (DC90)	DC input logic high	$V_{REF} + 0.090$	V_{DD}	V	1
V_{IL} (DC90)	DC input logic low	V_{SS}	$V_{REF} - 0.090$	V	1
V_{IH} (AC160)	AC input logic high	$V_{REF} + 0.160$	Note 2	V	1, 4
V_{IL} (AC160)	AC input logic low	Note 2	$V_{REF} - 0.160$	V	1, 4
V_{IH} (AC135)	AC input logic high	$V_{REF} + 0.135$	Note 2	V	1
V_{IL} (AC135)	AC input logic low	Note 2	$V_{REF} - 0.135$	V	1
$V_{REFCA}(DC)$	Reference voltage for ADD/CMD inputs	$0.49 \cdot V_{DD}$	$0.51 \cdot V_{DD}$	V	3
1.5V					
V_{IH} (DC100)	DC input logic high	$V_{REF} + 0.100$	V_{DD}	V	1
V_{IL} (DC100)	DC input logic low	V_{SS}	$V_{REF} - 0.100$	V	1
V_{IH} (AC175)	AC input logic high	$V_{REF} + 0.175$	Note 2	V	1, 4
V_{IL} (AC175)	AC input logic low	Note 2	$V_{REF} - 0.175$	V	1, 4
V_{IH} (AC150)	AC input logic high	$V_{REF} + 0.150$	Note 2	V	1
V_{IL} (AC150)	AC input logic low	Note 2	$V_{REF} - 0.150$	V	1
$V_{REFCA}(DC)$	Reference voltage for ADD/CMD inputs	$0.49 \cdot V_{DD}$	$0.51 \cdot V_{DD}$	V	3

Notes:

1. For Command and Address signals except RESET#, $V_{REF} = V_{REFCA}$. For DQ and DM, $V_{REF} = V_{REFDQ}$.
2. Refer to AC Overshoot and Undershoot Specifications for Address/Control Pins on page 21.
3. The AC peak noise on V_{REF} may not allow V_{REF} to deviate from $V_{REF(DC)}$ by more than $\pm 1\% V_{DD}$ (for reference: approximately $\pm 15mV$).
4. Applies to Command and Address signals only.

Differential Swing Requirements for Clock (CK/ $\overline{\text{CK}}$) and Strobe (DQS/ $\overline{\text{DQS}}$)

Symbol	Parameter	DDR3L-1600		Units	Notes
		Min	Max		
1.35V					
V_{IHDIFF}	Differential input logic high	0.180	Note 3	V	1
V_{ILDIFF}	Differential input logic high	Note 3	-0.180	V	1
$V_{\text{IHDIFF(AC)}}$	AC input logic high	$2 * (V_{\text{IH(AC)}} - V_{\text{REF}})$	Note 3	V	2
$V_{\text{ILDIFF(AC)}}$	AC input logic low	Note 3	$2 * (V_{\text{REF}} - V_{\text{IL(AC)}})$	V	2
1.5V					
V_{IHDIFF}	Differential input logic high	0.200	Note 3	V	1
V_{ILDIFF}	Differential input logic high	Note 3	-0.200	V	1
$V_{\text{IHDIFF(AC)}}$	AC input logic high	$2 * (V_{\text{IH(AC)}} - V_{\text{REF}})$	Note 3	V	2
$V_{\text{ILDIFF(AC)}}$	AC input logic low	Note 3	$2 * (V_{\text{REF}} - V_{\text{IL(AC)}})$	V	2

Notes:

- Used to define a differential signal slew-rate.
- For CK/ $\overline{\text{CK}}$, use $V_{\text{IH}}/V_{\text{IL(AC)}}$ of ADD/CMD and V_{REFCA} ; for DQS/ $\overline{\text{DQS}}$, use $V_{\text{IH}}/V_{\text{IL(AC)}}$ of DQs and V_{REFDQ} ; if a reduced AC-high or AC-low level is used for a signal group, then the reduced level applies also here.
- These values are not defined, however the single-ended signals CK, $\overline{\text{CK}}$, DQS, $\overline{\text{DQS}}$ need to be within the respective limits ($V_{\text{IH(DC)max}}$, $V_{\text{IL(DC)min}}$) for single-ended signals as well as the limitations for overshoot and undershoot. Refer to AC Overshoot/Undershoot Specification for Clock, Data, Strobe and Mask Pins on page 21.

AC Overshoot/Undershoot Specification for Address/Control Pins

Parameter	DDR3L-1600	Units
Maximum peak amplitude allowed for overshoot area.	0.4	V
Maximum peak amplitude allowed for undershoot area.	0.4	V
Maximum overshoot area above V_{DD} .	0.33	V-ns
Maximum undershoot area under V_{SS} .	0.33	V-ns
(A0-A15, BA0-BA2, CS, RAS, CAS, WE, CKE, ODT)		

AC Overshoot/Undershoot Specification for Clock, Data, Strobe and Mask Pins

Parameter	DDR3L-1600	Units
Maximum peak amplitude allowed for overshoot area.	0.4	V
Maximum peak amplitude allowed for undershoot area.	0.4	V
Maximum overshoot area above V_{DD} .	0.13	V-ns
Maximum undershoot area under V_{SS} .	0.13	V-ns
(CK, CK#, DQ, DQS, DQS#, DM)		

Device Standard Speed Bins

	CWL = 8		Reserved		ns	4
CL = 11	CWL = 5, 6, 7	$t_{CK(avg)}$	Reserved		ns	4
	CWL = 8		1.25	< 1.5	ns	1, 2, 3
Supported CL Settings		5, 6, 7, 8, 9, 10, 11		n_{CK}		
Supported CWL Settings		5, 6, 7, 8		n_{CK}		

Speed Bin Tables Notes

1. The CL setting and CWL setting result in $t_{CK(AVG)min}$ and $t_{CK(AVG)max}$ requirements. When making a selection of $t_{CK(AVG)}$, both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting.
2. $t_{CK(AVG)min}$ limits: Since \overline{CAS} Latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard $t_{CK(AVG)}$ value (3.0ns, 2.5ns, 1.875ns, 1.5ns, or 1.25ns) when calculating CL [nCK] = t_{AA} [ns] / $t_{CK(AVG)}$ [ns], rounding up to the next 'Supported CL', where $t_{CK(AVG)} = 3.0ns$ should only be used for CL = 5 calculation.
3. $t_{CK(AVG)max}$ limits: Calculate $t_{CK(AVG)} = t_{AA,max} / CL$ SELECTED and round the resulting $t_{CK(AVG)}$ down to the next valid speed bin (i.e. 3.0ns, 2.5ns, 1.875ns, 1.5ns, or 1.25ns). This result is $t_{CK(AVG)max}$ corresponding to CL SELECTED.
4. 'Reserved' settings are not allowed. User must program a different value.
5. Any DDR3-1600 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
6. In order to support down binning to CL=7 and CL=9, $t_{AA}/t_{RCD}/t_{RPmin}$ must be 13.125 ns or lower. SPD settings must be programmed to match. For example, DDR3-1600-11-11-11 devices supporting down binning to DDR3-1333-9-9-9 or DDR3-1066-7-7-7 should program 13.125 ns in SPD bytes for t_{AAmin} (Byte16), t_{RCDmin} (Byte 18), and t_{RPmin} (Byte 20). Once t_{RP} (Byte 20) is programmed to 13.125ns, t_{RCmin} (Bytes 21 & 23) also should be programmed accordingly ($t_{RASmin} + t_{RPmin} = 35 ns + 13.125 ns = 48.125ns$).
7. DDR3-800 AC timing apply if DRAM operates at lower than 800 MT/s data rate.

Device Timing Parameters by Speed Bin

Parameter	Symbol	DDR3L-1600		Units	Notes
		Min	Max		
Clock Timing					
Minimum clock cycle time (DLL off mode)	$t_{CK(DLL_OFF)}$	8	-	t_{CK}	6
Average clock period	$t_{CK(avg)}$	Refer to Speed Bin on page 22.		ps	
Average high pulse width	$t_{CH(avg)}$	0.47	0.53	$t_{CK(avg)}$	
Average low pulse width	$t_{CL(avg)}$	0.47	0.53	$t_{CK(avg)}$	
Absolute clock period	$t_{CK(abs)}$	$t_{CK(avg)min} + t_{JIT(per)min}$	$t_{CK(avg)max} + t_{JIT(per)max}$	ps	
Absolute clock high pulse width	$t_{CH(abs)}$	0.43	-	$t_{CK(avg)}$	25
Absolute clock low pulse width	$t_{CL(abs)}$	0.43	-	$t_{CK(avg)}$	26
Clock period jitter	$t_{JIT(per)}$	-70	70	ps	
Clock period jitter during DLL locking period	$t_{JIT(per, lck)}$	-60	60	ps	
Cycle to cycle period jitter	$t_{JIT(CC)}$	140		ps	
Cycle to cycle period jitter during DLL locking period	$t_{JIT(CC, lck)}$	120		ps	
Duty cycle jitter	$t_{JIT(duty)}$	-	-	ps

Write Leveling Timing					
First DQS/DQS rising edge after write leveling mode is programmed	t _{WLMRD}	40	-	nCK	3
DQS/DQS delay after write leveling mode is programmed	t _{WLDQSEN}	25	-	nCK	3
Write leveling setup time from rising CK, CK crossing to rising DQS, DQS crossing	t _{WLS}	165	-	ps	
Write leveling hold time from rising DQS, DQS crossing to rising CK, CK crossing	t _{WLH}	165	-	ps	
Write leveling output delay	t _{WLO}	0	7.5	ns	
Write leveling output error	t _{WLOE}	0	2	ns	

Device Timing Parameters Notes

1. Actual value dependant upon measurement level definitions which are TBD.
2. Commands requiring a locked DLL are: READ (and RAP) and synchronous ODT commands.
3. The max values are system dependent.
4. WR as programmed in the Mode Register.
5. Value must be rounded-up to next higher integer value.
6. There is no maximum cycle time limit besides the need to satisfy the refresh interval, t_{REFI} .
7. Minimum RTT turn-on time (t_{AONmin}) is the point in time when the device leaves high impedance and ODT resistance begins to turn on. Maximum RTT turn on time (t_{AONmax}) is the point in time when the ODT resistance is fully on. Both are measured from ODTLon.
8. Minimum RTT turn-off time (t_{AOFmin}) is the point in time when the device starts to turn off the ODT resistance. Maximum RTT turn off time (t_{AOFmax}) is the point in time when the on-die termination has reached high impedance. Both are measured from ODTLoff.
9. t_{WR} is defined in ns, for calculation of t_{WRPDEN} it is necessary to round up t_{WR} / t_{CK} to the next integer.
10. WR is in clock cycles as programmed in MR0.
11. The maximum postamble is bound by $t_{HZDQS(max)}$.
12. Output timing deratings are relative to the SDRAM input clock. When the device is operated with input clock jitter, this parameter needs to be derated by TBD.
13. Value is only valid for RON34.
14. Single ended signal parameter.
15. t_{REFI} depends on T_{OPER} .
16. $t_{IS(base)}$ and $t_{IH(base)}$ values are for 1V/ns CMD/ADD single-ended slew rate and 2V/ns CK, \overline{CK} differential slew rate. Note for DQ and DM signals, $V_{REF(DC)} = V_{REFDQ(DC)}$. For input only pins except \overline{RESET} , $V_{REF(DC)} = V_{REFCA(DC)}$.
17. $t_{DS(base)}$ and $t_{DH(base)}$ values are for 1V/ns DQ single-ended slew rate and 2V/ns DQS, \overline{DQS} differential slew rate. Note for DQ and DM signals, $V_{REF(DC)} = V_{REFDQ(DC)}$. For input only pins except \overline{RESET} , $V_{REF(DC)} = V_{REFCA(DC)}$.
18. Start of internal write transaction is defined as follows:
19. For BL8 (fixed by MRS and on- the-fly): Rising clock edge 4 clock cycles after WL.
20. For BC4 (on- the- fly): Rising clock edge 4 clock cycles after WL.
21. For BC4 (fixed by MRS): Rising clock edge 2 clock cycles after WL.
22. The maximum preamble is bound by $t_{LZDQS(min)}$.
23. CKE is allowed to be registered low while operations such as row activation, precharge, auto-precharge or refresh are in progress, but power-down IDD spec will not be applied until finishing those operations.
24. Although CKE is allowed to be registered LOW after a REFRESH command once $t_{REFPDEN(min)}$ is satisfied, there are cases where additional time such as $t_{XPDLL(min)}$ is also required.
25. Defined between end of MPR read burst and MRS which reloads MPR or disables MPR function.
26. One ZQCS command can effectively correct a minimum of 0.5% (ZQCorrection) of RON and RTT impedance error within 64 nCK for all speed bins assuming the maximum sensitivities specified in the 'Output Driver Voltage and Temperature Sensitivity' and 'ODT Voltage and Temperature Sensitivity' tables. The appropriate interval between ZQCS commands can be determined from these tables and other application-specific parameters.
27. One method for calculating the interval between ZQCS commands, given the temperature ($T_{driftrate}$) and voltage ($V_{driftrate}$) drift rates that the SDRAM is subject to in the application, is illustrated. The interval could be defined by the following formula:

$$\frac{ZQCorrection}{(TSens \times T_{driftrate}) + (VSens \times V_{driftrate})}$$

28. where $TSens = \max(dRTTdT, dRONdTM)$ and $VSens = \max(dRTTdV, dRONdVM)$ define the SDRAM temperature and voltage sensitivities.
29. For example, if $TSens = 1.5\% / ^\circ C$, $VSens = 0.15\% / mV$, $T_{driftrate} = 1 ^\circ C / sec$ and $V_{driftrate} = 15 mV / sec$, then the interval between ZQCS commands is calculated as:

$$\frac{0.5}{(1.5 \times 1) + (0.15 + 15)} = 0.133 \approx 128 ms$$

30. $n =$ from 13 cycles to 50 cycles. This row defines 38 parameters.
31. $t_{CH(abs)}$ is the absolute instantaneous clock high pulse width, as measured from one rising edge to the following falling edge.
32. $t_{CL(abs)}$ is the absolute instantaneous clock low pulse width, as measured from one falling edge to the following rising edge.
33. The $t_{IS(base)}$ AC150 specifications are adjusted from the $t_{IS(base)}$ specification by adding an additional 100 ps of derating to accommodate for the lower alternate threshold of 150 mV and another 25 ps to account for the earlier reference point $[(175mV - 150mV) / 1 V/ns]$.
34. Pulse width of a input signal is defined as the width between the first crossing of V_{REFDC} and the consecutive crossing of V_{REFDC} .

Jitter Notes

- a. When the device is operated with input clock jitter, this parameter needs to be derated by the actual $t_{ERR(mper)act}$ of the input clock, where $2 \leq m \leq 12$. (Output deratings are relative to the SDRAM input clock.)

For example, if the measured jitter into a DDR3-800 SDRAM has $t_{ERR(mper)act, min} = -172$ ps and $t_{ERR(mper)act, max} = +193$ ps, then $t_{DQSCkmin} (derated) = t_{DQSCkmin} - t_{ERR(mper)act, max} = -400$ ps - 193 ps = -593 ps and $t_{DQSCkmax} (derated) = t_{DQSCkmax} - t_{ERR(mper)act, min} = 400$ ps + 172ps = +572ps. Similarly, $t_{LZ(DQ)}$ for DDR3-800 derates to $t_{LZ(DQ)min} (derated) = -800$ ps - 193 ps = -993 ps and $t_{LZ(DQ)max} (derated) = 400$ ps + 172ps = +572ps. (Caution on the min/max usage!)

Note that $t_{ERR(mper)act, min}$ is the minimum measured value of $t_{ERR(nper)}$ where $2 \leq n \leq 12$, and $t_{ERR(mper)act, max}$ is the maximum measured value of $t_{ERR(nper)}$ where $2 \leq n \leq 12$.

- b. When the device is operated with input clock jitter, this parameter needs to be derated by the actual $t_{JIT(per)act}$ of the input clock. (Output deratings are relative to the SDRAM input clock.)

For example, if the measured jitter into a DDR3-800 SDRAM has $t_{CK(avg)act} = 2500$ ps, $t_{JIT(per)act, min} = -72$ ps and $t_{JIT(per)act, max} = +93$ ps, then $t_{RPREmin} (derated) = t_{RPREmin} + t_{JIT(per)act, min} = 0.9 \times t_{CK(avg)act} + t_{JIT(per)act, min} = 0.9 \times 2500$ ps - 72 ps = +2178 ps. Similarly, $t_{QHmin} (derated) = t_{QHmin} + t_{JIT(per)act, min} = 0.38 \times t_{CK(avg)act} + t_{JIT(per)act, min} = 0.38 \times 2500$ ps - 72 ps = +878 ps. (Caution on the min/max usage!)

- c. These parameters are measured from a data strobe signal (DQS, \overline{DQS}) crossing to its respective clock signal (CK, \overline{CK}) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. $t_{JIT(per)}$, $t_{JIT(CC)}$, etc.), as these are relative to the clock signal crossing. That is, these parameters should be met whether clock jitter is present or not.

- d. These parameters are measured from a data signal ($DM, DQ0, DQ1, etc.$) transition edge to its respective data strobe signal (DQS, \overline{DQS}) crossing.

- e. For these parameters, the DDR3 SDRAM device supports $t_{nPARAM} [nCK] = RU \{t_{PARAM} [ns] / t_{CK(avg)} [ns]\}$, which is in clock cycles, assuming all input clock jitter specifications are satisfied. For example, the device will support $t_{nRP} = RU \{t_{RP} / t_{CK(avg)}\}$, which is in clock cycles, if all input clock jitter specifications are met. This means: For DDR3-800 6-6-6, of which $t_{RP} = 15$ ns, the device will support $t_{nRP} = RU \{t_{RP} / t_{CK(avg)}\} = 6$, as long as the input clock jitter specifications are met, i.e. Precharge command at T_m and Active command at T_m+6 is valid even if $(T_m+6 - T_m)$ is less than 15 ns due to input clock jitter.

Definitions for IDD Measurement Conditions

- “0” and “LOW” is defined as $V_{IN} \leq V_{ILAC(max)}$.
- “1” and “HIGH” is defined as $V_{IN} \geq V_{IHAC(min)}$.
- “MID-LEVEL” is defined as inputs that are $V_{REF} = V_{DD}/2$.
- Timings used for IDD and IDDQ Measurement-Loop Patterns are provided in IDD and IDDQ Measurement-Loop Patterns Timing above.
- Basic IDD and IDDQ Measurement Conditions are described in IDD Measurement Conditions on pages 33-34.
- Detailed IDD and IDDQ Measurement-Loop Patterns are described in IDD Measurement-Loop Patterns on pages 36-41.
- IDD Measurements are done after properly initializing the DDR3 SDRAM. This includes but is not limited to setting:
 - RON = RZQ/7 (34 Ohm in MR1);
 - Qoff = 0_B (Output Buffer enabled in MR1);
 - RTT_Nom = RZQ/6 (40 Ohm in MR1);
 - RTT_Wr = RZQ/2 (120 Ohm in MR2);
 - TDQS Feature disabled in MR1.
- **Attention:** The IDD and IDDQ Measurement-Loop Patterns need to be executed at least one time before actual IDD or IDDQ measurement is started.
- Define $\underline{D} = \{\underline{CS}, \underline{RAS}, \underline{CAS}, \underline{WE}\} = \{\text{HIGH}, \text{LOW}, \text{LOW}, \text{LOW}\}$
- Define $\underline{D} = \{\underline{CS}, \underline{RAS}, \underline{CAS}, \underline{WE}\} = \{\text{HIGH}, \text{HIGH}, \text{HIGH}, \text{HIGH}\}$

IDD Measurement Conditions

Symbol	Description	Conditions
I _{DD0}	Operating One Bank Active-Precharge Current	CKE: High; External clock: On; t _{CK} , nRC, nRAS, CL: See IDD and IDDQ Timings on page 32; BL: 8 ¹ ; AL: 0; \overline{CS} : High between ACT and PRE; Command, Address, Bank Address Inputs: partially toggling according to IDD0 Measurement-Loop Pattern on page 36; Data I/O: MID-LEVEL; DM: stable at 0; Bank Activity: Cycling with one bank active at a time: 0,0,1,1,2,2,... (See IDD0 Measurement-Loop Pattern on page 36); Output Buffer and RTT: Enabled in Mode Registers ² ; ODT Signal: stable at 0; Pattern Details: See IDD0 Measurement-Loop Pattern on page 36.
I _{DD1}	Operating One Bank Active-Read-Precharge Current	CKE: High; External clock: On; t _{CK} , nRC, nRAS, nRCD, CL: See IDD and IDDQ Timings on page 32; BL: 8 ^{1,6} ; AL: 0; \overline{CS} : High between ACT, RD and PRE; Command, Address, Bank Address Inputs, Data I/O: partially toggling according to IDD1 Measurement-Loop Pattern on page 37; DM: stable at 0; Bank Activity: Cycling with one bank active at a time: 0,0,1,1,2,2,... (See IDD4R Measurement-Loop Pattern on page 39); Output Buffer and RTT: Enabled in Mode Registers ² ; ODT Signal: stable at 0; Pattern Details: See IDD4R Measurement-Loop Pattern on page 39.
I _{DD4W}	Operating Burst Write Current	CKE: High; External clock: On; t _{CK} , CL: See IDD and IDDQ Timings on page 32; BL: 8 ¹ ; AL: 0; \overline{CS} : High between WR; Command, Address, Bank Address Inputs: partially toggling according to IDD4W Measurement-Loop Pattern on page 39; Data I/O: seamless write data burst with different data between one burst and the next one according to IDD4W Measurement-Loop Pattern on page 39; DM: stable at 0; Bank Activity: all banks open, WR commands cycling through banks: 0,0,1,1,2,2,... (See IDD4W Measurement-Loop Pattern on page 39); Output Buffer and RTT: Enabled in Mode Registers ² ; ODT Signal: stable at HIGH; Pattern Details: See IDD4W Measurement-Loop Pattern on page 39.

IDD Measurement Conditions (Continued)

Symbol	Description	Conditions
I _{DD5B}	Burst Refresh Current	CKE: High; External clock: On; t _{CK} , CL, nRFC: See IDD and IDDQ Timings on page 32; BL: 8 ¹ ; AL: 0; \overline{CS} : High between REF; Command, Address, Bank Address Inputs: partially toggling according to IDD5B Measurement-Loop Pattern on page 40; Data I/O: MID-LEVEL; DM: stable at 0; Bank Activity: REF command every nRFC (See IDD5B Measurement-Loop Pattern on page 40); Output Buffer and RTT: Enabled in Mode Registers ² ; ODT Signal: stable at 0; Pattern Details: See IDD5B Measurement-Loop Pattern on page 40.
I _{DD6}	Self-Refresh Current: Normal Temperature Range	T _{CASE} : 0 °C - 85 °C; Auto Self-Refresh (ASR): Disabled ⁴ ; Self-Refresh Temperature Range (SRT): Normal ⁵ ; CKE: Low; External clock: Off; CK and CK#: LOW; CL: See IDD and IDDQ Timings on page 32; BL: 8 ¹ ; AL: 0; \overline{CS} , Command, Address, Bank Address, Data I/O: MID-LEVEL; DM: stable at 0; Bank Activity: Self-Refresh operation; Output Buffer and RTT: Enabled in Mode Registers ² ; ODT Signal: MID-LEVEL.
I _{DD6ET}	Self-Refresh Current: Extended Temperature Range	T _{CASE} : 85 °C - 95 °C; Auto Self-Refresh (ASR): Disabled ⁴ ; Self-Refresh Temperature Range (SRT): Extended ⁵ ; CKE: Low; External clock: Off; CK and CK#: LOW; CL: See IDD and IDDQ Timings on page 32; BL: 8 ¹ ; AL: 0; \overline{CS} , Command, Address, Bank Address, Data I/O: MID-LEVEL; DM: stable at 0; Bank Activity: Extended Temperature Self-Refresh operation; Output Buffer and RTT: Enabled in Mode Registers ² ; ODT Signal: MID-LEVEL.
I _{DD7}	All Bank Interleave Read Current	CKE: High; External clock: On; t _{CK} , nRC, nRAS, nRCD, nRRD, nFAW, CL: See IDD and IDDQ Timings on page 32; BL: 8 ^{1,6} ; AL: CL-1; \overline{CS} : High between ACT and RDA; Command, Address, Bank Address Inputs: partially toggling according to IDD7 Measurement-Loop Pattern on pages 40-41; Data I/O: read data bursts with different data between one burst and the next one according to IDD7 Measurement-Loop Pattern on pages 40-41; DM: stable at 0; Bank Activity: two times interleaved cycling through banks (0, 1,...7) with different addressing, See IDD7 Measurement-Loop Pattern on pages 40-41; Output Buffer and RTT: Enabled in Mode Registers ² ; ODT Signal: stable at 0; Pattern Details: See IDD7 Measurement-Loop Pattern on pages 40-41.

Notes:

- Burst Length: BL8 fixed by MRS: set MR0 A[1,0]=00B.
- Output Buffer Enable: set MR1 A[12] = 0B; set MR1 A[5,1] = 01B; RTT_Nom enable: set MR1 A[9,6,2] = 011B; RTT_Wr enable: set MR2 A[10,9] = 10B.
- Precharge Power Down Mode: set MR0 A[12] = 0B for Slow Exit or MR0 A[12]=1B for Fast Exit.
- Auto Self-Refresh (ASR): set MR2 A[6] = 0B to disable or 1B to enable feature.
- Self-Refresh Temperature Range (SRT): set MR2 A[7] = 0B for normal or 1B for extended temperature range.
- Read Burst Type: Nibble Sequential, set MR0 A[3] = 0B.

I _{DD6}	176	192	mA
I _{DD6ET}	224	240	mA
I _{DD7}	2016	2200	mA

Input/Output Capacitance

Parameter	Symbol	PC3L-12800				Units	Notes
		1.35V		1.5V			
		Min	Max	Min	Max		
Input/output capacitance, (DQ, DM, DQS, $\overline{\text{DQS}}$, TDQS, $\overline{\text{TDQS}}$)	C_{IO}	2.8	4.4	2.8	4.6	pF	1, 2
Input/output capacitance delta, (DQ, DM, DQS, $\overline{\text{DQS}}$, TDQS, $\overline{\text{TDQS}}$)	C_{DIO}	-1	0.6	-1	0.6	pF	2, 10
Input/output capacitance delta, (DQS and $\overline{\text{DQS}}$)	C_{DDQS}	0	0.3	0	0.3	pF	2, 4
Input capacitance, (CK and $\overline{\text{CK}}$)	C_{CK}	6.4	11.2	6.4	11.2	pF	2
Input capacitance delta, (CK and $\overline{\text{CK}}$)	C_{DCK}	0	1.2	0	1.2	pF	2, 3
Input capacitance, (ADD/CMD/CTRL input-only pins)	C_{I}	12	19.2	12	20.8	pF	2, 5
Input capacitance delta, (All ADD/CMD input-only pins)	$C_{\text{DI_ADD_CM}_D}$	-6.4	6.4	-6.4	6.4		2, 6, 7
Input capacitance delta, (All CTRL input-only pins)	$C_{\text{DI_CTRL}}$	-3.2	1.6	-3.2	1.6	pF	2, 8, 9

Notes:

- Although the DM, TDQS and $\overline{\text{TDQS}}$ pins have different functions, the loading matches DQ and DQS.
- This parameter is not subject to production test. It is verified by design and characterization.
- Absolute value of $C_{\text{CK}} - C_{\overline{\text{CK}}}$.
- Absolute value of $C_{\text{IO}}(\text{DQS}) - C_{\text{IO}}(\overline{\text{DQS}})$.
- C_{I} applies to ODT, $\overline{\text{CS}}$, CKE, A0-A15, BA0-BA2, $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\overline{\text{WE}}$.
- $C_{\text{DI_ADD_CMD}}$ applies to A0-A15, BA0-BA2, $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ and $\overline{\text{WE}}$.
- $C_{\text{DI_ADD_CMD}} = C_{\text{I}}(\text{ADD_CMD}) - 0.5 * (C_{\text{I}}(\text{CK}) + C_{\text{I}}(\overline{\text{CK}}))$.
- $C_{\text{DI_CTRL}}$ applies to ODT, $\overline{\text{CS}}$ and CKE.
- $C_{\text{DI_CTRL}} = C_{\text{I}}(\text{CTRL}) - 0.5 * (C_{\text{I}}(\text{CK}) + C_{\text{I}}(\overline{\text{CK}}))$.
- $C_{\text{DIO}} = C_{\text{IO}}(\text{DQ,DM}) - 0.5 * (C_{\text{IO}}(\text{DQS}) + C_{\text{IO}}(\overline{\text{DQS}}))$.

26	Minimum Internal Write to Read Command Delay Time (tWTRmin)	7.5ns	3Ch
27	Minimum Internal Read to Precharge Command Delay (tRTPmin)	7.5ns	3Ch
28	Upper Nibbles for tFAWmin	30ns	00h
29	Minimum four Active window delay (tFAWmin) (LSB)	30ns	F0h
30	SDRAM Optional Features	DLL-OFF / RZQ/7 / RZQ/6	83h
31	SDRAM Thermal and Refresh Options	No PASR / No ODTs / ASR / 2x refresh / Ext. Range	05h
32	Module Thermal Sensor	EEPROM/Thermal Sensor	80h
33	SDRAM Device Type	Monolithic	00h
34	Fine Offset for SDRAM Minimum Cycle Time (tCKmin)	0ns	00h
35	Fine Offset for Minimum CAS Latency Time (tAAmin)	0ns	00h
36	Fine Offset for Minimum RAS# to CAS# Delay Time (tRCDmin)	0ns	00h
37	Fine Offset for Minimum Row Precharge Delay Time (tRPmin)	0ns	00h
38	Fine Offset for Minimum Active to Active/Refresh Delay Time (tRCmin)	0ns	00h
39-59	Reserved	-	00h
60	Module Nominal Height	30mm	0Fh
61	Module Maximum Thickness	Front: 1.2mm / Back: 1.2mm	11h
62	Reference Raw Card Used	R/C F / Rev. 3	65h
63	Address Mapping from Edge Connector to DRAM	Standard	00h
64-116	Reserved	-	00h
117	Module Manufacturer ID Code (LSB)	Continuation Code	01h
118	Module Manufacturer ID Code (MSB)	SMART's ID	94h
119	Module Manufacturing Location	See Note 1	xxh
120	Module Manufacturing Date (Year)	Date	xxh
121	Module Manufacturing Date (Week)	Date	xxh
122-125	Module Serial Number	Serial Number	xxh
126	SPD Cyclical Redundancy Code (CRC)		BEh

Declaration of Conformity

Responsible Party Name: SMART Modular Technologies, Inc.
Address: 39870 Eureka Drive
Newark, CA 94560-4809, USA
Phone: +1-510-623-1231

hereby declares that the products:

SH5126SV325816NI

to which this declaration relates are in conformity with the following Directives and other normative documents:

RoHS Directive 2011/65/EU

Restriction of the use of certain hazardous substances in electrical and electronic equipment

• **EN 50581:2012**

Technical documentation for the assessment of electrical and electronic products with respect to the restriction of hazardous substances

Name: Jeffrey Milano
Title: Director, Worldwide Quality
Date: May 25, 2015

Representative in the European Union (for regulatory topics only):

Mr. Graham Kyle
SMART Modular Technologies (Europe) Ltd.
312 Nasmyth Building, Nasmyth Avenue
Scottish Enterprise Technology Park
East Kilbride, Scotland, G75 0QR

Disclaimer:

No part of this document may be copied or reproduced in any form or by any means, or transferred to any third party, without the prior written consent of an authorized representative of SMART Modular Technologies, Inc. ("SMART"). The information in this document is subject to change without notice. SMART assumes no responsibility for any errors or omissions that may appear in this document, and disclaims responsibility for any consequences resulting from the use of the information set forth herein. SMART makes no commitments to update or to keep current information contained in this document. The products listed in this document are not suitable for use in applications such as, but not limited to, aircraft control systems, aerospace equipment, submarine cables, nuclear reactor control systems and life support systems. Moreover, SMART does not recommend or approve the use of any of its products in life support devices or systems or in any application where failure could result in injury or death. If a customer wishes to use SMART products in applications not intended by SMART, said customer must contact an authorized SMART representative to determine SMART's willingness to support a given application. The information set forth in this document does not convey any license under the copyrights, patent rights, trademarks or other intellectual property rights claimed and owned by SMART. The information set forth in this document is considered to be "Proprietary" and "Confidential" property owned by SMART.

ALL PRODUCTS SOLD BY SMART ARE COVERED BY THE PROVISIONS APPEARING IN SMART'S TERMS AND CONDITIONS OF SALE ONLY, INCLUDING THE LIMITATIONS OF LIABILITY, WARRANTY AND INFRINGEMENT PROVISIONS. SMART MAKES NO WARRANTIES OF ANY KIND, EXPRESS, STATUTORY, IMPLIED OR OTHERWISE, REGARDING INFORMATION SET FORTH HEREIN OR REGARDING THE FREEDOM OF THE DESCRIBED PRODUCTS FROM INTELLECTUAL PROPERTY INFRINGEMENT, AND EXPRESSLY DISCLAIMS ANY SUCH WARRANTIES INCLUDING WITHOUT LIMITATION ANY EXPRESS, STATUTORY OR IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.
