SH79F166A

Enhanced 8051 Microcontroller with 10bit ADC

1. Features

- 8bits micro-controller with Pipe-line structured 8051 compatible instruction set
- Flash ROM: 16K Bytes
- RAM: internal 256 Bytes, external 256 Bytes, LCD RAM 19Bytes
- EEPROM-like: 1K Bytes
- Operation Voltage:
  f_{OSC} = 32.768kHz - 12MHz, V_{DD} = 2V - 5.5V
- Oscillator (code option)
  - Crystal oscillator: 32.768kHz
  - Crystal oscillator: 2MHz - 12MHz
  - Ceramic oscillator: 2MHz - 12MHz
  - Internal RC: 12MHz (±2%)/128K
- 41 CMOS bi-directional I/O pins
- Built-in pull-up resistor for input pin
- Four 16-bit timer/counters T2, T3,T4 and T5
- One 12-bit PWM
- Powerful interrupt sources:
  - Timer2, 3, 4, 5
  - INT0, 1, 2, 3
  - INT40, INT41, INT42, INT43
  - ADC，EUART，SCM
  - PWM
- EUART
- 8channels 10-bits Analog Digital Converter (ADC), with comparator function built-in
- Buzzer
- LED driver:
  - 8 X 8 dots (1/8 duty)
  - 4 X 8 dots (1/4 duty)
- LCD driver:
  - 8 X 19 dots (1/8 duty 1/4 bias)
  - 4 X 19 dots (1/4 duty 1/3 bias)
- Low Voltage Reset (LVR) function (enabled by code option)
  - LVR voltage level 1: 4.3V
  - LVR voltage level 2: 2.1V
- CPU Machine cycle:
  1 oscillator clock
- Watch Dog Timer (WDT)
- Warm-up Timer
- Support Low power operation modes:
  - Idle Mode
  - Power-Down Mode
- Flash Type
- Package: QFP44/LQFP44

2. General Description

The SH79F166A is a high performance 8051 compatible micro-controller, regard to its build-in Pipe-line instruction fetch structure, that helps the SH79F166A can perform more fast operation speed and higher calculation performance, if compare SH79F166A with standard 8051 at same clock speed.

The SH79F166A retains most features of the standard 8051. These features include internal 256 bytes RAM, UART and Int0-3.In addition, the SH79F166A provides external 256 bytes RAM, It also contains 16K bytes Flash memory block both for program and data. Also the ADC and PWM timer functions are incorporated in SH79F166A.

For high reliability and low cost issues, the SH79F166A builds in Watchdog Timer, Low Voltage Reset function. And SH79F166A also supports two power saving modes to reduce power consumption.

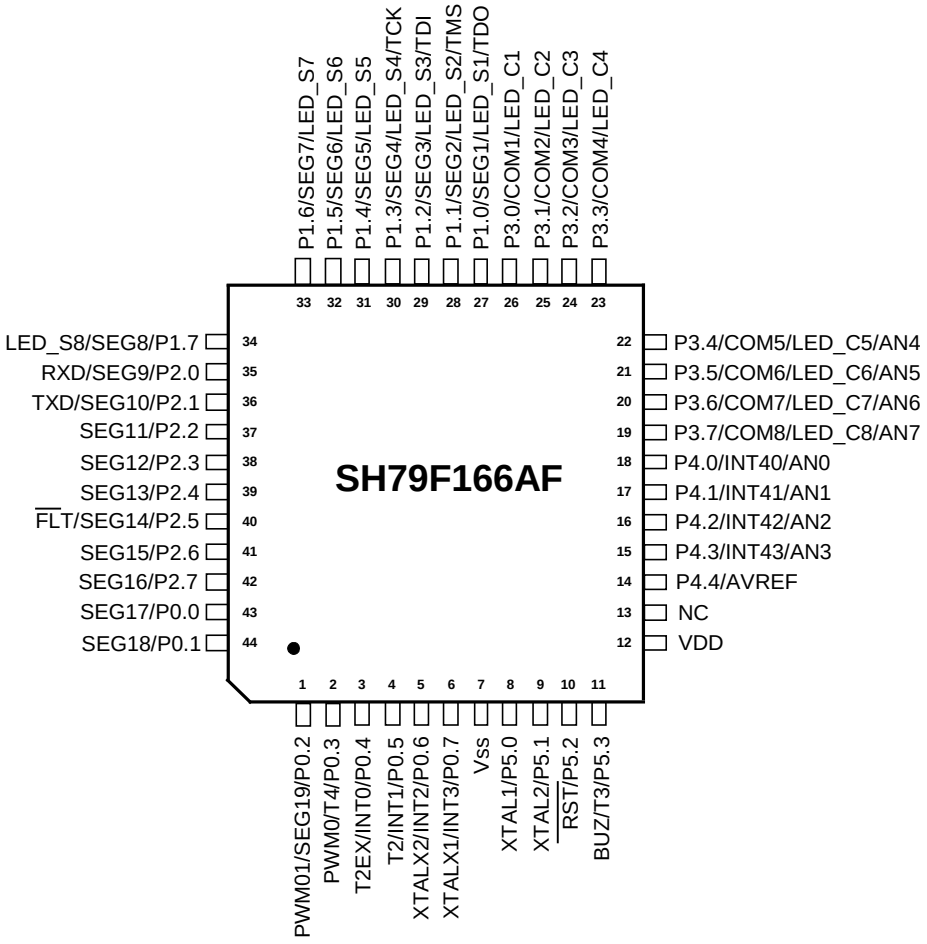
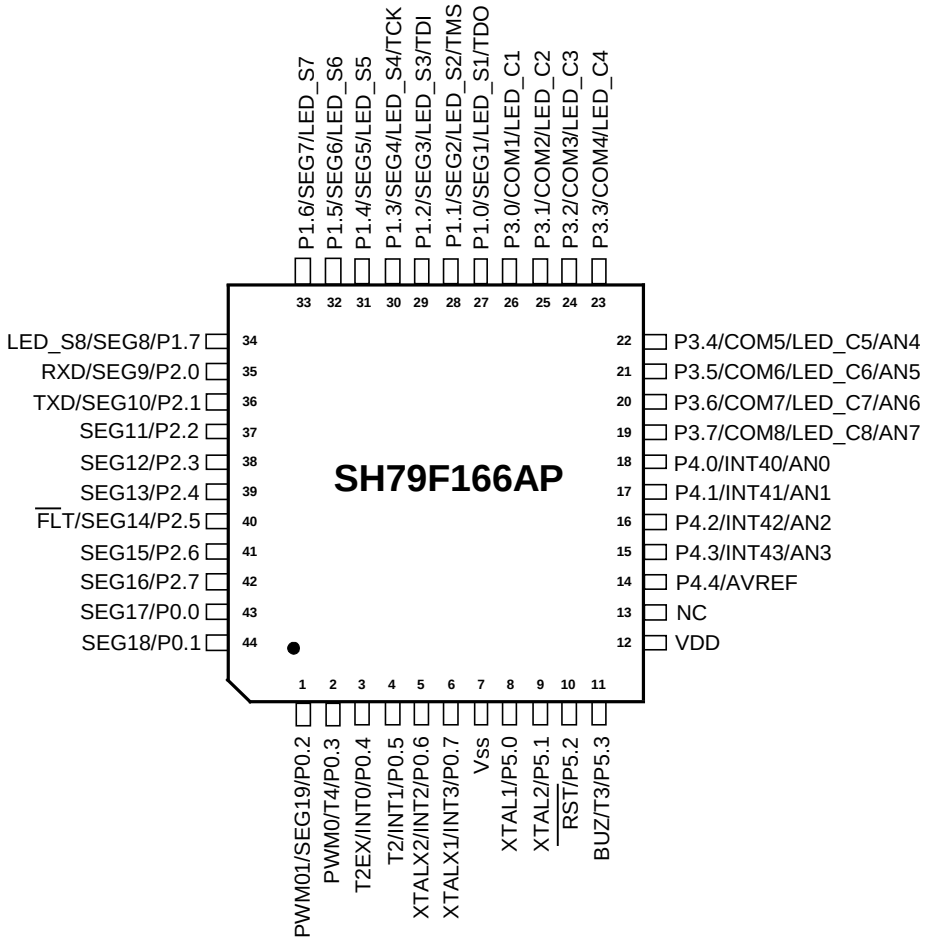
4. Pin Configuration

QFP44:



QFP44 Pin Configuration Diagram

LQFP44:



LQFP44 Pin Configuration Diagram

Note:

The out most pin function has the highest priority, and the inner most pin function has the lowest priority (Refer to Pin Configuration Diagram. This means when one pin is occupied by a higher priority function (if enabled) cannot be used as the lower priority functional pin, even when the lower priority function is also enabled. Until the higher priority function is closed by software, can the corresponding pin be released for the lower priority function use.

Table 4.1 Pin Function

Pin No.	Pin Name	Default function	Pin No.	Pin Name	Default function
1	PWM01/SEG19/P0.2	P0.2	23	LED_C4/COM4/P3.3	P3.3
2	PWM0/T4/P0.3	P0.3	24	LED_C3/COM3/P3.2	P3.2
*3	T2EX/INT0/P0.4	P0.4	25	LED_C2/COM2/P3.1	P3.1
*4	T2/INT1/P0.5	P0.5	26	LED_C1/COM1/P3.0	P3.0
5	XTALX2/INT2/P0.6	P0.6	27	LED_S1/SEG1/P1.0	P1.0

**** Note:** P0.4, P0.5 are configured as N-channel open drain I/O*

5. Pin Description

Pin No.	Type	Description
I/O PORT		
P0.0 - P0.7	I/O	8 bit General purpose CMOS I/O
P1.0 - P1.7	I/O	8 bit General purpose CMOS I/O
P2.0 - P2.7	I/O	8 bit General purpose CMOS I/O
P3.0 - P3.7	I/O	8 bit General purpose CMOS I/O
P4.0 - P4.4	I/O	5 bit General purpose CMOS I/O
P5.0 - P5.3	I/O	4 bit General purpose CMOS I/O
Timer		
T2	I/O	Timer2 external input
T3	I	Timer3 external input
T4	I/O	Timer4 external input/Comparator output
T2EX	I	Timer2 Reload/Capture/Direction Control
PWM		
PWM0	O	Output pin for 12-bit PWM timer
PWM01	O	Output pin for 12-bit PWM timer with fixed phase relationship of PWM0
FLT	I	PWM Fault Detect input
EUART		
RXD	I	EUART data input
TXD	O	EUART data output
ADC		
AN0 - AN7	I	ADC input channel
AVREF	I	External ADC reference voltage input
LCD		
COM1 - COM8	O	Common signal output for LCD display
SEG1 - SEG19	O	Segment signal output for LCD display
LED		
LED_C1 - LED_C8	O	Common signal output for LED display
LED_S1 - LED_S8	O	Segment signal output for LED display
Interrupt & Reset & Clock & Power		
INT0 - INT3	I	External interrupt 0-3 input source
INT40 - INT43	I	External interrupt 40-43 input source
$\overline{\text{RST}}$	I	The device will be reset by A low voltage on this pin longer than 10us, an internal resistor about 30kΩ to V_{DD}, So using only an external capacitor to GND can cause a power-on reset.
XTAL1	I	Oscillator input
XTAL2	O	Oscillator output
XTALX1	I	OscillatorX input
XTALX2	O	OscillatorX output
V_{SS}	P	Ground
V_{DD}	P	Power supply (2.0 - 5.5V)

(to be continued)

(continue)

Pin No.	Type	Description
Buzzer		
BUZ	O	Buzzer output pin
Programmer		
TDO (P1.0)	O	Debug interface: Test data out
TMS (P1.1)	I	Debug interface: Test mode select
TDI (P1.2)	I	Debug interface: Test data in
TCK (P1.3)	I	Debug interface: Test clock in
Note： *When P1.0-1.3 used as debug interface, functions of P1.0-1.3 are blocked.*		

6. SFR Mapping

The SH79F166A provides 256 bytes of internal RAM to contain general-purpose data memory and Special Function Register (SFR). The SFR of the SH79F166A fall into the following categories:

CPU Core Registers:	ACC, B, PSW, SP, DPL, DPH
Enhanced CPU Core Registers:	AUXC, DPL1, DPH1, INSCON, XPAGE
Power and Clock Control Registers:	PCON, SUSLO
Flash Registers:	IB_OFFSET, IB_DATA, IB_CON1, IB_CON2, IB_CON3, IB_CON4, IB_CON5, FLASHCON
Data Memory Register:	XPAGE
Hardware Watchdog Timer Registers:	RSTSTAT
System Clock Control Register:	CLKCON
Interrupt System Registers:	IEN0, IEN1, IENC, IPH0, IPL0, IPH1, IPL1, EXF0, EXF1
I/O Port Registers:	P0, P1, P2, P3, P4, P5, P0CR, P1CR, P2CR, P3CR, P4CR, P5CR, P0PCR, P1PCR, P2PCR, P3PCR, P4PCR, P5PCR, P0OS
Timer Registers:	TCON, T2CON, T2MOD, TH2, TL2, RCAP2L, RCAP2H, T3CON, TH3, TL3, T4CON, TH4, TL4, SWTHL, T5CON, TH5, TL5
EUART Registers:	SCON, SBUF, SADEN, SADDR, PCON, RxCON
ADC Registers:	ADCON, ADT, ADCH, ADDL, ADDH
LCD Registers:	DISPCON, DISPCLK0, DISPCLK1, P0SS, P1SS, P2SS, P3SS
LED Registers:	DISPCON, DISPCLK0, DISPCLK1, P1SS, P3SS
Buzzer Registers:	BUZCON
PWM Registers:	PWMEN, PWMEN1, PWMLO, PWM0C, PWM0PL, PWM0PH, PWM0DL, PWM0DH
LPD Registers:	LPDCON

7. Normal Function

7.1 CPU

7.1.1 CPU Core SFR

Feature

- CPU core registers: ACC, B, PSW, SP, DPL, DPH

Accumulator

ACC is the Accumulator register. The mnemonics for accumulator-specific instructions, however, refer to the Accumulator simply as A.

B Register

The B register is used during multiply and divide operations. For other instructions it can be treated as another scratch pad register.

Stack Pointer (SP)

The Stack Pointer Register is 8 bits wide, It is incremented before data is stored during PUSH, CALL executions and it is decremented after data is out of stack during POP, RET, RETI executions. The stack may reside anywhere in on-chip internal RAM (00H-FFH). On reset, the Stack Pointer is initialized to 07H causing the stack to begin at location 08H.

Program Status Word Register (PSW)

The PSW register contains program status information.

Table 7.1 PSW Register

D0H	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
PSW	CY	AC	F0	RS1	RS0	OV	F1	P
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R
Reset Value (POR/WDT/LVR/PIN)	0	0	0	0	0	0	0	0

Bit Number	Bit Mnemonic	Description
7	**CY**	**Carry flag bit** 0: no carry or borrow in an arithmetic or logic operation 1: a carry or borrow in an arithmetic or logic operation
6	**AC**	**Auxiliary Carry flag bit** 0: an auxiliary carry or borrow in an arithmetic or logic operation 1: an auxiliary carry or borrow in an arithmetic or logic operation
5	**F0**	**F0 flag bit** Available to the user for general purposes
4-3	**RS[1:0]**	**R0-R7 Register bank select bits** 00: Bank0 (Address to 00H-07H) 01: Bank1 (Address to 08H-0FH) 10: Bank2 (Address to 10H-17H) 11: Bank3 (Address to 18H-1FH)
2	**OV**	**Overflow flag bit** 0: no overflow happen 1: an overflow happen
1	**F1**	**F1 flag bit** Available to the user for general purposes
0	**P**	**Parity flag bit** 0: an even number of “one” bits in the Accumulator 1: an odd number of “one” bits in the Accumulator

Data Pointer Register (DPTR)

DPTR consists of a high byte (DPH) and a low byte (DPL). Its intended function is to hold a 16-bit address, but it may be manipulated as a 16-bit register or as two independent 8-bit registers.

7.1.2 Enhanced CPU core SFRs

- Extended 'MUL' and 'DIV' instructions: 16bit*8bit, 16bit/8bit
- Dual Data Pointer
- Enhanced CPU core registers: AUXC, DPL1, DPH1, INSCON

The SH79F166A has modified 'MUL' and 'DIV' instructions. These instructions support 16 bit operand. A new register - the register is applied to hold the upper part of the operand/result.

The AUXC register is used during 16 bit operand multiply and divide operations. For other instructions it can be treated as another scratch pad register.

After reset, the CPU is in standard mode, which means that the 'MUL' and 'DIV' instructions are operating like the standard 8051 instructions. To enable the 16 bit mode operation, the corresponding enable bit in the INSCON register must be set.

	Operation		Result		
			A	B	AUXC
MUL	INSCON.2 = 0; 8 bit mode	(A)*(B)	Low Byte	High Byte	---
	INSCON.2 = 1; 16 bit mode	(AUXC A)*(B)	Low Byte	Middle Byte	High Byte
DIV	INSCON.3 = 0; 8 bit mode	(A)/(B)	Quotient Low Byte	Remainder	---
	INSCON.3 = 1; 16 bit mode	(AUXC A)/(B)	Quotient Low Byte	Remainder	Quotient High Byte

Dual Data Pointer

Using two data pointers can accelerate data memory moves. The standard data pointer is called DPTR and the new data pointer is called DPTR1.

DPTR1 is the same with DPTR, which consists of a high byte (DPH1) and a low byte (DPL1). Its intended function is to hold a 16-bit address, but it may be manipulated as a 16-bit register or as two independent 8-bit registers.

The DPS bit in INSTCON register is used to choose the active pointer. The user can switch data pointers by toggling the DPS bit. And all DPTR-related instructions will use the currently selected data pointer.

7.1.3 Register

Table 7.2 Data Pointer Select Register

86H	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
INSCON	-	BKS0	-	-	DIV	MUL	-	DPS
R/W	-	R/W	-	-	R/W	R/W	-	R/W
Reset Value (POR/WDT/LVR/PIN)	-	0	-	-	0	0	-	0

Bit Number	Bit Mnemonic	Description
6	**BKS0**	**SFR Bank Selection Bit** 0: SFR Bank0 selected 1: SFR Bank1 selected
3	**DIV**	**16 bit/8 bit Divide Selection Bit** 0: 8 bit Divide 1: 16 bit Divide
2	**MUL**	**16 bit/8 bit Multiply Selection Bit** 0: 8 bit Multiply 1: 16 bit Multiply
0	**DPS**	**Data Pointer Selection Bit** 0: Data pointer 1: Data pointer1

7.2 RAM

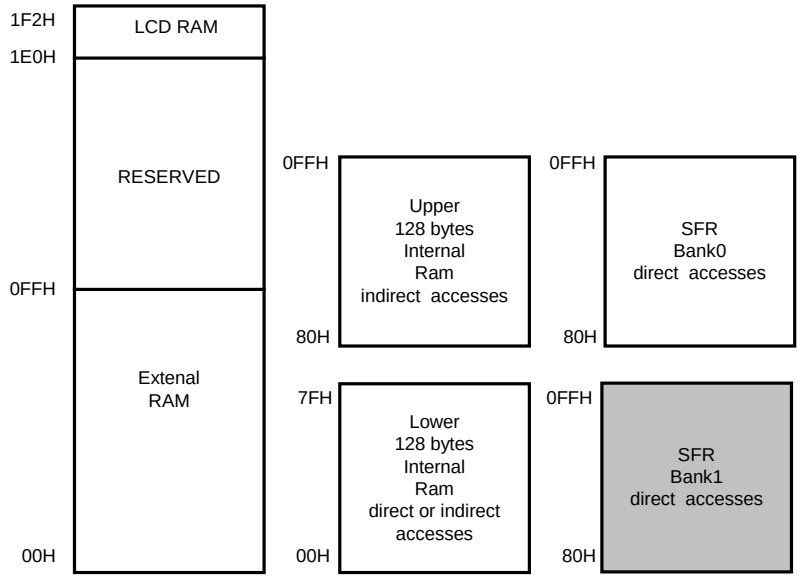
7.2.1 Features

SH79F166A provides both internal RAM and external RAM for random data storage. The internal data memory is mapped into four separated segments:

- The Lower 128 bytes of RAM (addresses 00H to 7FH) are directly and indirectly addressable.
- The Upper 128 bytes of RAM (addresses 80H to FFH) are indirectly addressable only.
- The Special Function Registers (SFR, addresses 80H to FFH) are directly addressable only.
- The 256 bytes of external RAM(addresses 00H to FFH) are indirectly accessed by MOVX instructions.

The Upper 128 bytes occupy the same address space as SFR, but they are physically separate from SFR space. When an instruction accesses an internal location above address 7FH, the CPU can distinguish whether to access the upper 128 bytes data RAM or to access SFR by different addressing mode of the instruction.

Note: *the unused address is unavailable in SFR.*



The Internal and External RAM Configuration

The SH79F166A provides traditional method for accessing of external RAM. Use *MOVXA, @Ri* or *MOVX @Ri, A;* to access external low 256 bytes RAM; *MOVX A, @DPTR* or *MOVX @DPTR, A* also to access external 256 bytes RAM.

In SH79F166A the user can also use XPAGE register to access external RAM only with *MOVX A, @Ri* or *MOVX @Ri, A* instructions. The user can use XPAGE to represent the high byte address of RAM above 256 Bytes.

But SH79F166A only has 256 bytes external RAM, XPAGE must be set as 0.

In Flash SSP mode, the XPAGE can also be used as sector selector (Refer to SSP Function).

7.2.2 Register

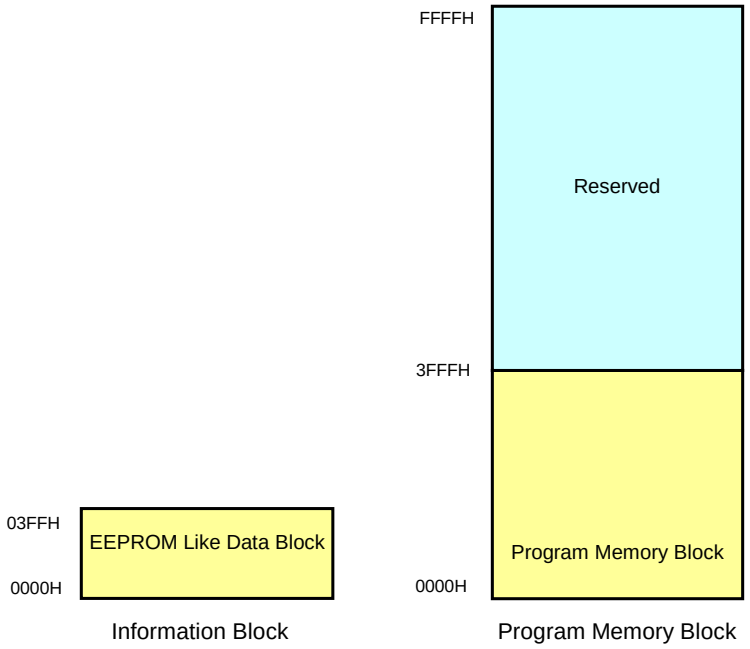
Bit Number	Bit Mnemonic	Description
5-0	**XPAGE[5:0]**	RAM Page Selector

7.3 Flash Program Memory

7.3.1 Features

- The program memory consists 16 X 1KB sectors, total 16KB
- Programming and erase can be done over the full operation voltage range
- Write, read and erase operation are all supported by In-Circuit Programming (ICP)
- Fast mass/sector erase and programming
- Minimum program/erase cycles: 100000
- Minimum years data retention: 10
- Low power consumption



The SH79F166A embeds 16K flash program memory for program code. The flash program memory provides electrical erasure and programming and supports In-Circuit Programming (ICP) mode and Self-Sector Programming (SSP) mode.

7.3.2 Flash Operation in ICP Mode

ICP mode is performed without removing the micro-controller from the system. In ICP mode, the user system must be power-off, and the programmer can refresh the program memory through ICP programming interface. The ICP programming interface consists of 6 wires (V_{DD}, GND, TCK, TDI, TMS, TDO).

At first the four JTAG pins (TDO, TDI, TCK, TMS) are used to enter the programming mode. Only after the three pins are inputted the specified waveform, the CPU will enter the programming mode. For more detail description please refers to the FLASH Programmer's user guide.

The ICP mode supports the following operations:

(1) Code-Protect Control mode Programming

SH79F166A implements code-protect function to offer high safeguard for customer code. Two modes are available for each sector.

Code-protect control mode 0: Used to enable/disable the write/read operation (except mass erase) from any programmer.

Code-protect control mode 1: Used to enable/disable the read operation through MOVC instruction from other sectors; or the sector erase/write operation through **SSP** Function.

To enable the wanted protect mode, the user must use the Flash Programmer to set the corresponding protect bit.

(2) Mass Erase

The mass erase operation will erase all the contents of program code, code option, code protect bit and customer code ID, regardless the status of code-protect control mode. (The Flash Programmer supplies customer code ID setting function for customer to distinguish their product.)

Mass erase is only available in Flash Programmer.

(3) Sector Erase

The sector erase operation will erase the contents of program code of selected sector . This operation can be done by Flash Programmer or the user's program.

If done by the Flash Programmer, the code-protect control mode 0 of the selected sector must be disabled.

(4) EEPROM-Like Erase

The EEPROM-Like erase operation will erase the contents of program code of EEPROM-Like. This operation can be done by Flash Programmer or the user's program.

(5) Write/Read Code

The Write/Read Code operation will write the customer code into the Flash Programming Memory or read the customer code from the Flash Programming Memory. This operation can be done by Flash Programmer or the user's program.

If done by the user's program, the code-protect control mode 1 of the selected sector must be disabled. But the program can read/write its own sector regardless of its security bit.

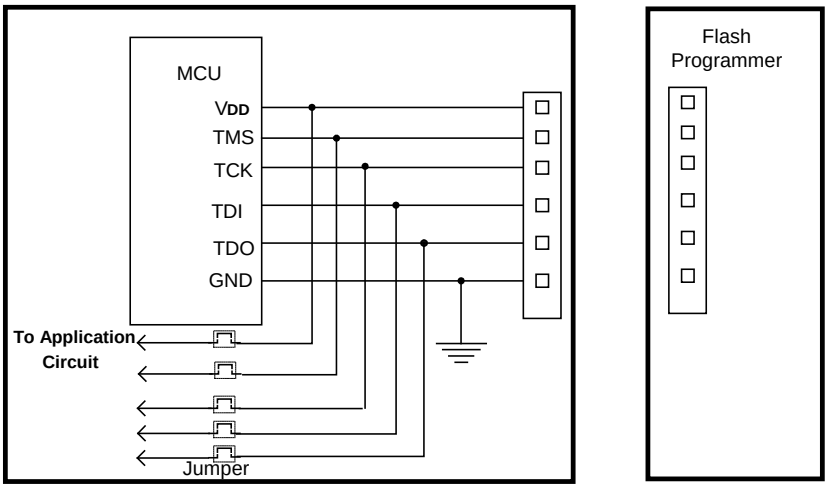
If done by the Flash Programmer, the code-protect control mode 0 of the selected sector must be disabled.

(6) Write/Read EEPROM-Like

The Write/Read EEPROM-Like operation will write the customer data into the EEPROM-Like or read the customer data from the EEPROM-Like. This operation can be done by Flash Programmer or the user's program.

Operation	ICP	SSP
Code Protection	Yes	No
Sector Erase	Yes (without security bit)	Yes (without security bit)
Mass Erase	Yes	No
EEPROM-like Erase	Yes	Yes
Write/Read	Yes (without security bit)	Yes (without security bit or its own sector)
EEPROM-like Write/Read	Yes	Yes

In ICP mode，all the flash operations are completed by the programmer through 6-wire interface. Since the program timing is very sensitive, five jumpers are needed (V_{DD}, TDO, TDI, TCK, TMS) to separate the program pins from the application circuit as the following diagram.



The recommended steps are as following:

(1) The jumpers must be open to separate the programming pins from the application circuit before programming.
(2) Connect the programming interface with programmer and begin programming.
(3) Disconnect programmer and short these jumpers after programming is complete.

7.4 SSP Function

The SH79F166A provides SSP (Self Sector Programming) function, each sector can be sector erased or programmed by the user's code if the selected sector is not be protected. But once sector has been programmed, it cannot be reprogrammed before sector erase.

The SH79F166A builds in a complex control flow to prevent the code from carelessly modification. If the dedicated conditions are not met (IB_CON2-5), the SSP will be terminated.

7.4.1 SSP Register

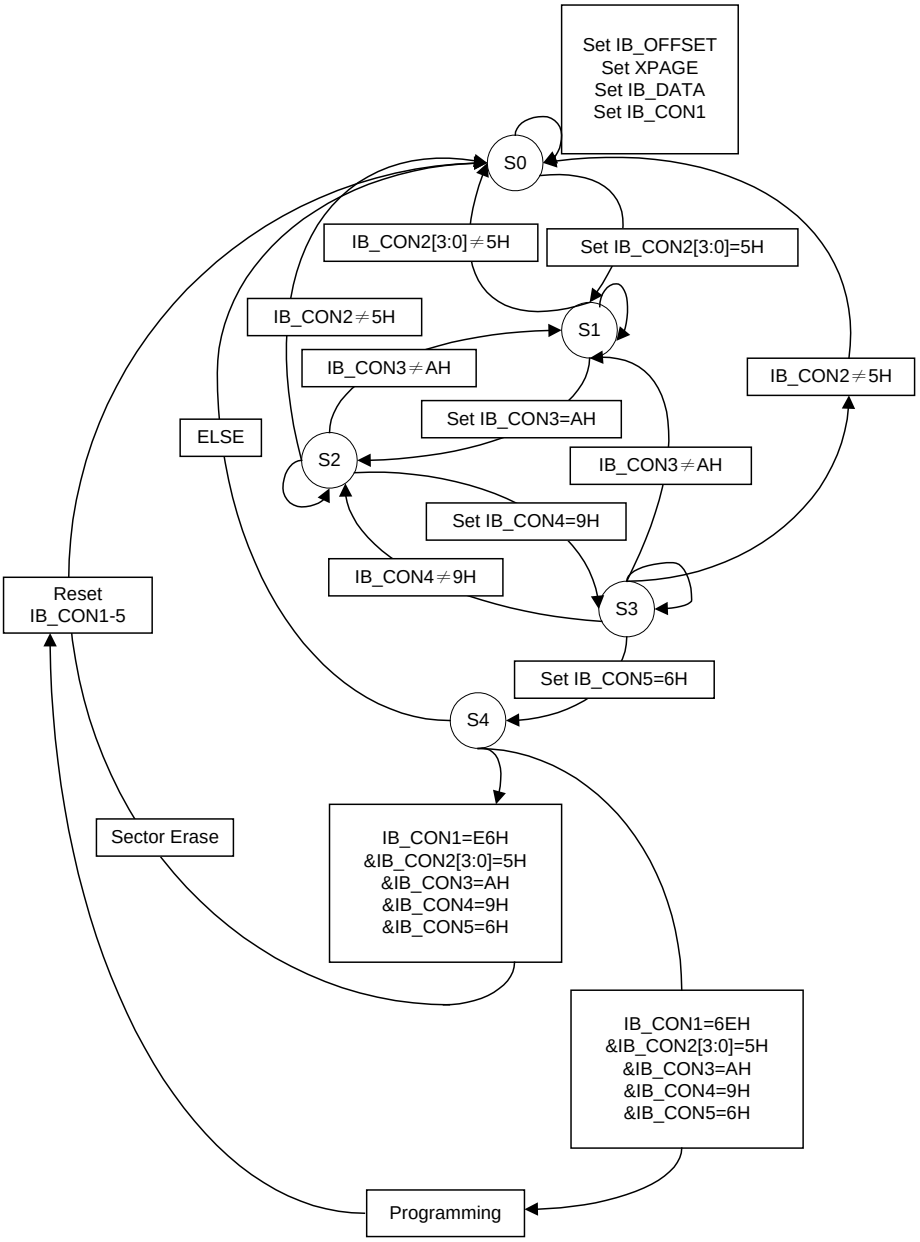
7.4.2 Flash Control Flow



7.4.3 SSP Programming Notice

To successfully complete SSP programming, the user's software must following the steps below:

(1) For Code/Data Programming:

1. Disable interrupt;
2. Fill in the XPAGE, IB_OFFSET for the corresponding address;
3. Fill in IB_DATA if programming is wanted;
4. Fill in IB_CON1-5 sequentially;
5. Add 4 nops for more stable operation;
6. Code/Data programming, CPU will be in IDLE mode;
7. Go to Step 2 if more data are to be programmed;
8. Clear XPAGE; enable interrupt if necessary.

(2) For Sector Erase:

1. Disable interrupt;
2. Fill in the XPAGE for the corresponding sector;
3. Fill in IB_CON1-5 sequentially;
4. Add 4 NOPs for more stable operation;
5. Sector Erase, CPU will be in IDLE mode;
6. Go to step 2 if more sectors are to be erased;
7. Clear XPAGE; enable interrupt if necessary.

(3) For Code Reading:

Just Use "MOVC A, @A+DPTR" or "MOVC A, @A+PC".

(4) For EEPROM-Like:

Steps is same as code programming,the diffenrences are:
1.Set FAC bit in FLASHCON register before programming or erase EEPROM-Like;
2.One sector of EEPROM-Like is 256 bytes.not 1024 bytes.

Table 7.12 Flash Access Control Register

A7H, Bank0	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0

Bit Number	Bit Mnemonic	Description
0	**FAC**	**FAC: Flash access control** 0: MOVC or SSP access main memory 1: MOVC or SSP access EEPROM-like

7.5 System Clock and Oscillator

7.5.1 Features

- Four oscillator types: 32.768kHz crystal, crystal oscillator, ceramic oscillator and 12MHz/128kHz internal RC
- 4 Oscillator pin (XTAL1, XTAL2, XTALX1, XTALX2)
- Built-in 12MHz Internal RC
- Built-in 32.768kHz speed up circuit
- Built-in system clock prescaler

7.5.2 Clock Definition

The SH79F166A have several internal clocks defined as below:

OSCCLK: the oscillator clock from one of the four oscillator types (32.768kHz crystal oscillator, crystal oscillator，ceramic oscillator and interal RC) f_{OSC} is defined as the OSCCLK frequency. t_{OSC} is defined as the OSCCLK period.

OSCXCLK: the oscillator clock from one of the three oscillator types (crystal oscillator, ceramic oscillator and interal RC) f_{OSCx} is defined as the OSCXCLK frequency. t_{OSCX} is defined as the OSCXCLK period.

Note: *OSCXCLK does not exist when code option OP_OSC is not 0011, 0110, 1010, 1101. (32.768kHz oscillator/128kHz internal RC is not selected, Refer to* ***code option*** *section for details)*

WDTCLK: the internal WDT RC clock. f_{WDT} is defined as the WDTCLK frequency. t_{WDT} is defined as the WDTCLK period.

OSCSCLK: the input of system clock prescaler. It can be OSCCLK or OSCXCLK. f_{OSCS} is defined as the OSCSCLK frequency. t_{OSCS} is defined as the OSCSCLK period.

SYSCLK: system clock, the output of system clock prescaler. It is the CPU instruction clock. f_{SYS} is defined as the SYSCLK frequency. t_{SYS} is defined as the SYSCLK period.

7.5.3 Description

SH79F166A has four oscillator types: 32.768kHz crystal oscillator, crystal oscillator (2MHz-12MHz), ceramic Oscillator (2MHz-12MHz) and internal RC (12MHz,), which is selected by code option OP_OSC (Refer to code option section for details). SH79F166A have 4 Oscillator pin (XTAL1, XTAL2, XTALX1, XTALX2) and can generates one or two clock sources from four oscillator types. It is selected by code option OP_OSC (Refer to **code option** section for details). The oscillator generates the basic clock pulse that provides the system clock to supply CPU and on-chip peripherals.

7.5.4 Register

Table 7.13 System Clock Control Register

B2H, Bank0	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
CLKCON	32k_SPDUP	CLKS1	CLKS0	SCMIF	HFON	FS	-	-
R/W	R/W	R/W	R/W	R	R/W	R/W	-	-
Reset Value (POR/WDT/LVR/PIN)	1	1	1	0	0	0	-	-

Bit Number	Bit Mnemonic	Description
7	**32k_SPDUP**	**32.768kHz oscillator speed up mode control bit** 0: 32.768kHz oscillator normal mode, cleared by software. 1: 32.768kHz oscillator speed up mode, set by hardware or software. This control bit is set by hardware automatically in all kinds of RESET such as Power on reset, watch dog reset etc. to speed up the 32.768kHz Oscillator oscillating, shorten the 32.768kHz oscillator start-oscillating time. And this bit also can be set or cleared by software if necessary. Such as set before entering Power-down mode and cleared when Power-down mode wakes up. It should be noticed that turning off 32.768kHz oscillator speed up (clear this bit) could reduce the system power consumption. Only when code option OP_OSC is 1010 or 1101, this bit is valid. (32.768kHz oscillator is selected, Refer to **code option** section for details)
6-5	**CLKS[1:0]**	**SYSCLK Prescaler Register** 00: $f_{SYS} = f_{OSCS}$ 01: $f_{SYS} = f_{OSCS}/2$ 10: $f_{SYS} = f_{OSCS}/4$ 11: $f_{SYS} = f_{OSCS}/12$ If 32.768kHz oscillator is selected as OSCSCLK, these control bits is invalid.
3	**HFON**	**OSCXCLK On control Register** 0: Cleared to turn off OSCXCLK 1: Set to turn on OSCXCLK Only when code option OP_OSC is 0010，0011，0101，1010,1101. this bit is valid. (32.768kHz oscillator/128kHz internal RC is selected, Refer to **code option** section for details)
2	**FS**	**Frequency Select Register** 0: 32.768kHz/128kHz is selected as OSCSCLK 1: OSCXCLK is selected as OSCSCLK Only when code option OP_OSC is 0010，0011，0101，1010,1101. this bit is valid. (32.768kHz oscillator/128kHz internal RC is selected, Refer to **code option** section)

Note:

1. If code option OP_OSC is 0011, 1010, OSCXCLK is Internal 12M RC; if code option OP_OSC is 0110 or 1101, OSCXCLK is crystal or ceramic at XTALX.

2. HFON and FS is valid only when code option OP_OSC is 0011, 0110, 1010, 1101.

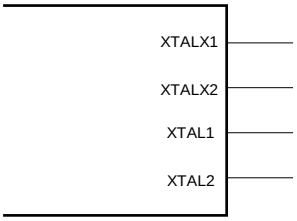
3. When OSCXCLK is used as OSCSCLK (that is HFON = 1 and FS = 1), HFON is can't be cleared by software.

4. When OSCSCLK changed from 32.768kHz/128kHz to OSCXCLK, if OSCXCLK is off, the steps below must be done in sequence:
   a. Set HFON = 1 to turn on the OSCXCLK
   *b. Wait at least Oscillator Warm-up timer (Refer to **Warm-up Timer** section for details)*
   c. Set FS = 1 to select OSCXCLK as OSCSCLK

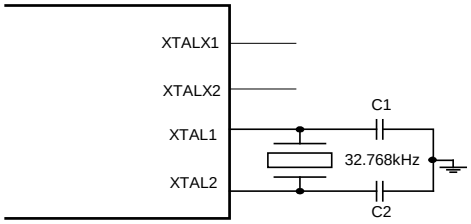
5. When OSCSCLK changed from OSCXCLK to 32.768kHz/128kHz, the steps below must be done in sequence:
   a. Clear FS to turn off the OSCXCLK
   b. Add one nop
   c. Clear HFON

7.5.5 Oscillator Type

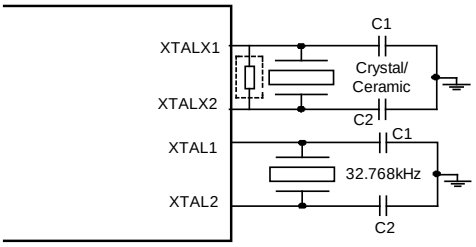
(1) OP_OSC = 0000, 0011: internal RC, XTAL and XTALX are shared with IO



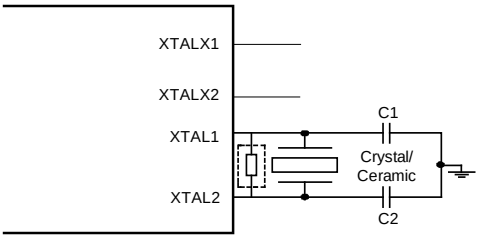
(2) OP_OSC = 1010: 32.768kHz Crystal Oscillator at XTAL, Internal RC can be enabled, XTALX shared with I/O



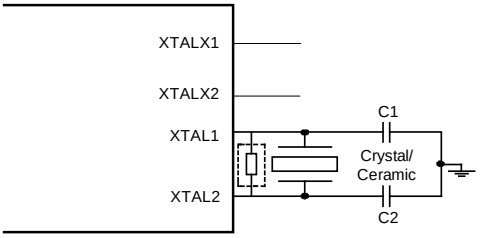
(3) OP_OSC = 1101: 32.768kHz Crystal Oscillator at XTAL, 2M - 12M Crystal/Ceramic Oscillator at XTALX*



(4) OP_OSC = 1110: 2M - 12M Crystal/Ceramic oscillator at XTAL*, XTALX shared with I/O



(5) OP_OSC = 0110: 128kHz internal RC, 2M - 12M Crystal/Ceramic resonator at XTAL*, XTALX shared with I/O



**: If the environment humidity is bigger, use the high frequency oscillator, advice plus 510k feedback resistance.*

7.5.6 Capacitor Selection for Oscillator

Ceramic Resonators		
Frequency	**C1**	**C2**
3.58MHz	-	-
4MHz	-	-

Crystal Oscillator		
Frequency	**C1**	**C2**
32.768kHz	10 - 12pF	10 - 12pF
4MHz	8 - 15pF	8 - 15pF
12MHz	8 - 15pF	8 - 15pF

Notes:

(1) ***Capacitor values are used for design guidance only!***

(2) These capacitors were tested with the crystals listed above for basic start-up and operation. They are ***not optimized.***

(3) Be careful for the stray capacitance on PCB board, the user should test the performance of the oscillator over the expected V_{DD} and the temperature range for the application.

Before selecting crystal/ceramic, the user should consult the crystal/ceramic manufacturer for appropriate value of external component to get best performance, visit http://www.sinowealth.comfor more recommended manufactures.

7.6 System Clock Monitor (SCM)

In order to enhance the system reliability, SH79F166A contains a system clock monitor (SCM) module. If the system clock fails (for example the oscillator stops oscillating), the built-in SCM will switch the OSCCLK to the internal 32k WDTCLK and set system clock monitor bit (SCMIF) to 1. And the SCM interrupt will be generated when EA and ESCM is enabled. If the OSCCLK comes back, SCM will switch the OSCCLK back to the oscillator and clears the SCMIF automatically.

Notes:

The SCMIF is read only register; it can be clear to 0 or set to 1 by hardware only.
If SCMIF is cleared, the SCM switches the system clock to the state before system clock fail automatically.
*If Internal RC is selected as OSCCLK by code option (Refer to **code option** section for detail), the SCM can not work.*

Table 7.14 System Clock Control Register

B2H	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
CLKCON	-	-	-	SCMIF	-	-	-	-
R/W	-	-	-	R	-	-	-	-
Reset Value (POR/WDT/LVR/PIN)	-	-	-	0	-	-	-	-

Bit Number	Bit Mnemonic	Description
4	**SCMIF**	**System Clock Monitor bit** 0: Clear by hardware to indicate system clock is normal 1: Set by hardware to indicate system clock fails

7.7 I/O Port

7.7.1 Features

- 41 bi-directional I/O ports
- Share with alternative functions

The SH79F166A has 41 bi-directional I/O ports. The PORT data is put in Px register. The PORT control register (PxCRy) controls the PORT as input or output. Each I/O port has an internal pull-high resistor, which is controlled by PxPCRy when the PORT is used as input (x = 0-5, y = 0-7).

For SH79F166A, some I/O pins can share with alternative functions. There exists a priority rule in CPU to avoid these functions be conflict when all the functions are enabled. (Refer to **Port Share** Section for details).

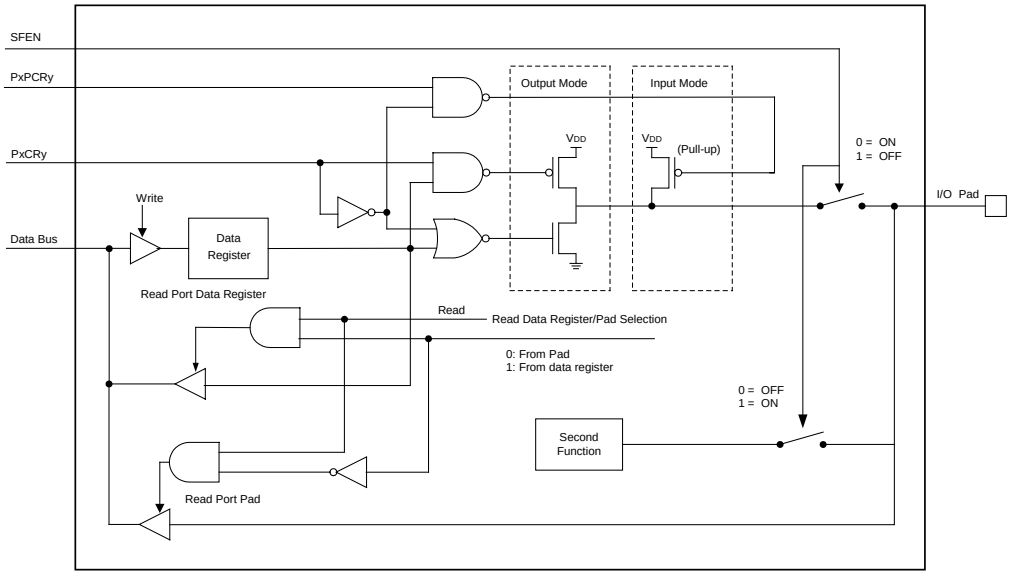
Note: *P0.4, P0.5 are configured as N-channel open drain I/O, but voltage provided for this pin can't exceed V_{DD}+0.3V.*

7.7.3 Port Diagram



Note:

(1) The input source of reading input port operation is from the input pin directly.

(2) The input source of reading output port operation has two paths, one is from the port data Register, and the other is from the output pin directly. The read Instruction distinguishes which path is selected: The read-modify-write instruction is for the reading of the data register in output mode, and the other instructions are for reading of the output pin directly.

(3) The destination of writing port operation is the data register regardless the port shared as the second function or not.

7.7.4 Port Share

The 41 bi-directional I/O ports can also share second or third special function. But the share priority should obey the **Outer Most Inner Lest** rule:

The out most pin function in **Pin Configuration** has the highest priority, and the inner most pin function has the lowest priority. This means when one pin is occupied by a higher priority function (if enabled), it cannot be used as the lower priority functional pin, even the lower priority function is also enabled. Only until the higher priority function is closed by hardware or software, can the corresponding pin be released for the lower priority function use. Also the function that need pull up resister is also controlled by the same rule.

When port share function is enabled, the user can modify PxCR, PxPCR (x = 0-5), but these operations will have no effect on the port status until the second function was disabled.

When port share function is enabled, any read or write operation to port will only affect the data register while the port pin keeps unchanged until all the share functions are disabled.

PORT0:

- LCD Segment 17-19 (P0.0-P0.2)
- PWM01: PWM01 output (P0.2)
- PWM0: PWM0 output (P0.3)
- INT0: external inturrupt0 (P0.4)
- INT1: external inturrupt1 (P0.5)
- INT2: external inturrupt2 (P0.6)
- INT3: external inturrupt3 (P0.7)

7.8 Timer

7.8.1 Features

- The SH79F166A has four timers (Timer2, 3, 4, 5)
- Timer2 is compatible with the standard 8052 and has up or down counting and programmable clock output function
- Timer3 is a 16-bit auto-reload timer and can operate even in Power-Down mode
- Timer4 is a 16-bit auto-reload timer and can be selected as a baud-rate generator
- Timer5 is a 16-bit auto-reload timer

7.8.2 Timer2

The Timer 2 is implemented as a 16-bit register accessed as two cascaded data registers: TH2 and TL2. It is controlled by the register T2CON and T2MOD. The Timer2 interrupt can be enabled by setting the ET2 bit in the IEN0 register. (Refer to Interrupt Section for details)

C/$\overline{T2}$selects system clock (timer operation) or external pin T2 (counter operation) as the timer clock input. Setting TR2 allows Timer 2/Counter 2 Data Register to increment by the selected input.

Timer2 Modes

Timer2 has 4 operating modes: Capture/Reload, Auto-reload mode with up or down counter, Baud Rate Generator and Programmable clock-output. These modes are selected by the combination of RCLK, TCLK and CP/RL2.

Table 7.25 Timer2 Mode select

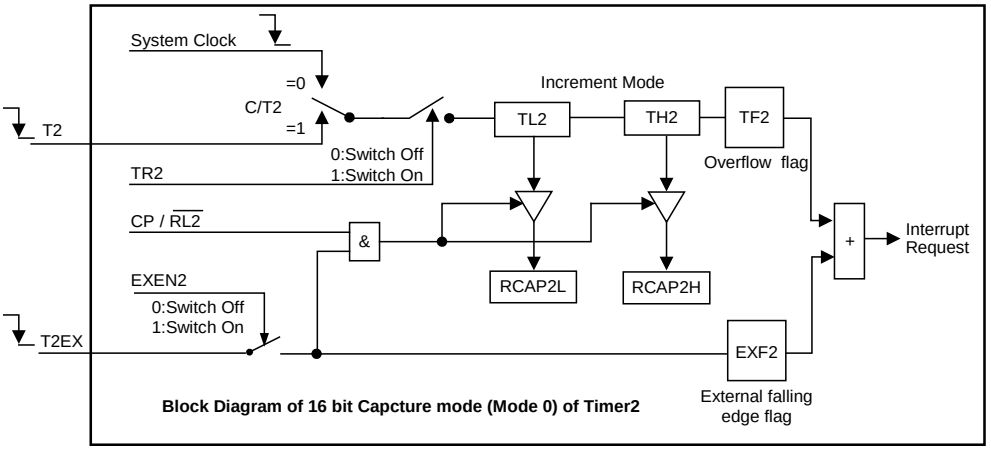
C/$\overline{T2}$	T2OE	DCEN	TR2	CP/RL2	RCLK	TCLK	Mode	
X	0	X	1	1	0	0	0	16 bit capture
X	0	0	1	0	0	0	1	16 bit auto-reload timer
X	0	1	1	0	0	0		
X	0	X	1	X	1	X	2	Baud-Rate generator
					X	1		
0	1	X	1	X	0	0	3	Programmable clock-output only
					1	X	3	Programmable clock-output, with Baud-rate generator
					X	1		
1	1	X	1	X	X	X		Not recommending
X	X	X	0	X	X	X	X	Timer2 stop, the T2EX path still enable

Mode0: 16 bit Capture

In the capture mode, two options are selected by bit EXEN2 in T2CON.

If EXEN2 = 0, Timer2 is a 16-bit timer or counter which will set TF2 on overflow to generate an interrupt if ET2 is enabled.

If EXEN2 = 1, Timer2 performs the same operation, but a 1-to-0 transition at external input T2EX also causes the current value in TH2 and TL2 to be captured into RCAP2H and RCAP2L respectively, In addition, a 1-to-0 transition at T2EX causes bit EXF2 in T2CON to be set. The EXF2 bit, like TF2, can also generate an interrupt if ET2 is enabled.



Block Diagram of 16 bit Capcture mode (Mode 0) of Timer2

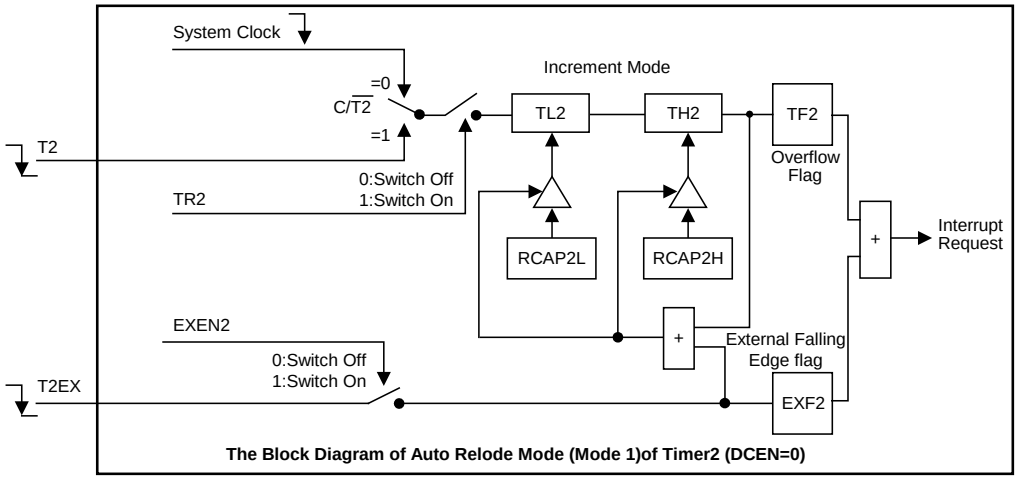
Mode1: 16 bit auto-reload Timer

Timer2 can be programmed to count up or down when configured in its 16-bit auto-reload mode. This feature is invoked by the DCEN (Down Counter Enable) bit in T2MOD. After reset, the DCEN bit is set to 0 so that Timer2 will default to count up. When DCEN is set, Timer2 can count up or down, depending on the value of the T2EX pin.

When DCEN = 0, two options are selected by bit EXEN2 in T2CON.

If EXEN2 = 0, Timer2 counts up to 0FFFFH and then sets the TF2 bit upon overflow. The overflow also causes the timer registers to be reloaded with the 16-bit value in RCAP2H and RCAP2L, which are pressed by software.

If EXEN2 = 1, a 16-bit reload can be triggered either by an overflow or by a 1-to-0 transition at external input T2EX. This transition also sets the EXF2 bit. Both the TF2 and EXF2 bits can generate an interrupt if ET2 is enabled.



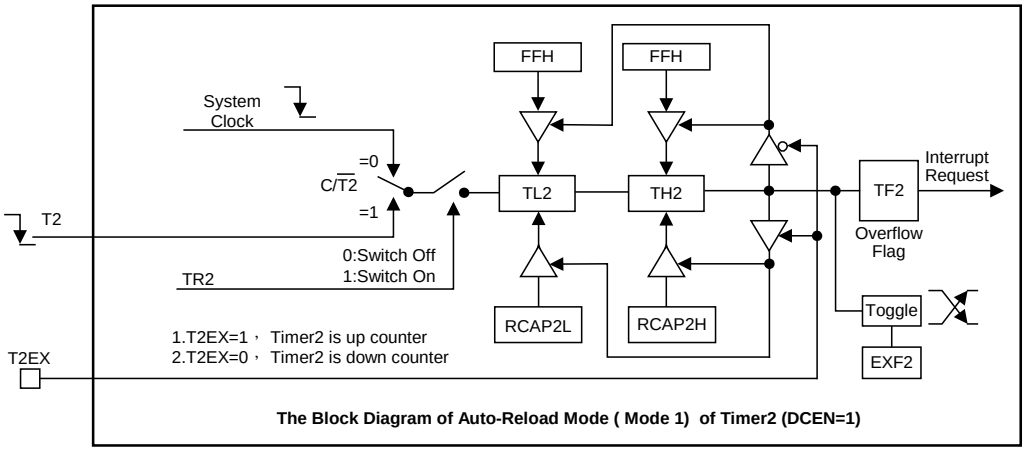
The Block Diagram of Auto Relode Mode (Mode 1)of Timer2 (DCEN=0)

Setting the DCEN bit enables Timer2 to count up or down. When DCEN = 1, the T2EX pin controls the direction of the count, and EXEN2's control is invalid.

A logical "1" at T2EX makes Timer2 count up. The timer will overflow at 0FFFFH and set the TF2 bit. This overflow also causes the 16-bit value in RCAP2H and RCAP2L to be reloaded into the timer registers, TH2 and TL2, respectively.

A logical "0" at T2EX makes Timer2 count down. The timer underflows when TH2 and TL2 equal the values stored in RCAP2H and RCAP2L. The underflow sets the TF2 bit and causes 0FFFFH to be reloaded into the timer registers.

The EXF2 bit toggles whenever Timer2 overflows or underflows and can be used as a 17th bit of resolution. In this operating mode, EXF2 does not flag an interrupt.



The Block Diagram of Auto-Reload Mode (Mode 1) of Timer2 (DCEN=1)

Mode2: Baud-Rate Generator

Timer2 is selected as the baud rate generator by setting TCLK and/or RCLK in T2CON. The baud rates for transmit and receive can be different if Timer2 is used for the receiver or transmitter and Timer4 is used for the other.

Setting RCLK and/or TCLK will put Timer2 into its baud rate generator mode, which is similar to the auto-reload mode.

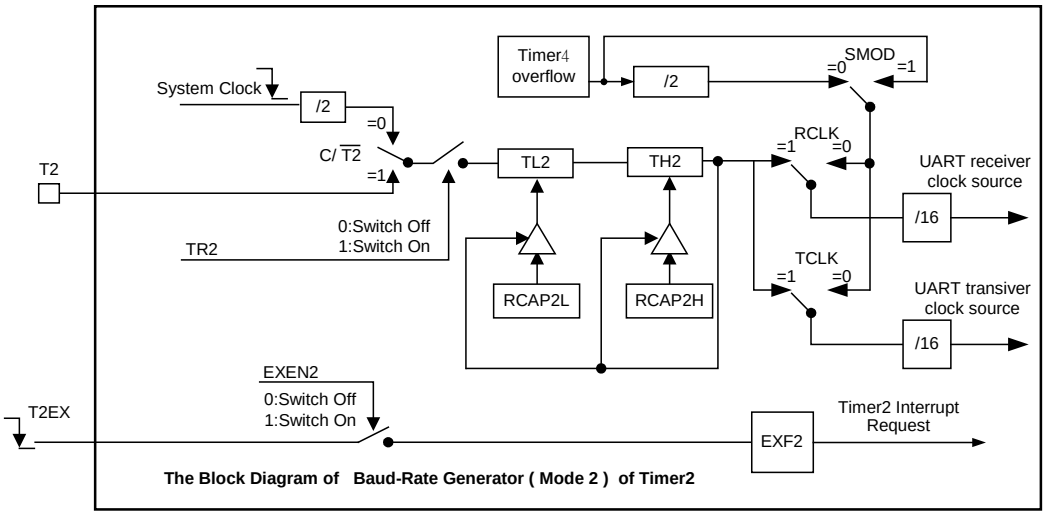
Over flow of Timer2 will causes the Timer2 registers to be reloaded with the 16-bit value in registers RCAP2H and RCAP2L that preset by software. But this will not generate an interrupt.

If EXEN2 is set, a 1-to-0 transition in T2EX will set EXF2 but will not cause a reload. Thus when Timer 2 is in use as a baud rate generator, T2EX can be used as an extra external interrupt.

The baud rates in EUART Modes1 and 3 are determined by Timer2's overflow rate according to the following equation.

$$\text{BaudRate} = \frac{1}{2\times 16}\times\frac{f_{SYS}}{65536-[\text{RCAP2H},\text{RCAP2L}]};\ C/\overline{T2} = 0$$

$$\text{BaudRate} = \frac{1}{16}\times\frac{f_{T2}}{65536-[\text{RCAP2H},\text{RCAP2L}]};\ C/\overline{T2} = 1$$



The Block Diagram of Baud-Rate Generator (Mode 2) of Timer2

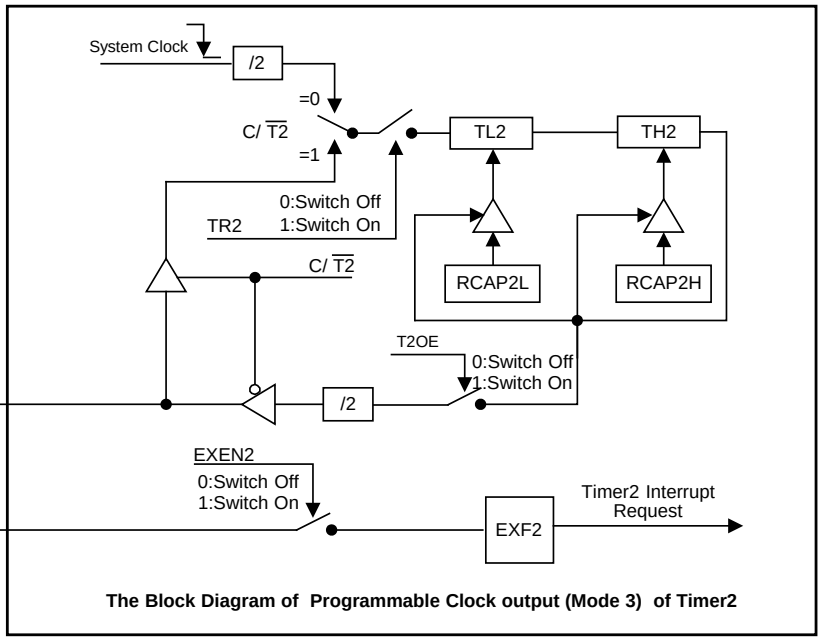
Mode3: Programmable Clock Output

A 50% duty cycle clock can be programmed to come out on P0.5. To configure the Timer2 as a clock generator, bit C/$\overline{T2}$ must be cleared and bit T2OE must be set. Bit TR2 starts and stops the timer.

In this mode T2 will output a 50% duty cycle clock:

$$\text{Clock Out Frequency} = \frac{1}{2 \times 2} \times \frac{f_{SYS}}{65536 - [\text{RCAP2H,RCAP2L}]}$$

Timer2 overflow will not generate an interrupt, so it is possible to use Timer2 as a baud-rate generator and a clock output simultaneously with the same frequency.



The Block Diagram of Programmable Clock output (Mode 3) of Timer2

Note:

(1) Both TF2 and EXF2 can cause timer2 interrupt request, and they have the same vector address.
(2) TF2 and EXF2 are set as 1 by hardware while event occurs. But they can also be set by software at any time. Only the software and the hardware reset will be able to clear TF2 & EXF2 to 0.
(3) When EA = 1 & ET2 = 1, setting TF2 or EXF2 as 1 will cause a timer2 interrupt.
(4) While Timer2 is used as baud rate generator,writing TH2/TL2, writing RCAPH2/RCAPL2 will affect the accuracy of baud rate, thus might make cause communication error.

7.8.3 Timer3

Timer3 is a 16-bit auto-reload timer. It is accessed as two cascaded Data Registers: TH3 and TL3. It is controlled by the T3CON register. The Timer3 interrupt can be enabled by setting ET3 bit in IEN1 register (Refer to **Interrupt** Section for details).

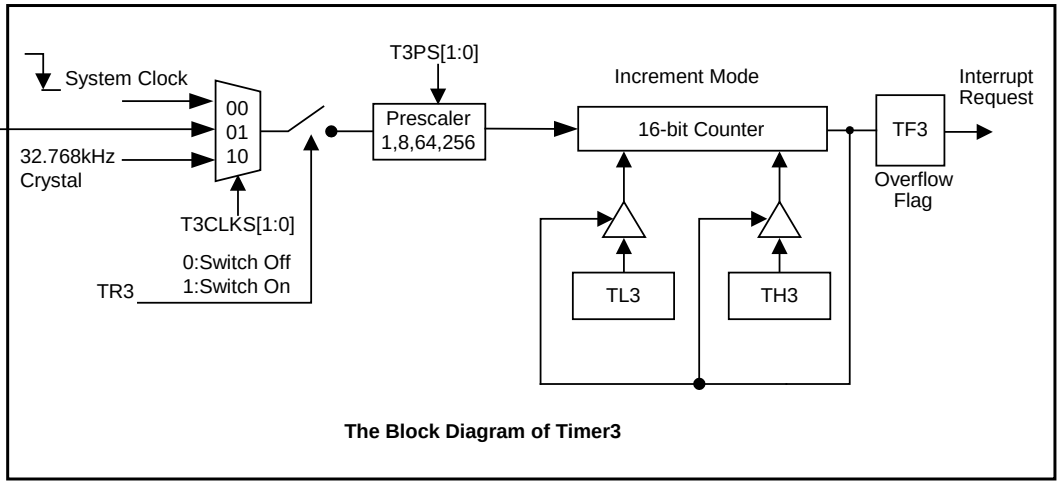
Timer3 has only one operating mode: 16-bit Counter/Timer with auto-reload. Timer3 also supports the following features: selectable pre-scaler setting and Operation during CPU Power-Down mode.

Timer3 consists of a 16-bit counter/reload register (TH3, TL3). When writing to TH3 and TL3, they are used as timer load register. When reading from TH3 and TL3, they are used as timer counter register. Setting the TR3 bit enables Timer 3 to count up. The Timer will overflow from 0xFFFF to 0x0000 and set the TF3 bit. This overflow also causes the 16-bit value written in timer load register to be reloaded into the timer counter register. Writing to TH3 also can cause the 16-bit value written in timer load register to be reloaded into the timer counter register.

Read or write operation to TH3 and TL3 should follow these steps:

Write operation: Low nibble first, High nibble to update the counter

Read operation: High nibble first, Low nibble followed.



The Block Diagram of Timer3

Timer3 can operate even in Power-Down mode.

When OP_OSC[3:0] (Refer to Code Option Section for details) is 1010, 1101, 0011 or 0110, T3CLKS [1:0] can select 00, 01 or 10. When OP_OSC[3:0] is not 1010, 1101, 0011 or 0110, T3CLKS[1:0] can select 00 or 01, and 10 will be an invalid value.

If T3CLKS[1:0] is 00, Timer 3 can't work in Power Down mode. If T3CLKS[1:0] is 01 and external clock input from T3 Pin, Timer3 can work in CPU normal operating or Power Down mode. If T3CLKS[1:0] is 10 and OP_OSC[3:0] is 1010, 1101, 0011 or 0110, Timer3 can work in CPU normal operating or Power Down mode (entering Power Down mode when system clock is high frequency). If T3CLKS[3:0] is 10 and OP_OSC[2:0] is not1010, 1101, 0011 or 0110, Timer3 can't work. It can be described in the following table.

OP_OSC[3:0]	T3CLKS[1:0]	Can work in normal mode	Can work in Power Down mode
1010, 1101, 0011 or 0110	00	YES	NO
	01	YES	YES
	10	YES	YES
Not 1010, 1101, 0011 or 0110	00	YES	NO
	01	YES	YES
	10	NO	NO

Note:

(1) When TH3 and TL3 read or written, must make sure TR3 = 0.

(2) When T3 is selected as Timer3 clock source and TR3 is set 0 to 1, the first T3 down edge will be ignored.

7.8.4 Timer4

Timer4 is a 16-bit auto-reload timer. It is accessed as two cascaded data registers: TH4 and TL4. It is controlled by the T4CON register. The Timer 4 interrupt can be enabled by setting ET4 bit in IEN1 register (Refer to **interrupt** Section for details).

When writing to TH4 and TL4, they are used as timer load register. When reading from TH4 and TL4, they are used as timer counter register. Setting the TR4 bit enables Timer 4 to count up. The timer will overflow from 0xFFFF to 0x0000 and set the TF4 bit. This overflow also causes the 16-bit value written in timer load register to be reloaded into the timer counter register. Writing to TH4 also can cause the 16-bit value written in timer load register to be reloaded into the timer counter register.

Read or write operation to TH4 and TL4 should follow these steps:

Write operation:Low nibble first,High nibble to update the counter.

Read operation:High nibble first,Low nibble followed.

Timer4 Modes

Timer4 has three operating modes: 16-bit auto-reload counter/timer, Baud Rate Generator and 16 bit auto-reload timer with T4 edge trig. These modes are selected by T4M[1:0] bits in T4CON Register.

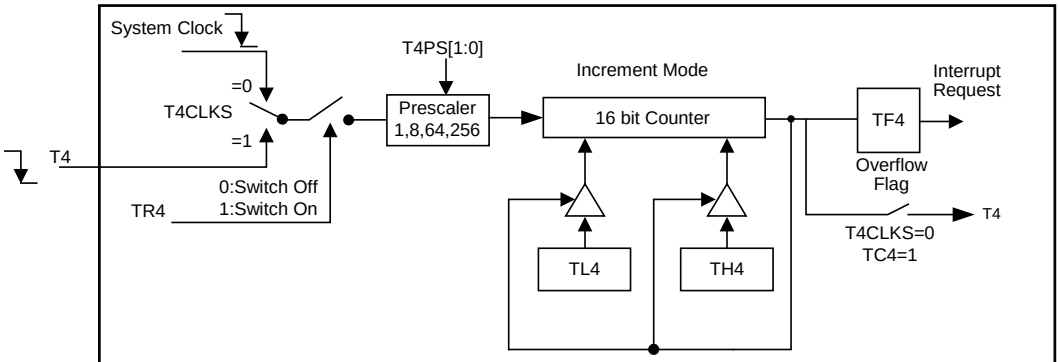
Mode0: 16 bit Auto-Reload Counter/Timer

Timer4 operates as 16-bit counter/timer in Mode 0. The TH4 register holds the high eight bits of the 16-bit counter/timer, TL4 holds the low eight bits. As the 16-bit timer register increments and overflows from 0xFFFF to 0x0000, the timer overflow flag TF4 (T4CON.7) is set and the 16-bit value in timer load register are reloaded into timer counter register, and an interrupt will occur if Timer 4 interrupts is enabled. The T4CLKS bit (T4CON.0) selects the counter/timer's clock source.

If T4CLKS = 1, external clock from the Pin T4 is selected as Timer4 clock, after prescaled, it will increase the Counter/Timer4 Data register. Else if T4CLKS = 0, the system clock is selected as Timer4 clock.

Setting the TR4 bit (T4CON.1) enables the timer. Setting TR4 does not force the timer to reset. The timer load register should be loaded with the desired initial value before the timer is enabled.

In Compare mode, the T4 pin is automatically set as output mode by hardware. the internal counter is constantly countered from TH4 and TL4 register value to 0xFFFF. When an overflow occurs, the T4 pin will be inverted. At the same time, interrupt flag bit of Time4 is set. Timer4 must be running in Timer mode (T4CLKS = 0) when compare function enabled.



The Block Diagram of Mode 0 of Timer 4

Mode1: Baud-Rate Generator

Timer4 is selected as the baud rate generator by setting T4MOD bit in T4CON register. The baud rates for transmit and receive can be different if Timer2 is used for the receiver or transmitter and Timer4 is used for the other.

The mode is similar to the auto-reload mode.Overflow of Timer4 will causes the Timer4 counter register to be reloaded with the 16-bit value in timer load register. But this will not generate an interrupt.

The baud rates in EUART mode1 and mode3 are determined by Timer4's overflow rate according to the following equation.

$$\text{BaudRate} = \frac{1}{2\times 16}\times\frac{f_{T4}/\text{PRESCALER}}{65536-[TH4,TL4]}$$, the clock source of Timer4 is system clock.

$$\text{BaudRate} = \frac{1}{16}\times\frac{f_{T4}/\text{PRESCALER}}{65536-[TH4,TL4]}$$, the clock source of Timer4 is input clock of T4 pin.

Here, TH4 and TL4 stand for Timer4 reload register.

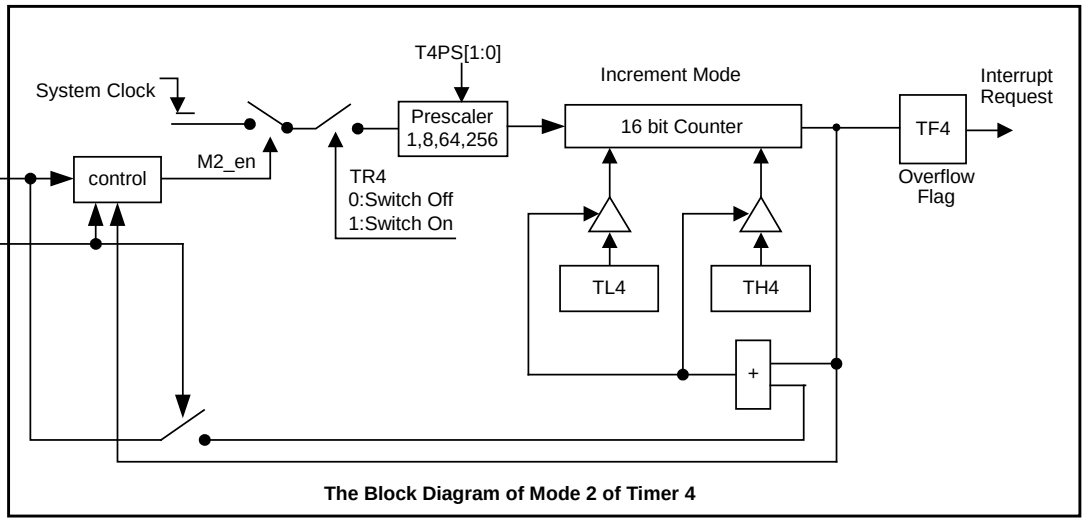
Mode2: 16 bit Auto-Reload Timer with T4 Edge Trig

Timer4 operates as 16-bit timer in Mode2. The TH4 register holds the high eight bits of the 16-bit counter/timer, TL4 holds the low eight bits. As the 16-bit timer register increments and overflows from 0xFFFF to 0x0000, the timer overflow flag TF4 (T4CON.7) is set and the 16-bit value in timer load register are reloaded into timer counter register, and an interrupt will occur if Timer4 interrupts is enabled. The T4CLKS bit (T4CON.0) is 0 always. Only the system clock is selected as Timer4 clock.

In Mode2, After Setting the TR4 bit (T4CON.1), Timer4 does not start counting but waits the trig signal (rising or falling edge controlled by T4M[1:0]) from T4. An active trig signal will start the Timer4. When Timer 4 overflows from 0XFFFF to 0x0000, TF4 will be set, TH4 and TL4 will be reloaded from timer load register, and Timer4 holds and waits the next trig edge.

When Timer4 is working, an active trig signal maybe come, if TC bit equals 0, the trig signal will be ignored; if TC bit equals 1, Timer4 will be re-trigged.

Setting TR4 does not force the timer to reset. The timer register should be loaded with the desired initial value before the timer is enabled.



The Block Diagram of Mode 2 of Timer 4

control : M2_en set to 1 when T4 edge trig, M2_en set to 0 when counter overflow

Note:

(1) When Timer4 is running (TR4 = 1) as a timer in the baud rate generator mode, TH4 or TL4 should not be written to. Because a write might overlap a reload and cause write and/or reload errors. So, the timer 4 must be turned off (TR4 = 0) before accessing the TH4 or TL4 registers.

(2) When Timer4 is used as a counter, the frequency of input signal of T4 pin must be less than half of system clock.

7.8.5 Timer5

Timer5 is a 16-bit auto-reload timer. It is accessed as two cascaded data registers: TH5 and TL5. It is controlled by the T5CON register. The interrupt can be enabled by setting ET5 bit in IEN0 register (Refer to **interrupt** Section for details).

When writing to TH5 and TL5, they are used as timer load register. When reading from TH5 and TL5, they are used as timer counter register. Setting the TR5 bit enables Timer5 to count up. The timer will overflow from 0xFFFF to 0x0000 and set the TF5 bit. This overflow also causes the 16-bit value written in timer load register to be reloaded into the timer counter register. Writing to TH4 also can cause the 16-bit value written in timer load register to be reloaded into the timer counter register.

Read or write operation to TH5 and TL5 should follow these steps:

Write operation:Low nibble first,High nibble to update the counter.

Read operation:High nibble first,Low nibble followed.

Timer5 Modes

Timer5 has one operating modes: 16-bit auto-reload counter/timer.

Mode0: 16 bit Auto-Reload Counter/Timer

Timer5 operates as 16-bit counter/timer in Mode 0. The TH5 register holds the high eight bits of the 16-bit counter/timer, TL5 holds the low eight bits. As the 16-bit timer register increments and overflows from 0xFFFF to 0x0000, the timer overflow flag TF5 (T5CON.7) is set and the 16-bit value in timer load register are reloaded into timer counter register, and an interrupt will occur if Timer 5 interrupts is enabled. The T4CLKS bit (T4CON.0) selects the counter/timer's clock source.

Setting the TR5 bit (T5CON.1) enables the timer. Setting TR5 does not force the timer to reset. The timer load register should be loaded with the desired initial value before the timer is enabled.

7.9 Interrupt

7.9.1 Feature

- 14 interrupt sources
- 4 interrupt priority levels

The SH79F166A provides total 14 interrupt sources: 5 external interrupts (INT0/1/2/3/4; INT4 including INT40-43, which share the same vector address), 4 timer interrupts (Timer2, 3, 4, 5), one EUART interrupt, ADC Interrupt, PWM interrupts, SCM interrupt and LPD interrupt.

7.9.2 Interrupt Enable Control

Each interrupt source can be individually enabled or disabled by setting or clearing the corresponding bit in the interrupt enable registers IEN0 or IEN1. The IEN0 register also contains global interrupt enable bit, EA, which can enable/disable all the interrupts at once. Generally, after reset, all interrupt enable bits are set to 0, which means that all the interrupts are disabled.

Table 7.37 Primary Interrupt Enable Register

A8H	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
IEN0	EA	EADC	ET2	ES0	-	EX1	ET5	EX0
R/W	R/W	R/W	R/W	R/W	-	R/W	R/W	R/W
Reset Value (POR/WDT/LVR/PIN)	0	0	0	0	-	0	0	0

Bit Number	Bit Mnemonic	Description
7	**EA**	**All interrupt enable bit** 0: Disable all interrupt 1: Enable all interrupt
6	**EADC**	**ADC interrupt enable bit** 0: Disable ADC interrupt 1: Enable ADC interrupt
5	**ET2**	**Timer2 overflow interrupt enable bit** 0: Disable Timer2 overflow interrupt 1: Enable Timer2 overflow interrupt
4	**ES0**	**EUART interrupt enable bit** 0: Disable EUART interrupt 1: Enable EUART interrupt
2	**EX1**	**External interrupt1 enable bit** 0: Disable external interrupt1 1: Enable external interrupt1
1	**ET5**	**Timer5 overflow interrupt enable bit** 0: Disable Timer5 overflow interrupt 1: Enable Timer5 overflow interrupt
0	**EX0**	**External interrupt0 enable bit** 0: Disable external interrupt0 1: Enable external interrupt0

IEN1	ESCM/ELPD	ET4	EPWM	ET3	EX4	EX3	EX2	-
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	-
Reset Value (POR/WDT/LVR/PIN)	0	0	0	0	0	0	0	-

Bit Number	Bit Mnemonic	Description
7	**ESCM/ELPD**	**SCM/LPD interrupt enable bit** 0: Disable SCM/LPD interrupt 1: Enable SCM/LPD interrupt
6	**ET4**	**Timer4 overflowinterrupt enable bit** 0: Disable Timer4 overflow interrupt 1: Enable Timer4 overflow interrupt
5	**EPWM**	**PWM interrupt enable bit** 0: Disable PWM interrupt 1: Enable PWM interrupt
4	**ET3**	**Timer3 overflowinterrupt enable bit** 0: Disable timer3 overflow interrupt 1: Enable timer3 overflow interrupt
3	**EX4**	**External interrupt4 enable bit** 0: Disable external interrupt4 1: Enable external interrupt4
2	**EX3**	**External interrupt3 enable bit** 0: Disable external interrupt3 1: Enable external interrupt3
1	**EX2**	**Enternal interrupt2 enable bit** 0: Disenable external interrupt2 1: Enable external interrupt2

Note:

(1) To enable External interrupt0/1/2/3/4, the corresponding port must be set to input mode before using it.

(2) To enable PWM timer interrupt, the EPWM bit here should be set. Also, the PWM0IE in PWM interrupt control register should be set.

0	**ELPD**	**LPD interrupt enable bit** 0: Disable LPD interrupt 1: Enable LPD interrupt

7.9.3 Interrupt Flag

Each Interrupt source has its own interrupt flag, when interrupt occurs, corresponding flag will be set by hardware, the interrupt flag bits are listed in Table bellow.

For **external interrupt (INT0/1/2/3)**, when an external interrupt0/1/2/3 is generated, if the interrupt was edge trigged, the flag (IE0-3 in TCON) that generated this interrupt is cleared by hardware when the service routine is vectored. If the interrupt was level trigged, then the requesting external source directly controls the request flag, rather than the on-chip hardware.

When an **external interrupt4** is generated, the flag (IF4x (x = 0-3) in EXF1 register) that generated this interrupt should be cleared by user's program because the same vector entrance was used in INT4. But if INT4 is setup as level trigged, the flag can't be cleared by user's program, it only be controlled by peripheral signal level that connect to INT source pin.

The **timer 2 interrupt** is generated by the logical OR of flag TF2 and bit EXF2 in T2CON register, which is set by hardware. None of these flags can be cleared by hardware when the service routine is vectored. In fact, the service routine may have to determine whether it was TF2 or EXF2 that generated the interrupt, so the flag must be cleared by software.

The **timer 3 interrupt** is generated when they overflow, the flag TF3 in T3CON register, which is set by hardware, and will be automatically cleared by hardware when the service routine is vectored.

The **timer 4 interrupt** is generated when they overflow, the flag TF4 in T4CON register, which is set by hardware, and will be automatically cleared by hardware when the service routine is vectored.

The **timer 5 interrupt** is generated when they overflow, the flag TF5 in T4CON register, which is set by hardware, and will be automatically cleared by hardware when the service routine is vectored.

The **EUART interrupt** is generated by the logical OR of flag RI and TI in SCON register, which is set by hardware. Neither of these flags can be cleared by hardware when the service routine is vectored. In fact, the service routine will normally have to determine whether it was the receive interrupt flag or the transmission interrupt flag that generated the interrupt, so the flag must be cleared by software.

The **ADC interrupt** is generated by ADCIF bit in ADCON. If an interrupt is generated, the converted result in ADCDH/ADCDL will be valid. If continuous compare function in ADC module is Enable, ADCIF will not be set at each conversion, but set if converted result is larger than compare value. The flag must be cleared by software.

The **SCM interrupt** is generated by SCMIF in SCM register, which is set by hardware. And the flag can only be cleared by hardware.

The **LPD interrupt** is generated by LPDF in LPDCON register. And the flag can only be cleared by hardware.

The **PWM interrupts** are generated by PWM0IF in PWM0C. The flags can be cleared by software.

7.9.4 Interrupt Vector

When an interrupt occurs, the program counter is pushed onto the stack and the corresponding interrupt vector address is loaded into the program counter. The interrupt vector addresses are listed in **Interrupt Summary table**.

7.9.5 Interrupt Priority

Each interrupt source can be individually programmed to one of four priority levels by setting or clearing corresponding bits in the interrupt priority control registers IPL0, IPH0, IPL1, and IPH1. But the OVL NMI interrupt has the highest Priority Level (except RESET) of all the interrupt sources, with no IPH/IPL control. The interrupt priority service is described below.

An interrupt service routine in progress can be interrupted by a higher priority interrupt, but can not by another interrupt with the same or lower priority.

The highest priority interrupt service cannot be interrupted by any other interrupt source. If two requests of different priority levels are received simultaneously, the request of higher priority level is serviced.

If requests of the same priority level are pending at the start of an instruction cycle, an internal polling sequence determines which request is serviced.

Interrupt Priority		
Priority bits		**Interrupt Lever Priority**
IPHx	**IPLx**	
0	0	Level 0 (lowest priority)
0	1	Level 1
1	0	Level 2
1	1	Level 3 (highest priority)

7-0	**PxxxL/H**	Corresponding interrupt source xxx's priority level selection bits

7.9.6 Interrupt Handling

The interrupt flags are sampled and polled at the fetch cycle of each machine cycle. All interrupts are sampled at the rising edge of the clock. If one of the flags was set, the CPU will find it and the interrupt system will generate a LCALL to the appropriate service routine, provided this hardware-generated LCALL is not blocked by any of the following conditions:

An interrupt of equal or higher priority is already in progress.

The current cycle is not in the final cycle of the instruction in progress. This ensures that the instruction in progress is completed before vectoring to any service routine.

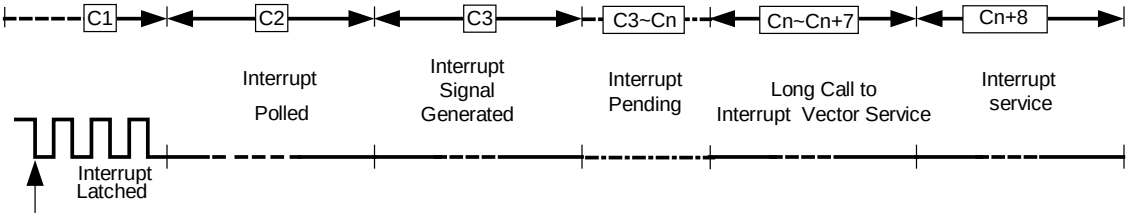
The instruction in progress is RETI. This ensures that if the instruction in progress is RETI then at least one more instruction except RETI will be executed before any interrupt is vectored to; this delay guarantees that the CPU can observe the changes of the interrupt status.

Note:

Since priority change normally needs 2 instructions, it is recommended to disable corresponding Interrupt Enable flag to avoid interrupt between these 2 instructions during the change of priority.

If the flag is no longer active when the blocking condition is removed, the denied interrupt will not be serviced. Every polling cycle interrogates only the valid interrupt requests.

The polling cycle/LCALL sequence is illustrated below:



Interrupt Response Timing

The hardware-generated LCALL pushes the contents of the program counter onto the stack (but it does not save the PSW) and reloads the program counter with corresponding address that depends on the source of the interrupt being vectored too, as shown in Interrupt Summary table.

Interrupt service execution proceeds from that location until the RETI instruction is encountered. The RETI instruction informs the processor that the interrupt routine is no longer in progress, and then pops the top two bytes from the stack and reloads the program counter. Execution of the interrupted program continues from the point where it was stopped. Note that the RETI instruction is very important because it informs the processor that the program left the current interrupt service. A simple RET instruction would also have returned execution to the interrupted program, but it would have left the interrupt control system thinking an interrupt with this priority was still in progress. In this case, no interrupt of the same or lower priority level would be acknowledged.

7.9.7 Interrupt Response Time

If an interrupt is recognized, its request flag is set in every machine cycle after recognize. The value will be polled by the circuitry until the next machine cycle; the CPU will generate an interrupt at the third machine cycle. If the request is active and conditions are right for it to be acknowledged, hardware LCALL to the requested service routine will be the next instruction to be executed. Else the interrupt will pending. The call itself takes 7 machine cycles. Thus a minimum of 3+7 complete machine cycles will elapse between activation and external interrupt request and the beginning of execution of the first instruction of the service routine.

A longer response time would be obtained if the request was blocked by one of the above three previously listed conditions. If an interrupt of equal or higher priority is already in progress, the additional wait time obviously depends on the nature of the other interrupt's service routine.

If the instruction in progress is not in its final cycle and the instruction in progress is RETI， the additional wait time is 8 machine cycles. For a single interrupt system, if the next instruction is 20 machine cycles long (the longest instructions DIV & MUL are 20 machine cycles long for 16 bit operation), adding the LCALL instruction 7 machine cycles the total response time is 2+8+20+7 machine cycles.

Thus interrupt response time is always more than 10 machine cycles and less than 37 machine cycles.

7.9.8 External Interrupt Inputs

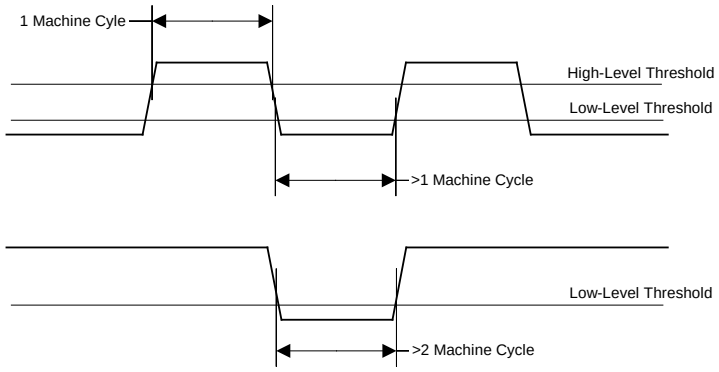
The SH79F166A has 5 external interrupt inputs. External interrupt0-3 each has one vector address. External interrupt 4 has 4 inputs; all of them share one vector address. These external interrupts can be programmed to be level-triggered or edge-triggered by clearing or setting bit IT1 or IT0 in register TCON and register EXF1. If ITn = 0 (n = 0 - 1), external interrupt 0/1 is triggered by a low level detected at the INT0/1 pin. If ITn = 1 (n = 0 - 1), external interrupt 0/1 is edge triggered. In this mode if consecutive samples of the INT0/1 pin show a high level in one cycle and a low level in the next cycle, interrupt request flag in register r EXF1 is set, causing an interrupt request. Since the external interrupt pins are sampled once each machine cycle, an input high or low level should be held for at least one machine cycle to ensure proper sampling.

If the external interrupt is edge-triggered, the external source has to hold the request pin high for at least one machine cycle, and then hold it low for at least one machine cycle. This is to ensure that the transition is detected and that interrupt request flag is set. Notice that IE0-1 is automatically cleared by CPU when the service routine is called while IF4x should be cleared by software. External interrupt4 operates in the similar ways except have different registers and have more selection of trigger.

If the external interrupt is level-triggered, the external source must hold the request active until the requested interrupt is generated, which will take 2 machine cycles. If the external interrupt is still asserted when the interrupt service routine is completed, another interrupt will be generated. It is not necessary to clear the interrupt flag IEx (x = 0, 1, 2, 3) when the interrupt is level sensitive, it simply tracks the input pin level.

If an external interrupt is enabled when the SH79F166A is put into Power down or Idle mode, the interrupt occurrence will cause the processor to wake up and resume operation.

***Note**: IE0-3 is automatically cleared by CPU when the service routine is called while IF40-43 should be cleared by software.*



7.9.9 Interrupt Summary

Source	Vector Address	Enable bits	Flag bits	Polling Priority	Interrupt number (c language)

8. Enhanced Function

8.1 Normal Resistor LCD Driver

The LCD driver contains a controller, a duty cycle generator with 4/8 Common signal pins and 19 Segment driver pins. Segment 1-19 and COM1-COM4 can also be used as I/O port, it is controlled by the P0SS, P1SS & P3SS register.

The 28 bytes display data RAM is addressed to 1E0H-1F2H, which could be used as data memory if needed. LCD COM1-8 can also be used as LED.

The MCU consists normal display topologies with contrast adjustment which supports both 1/4duty-1/3bias and 1/8duty-1/4 bias driving mode, DISPEDL (DISPCON.7) must be cleared before LCD working.When ELCC in DISPCON is set, the LCD supply power V_{LCD} is selected by VOL[3:0]. When ELCC is cleared, V_{LCD} equals to V_{DD}.

When MCU enters the Power-Down mode, the LCD will be turned off. If 32.768kHz crystal/128kHz works in Power-down mode, the LCD is still working.but the data of LCD RAM keeps the value.During the Power on Reset or Pin Reset or LVR Reset or Watch-dog Reset, the LCD will be turned off, and Common and Segment will output low.

The features of the LCD Normal Display Mode include the following:

- LCD clock is decided by code option OP_OSC
- When OP_OSC[3:0] is 1010, 1101, LCD clock source is 32.768kHz, DISPCLK register is invalid, LCD frame is 64Hz.
- When OP_OSC[3:0] is 0011, 0110, LCD clock source is 128kHz, DISPCLK register is invalid, LCD frame is 64Hz.
- When OP_OSC[3:0] is 0000, LCD clock source is internal RC (12MHz), LCD clock = internal RC (12MHz)/DISPCLK, LCD frame = LCD clock/512.
- When OP_OSC[3:0] is 1110, LCD clock source is crystal or ceramic, LCD clock = crystal or ceramic frenquncy/DISPCLK.
- 1/4duty -1/3 bias or 1/5 duty - 1/3 bias by configuring the DUTY bit in LCDCON register.
- LCD frame = LCD clock/512.
- 16 levels contrast adjustment by configuring the CONTR[2:0] bits in LCDCON1 register.
- LCD bias resistor (R_{LCD}) can be selected as 20K/75K/300KΩ in 1/3 bias mode, 15K/56K/225K in 1/4 bias mode

The relatively high current drain through the 20k resistor will get better LCD display effect, but it may not be suitable for some low current consume application. Lowering this current is possible by configucring the OP_RLCD[2:0] for switching the R_{LCD} value to 75/300K.

Therefore, SH79F166A provides both the low power consumption and display effect of the display mode:fast charge mode.

Set MOD[1:0] = 10 to select this mode. When refresh the display data 20k bias resistors are selected to provide larger current.When keep the display data 75/300K bias resistors are selected to save drive current. Charging time is selected as 1/8、1/16、1/32 or 1/64 of LCD com period by FCCTL[1:0] in DISPCLK1 register.

8.2 LED Driver

The LED driver contains a controller, a duty cycle generator with 4/8 Common signal pins and 8 Segment driver pins. Segment 1-8 can also be used as I/O port,When DISPSEL bit is set, LED function is enable,and LCD is disable. It is controlled by the P0SS, P1SS register.

When MCU enters the Power-Down mode, the LED will be turned off, If 32.768kHz crystal or 128k internal RC works in Power-down mode,the LED is still working. When OP_LEDCOM = 0 Common and Segment will output low. When OP_LEDCOM = 1 Common and Segment will output high.

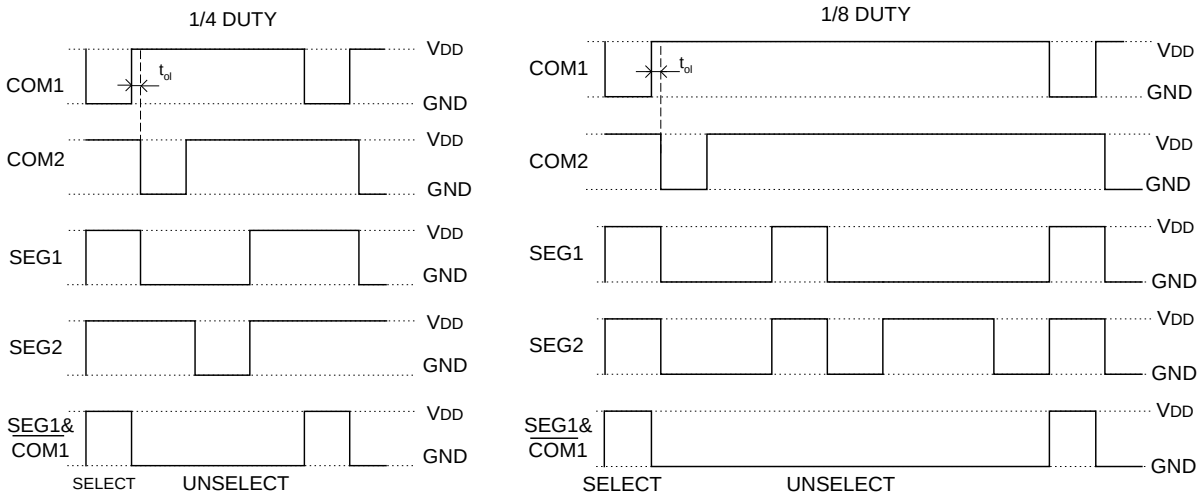
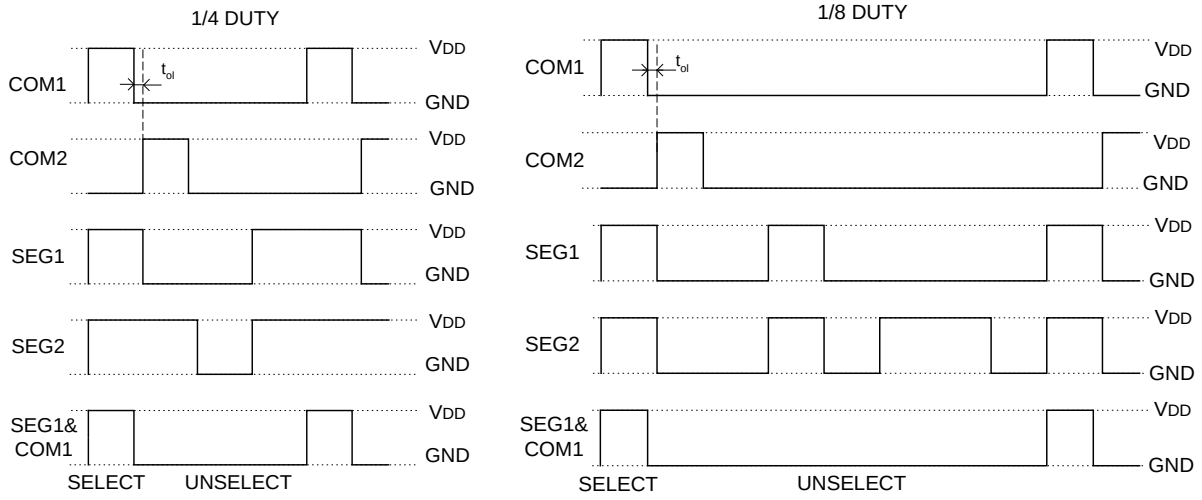
LED Waveform

(1) OP_LEDCOM = 0



(2) OP_LEDCOM [1] = 1



Note： *t_{OL} is overlap time of LED Common , t_{OL} =20μs-40μs.*

8.3 PWM (Pulse Width Modulation)

8.3.1 Feature

- Complementary output with dead time control
- Provided interrupt function on period
- Selectable output polarity
- Fault Detect function provided to disable PWM output immediately
- Lock register provided to avoid PWM control register to be unexpected change

The SH79F166A has one 12-bit PWM module. Which can provide the pulse width modulation waveform with the period and the duty being controlled individually by corresponding register.

PWM timer can be turned to inactive state by the input of FLT pin automatically if EFLT is set.

PWM timer also provides 1 interrupts for PWM0. This makes it possible to change period or duty in every PWM period.

8.3.2 PWM Module Enable

Table 8.12 PWM Module Enable Register

CFH	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
PWMEN	-	EFLT	-	-	EPWM01	-	-	EPWM0
R/W	-	R/W	-	-	R/W	-	-	R/W
Reset Value (POR/WDT/LVR/PIN)	-	0	-	-	0	-	-	0

Bit Number	Bit Mnemonic	Description
6	**EFLT**	**FLT pin configuration:** 0: general purpose I/O or $\overline{SS}$ pin (default) 1: PWM Fault Detect input pin
3	**EPWM01**	**PWM01 output enable** 0: I/O port 1: PWM output
0	**EPWM0**	**Enable 12-bit PWM0** 0: I/O port 1: PWM output

PWM output will be disable at the same time when the PWM Enable register is clear to 0.

The main purpose of the FLT pin is to inactivate the PWM output signals and drive them into an inactive state. The action of the FLT is performed directly in hardware so that when a fault occurs, it can be managed quickly and the PWMs outputs are put into an inactive state to save the power devices connected to the PWMs. The FLT pin has no internal pull-high resistor.

If EFLT is set to 0, it means the level on FLT pin has no effect on PWM timers.

Table 8.13 PWM Module Enable Register

B7H	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
PWMEN1	-	-	-	-	-	-	-	PWM0
R/W	-	-	-	-	-	-	-	R/W
Reset Value (POR/WDT/LVR/PIN)	-	-	-	-	-	-	-	0

Bit Number	Bit Mnemonic	Description
0	**PWM0**	**Enable 12-bit PWM0** 0: PWM output enable 1: PWM output disable, PWM0. PWM01 as I/O, but PWM timer can work normally, Trigger interrupt

8.3.3 PWM Timer Lock Register

This register is used to control the change of PWM timer enable register, PWM control register, PWM period register, PWM duty register and PWM dead time control register. Only when the data in this register is #55h, it is possible to change these register. Otherwise they cannot be changed.

This register is to enhance the anti-noise ability of SH79F166A.

Table 8.14 PWM Timer Lock Register

E7H	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
PWMLO	PWMLO.7	PWMLO.6	PWMLO.5	PWMLO.4	PWMLO.3	PWMLO.2	PWMLO.1	PWMLO.0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset Value (POR/WDT/LVR/PIN)	0	0	0	0	0	0	0	0

Bit Number	Bit Mnemonic	Description
7-0	**PWMLO[7:0]**	**PWM lock register** 55h: enable to change PWM related registers else: disable to change PWM related registers

8.3.4 12-bit PWM Timer

The SH79F166A has one 12-bit PWM module. The PWM module can provide the pulse width modulation waveform with the period and the duty being controlled, individually. The PWMC is used to control the PWM module operation with proper clocks. The PWMP is used to control the period cycle of the PWM module output. PWMD is used to control the duty in the waveform of the PWM module output.

It is acceptable to change these 3 registers during PWM output Enable. All the change will take affect at the next PWM period.

Table 8.15 12-bit PWM Control Register

D2H	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
PWM0C	PWM0IE	PWM0IF	-	FLTS	FLTC	PWM0S	TnCK01	TnCK00
R/W	R/W	R/W	-	R/W	R/W	R/W	R/W	R/W
Reset Value (POR/WDT/LVR/PIN)	0	0	-	0	0	0	0	0

Bit Number	Bit Mnemonic	Description
7	**PWM0IE**	**PWM0 interrupt enable bit (When EPWM bit in IEN1 is set)** 0: Disable PWM0 interrupt 1: Enable PWM0 interrupt
6	**PWM0IF**	**PWM0 interrupt flag** 0: Clear by software 1: Set by hardware to indicate that the PWM0 period counter overflow
4	**FLTS**	**FLT status bit** 0: PWM is in normal status, cleared by software 1: PWM is in inactive status, set automatically by hardware
3	**FLTC**	**FLT pin configuration** 0: Inactivate the PWM output when FLT is low level 1: Inactivate the PWM output when FLT is high level
2	**PWM0S**	**PWM0 output normal mode of duty cycle** 0: high active, PWM0 output high during duty time, output low during remain period time 1: low active, PWM0 output low during duty time, output high during remain period time
1-0	**TnCK0[1:0]**	**12-bit PWM clock selector:** 00: Oscillator clock/2 01: Oscillator/4 10: Oscillator/8 11: Oscillator/16 ***Note:*** *When OP_OSC is 0000, 0011 or 1010,PWM clock source is internal RC, When OP_OSC is 1110, PWM clock source is crystal or ceramic, When OP_OSC is 0110 or 1101, PWM clock source is crystal or ceramic in XTALX pins.*

Note:

(1)Inactivate PWM here means PWM0 and PWM01 outputs keep Low (if PWM0S = 0) or High (if PWM0S = 1).
(2) The PWM outputs will remain in the inactive states as soon as the high/low level of FLT pin is detected.
(3)Clearing FLTS bit when a FAULT input is coming will not success.

Table 8.16 PWM Period Control Register (PWM0PL)

R/W	-	-	-	-	R/W	R/W	R/W	R/W
Reset Value (POR/WDT/LVR/PIN)	-	-	-	-	0	0	0	0

Bit Number	Bit Mnemonic	Description
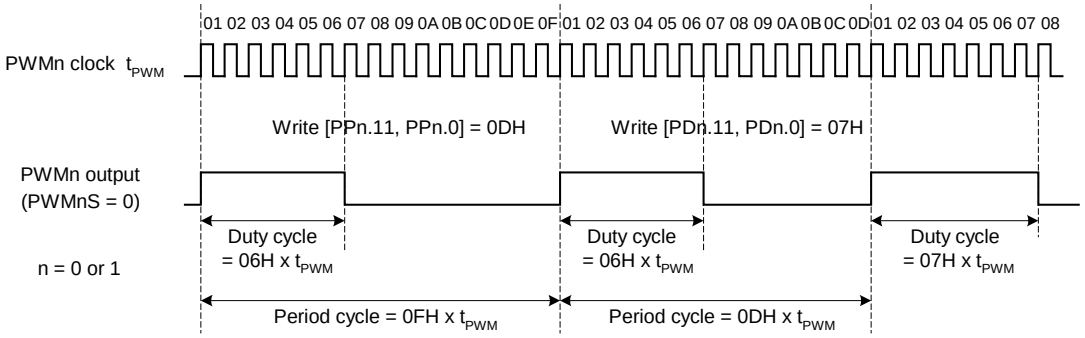
3-0	**PD0[11:8]**	12-bit PWM duty high 4 nibble registers

PWM output duty cycle = [PD0.11, PD0.0] X PWM clock.
If [PP0.11, PP0.0] ≤ [PD0.11, PD0.0], PWM0 outputs high level when the PWM0S bit is set to “0”.
If [PP0.11, PP0.0] ≤ [PD0.11, PD0.0], PWM0 outputs GND level when the PWM0S bit is set to “1”.

Programming Note:

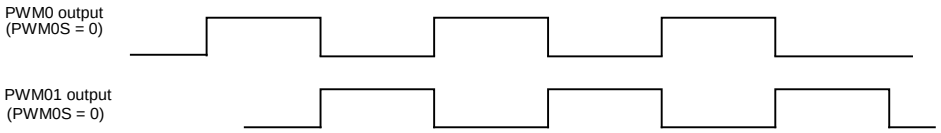
(1) Set PWMLO register to 55H and select the PWM module system clock.
(2) Set the PWM period/duty cycle by writing proper value to the PWM period control register (PWMP) or PWM duty control register (PWMD). First set the low Byte, then the high Byte.
(3) Select the PWM output mode of the duty cycle by writing the PWM0S bit in the PWM control register (PWMC).
(4) In order to output the desired PWM waveform, enable the PWM module by writing "1" to the EPWM bit in the PWM control register (PWMC).
(5) If the PWM period cycle or duty cycle is to be changed, the writing flow should be followed as described in step b or step c. Then the revised data are loaded into the re-load counter and the PWM module starts counting at next period.
(6) Change the data in PWMLO register not equal to 55h in order to enhance the anti-noise ability.



PWM output Period or Duty cycle changing example

8.3.5 PWM01

Generally, PWM01 have a 180° phase delay with PWM0 as shown below when there is no dead time inserted. It is automatically generated by hardware when EPWM01 in PWM timer enable register is set.



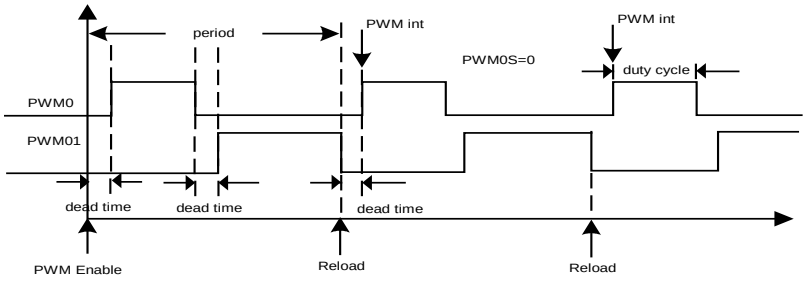
Note:

(1) That even if PWM0 are not enabled, PWM01 can also work if enabled.
(2) If EFLT is set, When a valid event occurs on FLT pin, PWM01 and PWM0 are both LOW (PWMS = 0)or both HIGH (PWMS = 1).

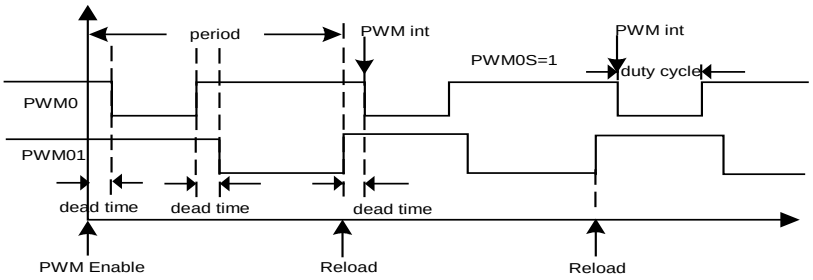
8.3.6 Dead Time

The SH79F166 provides dead time control function on-chip.

When PWM0S = 0, the dead time is generated as below.



When PWM0S = 1, the dead time is generated as below.



By writing PWM01 dead time control registers, a dead time can be generated between PWM0 and PWM01.

PWM01 have the same period as PWM0.

Note:

(1) Dead time0 must be set before PWM outputs enabled. Otherwise, dead time will not change. So in order to change dead time, please disable PWM outputs first (while PWMLO is #55h), then change the dead time, enable PWM. Finally, change the data in PWMLO not equal to #55h in order to make sure the PWM registers would not be changed by noise.

(2) In order to generate dead time, please make sure that (PWM0 Period - PWM0 Duty) > 2 PWM01 dead time control. Otherwise the output of PWM01 is high level when PWMS = 1 or GND when PWMS = 0.*

(3) PWMDT is to used to control Dead Time, the step value is fixed oscillator clock time, but period and duty step value is refer to TnCK0[1:0]. 2 oscillator clocks at least.

(4) If dead time is needed, any time when PWM is disabled, before enable PWM again, dead time register must be clear to 0 at first, and then set to proper value.

Table 8.20 PWM0 Dead Time Control Register

8.4 EUART

8.4.1 Feature

- The SH79F166A has one enhanced EUART which are compatible with the conventional 8051
- The baud rate can be selected from the divided clock of the system clock, or Timer4/2 overflow rate
- Enhancements over the standard 8051 the EUART include Framing Error detection and automatic address recognition
- The EUART can be operated in four modes

8.4.2 EUART Mode Description

The EUART can be operated in 4 modes. Users must initialize the SCON before any communication can take place. This involves selection of the Mode and the baud rate. The Timer4/2 should also be initialized if the mode 1 or the mode 3 is used.

In all of the 4 modes, transmission is initiated by any instruction that uses SBUF as a destination register. Reception is initiated in Mode 0 by the condition RI = 0 and REN = 1. This will generate a clock on the TxD pin and shift in 8 bits on the RxD pin. Reception is initiated in the other modes by the incoming start bit if RI = 0 and REN = 1. The external transmitter will start the communication by transmitting the start bit.

EUART Mode Summary

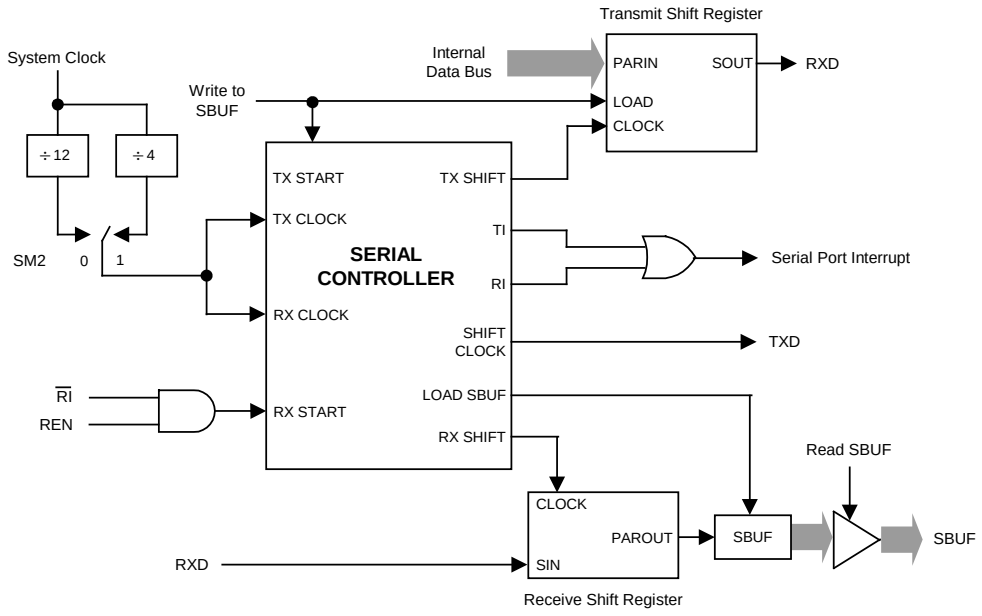
SM0	SM1	Mode	Type	Baud Clock	Frame Size	Start Bit	Stop Bit	9th bit
0	0	0	Sych	f_{SYS}/(4 or 12)	8 bits	NO	NO	None
0	1	1	Ansych	Timer 4 or 2 overflow rate/(16 or 32)	10 bits	1	1	None
1	0	2	Ansych	f_{SYS}/(32 or 64)	11 bits	1	1	0, 1
1	1	3	Ansych	Timer 4 or 2 overflow rate/(16 or 32)	11 bits	1	1	0, 1

Mode0: Synchronous Mode, Half duplex

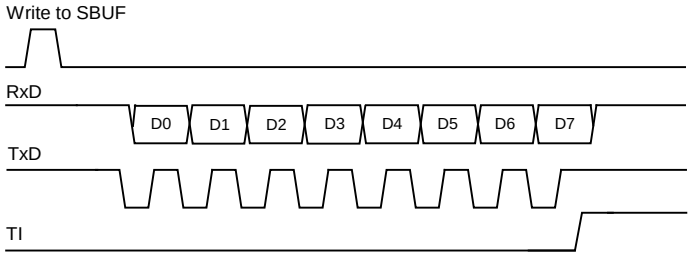
This mode provides synchronous communication with external devices. In this mode serial data is transmitted and received on the RxD line. TxD is used to output the shift clock. The TxD clock is provided by the SH79F166A whether the device is transmitting or receiving. This mode is therefore a half duplex mode of serial communication. In this mode, 8 bits are transmitted or received per frame. The LSB is transmitted/received first.

The baud rate is programmable to either 1/12 or 1/4 of the system clock. This baud rate is determined in the SM2 bit (SCON.5). When this bit is set to 0, the serial port runs at 1/12 of the system clock. When set to 1, the serial port runs at 1/4 of the system clock.

The functional block diagram is shown below. Data enters and exits the serial port on the RxD line. The TxD line is used to output the SHIFT CLOCK. The SHIFT CLOCK is used to shift data into and out of the SH79F166A.

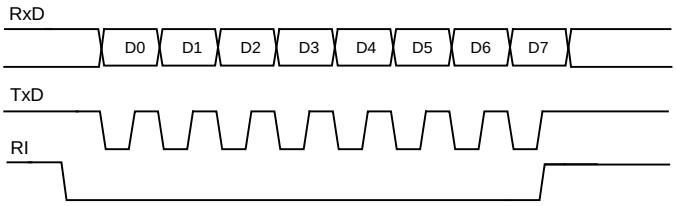


Any instruction that uses SBUF as a destination register (“write to SBUF” signal) will start the transmission. The next system clock tells the Tx control block to commence a transmission. The data shift occurs at the falling edge of the SHIFT CLOCK, and the contents of the transmit shift register is shifted one position to the right. As data bits shift to the right, zeros come in from the left. After transmission of all 8 bits in the transmit shift register, the Tx control block will deactivates SEND and sets TI (SCON.1) at the rising edge of the next system clock.



Send Timing of Mode 0

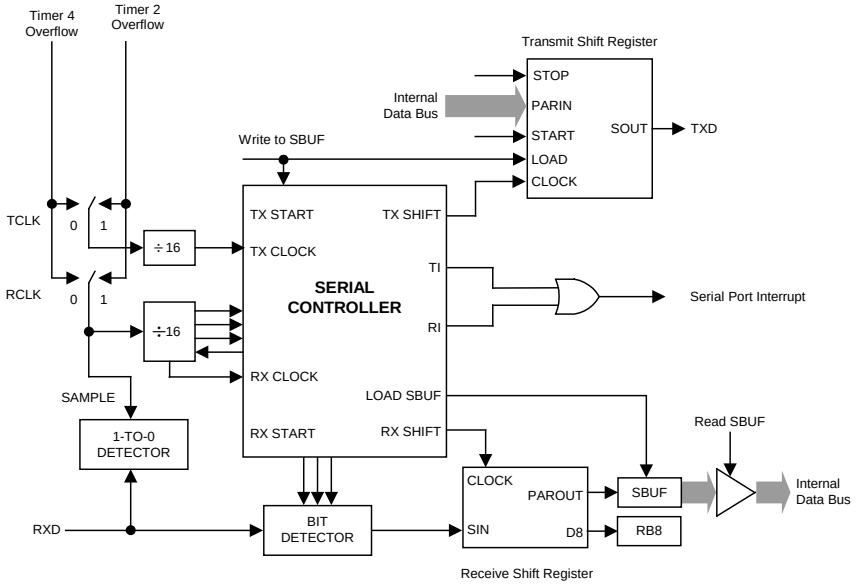
Reception is initiated by the condition REN (SCON.4) = 1 and RI (SCON.0) = 0. The next system clock activates RECEIVE. The data latch occurs at the rising edge of the SHIFT CLOCK, and the contents of the receive shift register are shifted one position to the left. After the receiving of all 8 bits into the receive shift register, the RX control block will deactivates RECEIVE and sets RI at the rising edge of the next system clock, and the reception will not be enabled till the RI is cleared by software.



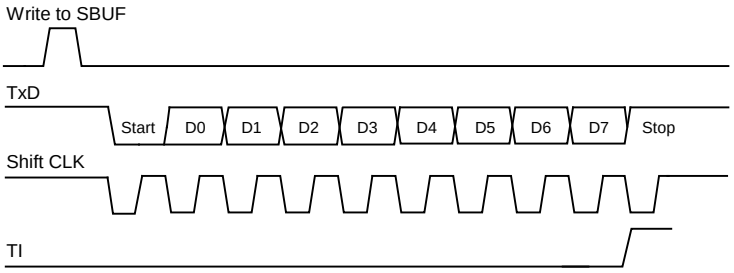
Receive Timing of Mode 0

Mode1: 8-Bit EUART, Variable Baud Rate, Asynchronous Full-Duplex

This mode provides the 10 bits full duplex asynchronous communication. The 10 bits consist of a start bit (logical 0), 8 data bits (LSB first), and a stop bit (logical 1). When receiving, the eight data bits are stored in SBUF and the stop bit goes into RB8 (SCON.2). The serial receive and transmit baud rate is 1/16 of the Timer4/2 overflow (Refer to **Baud Rate** Section for details). The functional block diagram is shown below.



Transmission begins with a “write to SBUF” signal, and it actually commences at the next system clock following the next rollover in the divide-by-16 counter (divide baud-rate by 16), thus, the bit times are synchronized to the divide-by-16 counter, not to the “write to SUBF” signal. The start bit is firstly put out on TxD pin, then are the 8 bits of data. After all 8 bits of data in the transmit shift register are transmitted, the stop bit is put out on the TxD pin, and the TI flag is set at the same time that the stop is send.



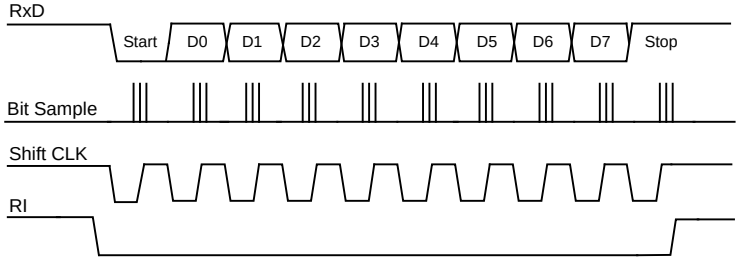
Send Timing of Mode 1

Reception is enabled only if REN is high. The serial port actually starts the receiving of serial data with the detection of a falling edge on the RxD pin. For this purpose RxD is sampled at the rate of 16 times baud rate. When a falling edge is detected, the divide-by-16 counter is immediately reset. This helps to align the bit boundaries with the rollovers of the divide-by-16 counter.The 16 states of the counter divide each bit time into 16ths. The bit detector samples the value of RxD at the 7^{th}, 8^{th} and 9^{th} counter states of each bit time. The value accepted is the value that was seen in at least 2 of the 3 samples. This is done for noise rejection. If the first bit after the falling edge of RxD pin is not 0, which indicates an invalid start bit, and the reception is immediately aborted. The receive circuits are reset and again waiting for a falling edge in the RxD line. If a valid start bit is detected, then the rest of the bits are also detected and shifted into the shift register. After shifting in 8 data bits and the stop bit, the SBUF and RB8 are loaded and RI are set if the following conditions are met:

1. RI must be 0
2. Either SM2 = 0, or the received stop bit = 1

If these conditions are met, then the stop bit goes to RB8, the 8 data bits go into SBUF and RI is set. Otherwise the received frame may be lost.

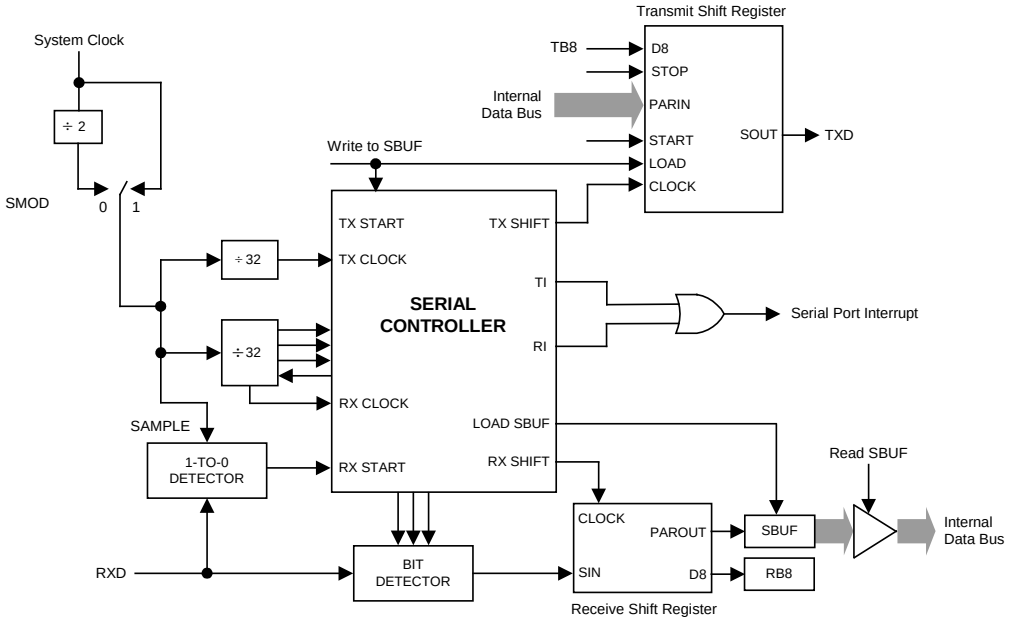
At the time, the receiver goes back to looking for another falling edge on the RxD pin. And the user should clear RI by software for further reception.



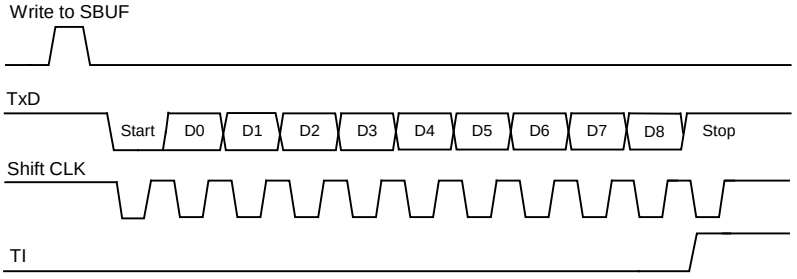
Receive Timing of Mode 1

Mode2: 9-Bit EUART, Fixed Baud Rate, Asynchronous Full-Duplex

This mode provides the 11 bits full duplex asynchronous communication. The 11 bit consists of one start bit (logical 0), 8 data bits (LSB first), a programmable 9th data bit, and a stop bit (logical 1). Mode 2 supports multiprocessor communications and hardware address recognition (Refer to Multiprocessor Communication Section for details). When data is transmitted, the 9th data bit (TB8 in SCON) can be assigned the value of 0 or 1, for example, the parity bit P in the PSW or used as data/address flag in multiprocessor communications. When data is received, the 9th data bit goes into RB8 and the stop bit is not saved. The baud rate is programmable to either 1/32 or 1/64 of the system working frequency, as determined by the SMOD bit in PCON. The functional block diagram is shown below:



Transmission begins with a “write to SBUF” signal, the “write to SBUF” signal also loads TB8 into the 9th bit position of the transmit shift register. Transmission actually commences at the next system clock following the next rollover in the divide-by-16 counter (thus, the bit times are synchronized to the divide-by-16 counter, not to the “write to SUBF” signal). The start bit is firstly put out on TxD pin, then are the 9 bits of data. After all 9 bits of data in the transmit shift register are transmitted, the stop bit is put out on the TxD pin, and the TI flag is set at the same time, this will be at the 11th rollover of the divide-by-16 counter after a write to SBUF.



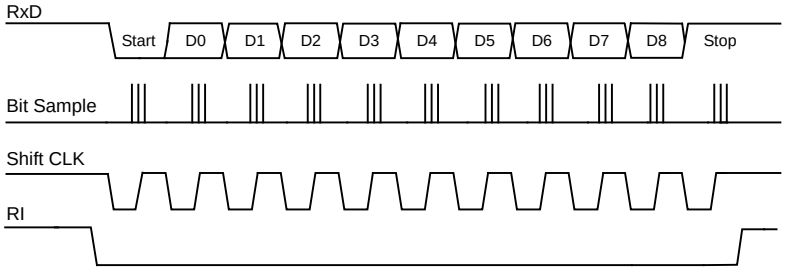
Send Timing of Mode 2

Reception is enabled only if REN is high. The serial port actually starts the receiving of serial data, with the detection of a falling edge on the RxD pin. For this purpose RxD is sampled at the rate of 16 times baud rate. When a falling edge is detected, the divide-by-16 counter is immediately reset. This helps to align the bit boundaries with the rollovers of the divide-by-16 counter. The 16 states of the counter divide each bit time into 16ths. The bit detector samples the value of RxD at the 7th, 8th and 9th counter state of each bit time. The value accepted is the value that was seen in at least 2 of the 3 samples. This is done for noise rejection. If the first bit detected after the falling edge of RxD pin is not 0, which indicates an invalid start bit, and the reception is immediately aborted. The receive circuits are reset and again looks for a falling edge in the RxD line. If a valid start bit is detected, then the rest of the bits are also detected and shifted into the shift register. After shifting in 9 data bits and the stop bit, the SBUF and RB8 are loaded and RI is set if the following conditions are met:

1. RI must be 0
2. Either SM2 = 0, or the received 9th bit = 1 and the received byte accords with Given Address

If these conditions are met, then the 9th bit goes to RB8, the 8 data bits go into SBUF and RI is set. Otherwise the received frame may be lost.

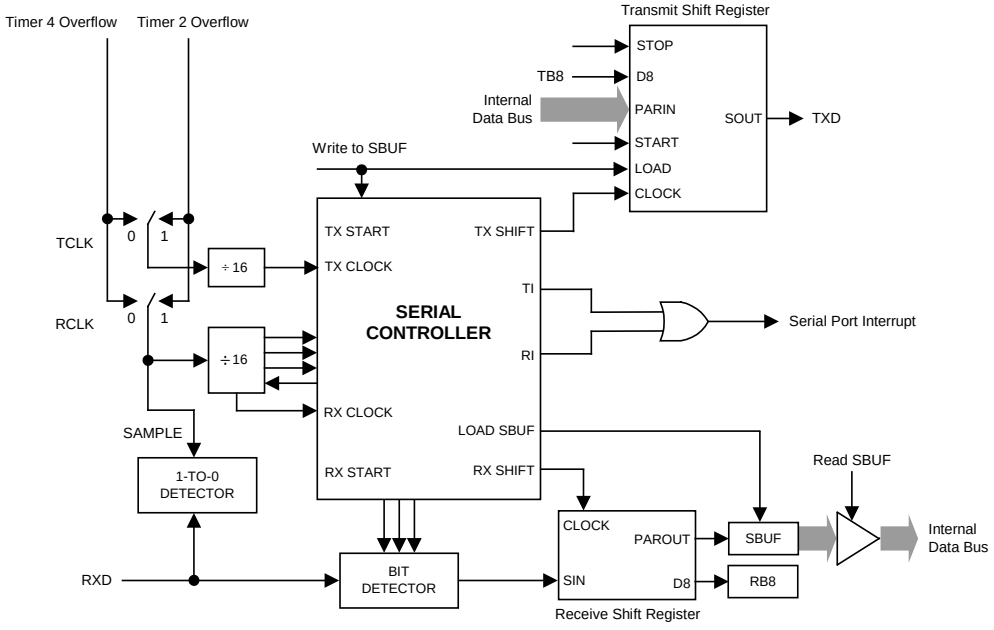
At the time, the receiver goes back to looking for another falling edge on the RxD pin. And the user should clear RI by software for further reception.



Receive Timing of Mode 2

Mode3: 9-Bit EUART, Variable Baud Rate, Asynchronous Full-Duplex

Mode3 uses transmission protocol of the Mode2 and baud rate generation of the Mode1.



8.4.3 Baud Rate Generate

In Mode0, the baud rate is programmable to either 1/12 or 1/4 of the system frequency. This baud rate is determined by SM2 bit. When set to 0, the serial port runs at 1/12 of the system clock. When set to 1, the serial port runs at 1/4 of the system clock.

In Mode1 & Mode3, the baud rate can be selected from Timer4/2 overflow rate.

The Mode1 & 3 baud rate equations are shown below, where [RCAP2H, RCAP2L] is the 16-bit reload register for Timer2, [TH4, TL4] is the 16-bit reload register for Timer4.

$$\text{BaudRate} = \frac{1}{2\times 16}\times\frac{f_{T2}}{65536-[\text{RCAP2H},\text{RCAP2L}]}$$, Baud Rate using Timer2, the clock source of Timer2 is system clock.

$$\text{BaudRate} = \frac{1}{16}\times\frac{f_{T2}}{65536-[\text{RCAP2H},\text{RCAP2L}]}$$, Baud Rate using Timer2, the clock source of Timer2 is input clock of T2 pin.

$$\text{BaudRate} = \frac{1}{2\times 16}\times\frac{f_{T4}/\text{PRESCALER}}{65536-[\text{TH4},\text{TL4}]}$$, , Baud Rate using Timer4, the clock source of Timer4 is system clock.

$$\text{BaudRate} = \frac{1}{16}\times\frac{f_{T4}/\text{PRESCALER}}{65536-[\text{TH4},\text{TL4}]}$$, Baud Rate using Timer4, the clock source of Timer4 is input clock of T4 pin.

In Mode2, the baud rate is programmable to either 1/32 or 1/64 of the system clock. This baud rate is determined by the SMOD bit (PCON.7). When this bit is set to 0, the serial port runs at 1/64 of the clock. When set to 1, the serial port runs at 1/32 of the clock.

$$\text{BaudRate} = 2^{\text{SMOD}}\times(\frac{f_{SYS}}{64})$$

8.4.4 Multi-Processor Communication

Software Address Recognition

Modes 2 and 3 of the EUART have a special provision for multi-processor communication. In these modes, 9 data bits are received. The 9th bit goes into RB8. Then a stop bit follows. The EUART can be programmed such that when the stop bit is received, the EUART interrupt will be activated (i.e. the request flag RI is set) only if RB8 = 1. This feature is enabled by setting the bit SM2 in SCON.

A way to use this feature in multiprocessor communications is as follows. If the master processor wants to transmit a block of data to one of the several slaves, it first sends out an address byte which identifies the target slave. An address byte differs from a data byte in that the 9th bit is 1 in an address byte and 0 in a data byte.

With SM2 = 1, no other slave will be interrupted by a data byte. An address byte, however, will interrupt all slaves, so that each slave can examine the received byte and see if it is being addressed. The addressed slave will clear its SM2 bit and prepare to receive the data bytes that will be coming. After having received a complete message, the slave sets SM2 again. The slaves that were not addressed leave their SM2 set and go on with their business, ignoring the incoming data bytes.

Note: *In Mode0, SM2 is used to select baud rate doubling. In Mode1, SM2 can be used to check the validity of the stop bit. If SM2 = 1 in Mode1, the receive interrupt will not be activated unless a valid stop bit is received.*

Automatic (Hardware) Address Recognition

In Mode2 & 3, setting the SM2 bit will configure EUART act as following: when a stop bit is received, EUART will generate an interrupt only if the 9th bit that goes into RB8 is logic 1 (address byte) and the received data byte matches the EUART slave address. Following the received address interrupt, the slave should clear its SM2 bit to enable interrupts on the reception of the following data byte(s).

The 9-bit mode requires that the 9th information bit is a 1 to indicate that the received information is an address and not data. When the master processor wants to transmit a block of data to one of the slaves, it first sends out the address of the targeted slave (or slaves). All the slave processors should have their SM2 bit set high when waiting for an address byte, which ensures that they will be interrupted only by the reception of an address byte. The Automatic address recognition feature further ensures that only the addressed slave will be interrupted. The address comparison is done by hardware not software.

After being interrupted, the addressed slave clears the SM2 bit to receive data bytes. The un-addressed slaves will be unaffected, as they will be still waiting for their address. Once the entire message is received, the addressed slave should set its SM2 bit to ignore all transmissions until it receives the next address byte.

The Automatic Address Recognition feature allows a master to selectively communicate with one or more slaves by invoking the Given Address. All of the slaves may be contacted by using the Broadcast address. Two special Function Registers are used to define the slave's address, SADDR, and the address mask, SADEN. The slave address is an 8-bit value specified in the SADDR register. The SADEN register is actually a mask for the byte value in SADDR. If a bit position in SADEN is 0, then the corresponding bit position in SADDR is don't care. Only those bit positions in SADDR whose corresponding bits in SADEN are 1 are used to obtain the Given Address. This gives the user flexibility to address multiple slaves without changing the slave address in SADDR. Use of the Given Address allows multiple slaves to be recognized while excluding others.

	Slave 1	Slave 2
SADDR	10100100	10100111
SADEN (0 mask)	11111010	11111001
Given Address	10100x0x	10100xx1
Broadcast Address (OR)	1111111x	11111111

The Given address for slave 1 and 2 differ in the LSB. For slave 1, it is a don't care, while for slave 2 it is 1. Thus to communicate only with slave 1, the master must send an address with LSB = 0 (10100000). Similarly the bit 1 is 0 for slave 1 and don't care for slave 2. Hence to communicate only with slave 2 the master has to transmit an address with bit 1 = 1 (1010 0011). If the master wishes to communicate with both slaves simultaneously, then the address must have bit 0 = 1 and bit 1 = 0. The bit 2 position is don't care for both the slaves. This allows two different addresses to select both slaves (1010 0001 and 1010 0101).

The master can communicate with all the slaves simultaneously with the Broadcast Address. This address is formed from the logical OR of the SADDR and SADEN. The zeros in the result are defined as don't cares. In most cases, the Broadcast Address is FFh, this address will be acknowledged by all slaves.

On reset, the SADDR and SADEN are initialized to 00h. This results in Given Address and Broadcast Address being set as XXXXXXXX (all bits don't care). This effectively removes the multiprocessor communications feature, since any selectivity is disabled. This ensures that the EUART 0 will reply to any address, which it is backwards compatible with the 80C51 microcontrollers that do not support automatic address recognition. So the user may implement multiprocessor by software address recognition mentioned above.

8.4.5 Error Detection

Error detection is available when the SSTAT bit in register PCON is set to logic 1.The SSTAT bit must be logic 1 to access any of the status bits (FE, RXOV, and TXCOL). The SSTAT bit must be logic 0 to access the Mode Select bits (SM0, SM1, and SM2).All the 3 bits should be cleared by software after they are set, even when the following frames received without any error will not be cleared automatically.

Transmit Collision

The Transmit Collision bit (TXCOL bit in register SCON) reads '1' if RI is set 0 and user software writes data to the SBUF register while a transmission is still in progress. If this occurs, the new data will be ignored and the transmit buffer will not be written.

Receive Overrun

The Receive Overrun bit (RXOV in register SCON) reads '1' if a new data byte is latched into the receive buffer before software has read the previous byte. The previous data is lost when this happen.

Frame Error

The Frame Error bit (FE in register SCON) reads '1' if an invalid (low) STOP bit is detected.

Break Detection

A break is detected when any 11 consecutive bits are sensed low. Since a break condition also satisfies the requirements for a framing error, a break condition will also result in reporting a framing error. Once a break condition has been detected, the EUART will go into an idle state and remain in this idle state until a valid stop bit (rising edge on RxD line) has been received.

8.4.6 Register

Table 8.21 EUART Control & Status Register

98H, Bank0	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0

8.5 Analog Digital Converter (ADC)

8.5.1 Feature

- 10-bit Resolution
- Build in V_{REF}
- Selectable external or built-in V_{REF}
- 8 Multiplexed Input Channels

The SH79F166A include a single ended, 10-bit SAR Analog to Digital Converter (ADC) with build in reference voltage connected to the V_{DD}, users also can select the V_{REF} pin input reference voltage. The 7 ADC channels are shared with 1 ADC module; each channel can be programmed to connect with the analog input individually. Only one channel can be available at one time. GO/$\overline{\text{DONE}}$ signal is available to start convert, and indicate end of convert. When conversion is completed, the data in AD convert data register will be updated and ADCIF bit in ADCON register will be set. If ADC Interrupt is enabled, the ADC interrupt will generate.

The ADC integrates a digital compare function to compare the value of analog input with the digital value in the AD converter. If this function is enabled (set EC bit in ADCON register) and ADC module is enabled (set ADON bit in ADCON register). When the corresponding digital value of analog input is larger than the value in compare value register (ADDH/L), the ADC interrupt will occur, otherwise no interrupt will be generated. The digital comparator can work continuously when GO/$\overline{\text{DONE}}$ bit is set until software clear, which behaviors different with the AD converter operation mode.

The ADC module including digital compare module can wok in Idle mode and the ADC interrupt will wake up the Idle mode, but is disabled in Power-Down mode.

Bit Number	Bit Mnemonic	Description
1-0 **7-0**	**A9-A0**	**ADC Data register** Digital Value of sampled analog voltage, updated when conversion is completed If ADC Compare function is enabled (EC = 1), this is the value to be compared with the analog input

The Approach for AD Conversion:

(1) Select the analog input channels and reference voltage.
(2) Enable the ADC module with the selected analog channel.
(3) Set GO/$\overline{DONE}$ = 1 to start the AD conversion.
(4) Wait until GO/$\overline{DONE}$ = 0 or ADCIF = 1, if the ADC interrupt is enabled, the ADC interrupt will occur.
(5) Acquire the converted data from ADDH/ADDL.
(6) Repeat step 3-5 if another conversion is required.

The Approach for Digital Compare Function:

(1) Select the analog input channels and reference voltage.
(2) Set ADDH/ADDL to the compare value.
(3) Set EC = 1 to enable compare function.
(4) Enable the ADC module with the selected analog channel.
(5) Set GO/$\overline{DONE}$ = 1 to start the compare function.
(6) If the analog input is lager than compare value set in ADDH/ADDL, the ADCIF will be set to 1. if the ADC interrupt is enabled, the ADC interrupt will occur.
(7) The compare function will continue work until the GO/$\overline{DONE}$ bit is cleared to 0.

8.6 Buzzer

8.6.1 Feature

- Output a signal (square wave) used for tones such as a confirmation tone
- Selectable whether to output one of 8 output frequencies or to disable the output

8.6.2 Register

8.7 Low Power Detect (LPD)

8.7.1 Feature

- An internal flag indicates low power is detected
- LPD detect voltage is selectable
- LPD de-bounce timer T_{LVR} is about 30-60μs

The low power detect (LPD) is used to monitor the supply voltage and generate an internal flag if the voltage decrease below the specified value. It is used to inform CPU whether the power is shut off or the battery is used out, so the software may do some protection action before the voltage drop down to the minimal operation voltage.

8.7.2 Register

Table 8.31 Low Power Detection Control Register

B3H	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0

8.8 Low Voltage Reset (LVR)

8.8.1 Feature

- Enabled by the code option and VLVR is 4.3V or 2.1V
- LVR de-bounce timer T_{LVR} is about 30-60μs
- An internal reset flag indicates low voltage reset generates

The LVR function is used to monitor the supply voltage and generate an internal reset in the device when the supply voltage below the specified value V_{LVR}. The LVR de-bounce timer T_{LVR} is about 30μs.

The LVR circuit has the following functions when the LVR function is enabled: (t means the time of the supply voltage below V_{LVR})

Generates a system reset when $V_{DD} \leq V_{LVR}$ and $t \geq T_{LVR}$;

Cancels the system reset when $V_{DD} > V_{LVR}$ or $V_{DD} < V_{LVR}$, but $t < T_{LVR}$.

The LVR function is enabled by the code option.

It is typically used in AC line or large battery supplier applications, where heavy loads may be switched on and cause the MCU supply-voltage temporarily falls below the minimum specified operating voltage. This feature can protect system from working under bad power supply environment.

8.9 Watchdog Timer (WDT) and Reset State

8.9.1 Feature

- Auto detect Program Counter(PC) over range, and generate OVL Reset
- WDT runs even in the Power-Down mode
- Selectable different WDT overflow frequency

OVL Reset

To enhance the anti-noise ability, SH79F166A built in Program Counter (PC) over range detect circuit, if program counter value is larger than flash romsize, or detect operation code equal to A5H which is not exist in 8051 instruction set, a OVL reset will be generate to reset CPU, and set WDOF bit. So, to make use of this feature, you should fill unused flash rom with A5H.

Watchdog Timer

The watchdog timer is a down counter, and its clock source is an independent built-in RC oscillator, so it always runs even in the Power-Down mode. The watchdog timer will generate a device reset when it overflows. It can be enabled or disabled permanently by the code option.

The watchdog timer control bits (WDT.2-0) are used to select different overflow frequency. The watchdog timer overflow flag (WDOF) will be automatically set to “1” by hardware when overflow happens. To prevent overflow happen, by reading or writing the WDT register RSTSTAT, the watchdog timer should re-count before the overflow happens.

There are also some reset flags in this register as below:

8.9.2 Register

Table 8.32 Reset Control Register

B1H, Bank0	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
RSTSTAT	WDOF	-	PORF	LVRF	CLRF	WDT.2	WDT.1	WDT.0
R/W	R/W	-	R/W	R/W	R/W	R/W	R/W	R/W
Reset Value (POR)	0	-	1	0	0	0	0	0
Reset Value (WDT)	1	-	u	u	u	0	0	0
Reset Value (LVR)	u	-	u	1	u	0	0	0
Reset Value (PIN)	u	-	u	u	1	0	0	0

Bit Number	Bit Mnemonic	Description
7	**WDOF**	**Watch Dog Timer Overflow or OVL Reset Flag** Set by hardware when WDT overflow or OVL reset happened, cleared by software or Power On Reset 0: Watch Dog not overflows and no OVL reset generated 1: Watch Dog overflow or OVL reset occurred
5	**PORF**	**Power On Reset Flag** Set only by Power On Reset, cleared only by software 0: No Power On Reset. 1: Power On Reset occurred.
4	**LVRF**	**Low Voltage Reset Flag** Set only by Low Voltage Reset, cleared by software or Power On Reset 0: No Low Voltage Reset occurs 1: Low Voltage Reset occurred
3	**CLRF**	**Pin Reset Flag** Set only by pin reset, cleared by software or Power On Reset 0: No Pin Reset occurs 1: Pin Reset occurred
2-0	**WDT[2:0]**	**WDT Overflow period control bit** 000: Overflow period minimal value= 4096 ms 001: Overflow period minimal value= 1024 ms 010: Overflow period minimal value = 256 ms 011: Overflow period minimal value = 128 ms 100: Overflow period minimal value = 64ms 101: Overflow period minimal value = 16ms 110: Overflow period minimal value = 4ms 111: Overflow period minimal value = 1ms ***Notes:*** *If WDT_opt is enable in application, you must clear WatchDog periodically, and the interval must be less than the value list above.*

8.10 Power Management

8.10.1 Feature

- Two power saving modes: Idle mode and Power-Down mode
- Two ways to exit Idle and Power-Down mode: interrupt and reset

To reduce power consumption, SH79F166A supplies two power saving modes: Idle mode and Power-Down mode. These two modes are controlled by PCON & SUSLO register.

8.10.2 Idle Mode

In this mode, the clock to CPU is frozen, the program execution is halted, and the CPU will stop at a defined state. But the peripherals continue to be clocked. When entering idle mode, all the CPU status before entering will be preserved. Such as: PSW, PC, SFR & RAM are all retained.

By two consecutive instructions: setting SUSLO register as 0x55, and immediately followed by setting the IDL bit in PCON register, will make SH79F166A enter Idle mode. If the consecutive instruction sequence requirement is not met, the CPU will clear either SUSLO register or IDL bit in the next machine cycle. And the CPU will not enter Idle mode. The setting of IDL bit will be the last instruction that CPU executed.

There are two ways to exit Idle mode:

(1) An interrupt generated. The clock to the CPU will be restored, and the hardware will clear SUSLO register and IDL bit in PCON register. Then the program will execute the interrupt service routine first, and then jumps to the instruction immediately following the instruction that activated Idle mode.

(2) Reset signal (logic low on the RESET pin, WDT RESET if enabled, LVR REST if enabled), this will restore the clock to the CPU, the SUSLO register and the IDL bit in PCON register will be cleared by hardware, finally the SH79F166A will be reset. And the program will execute from address 0000H. The RAM will keep unchanged and the SFR value might be changed according to different function module.

8.10.3 Power-Down Mode

The Power-Down mode places the SH79F166A in a very low power state. Power-Down mode will stop all the clocks including CPU and peripherals. If WDT is enabled, WDT block will keep on working. When entering Power-Down mode, all the CPU status before entering will be preserved. Such as: PSW, PC, SFR & RAM are all retained.

By two consecutive instructions: setting SUSLO register as 0x55, and immediately followed by setting the PD bit in PCON register, will make SH79F166A enter Power-Down mode. If the consecutive instruction sequence requirement is not met, the CPU will clear either SUSLO register or PD bit in the next machine cycle. And the CPU will not enter Power-Down mode.

The setting of PD bit will be the last instruction that CPU executed.

Note: *If IDL bit and PD bit are set simultaneously, the SH79F166A enters Power-Down mode. The CPU will not go in Idle mode when exiting from Power-Down mode, and the hardware will clear both IDL & PD bit after exit form Power-Down mode.*

There are two ways to exit the Power-Down mode:

(1) An active external Interrupt such as INT0, INT1 & INT4 will make SH79F166A exit Power-Down mode. The oscillator will start after interrupt happens, after warm-up time, the clocks to the CPU and peripheral will be restored, the SUSLO register and PD bit in PCON register will be cleared by hardware. Program execution resumes with the interrupt service routine. After completion of the interrupt service routine, program execution resumes with the instruction immediately following the instruction that activated Power-Down mode.

(2) Timer3 interrupt will make SH79F166A exit Power-Down mode when 32.768kHz or 128KHz is the clock source. The oscillator will start after interrupt happens, after warm-up time, the clocks to the CPU and peripheral will be restored, the SUSLO register and PD bit in PCON register will be cleared by hardware. Program execution resumes with the interrupt service routine. After completion of the interrupt service routine, program execution resumes with the instruction immediately following the instruction that activated Power-Down mode.

(3) Reset signal (logic low on the RESET pin, WDT RESET if enabled, LVR REST if enabled). This will restore the clock to the CPU after warm-up time, the SUSLO register and the PD bit in PCON register will be cleared by hardware, finally the SH79F166A will be reset. And the program will execute from address 0000H. The RAM will keep unchanged and the SFR value might be changed according to different function module.

Note: *In order to entering Idle/Power-Down, it is necessary to add 3 NOPs after setting IDL/PD bit in PCON.*

8.10.4 Register

Table 8.33 Power Control Register

87H	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
PCON	SMOD	SSTAT	-	-	GF1	GF0	PD	IDL
R/W	R/W	R/W	-	-	R/W	R/W	R/W	R/W

0	**IDL**	**Idle mode control bit** 0: Cleared by hardware when an interrupt or reset occurs 1: Set by software to activate the Idle mode

Table 8.34 Suspend Mode Control Register

8EH	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
SUSLO	SUSLO.7	SUSLO.6	SUSLO.5	SUSLO.4	SUSLO.3	SUSLO.2	SUSLO.1	SUSLO.0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset Value (POR/WDT/LVR/PIN)	0	0	0	0	0	0	0	0

Bit Number	Bit Mnemonic	Description
7-0	**SUSLO[7:0]**	This register is used to control the CPU enter suspend mode (Idle or Power-Down). Only consecutive instructions like below will make CPU enter suspend mode. Other wise the either SUSLO, IDL or PD bit will be cleared by hardware in the next machine cycle.

Example:

```
IDLE_MODE:
        MOV     SUSLO, #55H
        ORL     PCON, #01H
        NOP
        NOP
        NOP
```

```
POWERDOWN_MODE:
        MOV     SUSLO, #55H
        ORL     PCON, #02H
        NOP
        NOP
        NOP
```

8.11 Warm-up Timer

8.11.1 Feature

- Built-in power on warm-up counter to eliminate unstable state of power on
- Built-in oscillator warm-up counter to eliminate unstable state when oscillation startup

SH79F166A has a built-in power warm-up counter; it is designed to eliminate unstable state after power on or to do some internal initial operation such as read customer option etc.

SH79F166A has also a built-in oscillator warm-up counter, it is designed to eliminate unstable state when oscillator starts oscillating in the following conditions: Power-on reset, Pin reset, LVR reset, Watchdog Reset and Wake up from Power-down mode.

After power-on, SH79F166A will start power warm-up procedure first, and then oscillator warm-up procedure.

Power Warm-up Time

Power On Reset/ Pin Reset/ Low Voltage Reset		**WDT Reset (Not in Power-Down Mode)**		**WDT Reset (Wakeup from Power-Down Mode)**		**Wakeup from Power-Down Mode (Only for interrupt)**

MOV direct, #data	Move immediate data to direct byte	0x75	3	3
MOV @Ri, A	Move accumulator to indirect RAM	0xF6-0xF7	1	2
MOV @Ri, direct	Move direct byte to indirect RAM	0xA6-0xA7	2	3
MOV @Ri, #data	Move immediate data to indirect RAM	0x76-0x77	2	2
MOV DPTR, #data16	Load data pointer with a 16-bit constant	0x90	3	3
MOVC A, @A+DPTR	Move code byte relative to DPTR to A	0x93	1	7
MOVC A, @A+PC	Move code byte relative to PC to A	0x83	1	8
MOVX A, @Ri	Move external RAM (8-bit address) to A	0xE2-0xE3	1	5
MOVX A, @DPTR	Move external RAM (16-bit address) to A	0xE0	1	6
MOVX @Ri, A	Move A to external RAM (8-bit address)	0xF2-F3	1	4
MOVX @DPTR, A	Move A to external RAM (16-bit address)	0xF0	1	5
PUSH direct	Push direct byte onto stack	0xC0	2	5
POP direct	Pop direct byte from stack	0xD0	2	4
XCH A, Rn	Exchange register with accumulator	0xC8-0xCF	1	3
XCH A, direct	Exchange direct byte with accumulator	0xC5	2	4
XCH A, @Ri	Exchange indirect RAM with accumulator	0xC6-0xC7	1	4
XCHD A, @Ri	Exchange low-order nibble indirect RAM with A	0xD6-0xD7	1	4

PROGRAM BRANCHES					
Opcode		**Description**	**Code**	**Byte**	**Cycle**
ACALL addr11		Absolute subroutine call	0x11-0xF1	2	7
LCALL addr16		Long subroutine call	0x12	3	7
RET		Return from subroutine	0x22	1	8
RETI		Return from interrupt	0x32	1	8

JNC rel	(not taken) (taken)	Jump if carry flag is not set	0x50	2	2 4
JB bit, rel	(not taken) (taken)	Jump if direct bit is set	0x20	3	4 6
JNB bit, rel	(not taken) (taken)	Jump if direct bit is not set	0x30	3	4 6
JBC bit, rel	(not taken) (taken)	Jump if direct bit is set and clear bit	0x10	3	4 6
CJNE A, direct, rel	(not taken) (taken)	Compare direct byte to A and jump if not equal	0xB5	3	4 6
CJNE A, #data, rel	(not taken) (taken)	Compare immediate to A and jump if not equal	0xB4	3	4 6
CJNE Rn, #data, rel	(not taken) (taken)	Compare immediate to reg. and jump if not equal	0xB8-0xBF	3	4 6
CJNE @Ri, #data, rel	(not taken) (taken)	Compare immediate to Ri and jump if not equal	0xB6-0xB7	3	4 6
DJNZ Rn, rel	(not taken) (taken)	Decrement register and jump if not zero	0xD8-0xDF	2	3 5
DJNZ direct, rel	(not taken) (taken)	Decrement direct byte and jump if not zero	0xD5	3	4 6
NOP		No operation	0	1	1

BOOLEAN MANIPULATION				
Opcode	**Description**	**Code**	**Byte**	**Cycle**
CLR C	Clear carry flag	0xC3	1	1
CLR bit	Clear direct bit	0xC2	2	3
SETB C	Set carry flag	0xD3	1	1
SETB bit	Set direct bit	0xD2	2	3
CPL C	Complement carry flag	0xB3	1	1
CPL bit	Complement direct bit	0xB2	2	3
ANL C, bit	AND direct bit to carry flag	0x82	2	2
ANL C, /bit	AND complement of direct bit to carry	0xB0	2	2
ORL C, bit	OR direct bit to carry flag	0x72	2	2
ORL C, /bit	OR complement of direct bit to carry	0xA0	2	2
MOV C, bit	Move direct bit to carry flag	0xA2	2	2
MOV bit, C	Move carry flag to direct bit	0x92	2	3

10. Electrical Characteristics

Absolute Maximum Ratings*

DC Supply Voltage. . . . . .-0.3V to +6.0V

Input/Output Voltage. . . . . GND-0.3V to V_{DD}+0.3V

Operating Ambient Temperature. . . . . -40℃ to +85℃

Storage Temperature . . . .-55℃ to +125℃

FLASH write/erase operating. . . . . 0℃ to +85℃

***Comments**

Stresses exceed those listed under "**Absolute Maximum Ratings**" may cause permanent damage to this device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of this specification is not implied or intended. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

DC Electrical Characteristics (V_{DD} = 2.0V - 5.5V, GND = 0V, T_A = +25°C, unless otherwise specified)

Parameter	Symbol	Min.	Typ.*	Max.	Unit	Condition
Operating Voltage	V_{DD}	2.0	5.0	5.5	V	32.768kHz or 2MHz ≤ f_{OSC} ≤ 12MHz
Operating Current	I_{OP}	-	5	10	mA	f_{OSC} = 12MHz, V_{DD} = 5.0V All output pins unload (including all digital input pins unfloating) CPU on (execute NOP instruction), WDT on, all other function block off
	I_{OP2}	-	25	35	μA	f_{OSC} = 32.768kHz, OSCX off, V_{DD} = 5.0V All output pins unload (including all digital input pins unfloating) CPU on (execute NOP instruction), LVR off, all other function block off
Stand by Current (IDLE)	I_{SB1}	-	3	5	mA	f_{OSC} = 12MHz, V_{DD} = 5.0V All output pins unload(including all digital input pins unfloating), CPU off (IDLE), LVR off, LCD off, all other function block off
	I_{SB2}	-	15	20	μA	f_{OSC} = 32.768kHz, OSCX off ,V_{DD} = 5.0V All output pins unload (including all digital input pins unfloating) CPU off (IDLE), LVR off, LCD off, all other function block off
Stand by Current (Power-Down)	I_{SB3}	-	2	10	μA	Osc off, V_{DD} = 5.0V All output pins unload(including all digital input pins unfloating), CPU off (Power-Down), LVR off, LCD off, WDT off, all other function block off
	I_{SB4}	-	4	15	μA	f_{OSC} = 32.768kHz, OSCX off, V_{DD} = 5.0V All output pins unload(including all digital input pins unfloating), CPU off (Power-Down), LVR off, LCD off, WDT off, all other function block off
WDT Current	I_{WDT}	-	1	3	μA	All output pins unload, WDT on, V_{DD} = 5.0V
LCD Current	I_{LCD}	-	6	7	μA	traditional bias resistance mode, V_{DD} = 5.0V 300kΩ LCD bias resistance, contrast[3:0] = 1111
LPD Current	I_{LPD}	-	-	1	μA	V_{DD} = 2.0 - 5.5V
Input Low Voltage 1	V_{IL1}	GND	-	0.3 X V_{DD}	V	I/O Ports
Input High Voltage 1	V_{IH1}	0.7 X V_{DD}	-	V_{DD}	V	I/O Ports

(to be continued)

(continue)

Parameter	Symbol	Min.	Typ.*	Max.	Unit	Condition
Input Low Voltage 2	V_{IL2}	GND	-	0.2 X V_{DD}	V	$\overline{RST}$, T2, T3, T4, INT0/1/2/3/4, T2EX, RXD (RxCON[1:0] = 00), TXD, FLT, V_{DD} = 2.4 - 5.5V
		GND	-	0.4 X V_{DD}	V	RXD (RxCON[1:0] = 01), V_{DD} = 2.4 - 5.5V
		GND	-	0.5 X V_{DD}	V	RXD (RxCON[1:0] = 10), V_{DD} = 2.4 - 5.5V
Input High Voltage 2	V_{IH2}	0.8 X V_{DD}	-	V_{DD}	V	$\overline{RST}$, T2, T3, T4, INT0/1/2/3/4, T2EX, RXD, TXD, FLT, V_{DD} = 2.4 - 5.5V
Input Leakage Current	I_{IL}	-1	-	1	μA	Input pad, V_{IN} = V_{DD} or GND
Output Leakage Current	I_{OL}	-1	-	1	μA	Open-drain output, V_{DD} = 5.0V V_{OUT} = V_{DD} or GND
Pull-high Resistor	R_{PH}	-	30	-	kΩ	V_{DD} = 5.0V, V_{IN} = GND
Rest pin Pull-high Resistor	R_{RPH}	-	30	-	kΩ	V_{DD} = 5.0V, V_{IN} = GND
Output High Voltage	V_{OH}	V_{DD} - 0.7	-	-	V	I/O Ports, I_{OH} = -10mA, V_{DD} = 5.0V
Output Low Voltage	V_{OL1}	-	-	GND + 0.6	V	I/O Ports, I_{OL} = 15mA, V_{DD} = 5.0V
LCD Resistor	R_{ON}	-	5	-	kΩ	SEG1 - 19, COM1 - 8, V_{DD} = 3.6V - 5.0V The voltage variation of V1, V2, V3 is less than 0.2V

Note:

1. "" Data in "Typ." Column is at 5.0V, 25°C, unless otherwise specified.*
2. Maximum value of the supply current to V_{DD} is 80mA.
3. Maximum value of the output current from GND is 100mA.

A/D Converter Electrical Characteristics (V_{DD} = 3V, GND = 0V, T_A = 25℃, Unless otherwise specified)

Parameter	Symbol	Min.	Typ.	Max.	Unit	Condition
Supply Voltage	V_{AD}	2.5	3	3.5	V	
Resolution	N_R	-	10	-	bit	GND ≤ V_{AIN} ≤ V_{REF}
A/D Input Voltage	V_{AIN}	GND	-	V_{REF}	V	
A/D Input Resistor*	R_{AIN}	2	-	-	MΩ	V_{IN} = 3.0V
Recommended impedance of analog voltage source	Z_{AIN}	-	-	10	kΩ	
A/D conversion current	I_{AD}	-	1	3	mA	ADC module operating, V_{DD} = 3.0V
A/D Input current	I_{ADIN}	-	-	10	μA	V_{DD} = 3.0V
Differential linearity error	D_{LE}	-	-	±1	LSB	f_{OSC} = 12MHz, V_{DD} = 3.0V
Integral linearity error	I_{LE}	-	-	±2	LSB	f_{OSC} = 12MHz, V_{DD} = 3.0V
Full scale error	E_F	-	±1	±3	LSB	f_{OSC} = 12MHz, V_{DD} = 3.0V
Offset error	E_Z	-	±0.5	±3	LSB	f_{OSC} = 12MHz, V_{DD} = 3.0V
Total Absolute error	E_{AD}	-	-	±3	LSB	f_{OSC} = 12MHz, V_{DD} = 3.0V
Total Conversion time	T_{CON}	14	-	-	t_{AD}	10 bit Resolution, V_{DD} = 3.0V, t_{AD} = 1μs

***Note:** "*" Here the A/D input Resistor is the DC input-resistance of A/D itself.*

AC Electrical Characteristics (V_{DD} = 2.0V - 5.5V, GND = 0V, T_A = 25°C, f_{OSC} = 12MHz, unless otherwise specified)

Parameter	Symbol	Min.	Typ.	Max.	Unit	Condition
Oscillator start time	T_{OSC}	-	-	1	s	f_{OSC}= 32.768kHz
	T_{OSC}	-	1	2	ms	f_{OSC} = 12MHz
RESET pulse width	t_{RESET}	10	-	-	μs	Low active
WDT RC Frequency	f_{WDT}	-	2	3	kHz	
Frequency Stability (RC)	| Δ F|/F	-	±1	±2	%	RC Oscillator |F - 12MHz|/12MHz (V_{DD} = 2.0 - 5.0V, T_A = -40°C to +85°C)
		-	-	±2	%	RC Oscillator |F - 128kHz|/128kHz (V_{DD} = 2.0 - 5.0V, T_A = 25°C)

Low Voltage Reset Electrical Characteristics (V_{DD} = 2.0V - 5.5V, GND = 0V, T_A = +25°C, unless otherwise specified)

Parameter	Symbol	Min.	Typ.	Max.	Unit	Condition
LVR Voltage1	V_{LVR1}	4.2	4.3	4.4	V	LVR1 enabled
